26-FOI-00415 00000006279 "UNCLASSIFIED" 4/30/2026

NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)
UNIVERSAL SINGLE-LEVEL FLEET REPLACEMENT

GENERAL PROVISIONS

CONTRACT NO: _____

1. DEFINITIONS

Capitalized terms used in these General Provisions without definition shall have the meaning ascribed to them in this Article 1. Certain additional capitalized terms are defined elsewhere in this Contract. Unless the context otherwise requires, the singular shall include the plural, and the masculine gender shall include the feminine and neuter genders and vice versa.

"**Adverse Rights**" has that meaning ascribed to it in Article 19.

"**Agreed Testing Program**" means the testing program and Test Plan described in the Specification to be produced by the Contractor and approved by and agreed to by Amtrak.

"**Amtrak**" refers to the National Railroad Passenger Corporation, which has its headquarters at 1 Massachusetts Avenue, NW, Washington, DC 20001, and any permitted assignee of Amtrak's rights under the Contract.

"**Amtrak Collateral**" means all present and future Supplies and Equipment, including Cars, Special Tools, Spares, Amtrak Owned Spares, Mockups, and Contractor IP Rights, software, applications and programs, Technical Documents, machinery, inventory, tools, tooling, materials, components and any Work in process to be furnished by Contractor under the Contract or otherwise related to the design, engineering, manufacture, testing or equipping of the Equipment; all general intangibles and contract rights of Contractor in respect of subcontracts and supply contracts with Subcontractors to supply parts, equipment, materials, or services to perform the Contract or to manufacture, assemble, test, and deliver the Equipment and other Supplies; and all products, supporting obligations and proceeds, including insurance proceeds, of any of the foregoing.

"**Amtrak-Owned Spare**" means any spares purchased by Amtrak under the Contract.

"**Applicable Laws**" means all applicable federal, state and local laws, codes, ordinances, rules, regulations, judgments, decrees, directives, guidelines, policy requirements, orders or other governmental restrictions of any Government Authority, each as may be amended and in each case including successor provisions. For the avoidance of doubt, "Applicable Laws" includes any applicable Rules of Particular Applicability issued by the FRA and the Foreign Corrupt Practices Act.

"**Base Order**" refers to the first order of Equipment ordered by Amtrak under the Contract. The Base Order shall be identified in the Contract document signed by the Parties.

"**Business (Working) Day**" means a weekday (Monday to Friday) in the United States that is not an Amtrak holiday.

"**Car/Cars**" means the railroad passenger cars to be provided by the Contractor pursuant to this Contract. For the avoidance of doubt, the term Car or Cars includes any reference in the Contract Documents to Pilot Cars and/or Production Cars.

"**Car Builder**" means the Contractor.

"**Certificate of Conditional Acceptance**" refers to the certificate to be furnished by Amtrak to Contractor pursuant to Article 8, Section 8.3.

"**Certificate of Final Acceptance**" refers to the certificate to be furnished by Amtrak to Contractor pursuant to Article 8, Section 8.3.

"**Certificate of Final Fleet Acceptance**" refers to the certificate to be furnished by Amtrak to Contractor pursuant to Article 8, Section 8.4.

"**Change**" means any change or variation authorized by Amtrak pursuant to a Contract Modification issued by the Contracting Official or his representative.

"**Change Order**" means a unilateral written order by the Contracting Official directing the Contractor to make a change that Article 15, Changes, authorizes the Contracting Official to order without the Contractor's consent.

"**Claim**" means a formal demand or assertion by Contractor seeking, as a matter of right, adjustment or interpretation of Contract terms, payment of money, extension of time or other relief with respect to the terms of the Contract. The term "Claim" may also include Contractor demands or assertions related to other disputes and matters in question between Amtrak and Contractor arising out of or relating to the Contract.

"**Component**" except for purposes of the domestic preference or Buy America(n) requirements, shall mean usually self-contained, a component is comprised of parts, devices and structure and performs a distinctive function necessary to the operation of a system or subsystem.

"**Conflict of Interest**" means that because of activities or relationships with other persons or entities, (1) a person or entity is unable to render impartial assistance or advice to Amtrak, (2) the person's or entity's objectivity in performing the Work under this Contract is or might be otherwise impaired, or (3) the person or entity has, or attempts to create, an unfair competitive advantage.

"**Contract**" means the Equipment Contract between Amtrak and Contractor, signed by the duly authorized representatives of Amtrak and Contractor. The Contract includes multiple documents, which are collectively referred to as the Contract Documents.

"Conformed Specification" means these Specifications as revised to include and reflect all approved change orders, variances and waivers implemented throughout the duration of the Contract.

"**Contract Documents**" are identified in the Contract. They consist of the Contract and all other documents specifically identified and incorporated therein, including, without limitation, the Supplementary General Provisions for Non-construction Contracts, these Equipment Contract General Provisions; the Pricing Schedule; Drawings (and Revisions thereto); Specifications (and

Addenda thereto); Contract Modifications; and any other documents identified as Contract Documents in the Contract. Unless specifically identified in the Contract, the Contract Documents do not include solicitation documents (e.g., requests for bids or proposals, instructions to bidders or offerors). The Contract Documents follow the order of precedence as set forth in Section "Order of Precedence".

"**Contract Amount**" means the total purchase price for the Work including all amounts in respect of the Base Order, Contract Modifications, escalations and Option Orders or quantities.

"**Contract Modification**" is a document Amtrak issues that is executed after the Contract is awarded, to clarify, revise, add to, or delete from, or to modify the Contract. To be a valid modification, a Contract Modification must be in writing. Contract Modifications will serve as written amendments to the Contract, or a change order signed by Amtrak, or by Amtrak and the Contractor.

"**Contract Time**" means the period of time allotted in the Contract for completion of the Work or a portion thereof, as applicable.

"**Contracting Official**" or "**CO**" means is the individual identified as such in the Contract (or their delegee or successor) and duly authorized in writing by Amtrak to execute, administer, and make changes to the Contract on behalf of Amtrak and to make related determinations and findings on behalf of Amtrak. This includes a duly appointed successor. The Contracting Official is not necessarily an officer of Amtrak, is empowered to act within the limits of the Contracting Official's authority, and assumes no personal liability under the Contract. Other individuals including but not limited to the Contracting Official's Technical Representative, Program Managers, and Project Managers do not possess the authority of the CO.

"**Contracting Official's Technical Representative**" or "**COTR**" means the Contracting Official's Technical Representative identified in the Contract and any duly appointed successor. The COTR may monitor the Contractor's performance and provide technical advice to the CO within the Statement of Work or performance of work regarding the progress of the Contract. The COTR may not change the terms and conditions of the Contract without written approval by the Contracting Official.

"**Contractor**" means the individual, entity, or authorized representative of same, identified as such in the Contract.

"**Contractor Party**" means Contractor or any of its Subcontractors, suppliers, or any of their respective employees, agents or authorized representatives.

"**Day**" or "**day**" as used in the Contract means a United States calendar day unless otherwise noted.

"**Delivery Documentation**" means, in respect of each unit of Equipment, details of any Changes applied to that Equipment, repairs made during production, modification status, all critical components by part number/serial number, Service Bulletin embodiment status, Failures

identified during testing and actions taken in respect of those Failures, differences from any previously accepted Equipment and originals, when necessary, of all certificates issued in relation to a unit of Equipment in all cases prior to acceptance or conditional acceptance of that Equipment.

"**Delivery and Acceptance Schedule**" as used herein means the mutually agreed upon schedule for the delivery and acceptance of the Equipment.

"**Documentation**" except as applicable to commercially available software, includes all user manuals, Systems manuals, training materials, guides, logic diagrams, programmer's notes, flow-charts, algorithms, development tools and development platforms and other materials necessary for Amtrak's understanding and use of the Software for the Allowable Uses in the form prepared by the Contractor, subcontractor, Supplier or Manufacturer in the regular course of its business, or, to the extent that the Specification requires a different form, then in the form required by the Specification.

"**Draw Event**" means, with respect to a Letter of Credit, one or more of the following: (i) the Contract has been terminated by Amtrak for default pursuant to Section 16.1; (ii) Contractor or Guarantor is subject to a bankruptcy or insolvency event; (iii) Contractor has not paid indemnity obligations owed to Amtrak arising out of third party claims for bodily injury or death, or damage to or loss (including loss of use) of any property, or any infringement, violation or misappropriation of third party intellectual property rights; (iv) Contractor has not maintained insurance as required by Article 59; (v) Contractor has failed to make payment of undisputed amounts to its Subcontractors and Amtrak has made demand on Contractor to do so, and Contractor has failed to do so within thirty (30) days thereafter; or (vi) the Letter of Credit or its Confirmation will expire within thirty (30) days or less and the conditions for cancellation or release of the Letter of Credit as stated in Section 6.12 have not been met.

"**Drawings**" means, as applicable, two (2) dimensional or three (3) dimensional models, modules or drawings.

"**Equipment**" means all Cars, and Spare Vehicles ordered under the Contract, including all options for additional Cars or Spare Vehicles exercised. It may also refer to any physical device that is part of the Cars and/or is the object of maintenance actions.

"**Excess Costs**" are the difference between the Contract price for the terminated Supplies and/or Work and the total costs incurred by Amtrak to procure replacement Equipment and/or Work.

"**Excused Performance**" shall mean a Force Majeure Event, accident, vandalism (including graffiti), operational anomalies or negligence by Amtrak, its officers, directors, employees, agents, servants, or any other damage or events not attributable to Contractor and/or Amtrak. Minor Debris Damage shall not be covered by this definition.

"**Facility**" or "**Facilities**" as used herein means the facilities for service, inspection, periodic maintenance and/or repair.

"**Failure**" means that the Equipment or a unit thereof, a component, or other supplies, instructions, Technical Support, software, or any service supplied by Contractor or Contractor Party under the Contract or the TSSSA did not comply with the requirements or specifications or violated any applicable law, did not perform as designed or its intended purpose or the use to which it was put, or if a service, was improperly delayed or omitted, in all such cases, whether in consequence of faulty design, faulty Materials, poor workmanship, improper handling, security, storage or installation, negligence, willful misconduct or strict liability, or other errors or omissions or for any other reason attributable to the Contractor.

"**Failure – Type I**" shall mean a Failure that results in either one of below:

(a) A Car being Unfit for Revenue Service within one (1) hour of the scheduled departure due to but not limited to a trainline failure resulting in loss of train line communications or power transmission resulting in Amtrak making modifications to a scheduled consist to operate the train in Revenue Service, or a Car causing an en-route delay of the Revenue Service train more than sixty (60) minutes at a scheduled departure or arrival at any scheduled station, or a failure requiring a Car to be removed from the train consist en-route.

(b) A loss of fifty percent (50%) or more of food service in any of the food service cars due to equipment failure that results in a loss of food storage, refrigeration, cooking, increased meal prep times and/or food delivery, etc.

(c) The loss of the water and/or waste system in a Car during Revenue Service and/or the loss of any restroom in a Car during Revenue Service.

(d) The loss of one (1) HVAC unit in a car during Revenue Service.

(e) The loss of 50% of any one passenger amenity in any car type (i.e. convenience outlets, etc.). A list of all amenities will be determined prior to Contract Award.

(f) The failure of the Passenger Emergency Intercom (PEI) or Public Address/Intercom (PAIC) system in any Car.

Contractor understands and agrees that if vehicle options are exercised, this failure type will be updated and revised to reflect the unique components associated with those cars

"Failure – Type II" shall mean a Failure that results in:

(a) A Car being Unfit for Revenue Service within four (4) hours of the scheduled departure due to but not limited to a trainline failure resulting in loss of train line communications or power transmission resulting in Amtrak needing to make modifications to a scheduled consist, or a Car causing an en-route delay of the Revenue Service train of less than sixty (60) minutes but more than fifteen (15) minutes of a scheduled departure or arrival at any scheduled station.

(b) The failure or impacted operation of any door that adversely affects boarding and/or

alighting, passenger comfort and/or any passenger or crew accommodations.

(c) The loss of any passenger amenity including but not limited to, lighting, seating, etc. that affects ten percent (10%) or more of the seating capacity in that given Car.

(d) The loss of wayfinding capabilities in a Car during Revenue Service, i.e., any passenger information screen.

(e) The loss of connectivity in a Car during Revenue Service due to a defect or failure of Contractor supplied Material.

"**Failure – Type III**" shall mean a Failure that results in an actual repair time that exceeds one-half (0.5) labor hour and does not meet the criteria of a Type I or a Type II Failure. Type III Failures constitute Unscheduled Maintenance and can typically be repaired without causing delay to the scheduled departure or arrival of a Car or requiring the movement of the Car to a repair track or facility. I.E. cabinet latch, drawer slide, display screen not fully illuminated, loose trim, etc. not causing a safety issue.

"**Failure – Type IV**" shall mean any Failure that leads to a train being annulled or unable to be placed in Revenue Service.

"**Federal Railroad Administration**" or "**FRA**" means an agency within the U.S. Department of Transportation.

"**Fleet**" means all means all, Cars and Spare Vehicles ordered under the Contract, including all options for additional Cars or Spare Vehicles exercised

"Field Modification Instructions (**FMI)**" means instructions for applying and installing engineering solutions to resolve fleet-wide defects and/or upgrade installations and/or systems to Equipment that have already been shipped from the factory.

"**Final Fleet Acceptance**" means the Fleet has met all conditions prerequisite for issuance of a Certificate of Final Fleet Acceptance.

"**Final Payment**" refers to the retainage or final installment of the Contract Amount payable in connection with the Work. Final Payment is made to the Contractor when it has satisfied all of the requirements called for by all provisions of the Contract, including all of the required documentation.

"**Financing Parties**" means Lender or any Person that advances funds or provides financing (other than as capital contributions) to Amtrak for all or a part of the costs and expenses associated with the Equipment, including (a) Lender, banks, financial institutions and capital market participants and (b) any trustee or agent acting on behalf of any Person referred to in the preceding clause (a).

"Fit for Purpose" means:

(a) In respect of each Equipment, that:

i). all relevant approvals in respect of that Equipment have been obtained and remain in force;

ii). such Equipment:

(b) meets the requirements of the Contract, and

(c) is in a condition which enables Amtrak to operate such Equipment in Revenue Service in accordance with the Contract; and such Equipment is and shall remain fit for the purposes specified in paragraph (a)(ii) above throughout its service life;

(d) In relation to each Amtrak-Owned Spare that such Amtrak-Owned Spare when incorporated into an Equipment, does not prevent such Equipment from being Fit for Purpose as defined in paragraph (a) above; and

(e) In relation to each Special Tool that such Special Tool is fit for use by a maintainer of rolling stock to carry out the maintenance and/or services.

"**General Provisions**" means these terms and conditions.

"**Government Authority"** means (a) any international, foreign, federal, state, county or municipal government, or political subdivision thereof, (b) any governmental or quasi-governmental agency, authority, board, bureau, commission, department, instrumentality or public body or (c) any court or administrative tribunal of competent jurisdiction.

"**Guarantor**" means the company that will execute, deliver and be liable on the Parent Guaranty, or the respective successor.

"**Indemnified Party Claim**" has that meaning ascribed to it in Article 32.1.

"**Indemnified Parties**" means Amtrak, its officers, directors, employees, agents, servants, successors, assigns subsidiaries, subcontractors, representatives, attorneys, and consultants, and any Financing Parties.

"**Intellectual Property**" shall mean any recognized protectable intellectual property, such as patents, utility models, copyrights, corporate names, trade names, trademarks, trade dress, service marks, applications for any of the foregoing, discoveries, inventions, software, firmware, trade secrets, mask works, industrial design rights, rights of priority, know how, design flows, methodologies and any and all other intangible protectable proprietary information that is legally recognized. Intellectual Property includes without limitation any and all drawings, designs, specifications, documentation, notes and other works, prepared, developed or acquired in performance of the design services component of the Work (collectively, the "Equipment Design Documents") or in the performance of the Design/Build Services (collectively, the "Design

Procurement Documents") or otherwise delivered to Amtrak in connection with the Work (the "Other Documents").

"**IP Rights**" means any and all of the following rights and interests worldwide: (a) any and all patent applications and patents and unpatented inventions or technology; (b) any and all proprietary knowledge, know-how, data and trade secrets; (c) any and all copyrights, whether registered or unregistered, and applications to register the same; (d) any and all rights in software, data, databases or related documentation; (e) any and all engineering data and information; and (f) any and all other proprietary rights or Intellectual Property rights.

"**Lender**" means any entity that lends Amtrak funding for the Contract.

"**Letter of Credit**" means a letter of credit to Amtrak in the form of Exhibit U-9, Irrevocable Standby Letter of Credit or otherwise acceptable to Amtrak issued with only such modifications to such form as are approved by Amtrak in its sole discretion. The Letter of Credit shall be issued by one or more Qualified Issuers and if requested by Amtrak, will be issued in SWIFT format through Amtrak's designated advising bank.

"**Major Component**" shall mean those components designated by Contractor and agreed to by Amtrak as being significant for purposes of Article 13, Section 13.7.

"**Mandatory Modification**" means a Modification which is required to be made under any Applicable Laws.

"**Mean Time Between Component Failures (MTBCF)**" means time between individual component failures.

MTBCF = Total Operating Distance (miles)

Total Number of Component Failures

"Mean Distance Between Service Failures (MDBSF)" means operating mileage between service failures caused by equipment or system failures.

MDBSF = Total Operating Distance (miles)

Total Number of Service Failures

"**Modification**" means any variation, modification or addition to the Equipment Contract.

"**Non-Allowable Service Interruption**" means Service Interruptions other than Allowable Service Interruptions.

"**Northeast Corridor**" or "**NEC**" means the intercity operations of Amtrak from Washington, D.C. to Boston, Massachusetts.

"**Notice to Proceed**" or "**NTP**" means a notice provided to Contractor that it may begin performance of the Contract or a Contract Modification.

"**Option Order**" refers to one or more of the options that may be exercised by Amtrak in its sole discretion for purchasing additional Equipment. under the terms of the Contract.

"**Parent Guaranty**" means a guaranty of payment and performance (and not of collection) issued by Guarantor guarantying the Work under this Contract, including Contractor's present and future performance, obligations and liabilities under this Contract.

"**Performance and Payment Bond**" has that meaning ascribed to it in Article 6.

"**Person**" means a person (including Contractor and Amtrak) and shall be construed as including references to an individual, firm, company, corporation, unincorporated association or body of persons or any government authority (including any of its agencies).

"**Pilot Car(s)**" means the first Car (of each type) to be fully assembled at the Contractor's final assembly facility.

"**Project Schedule**" means the mutually-agreed upon project schedule for production of the Equipment and the provision of other deliverables.

"**Project Management Plans**" or "**Plans**" means the Project Management Plan described in the Specification.

"**Qualified Issuer**" means either: 1) an issuing bank that issues the Letter of Credit that meets the following criteria: (i) it is a U.S. bank or a U.S. branch of a foreign bank, (ii) it has and maintains assets of at least $50 billion USD, and (iii) it or its holding company's long term debt is rated no lower than A by Standard & Poor's Rating Services or no lower than A3 by Moody's Investor Service, or 2) a surety(ies) acceptable to Amtrak, registered in the U.S. Department of Treasury's Circular TD 570, licensed to do business in all states in which the Work is performed, and carrying a financial rating from A.M. Best Company of A-VIII or better.

"**Reliability Demonstration Commencement Date**" means the date that the first unit of Equipment is placed into Revenue Service.

"**Reliability Demonstration for Final Fleet Acceptance**" has that meaning ascribed to it in Article 8, Section 8.4.

"**Reliability Target**" has that meaning ascribed to it in Article 8.

"**Relevant Approval**" means a consent, approval or authorization granted or required to be granted (as the context may require) by a Government Authority in relation to the Equipment in order to permit the operation of such Equipment with or without passengers.

"**Revenue Service**" means the time when a unit of Equipment is available to the general public and there is a reasonable expectation of carrying passengers that either directly pay fares, are subsidized by public policy, or provide payment through some contractual arrangement. Equipment operated in fare free service are considered in Revenue Service.

"**Safety**" means the condition in which persons and equipment are free from threat, danger, harm, or loss arising from improper design, manufacture, assembly or function, or a failure of the car or any of its components or systems.

"**Safety Critical**" means a system, or any portion thereof, means the correct performance of which is essential to safety of personnel or Equipment, or both; or the incorrect performance of which could cause a hazardous condition, or allow a hazardous condition which was intended to be prevented by the function or system to exist.

"**Safety Plan**" means the safety plan produced by Contractor based on the principles specified in the Management Plans and approved by and agreed to by Amtrak in accordance with the Contract.

"**Scheduled Final Fleet Acceptance Date**" means the date specified in Contractor's Amtrak-approved Project Schedule on which Final Fleet Acceptance is scheduled to occur.

"Scheduled Trip" means a scheduled train trip from start to finish.

"**Security**" has that meaning ascribed to it in Article 6.

"**Service Bulletin**" means any documentation produced by Contractor that sets out details of any design changes to the Cars and details how such changes impact the Equipment; what, if any, modifications are necessary; and any other relevant information.

"**Spares**" means spare parts, Supplies, Equipment, and components that fit, form and functionally equivalent to the original design and consumables or expendables.

"**Software**" means any and all computer application programs which are incorporated as part of any system, subsystem, assembly, subassembly or components thereof, or any interface system control between or among the systems, subsystems, assemblies, subassemblies, or components thereof, in the Cars , or which are used in connection with a system (which use involves microprocessors, controllers, drivers, or other electronic data processing elements) or which are used in connection with any related diagnostic or testing equipment, together with all related Documentation, including without limitation, the object code, source code and pseudo-code versions of such assemblies, subassemblies, programs, firmware containing such programs, know-how protocols, listings, instruction sets, indices and other intellectual property necessary for the Amtrak's use of the Software for the Allowable Uses in the form prepared by the Contractor, Subcontractor, Supplier or Manufacturer in the regular course of its business, or to the extent that the Specification requires a different form, then in the form required by the Specification.

"**Source Code**" means the programming statements and instructions a programmer writes, but which statements and instructions ("code") are not directly executable by the computer that will execute the instructions provided by the programmers until converted into executable or machine language.

"**Special Tools**" means all specialized tools, gauges, meters, diagnostic equipment (including laptop computer software), etc. that will be necessary to operate, maintain, overhaul, inspect, test, troubleshoot and repair all configurations of the Equipment throughout its design life. Special tools do not include those tools that are commercially available "off the shelf".

"**Specification**" means any specification referenced in this document, including any schedule, exhibit or attachment to it, or any Contract or Subcontract, including without limitation the Technical Specification with Options, as amended, the Conformed Specification, and the technical specifications referenced therein.

"**Subcontractor**" means any party that takes portions of the Contract from Contractor or another subcontractor to provide a service and/or Supplies, parts or material necessary for the performance of the Contract.

"**Subcontractor IP Rights**" shall mean all rights and interests held or otherwise controlled by a Subcontractor worldwide in and to any IP Rights.

"**Supplies**" means the supplies, equipment, materials, articles, or other items ordered by Amtrak and furnished by Contractor under the Contract including, but not limited to, Cars, Amtrak-Owned Spares, Special Tools, and Mock-Ups.

"**Technical Proposal**" means the technical proposal submitted by Contractor to Amtrak in response to the RFP, as amended.

"**Technical Specification**" refers to the Amtrak Mechanical Department Rolling Stock Equipment Specification for Long Distance Universal Single Level Fleet Replacement, Specification No. 1139, as amended.

"**Technical Support and Spares Supply Agreement**" or "**TSSSA**" means the agreement entered into between Amtrak and Contractor for the provision of technical support and spares.

"**Temporary Permit to Enter**" means a permit issued by Amtrak to permit Contractor to enter Amtrak's property and perform work or services.

"**Test Plan**" means the plan and schedule for conducting all the tests required on the vehicle.

"**Total Order**" refers to the Equipment ordered by Amtrak under the Base Order and Option Orders.

"**Three-Year Warranty Period**" for each of unit of Equipment means the three (3) year period after issuance of a Certificate of Final Acceptance or Certificate of Conditional Acceptance.

"**Train**" means any number of cars coupled to a locomotive or a source of self-propulsion, and moving as one.

"**Train Delay**" means an Equipment-related failure that causes a Train in service to be: more than 15 minutes late at its destination terminal; canceled either at its originating point or en-route; or reduced in size or revenue capacity due to requiring a failed Car to be removed from the train.

"**Unfit for Revenue Service**" means the presence of one or more Failures preventing use of the Equipment in Revenue Service.

"**Unscheduled Maintenance**" shall mean those unpredictable maintenance requirements or activities that were not previously planned or programmed, but require prompt attention and must be added to, integrated with or substituted for previously scheduled workloads. This includes, but is not limited to, maintenance that restores operability to the Equipment that is performed after a Failure, defect or problem emerges in Equipment.

"**U.S. Department of Transportation**" (USDOT) means the Secretary of the USDOT and other persons who may at the time be acting in the capacity of the Secretary, or authorized representative or any person otherwise authorized to perform the functions to be performed hereunder, including representatives of the Federal Transit Administration (FTA) and Federal Railroad Administration (FRA).

"**Vehicle**" means the same as Car or locomotive.

"**Vehicle History Book**" means a document specific to an individual rail vehicle containing records of technical and parts data pertinent to that individual vehicle.

"**Work**" as used herein, means the provision of the deliverables and Equipment, including, but not limited to, the Equipment, Amtrak-Owned Spares, and Special Tools, identified and required by the Contract and the designs, engineering, manufacturing, assembly, testing, operations, maintenance services or other activities/services performed pursuant to the Contract. Work includes the work performed and materials acquired for the Contract under a limited notice to proceed or similar request by Amtrak.

"**Work Product**" shall mean any deliverable described in the Statement of Work or Contract Documents, and all written or fixed media material, ideas, concepts, discoveries, inventions, improvements, enhancements, modifications, and designs (whether or not registerable or patentable), developed, conceived or reduced to practice by Contractor or its employees in connection with the performance of the Contract. Amtrak and Contractor hereby agree that the Equipment Design Documents, Design Procurement Documents, and Other Documents shall be Work Product under the Contract.

2. INTERPRETATION OF DOCUMENTS

2.1. The Contract constitutes the entire agreement of the parties. Except as provided under the Changes article hereof, neither oral statements nor other writings may be used to supplement, modify, or

otherwise affect the provisions of the Contract. Contractor acknowledges that it has not been induced to enter into the Contract by any representations or promises not specifically stated in the Contract. Unless otherwise specified herein, all previous or contemporaneous proposals, letters, promises, representations, documents, agreements, or understandings, whether written or oral, relating to the subject manner of the Contract are hereby declared to be null and void and are superseded by the terms and conditions of the Contract. The terms and conditions of the Contract supersede any and all terms and conditions submitted by Contractor prior to, concurrently with, or pursuant to the Contract. Any additional or different terms proposed by Contractor are expressly rejected unless specifically accepted in writing by the Contracting Official. No other terms and conditions, or changes or modifications to the Contract shall be binding upon Amtrak unless agreed to in writing in accordance with the Changes section herein.

2.2. Any inconsistencies in Contract provisions or Contract shall be resolved by giving precedence in the following order:

(a) Contract Modifications;

(b) The Universal Single-Level Fleet Replacement Equipment Contract;

(c) Supplementary General Provisions;

(d) General Provisions;

(e) Technical Specification; and

(f) Design documentation, including Drawings and/or construction or manufacturing Drawings produced as a result of the Technical Specification, or otherwise, in the following order of precedence:

i). Notes on Drawings,

ii). Large scale details,

iii). Figured dimensions, and

iv). Scaled dimensions.

2.3. If any uncertainty remains after reference to the hierarchy set forth in Section 2.2, the Contractor shall then confer with and be governed by the interpretation(s) of the Contracting Official or his authorized representative.

2.4. The captions in these General Provisions are for the convenience of the parties in identification of the several provisions and shall not constitute a part of the Contract nor be considered interpretative hereof.

2.5. Drawings and Specifications are complementary. Anything shown in the Drawings and not mentioned in the Specifications or mentioned in the Specifications and not shown in the

Drawings, shall have the same effect as if shown or mentioned in both. The Contractor is responsible for assuring that the Drawings and Specifications conform to the terms of the Contract. A typical or representative detail indicated on or reasonably inferable from the Contract or from normal custom and practice shall constitute the standard for workmanship and material throughout corresponding parts of the Work. Where necessary, and where reasonably inferable from the Contract, the Contractor shall adapt, or have adapted, such representative detail for application to corresponding parts of the Work. Repetitive features shown in outline on the Drawings shall be in reasonable accordance with corresponding features completely shown.

2.6. It shall be the Contractor's responsibility to study the Contract and to report, at once in writing to the COTR, any errors, inconsistencies or omissions therein. Should the Contractor believe that the correction of the alleged errors, inconsistencies or omissions shall be the cause of additional expenditures or impact the schedule for performance of the Work, or portion thereof, the Contractor shall so advise Amtrak as part of the written notification. Any Work performed by the Contractor prior to receiving a written response from Amtrak with respect to any alleged error, inconsistency or omission shall be at the Contractor's own risk and expense.

2.7. The Contractor is under an obligation to control and check all project materials. Errors or omissions in the Specification, Drawings or other supplementary specifications supplied by Amtrak shall in no way affect Contractor's warranties that the Equipment fulfills the provisions of this Contract in all respects.

2.8. Where standard specifications issued by a recognized industry association or regulatory body are referenced, the reference shall be interpreted as incorporating the standard specifications in total unless otherwise noted in the Contract.

2.9. The Contractor shall coordinate its designs and Drawings, and review them for accuracy, completeness, and compliance with Contract requirements and shall indicate its approval thereon as evidence of such coordination and review prior to submission to the COTR. Drawings submitted to the COTR without evidence of the Contractor's approval may be returned for resubmission. Acceptance by the COTR shall not relieve the Contractor from responsibility for any errors or omissions in such Drawings, nor from responsibility for complying with the requirements of this Contract, except with respect to variations expressly approved in accordance with the Contract.

2.10. If Drawings show variations from the requirements contained in the Contract, Contractor shall describe such variations citing the specific contract requirement(s) in writing, separate from the Drawings, at the time of submission. If the Contracting Official approves any such variation(s), he shall issue an appropriate Contract Modification or Change Order. If the variation is minor and does not involve a change in the time required for performance, or the cost of performing the Work, the Contracting Official shall note this fact on the Contract Modification and issue a corresponding no-cost or no-time extension Change Order.

2.11. The Equipment specified herein shall embody all of the latest tested and proven developments and improvements available to the Contractor during the course of design and manufacture of the Equipment and shall be of the best engineered design for the service intended. Unless stresses,

deflections, or properties of structural sections are specifically required herein, the Contractor shall use its best judgment and experience in determining the stresses imposed by the type of operation, and it shall provide for these stresses with an adequate margin of safety. In no case may design stresses exceed those generally considered reasonable and prudent in the industry.

3. APPROACH AND SUPERVISION OF WORK

3.1. The Contractor shall use a systematic management approach to provide completed Equipment meeting all specified performance levels compatible with all elements of the railway system over which the Equipment shall operate, for the service life of the Equipment (forty (40) years) as defined in the Contract. The Contractor shall apply this management approach throughout the design, development, production, and delivery phases of the Contract and to all aspects of the Work or material or components of the Equipment provided by the Contractor or its Subcontractors.

3.2. RESERVED

3.3. Copies of all drawings, manufacturing procedures, test procedures, test reports, test equipment calibration certificates, welder certifications, diagrams, schedules, changes, deviations, revisions and data shall be furnished to Amtrak at the same time these are made available to the Contractor's QA department and in advance of any work being performed. Data shall be sufficient to verify design, construction, assembly, installation, workmanship, clearance, tolerance and functioning of the Equipment.

3.4. The Contractor shall supervise and direct the Work, using its best skill and attention. It shall be solely responsible for all means, methods, techniques, sequences and procedures and for coordinating all portions of the Work prescribed by the Contract.

3.5. The Contractor shall submit, pursuant to Article 33, a list of Subcontractor(s) or supplier(s) selected to provide any Safety Critical systems, subsystems, components, or parts of the Equipment or to perform any aspect of the Work over an aggregate value of $1,000,000.

3.6. The Contractor shall require that each Subcontractor of materials, apparatus, components, assemblies or parts, except as otherwise provided herein, shall provide all labor, tools and materials necessary to make, assemble, completely test, and ready for installation by the Contractor, the component or apparatus to be furnished by said Subcontractor.

3.7. The Contractor shall require that the Subcontractors of all materials, apparatus, components, assemblies and parts, cooperate, to the fullest extent during design and manufacture of the Equipment, to ensure proper use and installation of their products. The Subcontractors shall give prompt notice to the Contractor and Amtrak if the use or installation of their Equipment by the Contractor is not satisfactory to them. No agreement with respect to the above shall be made without an immediate conference at which Amtrak, Contractor and the Subcontractor are each represented, and the resolution is approved by the Contracting Official. Copies of purchase orders and revisions to purchase orders for all major items of Equipment shall be promptly submitted to Amtrak upon request.

3.8. The Contractor shall take measurements and verify all conditions and shall carefully compare such measurements and conditions and other information known to the Contractor with the Contract before commencing activities. Errors, inconsistencies or omissions discovered shall be reported, in writing, to the Contracting Official at once. The Contractor shall satisfy itself as to the accuracy of all measurements and conditions. Any errors due to the Contractor's failure to so verify and to so take measurements shall be promptly rectified by the Contractor without any additional cost to Amtrak. No Change Order, whether for an adjustment in the Contract Amount or Contract Time, shall be allowed based on any such error described in this Article.

3.9. RESERVED.

4. APPROVED/REVIEWED

4.1. When the words "approved," "satisfactory," "proper" or "as directed" are in the Contract, approval by the Contracting Official or his authorized representative shall be required.

4.2. Contractor shall submit all documentation and Drawings for either Amtrak "review" or Amtrak "approval". All submittals are for Amtrak review, unless the Contract provides for Amtrak approval. Amtrak responses shall be in accordance with the Specification. Prior to requesting review by Amtrak, Contractor shall notify Amtrak in writing, providing Amtrak with sufficient advance notice, of the time when such review may be undertaken. If the review is to take place within the continental United States, thirty (30) days is sufficient advance notice. If the review is to take place outside of the United States, forty-five (45) days is sufficient advance notice. Contractor shall provide Amtrak with any and all related information and documentation, including information and documentation that may be requested by Amtrak, sufficiently in advance to enable Amtrak or its authorized representative to perform a meaningful review.

4.3. If Contractor submits two (2) or more requests for reviews and/or decisions, within the same or a similar timeframe or with the same or similar due dates, Contractor shall prioritize those items and advise Amtrak in writing which reviews or decisions should be addressed first. Amtrak shall advise Contractor of the time required for completion of its review and the parties shall mutually agree upon a date for the completion of Amtrak's review of those items or the rendering of Amtrak's decision.

4.4. Unless a greater time is set forth in the Contract, in the case of decisions with respect to the Equipment, Amtrak shall have at least thirty (30) business days or if Amtrak receives multiple requests from Contractor as described in Section 4.3 above, a mutually agreeable greater amount of time from the date on which Contractor completes its submission to Amtrak of all information and documents required in connection with making the requisite decision, to notify the Contractor of its decision. Notwithstanding the foregoing, in the case of decisions with respect to training documentation, manuals and parts catalogs, Amtrak shall have at least sixty (60) business days unless Contractor has specified a greater time period or some other time period is agreed to by the parties.

4.5. If a decision by the Contracting Official or COTR is required by a certain time in order to avoid a delay in the Work, the Contractor shall notify the Contracting Official in writing at the time the

request for decision is submitted. Such notice shall (1) set forth the requested due date for the decision; (2) provide the expected impact to the schedule if such decision is not received by the requested due date; and (3) transmit any information or documentation not previously provided to Amtrak that may be reasonably required for Amtrak to render a decision. Such notice shall be given sufficiently in advance to enable the Contracting Official or Amtrak to make an appropriately considered decision, and in no case later than the date on which Contractor first requests a decision from Amtrak. Failure to give such notice shall be deemed a waiver by the Contractor of its right to make a Claim based on an untimely decision by the Contracting Official.

4.6. For the avoidance of doubt, the times for decisions from Amtrak in this Article and the Specification only applies to decisions with respect to the Equipment. It does not apply to decisions with respect to any commercial or other aspects of the Contract.

5. CONTRACTING OFFICIAL'S REPRESENTATIVE (COR) AND CONTRACTING OFFICIAL'S TECHNICAL REPRESENTATIVE (COTR)

5.1. The Contracting Official may designate Amtrak personnel or agents to act as the Contracting Official's Representative (COR) or technical representative (COTR). Such designation shall be set forth in the Contract or by separate letter signed by the Contracting Official, and shall contain specific instructions as to the extent to which the representative may take action for the Contracting Official.

5.2. Unless otherwise provided in writing by the Contracting Official, the COTR's authority shall be to review and interpret Drawings and Contract technical submissions, review schedules, conduct design reviews, review invoices and progress payments, accept the Equipment and the related accessories and all other interface functions of a technical or commercial nature between the Contractor and Amtrak. All orders and directives issued by the COTR shall be in writing. Acceptance of Drawings by the COTR shall not relieve the Contractor of any contractual obligation. Acceptance of Drawings does not signify that the COTR is conducting an equal engineering effort in parallel with the Contractor to assure that the entire Equipment design as a whole shall meet all requirements of the Contract.

5.3. Contractor shall designate one of its employees as its Contractor Project Director, who shall be assigned by Contractor to supervise Contractor's Work hereunder and shall serve as Amtrak's point of contact for the resolution of problems. Amtrak shall designate an Amtrak Project Director to coordinate issues concerning Contractor's performance of the Work. The Amtrak Project Director shall serve as Contractor's point of contact for the resolution of problems related to the management of the relationship under the Contract. Contractor may not, without the consent of the Amtrak Project Director, replace its Project Manager unless the replacement is a result of the individual: (a) voluntarily resigning from employment with Contractor; (b) being dismissed by Contractor for misconduct or unsatisfactory performance; or (c) being unable to perform duties due to death or disability.

6. PERFORMANCE ASSURANCES REQUIRED FOR START OF WORK

6.1. Start of Work/Conditions on Issuance of NTP

6.1.1. Within ten (10) days after the Notice of Award (NOA) is issued and noticed to Contractor, Contractor must submit to Amtrak and thereafter cause to be maintained for the duration specified in this Article 6: (i) the Security in the amount described in herein, (ii) a Parent Guaranty, if applicable, in a form specified by Amtrak, together with an opinion of counsel if required by these general provisions, and (iii) a certificate of insurance evidencing the insurance coverage required hereunder, in each case with only such modifications to the scheduled form or requirements stated in this Contract as have been approved by Amtrak in writing. Within fifteen (15) days (or as soon as practicable thereafter) after Amtrak's receipt and acceptance of the Parent Guaranty accompanied by the opinion of counsel if required, and certificates from Contractor's insurers or insurance brokers showing insurance required hereunder is in place, Amtrak shall issue a NTP. The date of an NTP with respect to any phase of the Work shall be considered by Amtrak as the date that Work commences and shall provide the basis for the calculation of timely completion of the Work in connection with the Equipment and related Supplies, except that, in the event Contractor fails to timely submit the Parent Guaranty with accompanying opinion, and/or proof of required insurance, the fifteenth (15th) day after the execution of the Contract by Amtrak shall be used as the basis for calculating timely completion of the Work in connection with the Equipment and related Supplies.

6.2. Performance and Payment Security

6.2.1. Contractor shall furnish and cause to be maintained Security at fifty percent (50%) of the Contract Amount until the conditions of cancellation for the Security set forth below have been met.

(a) For purposes of this Contract, Security means:

i). A Performance Bond

ii). A Payment Bond in the form attached included in the Solicitation or a form otherwise acceptable to Amtrak that meets the requirements set forth herein (for the avoidance of doubt, each bond type will be issued in full at [TBD] ([TBD]) percent of the Contract Amount, respectively); or

iii). A Letter of Credit as that term is defined herein.

6.3. Performance and Payment Bonds as Security

6.3.1. The Performance and Payment Bonds must be issued by a Qualified Issuer. The Bonds must reference the Contract Number and shall be in a form agreeable to Amtrak and shall include: (1) a requirement that the surety agree that no change, extension of time, alteration, addition, omission, or other modification of the terms of the Contract or the work to be performed shall in any way affect its obligation on the bond, and (2) a requirement that the surety waives notice of any such change, extension of time, alteration, addition, omission or other modification. All bonds are subject to review by Amtrak and must have properly

executed power of attorney attached and seals affixed. Bonds must be properly countersigned where state law so requires.

6.4. Letter of Credit as Security

6.4.1. Letters of Credit shall have an initial expiration date of i) the date agreed to by Amtrak as the scheduled date of Acceptance of the second Production #3 or (ii) one (1) year from date of issuance but contain an automatic extension clause that requires at least ninety (90) days advance written notice to Amtrak by the issuer of a non-extension if the then current expiration date is not to be extended for another year.

6.4.2. Amtrak may give notice to Contractor that it must replace the Letter of Credit with Security issued by a Qualified Issuer if at any time (i) in the opinion of Amtrak, the issuer of the Letter of Credit ceases to be a Qualified Issuer, (ii) the issuer of the Letter of Credit sends notice that it will not be extending the Letter of Credit, (iii) the Letter of Credit will expire within sixty days (60) days or less, or (iv) the issuer wrongfully dishonors a draw made on its Letter of Credit by Amtrak. Contractor shall thereupon have thirty (30) days from the date of such notice to obtain a suitable replacement Security that meets the requirements of this Article 6 and is issued by a Qualified Issuer, in which event Amtrak shall authorize the cancellation of the original Letter of Credit. If Contractor fails to obtain a suitable replacement Security issued by a Qualified Issuer within such thirty (30) day period, Amtrak may draw upon the Letter of Credit for the full amount thereof, and hold the proceeds in a segregated account as cash collateral securing Contractor's obligations under this Contract. Such cash collateral shall be held until a suitable replacement Security issued by a Qualified Issuer in the amount required by this Contract is delivered to Amtrak or until the cash collateral is used to pay, perform or otherwise satisfy Matured Contractor Obligations. Upon receipt of a suitable replacement Letter of Credit in the proper amount, Amtrak shall release or cause the release of the cash collateral being held by it to or at the direction of Contractor. If at any time cash collateral is held by Amtrak as a result of a drawing on the Letter of Credit because the issuer ceases to be a Qualified Issuer or because the issuer sends a notice that the Letter of Credit will not be extended, the amount of such cash collateral shall be increased or reduced and the amount of the reduction released to Contractor in the same manner and in the same amounts as would be the case for an increase or reduction of the amount of a Letter of Credit were it still being held by Amtrak instead of cash collateral. If the issuer wrongfully dishonors a draw on its Letter of Credit and Contractor fails to procure and deliver to Amtrak a suitable replacement Security within the time specified above, then Contractor shall be in default of this Contract. Among other remedies, Amtrak may withhold milestone or other payments from Contractor until an amount of cash collateral equivalent to the amount required of Contractor for a Letter of Credit is withheld by Amtrak or until a suitable replacement Security is issued by a Qualified Issuer to Amtrak.

6.5. Amtrak may draw upon a Letter of Credit in accordance with the terms of the Letter of Credit for any Draw Event.

6.6. Within ten (10) days of Contract Award, Contractor shall submit Security for twenty percent (20%) of the Base Contract Amount. As a condition of Amtrak's approval and payment of the Contract milestones and any other payment made to Contractor, Security must be submitted or amended to increase the value before or with the milestone or other payment invoice, such that the total amount of Security will be equal to or exceed the sum of i) all payments previously made to Contractor and ii) the invoice submitted, before and as a condition of the subsequent milestone or other payment. The amount of Security required under this Article shall continue to increase in accordance with this provision until it meets or exceeds fifty percent (50%) of the Contract Amount.

6.7. Within ten (10) days of receipt of any Option Order, duly executed by Amtrak, Contractor shall submit Security for twenty percent (20%) of the Total Option Order Amount. As a condition of Amtrak's approval and payment of the Contract milestones and any other payment made to Contractor, Security must be submitted or amended to increase the value before or with the milestone or other payment invoice, such that the total amount of Security will be equal to or exceed he sum of i) all payments previously made to Contractor and ii) the invoice submitted, before and as a condition of the subsequent milestone or other payment. Note: if Amtrak exercises any options under the Contract, a milestone payment schedule for the Option Order shall be provided to Contractor. The amount of Security required under this Article shall continue to increase in accordance with this provision until it meets or exceeds fifty percent (50%) of the Total Option Order Amount.

6.8. The amount of the Security may be decreased by amendment to the Security as follows:

(a) No earlier than three (3) months after Amtrak has issued a Certificate of Conditional Acceptance for more than fifty percent (50%) of the Base Order of Equipment, and provided that all Equipment delivered to Amtrak as of that date has received a Certificate of Conditional Acceptance, Contractor may submit a written request for a reduction in the Security. Upon such request, Amtrak shall permit a reduction in the Security to an amount equal to twenty percent (20%) of the Base Order value, plus:

i). twice the amount that Amtrak is entitled to withhold for uncorrected defects, open field modification instructions (FMIs) or incomplete Work for any Equipment under the Contract for the Base Order that is subject to a Certificate of Conditional Acceptance, and

ii). any unpaid liquidated damages or other unpaid claims for damages or amounts due and owing by Contractor to Amtrak.

(b) No earlier than three (3) months after Amtrak has issued a Certificate of Conditional Acceptance for more than fifty percent (50%) of the Option Order of Equipment, and provided that all Equipment delivered to Amtrak as of that date has received a Certificate of Conditional Acceptance, Contractor may submit a written request for a reduction in the Security. Upon such request, Amtrak shall permit a reduction in the Security to an amount equal to twenty percent (20%) of the Option Order value, plus:

i). twice the amount that Amtrak is entitled to withhold for uncorrected defects, open FMIs or incomplete Work for Base Order any Equipment under the Contract for the Base Order that is subject to a Certificate of Conditional Acceptance, and

ii). any unpaid liquidated damages or other unpaid claims for damages or amounts due and owing by Contractor to Amtrak.

6.9. In no event shall the Security be reduced below twenty percent (20%) of the value of the Base Order and any Option Orders, except as provided in Section 6.10 below.

6.10. On the later of (a) thirty-six (36) months after issuance of a Certificate of Final Acceptance of the last unit of Equipment ordered and delivered or (b) the issuance of a Certificate of Final Fleet Acceptance, and provided that all warranty Work, uncorrected defects, and outstanding FMIs have been satisfactorily completed, Contractor shall be entitled to request Amtrak to authorize cancellation of the Security. Amtrak shall authorize a cancellation or, pursuant to the next sentence, a reduction of the Security upon review of such request if all the preceding conditions for cancellation of the Security have been met. If Amtrak refuses to authorize a cancellation of the Security to which the Contractor believes it is entitled because of pending claims or disputes, (i) Amtrak shall authorize reduction of the amount of the Security that Amtrak does not dispute can be reduced, and (ii) Contractor may reserve its rights or proceed to dispute resolution procedures to obtain the further reduction or cancellation of the Security to which it claims it is entitled.

6.11. Amtrak or a Financing Party may give written notice to Contractor that Amtrak's rights under the Security and/or this Article 6 will be exercised by a Financing Party, and Amtrak will notify Contractor promptly after it learns the identity of such Financing Party. In that event, the Financing Party shall be entitled to take all actions and succeed to all rights of Amtrak with respect to such Security and any related rights granted to Amtrak by this Article 6, once it is satisfied that such Financing Party has complied with the requirements described under Article 6.12.1 (iii) of the Contract.

6.12. Security Interest in Amtrak Collateral

6.12.1. To secure all of Contractor's present and future performance, obligations, liabilities and indebtedness to Amtrak under or in respect of this Contract, and in particular Contractor's obligation to deliver the Equipment, Contractor hereby grants to Amtrak and its Financing Parties a security interest in all its present and future rights, title and interest in and to the Amtrak Collateral, provided that the Financing Parties, if any, (i) satisfy the ethics, compliance and business conduct programs and policies that are applied by Contractor and its Guarantor to persons with which it does business, (ii) have sufficient financial resources, or shall be supported by a satisfactory guarantee, to carry out the obligations of Amtrak under the Contract in the event Amtrak assigns to the Financing Parties its rights and delegate its responsibilities, in whole or in part, under Article 39.1 of the Contract, (iii) has complied with all necessary "know your customer" or other similar checks under all applicable laws in relation to that security interest. "Know your customer" checks are the

identification checks that one or more Qualified Issuers request to meet its obligations under any applicable law or regulation to identify a person who is (or is to become) its customer, including being the beneficiary of a Letter of Credit or of a Performance and Payment Bond. In the event of default by Contractor under the Contract, nonperformance or nonpayment of any obligation of Contractor when due or termination of the Contract, Amtrak shall have all the rights and remedies of a secured creditor under Article 9 of the Uniform Commercial Code in each state where the Amtrak Collateral may be located or have as its situs. Such rights include the right to require segregation of, inspection and repossession or use or sale in place by Amtrak of the tangible Amtrak Collateral so that Amtrak can obtain it for use in continuing the Work with another contractor or sell it and realize on its value. Amtrak shall also have the right and remedy of enforcing its security interest in intangible Amtrak Collateral such as contract rights, by notifying and contracting directly with any and all Subcontractors to continue their work and furnishing supplies for the benefit of Amtrak.

6.12.2. Contractor represents that it has not, and covenants that it will not, grant to any other person or entity any interest including any security interest, in the Amtrak Collateral and will keep it free and clear of any other liens, claims or encumbrances. If there are any existing security interests, liens or claims filed against or otherwise granted by Contractor in or on any Amtrak Collateral, Contractor shall satisfy or otherwise obtain from the party holding such security interest, a disclaimer and release of their claim, lien or security interest in or on Amtrak Collateral as a condition of receiving any milestone or other payment from Amtrak. Contractor shall not lease, sell or otherwise dispose of Amtrak Collateral except in the ordinary course of its business. Notwithstanding the foregoing, if a Performance Bond is claimed upon, Contractor may assign to the surety those items of the Amtrak Collateral that are needed to allow the surety to perform its obligations under the surety agreement.

6.12.3. Contractor shall provide Amtrak monthly and upon request with a listing of the location and items of tangible Amtrak Collateral in its possession or control or in the hands of Subcontractors. Contractor must promptly notify Amtrak by written or electronic communication of any change in location of the Amtrak Collateral, specifying the new location. Contractor hereby grants to Amtrak the right to inspect the Amtrak Collateral at all reasonable times and upon reasonable notice. Contractor must: (a) maintain the Amtrak Collateral in good condition; (b) pay when due or discharge all judgments or charges of any kind payable in respect of or levied or assessed thereon; (c) keep current all rent, assessments, taxes, insurance premiums, maintenance fees, and mortgage payments due, if any, on premises where the Amtrak Collateral is located; and (d) maintain hazard insurance on the tangible Amtrak Collateral, with an insurance company and in an amounts required by Articles 58 and 59 of this Contract.

6.12.4. Contractor must notify Amtrak by written or electronic communication not less than thirty (30) days before taking any of the following actions and obtain Amtrak's written consent for each of them, which consent may be conditioned on insuring uninterrupted performance of this Contract by Contractor with sufficient working capital, assets, qualified workforce

and other capabilities: (a) changing or reorganizing the type of organization or form under which it does business; (b) moving, changing its place of business or adding a place of business; (c) changing its jurisdiction of organization; (d) selling or transferring any substantial part of its business or assets; or (e) changing its name.

6.12.5. Contractor consents, without further notice, to Amtrak's filing or recording of any documents necessary to perfect, continue, amend or terminate its security interest. Upon request of Amtrak, Contractor must sign or otherwise authenticate all documents that Amtrak deems necessary at any time to allow Amtrak to acquire, perfect, continue, amend, enforce or realize on its security interest in the Amtrak Collateral. Contractor will pay the filing and recording costs of any documents relating to Amtrak's security interest.

6.12.6. Amtrak or a Financing Party may give written notice to Contractor that Amtrak's rights as a secured party under this Article 6 will be exercised by a Financing Party. In that event the Financing Party exercising Amtrak's rights with respect to the security interests granted by this Article 6 shall be entitled to take all actions and succeed to all rights of Amtrak with respect to such security interests in the Amtrak Collateral and related rights granted to Amtrak by this Article 6 or otherwise available to it under Article 9 of the Uniform Commercial Code or other Applicable Law.

6.13. Parent Guaranty

6.13.1. If Contractor is a subsidiary of another entity, then Amtrak's obligations under the Contract shall be contingent upon Amtrak's receipt of a satisfactory Parent Guaranty executed by the ultimate parent entity of Contractor or a related entity acceptable to Amtrak guarantying payment and performance of Contractor's obligations and liabilities under this Contract. In the event the ultimate parent entity of Contractor is changed, the new ultimate parent entity of Contractor shall become the Guarantor, and the existing Parent Guaranty shall be substituted with a Parent Guaranty provided by the new ultimate parent entity of Contractor.

6.13.2. If Guarantor is incorporated or organized in a jurisdiction outside the United States of America, the Parent Guaranty delivered to Contractor shall be accompanied by an opinion addressed to Amtrak from counsel acceptable to Amtrak who are authorized to practice law in the Guarantor's jurisdiction, to the effect that the Parent Guaranty has been duly authorized, executed and delivered, is within the corporate power and authority of the Guarantor, requires no permits, filings, payments, consents or authorizations from any governmental authority or private party for its execution and delivery which have not been obtained by Contractor and/or Guarantor, complies with Applicable Laws, is legal, valid, binding, and a judgment or arbitration award properly obtained in the United States against Guarantor on the Parent Guaranty will be recognized and enforceable in the jurisdiction of the Guarantor without a de novo hearing on the merits of the judgment obtained.

6.13.3. Contractor shall provide to Amtrak a copy of the Contractor's most recent annual audited financial statements, if available (if not available, the annual financial statement is acceptable and shall be provided to Amtrak) and Guarantor's most recent annual audited

financial statements prior to Amtrak's issuance of a NTP and also within one hundred twenty (120) days after the end of each of Contractor's and Guarantor's fiscal years thereafter until three years after Amtrak's issuance of a Certificate of Final Fleet Acceptance. Any non-public financial statements submitted to Amtrak shall be treated as Amtrak treats its own confidential information if marked as such. The year-end financial statements of Contractor and Guarantor shall be prepared in accordance with US Generally Accepted Accounting Principles or other similar accounting principles. If Guarantor restructures or divests itself of assets causing a substantial reduction in its net worth, it shall provide Amtrak written notice thirty (30) days prior to the public announcement of any restructuring, unless Guarantor's notification to Amtrak would violate financial securities laws or regulations then in place, in which case such notification shall not be required. In that event, or in response to publicly disclosed or privately provided financial information regarding Guarantor, Amtrak may by written notice to Contractor require a meeting with senior officials of Contractor to discuss Guarantor's financial situation and what assurances Amtrak has of the Guarantor's ability to honor the Parent Guaranty and other obligations including the Contractor's ability to complete delivery of the Equipment and other Supplies under the terms of this Contract. If Amtrak is or remains insecure about Guarantor's financial condition or Contractor's ability to complete the Contract in accordance with its terms, Amtrak may by further written notice to Contractor, require Contractor to transfer title to Amtrak (but not risk of loss) to all present Equipment and Supplies in process notwithstanding their state of completion or that they remain in the possession of Contractor. Upon Amtrak's written notice given under the prior sentence, title to all Equipment and Supplies in process of Contractor relating to this Contract for which Amtrak has been invoiced and such invoices have been paid as required by this Contract, shall automatically be deemed to have transferred to Amtrak at the time of such notice.

6.13.4. The Parent Guaranty may be enforced by either Amtrak or a Financing Party, the latter's enforcement being subject to the prior consent of the Contractor that such Financing Party has complied with the requirements described under Article 6.12.1 (i) and (ii) of the Contract, provided that the enforcement of the Parent Guaranty by any such Financing Party shall only be permitted for Contractor defaults and damages and amounts owed by Contractor to Amtrak under this Contract, and not for defaults by Amtrak under any of its funding agreements or otherwise outside of the scope of this Contract. In the event that Amtrak transfers the Contract, the obligations of the Guarantor pursuant to the Parent Guaranty shall not exceed Contractor's unsatisfied obligations under the Contract.

6.13.5. Following receipt of payment by Contractor for the Equipment as required by this Contract for which Amtrak has been invoiced and that have been manufactured and allocated to this Contract but have not been delivered to Amtrak (including the Equipment and/or Supplies referenced in Section 10.2), Contractor shall, use its existing information technology systems to segregate such Equipment and Supplies from its other inventory and designate Amtrak as the sole beneficiary of such Equipment and Supplies.

7. CONTRACT DELIVERABLES AND REQUIREMENTS

In addition to the requirements and deliverables specified elsewhere in the Contract, including the Technical Specification, Contractor shall provide those items listed in the Sections below.

7.1. The Equipment

7.1.1. The Contractor shall design, manufacture, test, certify, commission, and sell the Equipment, and provide warranty support in accordance with the Contract, including the Technical Specification, the Agreed Testing Program, and all Applicable Laws.

7.1.2. If Contractor's performance of the Work or delivery of the Equipment is delayed for any reason, Amtrak may, in its sole discretion, adjust the due dates for any deliverables or CDRLs and may extend, compress, re-sequence, or otherwise modify the schedule as it deems appropriate in light of such delay. Contractor shall perform in accordance with all such revised schedules and shall not be entitled to any increase in the Contract Amount, equitable adjustment, or extension of the Contract time arising from Amtrak's exercise of these rights except to the extent expressly authorized in writing by Amtrak.

7.1.3. If Amtrak determines that Contractor is behind schedule, Amtrak may require Contractor to develop and submit at Contractor's sole cost and expense, a schedule-recovery plan. Such plan shall include: (a) corrective actions; (b) additional resource allocations; (c) revised sequencing; and (d) updated recovery timelines. Contractor shall implement the approved recovered plan promptly. Failure to timely submit or implement an adequate recovery plan shall constitute a material breach of the Contract.

7.2. Technical Proposal

7.2.1. If after submission of Contractor's Technical Proposal, as amended, Contractor identifies any improvements and/or modifications in relation to the design, testing and manufacturing process of the Equipment or other similar rolling stock, it will notify Amtrak and discuss in good faith whether and how such improvements could be incorporated into the design, manufacturing, testing and operation of the Equipment.

7.2.2. The Contractor shall build the mock-ups and develop the Equipment exhibits in accordance with the Technical Specification by no later than the date in the Contract or by some other date as may be specified by Amtrak.

7.3. Storage

7.3.1. Contractor shall be responsible for providing, at its own cost, for the storage of the Equipment, the Special Tools, Mock-Ups, at all times until the issuance of a Certificate of Final Acceptance or Conditional Acceptance, as the case may be, of such Equipment or, in the case of the Special Tools, until acceptance of such Special Tools in accordance with the Contract or, in the case of Amtrak-Owned Spares, until acceptance of such Amtrak-Owned Spares under the Contract. For the avoidance of doubt, Contractor shall not expect, rely upon, or assume the availability of any Amtrak property for the storage of Equipment at any time. After Acceptance of the Amtrak-Owned Spares, they shall be stored in

accordance with the TSSSA. Contractor shall also be responsible for the disposal of the Mock-Ups as directed by Amtrak.

7.4. Amtrak-Owned Spares

7.4.1. If Amtrak places an order for Amtrak-Owned Spares, Contractor shall supply the Amtrak-Owned Spares in accordance with Amtrak's written directions and in accordance with the Specification. Contractor shall ensure that all Amtrak-Owned Spares are Fit for Purpose and meet the requirements of the Contract.

7.5. Special Tools

7.5.1. The Contractor shall supply to Amtrak all Special Tools required to maintain the Equipment, and all associated Special Tools delivery documentation in accordance with the Specification, and all Applicable Laws, and shall ensure that all Special Tools and associated Special Tools delivery documentation are Fit for Purpose and meet the requirements of the Contract. Upon Amtrak's request and payment, Contractor shall supply to Amtrak any additional Special Tools ordered by Amtrak and delivery documentation that meet the requirements of this provision. The prices Contractor charges Amtrak for such Special Tools shall be the lowest prices Contractor has charged others for comparable items under similar terms and conditions.

7.6. Training

7.6.1. Contractor shall, at its own expense, organize and provide to Amtrak a program of training courses in accordance with the Specification, Training Requirements, including appropriate training of employees of Amtrak to administer such program, which will enable Amtrak to train its employees to operate the Equipment and to undertake its responsibilities under this Agreement and the TSSSA. Such courses shall be provided at a location specified by Amtrak and will include the provision of such training materials and equipment as are reasonably necessary to permit Amtrak's training instructors to undertake further training of Amtrak's employees. In the event that delivery of the Equipment is delayed, Contractor shall adjust the Training Scheduled as directed by Amtrak.

7.6.2. Contractor shall provide Amtrak for its review and approval proper written training materials in both hard copy and in an electronic format specified by Amtrak. Amtrak shall be entitled, free of charge, to duplicate as many copies of such training materials as it reasonably requires for the purposes of training its employees.

7.6.3. At Amtrak's request, Contractor shall provide such additional training as Amtrak may require (at Amtrak's cost), save that if such additional training is required as a result of any Modifications requested by Contractor (other than a Mandatory Modification) such training shall be provided at Contractor's expense.

8. DELIVERY, INSPECTION, AND ACCEPTANCE

8.1. Delivery

8.1.1. Prior to delivery of the production batches described in the Delivery and Acceptance Schedule at Exhibit V, Contractor shall deliver the Pilot Cars and such Pilot Cars shall meet the form, fit and functionality requirements of that Car type. The Pilot Car will be used to prove out manufacturability issues, confirm system integration and perform pre-qualification testing prior to construction and delivery of the remaining Cars. The Pilot Cars shall be delivered to the Transportation Technology Center, Inc. (TTCI) facility in Pueblo, CO or to another location designated by Amtrak for testing, including reliability testing and obtaining FRA and Amtrak approval for each Car type. Amtrak shall provide reasonable assistance to Contractor to ensure that the Association of American Railroads supports Contractor's request. After successful testing of the Pilot Cars and the approval described herein, unless otherwise agreed to by Amtrak in writing, Contractor shall return the Pilot Cars to its facility for rebuilding and modification to incorporate the latest configuration, including implementing the current modifications and renewing any Equipment requiring such (e.g. brake components) to reset the COTS date.

All remaining Equipment shall be delivered in accordance with the Delivery and Acceptance Schedule and Section 8.5 below.

8.1.2. Delivery of Equipment shall be FOB Destination, during normal working hours 8:00 AM to 4:00 PM (New York Time), to one or more of Amtrak's depots or some other location designated by Amtrak. Notwithstanding the foregoing, Amtrak, in its sole discretion, may agree to provide delivery services on Contractor's behalf, in this case, the movement of the Equipment shall be in accordance with Amtrak's then current Movement Agreement. Amtrak shall not be obligated to accept delivery or authorize the shipment of Equipment for which there are open FMIs.

8.1.3. Unless otherwise agreed to by Amtrak, Deliveries shall only be made on Business Days.

8.2. Inspection

8.2.1. All Equipment Delivered to Amtrak shall be inspected in accordance with the Specification and the agreed upon Inspection Plan.

8.3. Equipment Acceptance

8.3.1. Should arrival inspections and tests indicate that Equipment conforms to the requirements of the Contract, has been received in sound and serviceable condition at a location specified by Amtrak, has successfully performed under the tests specified in the Contract, and the COTR has determined the Equipment has met all of the requirements of the Contract and is Fit for Revenue Service, the COTR shall issue a Certificate of Conditional Acceptance or a Certificate of Final Acceptance; provided that, as a condition to the issuance of such Certificate, Contractor shall have delivered all documents or other materials necessary to achieve the passage of title to the applicable unit of Equipment free of all Adverse Rights in accordance with Article 19 hereof. Subject to Section 6.13.5, upon issuance of a Certificate of Conditional Acceptance or a Certificate of Final Acceptance for a unit of Equipment, title and risk of loss shall pass to Amtrak, or an entity designated by Amtrak.

8.3.2. During the testing of each unit of Equipment, after delivery to the appropriate facility where receiving and commissioning testing is to occur, and up to the point of final acceptance of the Equipment, Contractor shall make such adjustments and optimization of the mechanical, electrical, electronic and other technical equipment of the Equipment in general as Amtrak may find necessary or appropriate in order to obtain optimal functioning and reliability of the Equipment as contemplated by the Contract. Reasonable adjustments and optimization shall be made at no additional charge to Amtrak.

8.3.3. Amtrak may issue a Certificate of Conditional Acceptance, rather than a Certificate of Final Acceptance, to Contractor for a unit of Equipment when the applicable unit of Equipment meets all the conditions to acceptance identified and otherwise herein but is defective or deficient in some respects, but Amtrak determines the unit of Equipment is suitable for Revenue Service. The defects and/or deficiencies which caused the Contracting Official to issue a Certificate of Conditional Acceptance shall be listed on the Certificate of Conditional Acceptance and shall indicate that the unit of Equipment shall be accepted on the condition that all necessary repairs or corrective actions to remedy the defects and/or deficiencies shall be affected as soon as practicable, but in no event more than sixty (60) days, unless otherwise agreed to by Amtrak. In addition to the foregoing, should FMIs be identified after issuance of a Certificate of Conditional Acceptance, such FMIs must be completed within a reasonable timeframe. Should Amtrak conditionally accept a unit of Equipment, it may withhold from the relevant payment an amount as determined by the Contracting Official, which shall be no more than twice the estimated amount necessary to correct the defects and/or deficiencies, provided that no such withholding shall be required if Contractor provides Amtrak with a letter of credit in the applicable amount and satisfactory to Amtrak. Such letter of credit shall be assignable to the Financing Parties. Contractor shall not perform any such corrective Work on Amtrak's premises without Amtrak's express permission and direction.

8.3.3.1. If Amtrak grants Contractor permission to perform work on the railroad or Amtrak's premises, Contractor shall execute Amtrak's then current Temporary Permit to Enter prior to performing any work on the Railroad or Amtrak's premises. Amtrak shall set a date upon which the defects and/or deficiencies must be corrected. Unless otherwise agreed to by Amtrak, such date shall not allow for more than sixty (60) days to correct the defects and/or deficiencies. Should Contractor fail to remedy the defects and/or deficiencies within this timeframe, Amtrak may elect to remedy such defects and/or deficiencies in whatever manner it sees fit including hiring another contractor at Contractor's expense including any incidental costs related to the hiring of such third party.

8.3.4. After all defects and deficiencies, including open FMIs and any fleetwide modifications, have been remedied to Amtrak's satisfaction, the Contracting Official shall issue a Certificate of Final Acceptance.

8.4. Reliability Demonstration for Final Fleet Acceptance and Final Fleet Acceptance

8.4.1. As a condition precedent to Final Fleet Acceptance, in accordance with the Specification, a Reliability Demonstration must be successfully performed, analyzed and reported upon by the Contractor to validate the reliability of the cars, systems, subsystems and components in Revenue Service. To meet the Reliability Demonstration in any continuous three hundred and sixty-five (365) day period (the "Measurement Period"), the Fleet must meet the Reliability Requirements, including the MDBSF, MDBCF and availability targets and requirements, in the Specification at Chapter 4: Reliability, Availability and Maintainability. Additionally, all open FMIs and any outstanding Fleet wide modifications must be completed and accepted by Amtrak.

8.4.2. If Contractor is unable to achieve Final Fleet Acceptance within two (2) years after the issuance of a Certificate of Final Acceptance for the last unit of Equipment, Amtrak and Contractor shall meet to address the issue and Amtrak shall determine next steps.

8.5. Rate of Delivery and Acceptance

8.5.1. In any forty (40) day period, the Contractor shall not tender more than ten (10) Cars for acceptance or conditional acceptance, unless otherwise agreed to by Amtrak in writing. All Equipment shall be tendered for acceptance in accordance with the Amtrak-approved Delivery and Acceptance Schedule, which shall specify the type, quantity, and order of Cars to be delivered to Amtrak for acceptance . Unless otherwise agreed to and directed by Amtrak, no Option Orders shall be delivered to Amtrak until after delivery and acceptance of the Base Order.

8.6. Special Tools

8.6.1. The Contractor shall deliver and tender for acceptance the Special Tools to the locations identified in the Technical Specification (or any alternative location specified by Amtrak) upon the dates specified by Amtrak. Special Tools shall be delivered to Amtrak no sooner than within thirty (30) days of the first unit of Equipment is presented to Amtrak for conditional acceptance.

8.6.2. Amtrak shall not be obliged to accept any of the Special Tools for acceptance unless:

i). Amtrak has received the Special Tools Delivery Documentation;

ii). the Special Tools conform with the Contract; and

iii). the Special Tools comply with all Applicable Laws.

Where each condition specified herein has been fulfilled, acceptance of the Special Tools shall occur and, subject to receipt of payment for the Special Tools, title in the Special Tools shall transfer to Amtrak, or an entity designated by Amtrak.

8.6.3. The Contractor shall ensure that sufficient numbers of Amtrak's staff are trained to operate the Special Tools by the time the Special Tools are delivered pursuant to the Contract. If the TSSSA is terminated due to a TSSSA supplier event of default, the Contractor shall

arrange at its own cost for the training required to enable the replacement supplier's staff to operate the Special Tools.

8.7. Failures

8.7.1. Amtrak shall not be obligated to accept any unit of Equipment for final acceptance or conditional acceptance if a failure has become apparent in another unit of Equipment which has been, or is to be, delivered, until such time as Amtrak is satisfied that the same failure is not present in the unit of Equipment to be accepted, or has been remedied or Contractor has proposed a suitable plan to remedy such failure. Notwithstanding anything to the contrary contained herein, or contained under any other Article, the delivery, acceptance, or conditional acceptance of any unit of Equipment shall not constitute a waiver by Amtrak of its rights thereafter to identify and seek any remedies available under this Contract for any failure, nonconformity or defect in that or any other unit of Equipment.

9. TESTING

9.1. In accordance with the Specification, Contractor shall provide a test plan to Amtrak (the "Test Plan") which must be approved by Amtrak.

9.1.1. Unless otherwise provided in the Contract, all costs and expenses associated with testing and inspecting the Equipment shall be borne by Contractor.

9.1.2. Notwithstanding the preceding provision, Amtrak shall not charge the Contractor a fee for the use of Amtrak-owned facilities, tracks or utilities located at Amtrak's facilities, or for the use of Amtrak personnel, the first time a particular inspection or test is performed on a particular unit of Equipment. Amtrak shall have the right to charge Contractor for, and Contractor shall pay, all such expenses in connection with any re-inspection or retesting of a particular unit of Equipment required as a result of a unit of Equipment not having successfully passed the applicable test. Acceptance of the Fleet or any Equipment thereof by Amtrak shall not occur until after all tests, and retests if applicable, are successfully completed in accordance with the requirements stated in the Contract.

9.2. If the Contract, or any subcontracts, Applicable Laws of any public authority having jurisdiction over Amtrak operations, require the Equipment or other Supplies to be inspected, tested or approved, Contractor shall give Amtrak at least forty-five (45) days in order to assure timely notification to the FRA and sixty (60) days for international travel. This will allow time for arrangements for such testing so Amtrak may observe such inspection, testing or approval. Contractor shall perform and bear all costs of performing such inspections, tests and approvals unless otherwise provided in the Contract. If after Contractor begins delivery of the Equipment or Supplies, Amtrak determines that any such item, Amtrak determines that any such item requires additional inspection, testing, or approval (in addition to inspections and tests provided under the Contract), Contractor shall, upon written authorization from Amtrak, order such additional inspection, testing or approval and Contractor shall give notice as provided hereunder. These additional inspections or tests shall be conducted at the initial expense of Amtrak, and Amtrak shall grant a non-compensable extension of time equal to any delay caused by such tests.

Notwithstanding the preceding sentence, if such additional test or inspection reveals a defect or failure of the Equipment or Supplies to comply with the requirements of the Contract; or with any Applicable Laws, ordinances, rules, regulations or orders or if the original test or any retest or additional testing is improperly conducted by a Contractor Party, Contractor shall bear all costs of correction and retesting thereof, and no extension of the Contract Time shall be granted. Required certificates of inspection, testing or approval shall be secured by Contractor and promptly delivered to Amtrak. Neither the observations nor representations of Amtrak in its administration of the Contract, nor Amtrak's inspections, tests or approvals shall relieve Contractor from its obligations to perform the Work in accordance with the Contract.

9.3. Except as otherwise provided herein or agreed to by the Parties; tests shall be performed at plants of Contractor or its Subcontractors. Contractor shall have executed Amtrak's then-current Temporary Permit to Enter prior to performing any work on the Railroad or Amtrak's premises.

9.4. Contractor and Amtrak jointly shall select suitable track of proper length and alignment to permit implementation of the qualification track tests required. These tests shall be conducted by, and at the expense of, Contractor; provided that the first time a particular inspection or test is performed on a particular unit of Equipment, Amtrak shall not charge Contractor a fee for the use of Amtrak-owned facilities, tracks or utilities located on the Northeast Corridor, or for the use of Amtrak personnel, in connection with such inspection or test. Amtrak shall have the right to charge Contractor for, and Contractor shall pay, all such expenses in connection with any re-inspection or retesting of a particular unit of Equipment required as a result of the unit not having successfully passed the applicable test. All working and moving parts, and all operating devices and controls of each unit of Equipment and its apparatus, shall be tested and put in proper operating condition by Contractor and approved by Amtrak before a unit of Equipment shall be accepted by Amtrak. Contractor shall perform all of the adjustments specified herein.

9.5. Should a unit of Equipment be disassembled in any way for shipment, an operational test shall be conducted by Contractor upon reassembling at the delivery point on a track provided by Amtrak at the expense of Contractor. Any such test shall be witnessed by Amtrak.

9.6. After receipt of a unit of Equipment at the designated delivery point and before being put into passenger service, the unit of Equipment shall be inspected by Amtrak and any part, device or apparatus requiring adjustment, repair or replacement shall be called to the attention of Contractor, in writing, who shall promptly make adjustment, repair or replacement at its own expense. All costs and expenses incurred in performing these tests shall be borne solely by Contractor.

10. PAYMENT

10.1. Amtrak shall make milestone payments to Contractor pursuant to an approved payment schedule upon Contractor's successful completion of certain tasks (milestones) during the Contract. Contractor shall not be entitled to any milestone payment until its respective milestone is achieved and Contractor may only invoice Amtrak for the completion of a milestone if Contractor is in compliance with the Contract including the performance assurance requirements of Article 6. In the case of a conditional acceptance milestone, no milestone payment shall be due until the earliest

date such milestone was to have been achieved, as set forth in the Milestone Payment Schedule. Any milestone based on acceptance or conditional acceptance of a unit of Equipment shall be deemed achieved on the last day of the month in which a Certificate of Final Acceptance or Certificate of Conditional Acceptance, as applicable, for such unit of Equipment is issued.

10.2. Any invoice based upon the acceptance or conditional acceptance of Equipment shall indicate the Equipment number on the invoice, and have attached a copy of the signed Certificate of Final Acceptance or Certificate of Conditional Acceptance, as applicable. Payment for accepted or conditionally accepted Equipment shall be made in accordance with the Contract.

10.3. Except for any other express provisions to the contrary contained in the Contract, Amtrak shall pay all undisputed invoices within ninety (90) days of receipt of an invoice meeting the criteria set forth herein. Amtrak shall not pay penalties, interest charges, or collection fees on any late payments [Contractor may request earlier payment at a discount to be agreed by Amtrak at the time of invoice submission.] Notwithstanding the foregoing, in light of any potential Financing Parties requirements, reasonable adjustments to the payment procedures may be requested by Amtrak.

10.4. Final Payment shall not become due until a Certificate of Final Fleet Acceptance has been issued by Amtrak, there are no open FMIs and all associated contract deliverables have been delivered and/or submitted to Amtrak and the Contractor or its Subcontractor, if applicable, submits to Amtrak: (a) an affidavit that all payrolls, bills for materials and equipment, and other indebtedness connected with the Work for which Amtrak might in any way be liable have been paid or otherwise satisfied; (b) consent of surety, if any, to final payment; (c) if required by Amtrak, other data establishing payment or satisfaction of all such obligations, such as receipts, releases and waivers of liens arising out of the Contract, to the extent and in such form as may be designated by Amtrak; (d) all guarantees and warranties, license agreements, fabrication Drawings, and all other documentation or items required pursuant to the Contract; (e) proof of all governmental approvals related to operation of the Equipment that must be effectuated by Contractor; (f) a certificate evidencing that insurance required by the Contract to remain in force after final payment is currently in effect and shall not be canceled or allowed to expire until at least thirty (30) days' prior written notice has been given to Amtrak and the Financing Parties; (g) a written statement that Contractor knows of no reason that the insurance shall not be renewable to cover the period required by the Contract; (h) a properly executed voucher and (i) any additional documents required to effectuate the transfer of title to Amtrak, or an entity designated by Amtrak, or ensure compliance with the Contract. If any of Contractor's Subcontractors refuse to furnish a release or waiver required by Amtrak, Contractor may furnish a bond satisfactory to Amtrak to indemnify it against any such lien. If any such lien remains unsatisfied after all payments are made, Contractor shall refund to Amtrak all moneys that the latter may be compelled to pay in discharging such lien, including all costs and reasonable attorney's fees. Final Payment is subject to adjustment to account for damages and disputed payments or Claims, including liquidated damages assessed pursuant to Article 12.

10.5. Contractor shall invoice Amtrak by submitting an original invoice, along with supporting documentation, to the individual at the address set forth in the Contract. In accordance with an

Amtrak-approved payment schedule, Amtrak shall pay Contractor ninety-five percent (95%) of all undisputed invoiced amounts. Amtrak shall pay all invoices in accordance with an Amtrak-approved payment schedule.

10.6. At least one hundred and twenty (120) days prior to completion of the second to the last scheduled milestone, the parties shall meet to discuss the transition period, which shall be the period from the transition meeting until Contract termination. During this transition, the Contractor shall provide Amtrak with all required documentation, evidence of work completion, updates to manuals, training curriculums and a schedule of future upgrades to the equipment and software. At this meeting, the contractor shall provide its plan for required warranty support and operational transition.

10.7. The acceptance of Final Payment shall constitute a waiver by Contractor of all Claims except for those that have been submitted to the dispute resolution procedures of Section 35.6.

11. PROJECT MANAGEMENT

11.1. Contractor shall manage the project in accordance with the Contract and comply with all terms therein.

12. LIQUIDATED DAMAGES

12.1. The parties have agreed that Amtrak shall be damaged if the conditions prerequisite to issuance of a Certificate of Final Acceptance or Certificate of Conditional Acceptance for the Base Order and any Options ordered under the Contract have not been met by Contractor with respect to any or all of the Equipment by the time (the "Delivery and Acceptance Schedule") specified in the Contract for such conditions to have been met, or any extension of such time granted pursuant to the terms of the Contract and (i) that such damages would include, but not be limited to, loss of revenues arising from the loss of both current and potential ridership and (ii) the extent of such damages would be uncertain in amount and difficult to ascertain. Accordingly, the parties have agreed that Contractor shall, in place of actual damages for such delay, pay to Amtrak as fixed, agreed, and liquidated damages an amount as follows:

Vehicle Type	**Liquidated Damages Amount**
Accessible Sleeper Car	$1,000
Cab Car	$1,000
Café' Car	$500
Diner Car	$1,000
Diner Lounge Car	$1,000
High-Capacity Coach Car	$500

Premium Accessible Coach Car	$500
Standard Coach Car	$500
Standard Sleeper Car	$1,000
Utility Car	$500

12.1.1. Contractor understands that Amtrak requires batch deliveries as set forth in Exhibit V to align with Amtrak's utilization, commissioning, maintenance, and fleet-integration plans. Amtrak does not intend to introduce Cars into Revenue Service on a one-off or incremental basis. Batch-level deliveries are necessary to allow Amtrak to place Cars into coordinated service configurations and to maintain efficient deployment and training schedules. Contractor shall therefore plan and execute its production and delivery activities in a manner that facilitates timely batch delivery and issuance of Certificates of Conditional Acceptance for all Cars in each batch.

12.1.2. The Parties acknowledge that, although the liquidated damages specified in this Article 12.1 are calculated on a per-Car basis, the Delivery and Acceptance Schedule set forth in Exhibit V requires that Cars be delivered in production batches of ten (10) Cars, or such batch size as may be expressly agreed to by Amtrak and reflected in Exhibit V. Contractor shall sequence and perform, production, testing, shipment and delivery activities so as to ensure that each batch is delivered in accordance with the dates established for that batch in the Delivery and Acceptance Schedule.

12.1.3. Cars that have been fully manufactured but are awaiting shipping, staging or tender to Amtrak while Contractor completes the remaining Cars in the applicable production batch shall not be exempt from liquidated damages. A Car shall continue to accrue liquidated damages until Amtrak issues a Certificate of Conditional Acceptance for that Car in accordance with Article 8.

12.1.4. For the avoidance of doubt, if any Car within a required batch does not meet the applicable Conditional Acceptance date for that Car, all Cars in that batch shall accrue liquidated damages until each Car in that batch has received a Certificate of Conditional Acceptance.

12.2. The liquidated damages described in Section 12.1 shall not exceed twenty percent (20%) of the Contract Amount.

12.3. Cars for each day of delay. The amount shall be calculated by multiplying the figure set forth in the chart above by the number of days delay for each Car.

12.4. In addition to the liquidated damages for delay described above, for a period of thirty-six (36) months for each unit of Equipment, Contractor shall pay Amtrak as fixed, agreed and liquidated damages, for each Car the following amounts:

(a) Failure – Type I the amount of $29,960.

(b) Failure – Type II the amount of $5,992.

(c) Failure – Type III the amount of $322.

(d) Failure – Type IV the amount of $60,000.

In addition to the foregoing, for each day that the original Failure has not been resolved due to Contractor's failure to provide the spare parts or Materials needed to remedy or repair the Failure, Contractor shall pay to Amtrak the Availability Performance Guarantees set forth in the TSSSA Scope of Work at Section G.11.

If a Failure can be classified as more than one type, Contractor shall pay the higher amount.

For each Car delivered under the Contract, the thirty-six (36) month period for each Car shall begin thirty (30) days after the date the Car is first placed into Revenue Service.

12.5. Amtrak shall use reasonable efforts to move any Equipment that requires warranty work to a maintenance facility within one (1) day. Any additional time required to move such Equipment to a maintenance facility shall not be deemed as "Out-of-Service" time. However, it is agreed that any time required to make such warranty repair or field modification work on any Equipment shall be deemed "Out-of-Service" time. Field modifications, which result from Amtrak change orders, shall not fall under this provision. During the period in which Equipment is in a maintenance facility for warranty work, Amtrak and/or the Federal Railroad Administration shall be allotted one (1) day of unavailability for any scheduled maintenance inspections and such time shall not be deemed "Out-of-Service" time.

12.6. Amtrak reserves the right to determine the suitability of any Equipment for return to Revenue Service based upon the past performance of such Equipment and the demonstration of the adequate and satisfactory repair of such Equipment.

12.7. Liquidated damages payable pursuant to this Article 12 may be retained by Amtrak from, and may be offset by Amtrak against, monies due or to become due to Contractor or, at its option, Amtrak may invoice Contractor for Liquidated damages payable pursuant to this Article 12 as they become due, in which case Contractor shall pay such invoices within thirty (30) days.

12.8. In the event that Contractor's performance is delayed to such an extent that, by the terms of Section 12.1, aggregate liquidated damages calculated in accordance with Section 12.1 would equal or exceed five percent (5%) of the Contract Amount, or the first two (2) units of Equipment ordered under the Contract do not meet the requirements for issuance of a Certificate of Conditional Acceptance within three-hundred sixty-five (365) days of the date scheduled for issuance of such certificates under the Contract, then Amtrak shall have the right to terminate this Contract for default, in whole or in part, under Article 16. If the Contract is terminated for default pursuant to this provision, Contractor shall be liable for fixed, agreed, and liquidated damages calculated as provided in Section 12.1, and such amount shall be in addition to amounts payable pursuant to Article 16 hereof; provided, however, that Amtrak shall not have the right to recover,

under Article 16, monetary damages for delay for which Amtrak was also compensated under this Article 12.

12.9. The parties have agreed that Amtrak shall be damaged in the event that the satisfaction of the condition's prerequisite to issuance of a Certificate of Conditional Acceptance with respect to any Equipment is delayed beyond the applicable Delivery and Acceptance Schedule. The parties further agree that (i) the damages that would result from such delay would include, but not be limited to, loss of revenues resulting from the loss of both current and potential ridership, increased project and personnel costs, and additional costs resulting from the use of replacement equipment, and (ii) the extent of such damages would be uncertain in amount and very difficult to ascertain. Accordingly, the parties have agreed to establish the liquidated damages set forth in this Article 12 and agree that these damages do not constitute a penalty but rather a reasonable prediction of portions of damages Amtrak would incur as a result of a delay in the delivery of the Equipment. Amtrak acknowledges that by entering into this liquidated damages provision except as otherwise provided for herein it shall forego portions of the consequential damages it might be entitled to recover arising from the events described in this paragraph. The remedy provided for by this Article 12 is cumulative with and in addition to all other rights Amtrak has hereunder and all other remedies to which Amtrak is entitled at law or in equity in respect of facts, circumstances, events or occurrences other than delays described in this Article 12, it being understood that Amtrak shall not have the right to recover monetary damages solely for such delay in excess of those contemplated by Article 16.

12.10. Amtrak may deduct from subsequent payments due Contractor under any contract with Contractor or from any sums retained, all or such part of these sums as may be required to pay the aforesaid damages, with Contractor being responsible for any deficiency.

13. WARRANTY

13.1. Contractor covenants and warrants to Amtrak that each unit of Equipment, Special Tool and Spare, including, but not limited to, the Amtrak-Owned Spares, and all parts (including spare parts), Mockups and equipment accessories and the Technical Documentation furnished under the Contract shall be new, the best of its kind or quality, free from Failures, defects in design, material and workmanship and Fit for Purpose, and shall be constructed and shall operate in conformance with the requirements and Specifications of the Contract. If required by Amtrak, Contractor shall furnish evidence satisfactory to Amtrak as to the kind and quality of materials and equipment. The terms "breach", "defect", "fault", or "defect in workmanship, materials or design" and like terms as used in this Article 13 shall mean, with respect to any Work, Supplies or other items furnished by Contractor or any Subcontractor, that they are not as warranted under this Article 13, which includes a warranty that items must comply with the requirements and specifications of the Contract.

13.2. Contractor also covenants and warrants that all electric, electronic and mechanical systems (including software) incorporated in the Equipment, Special Tool, Spare, including, but not limited to, the Amtrak-Owned Spares, and all parts (including spare parts), Mockups and equipment accessories and other Supplies and items furnished under the Contract shall be covered by the warranty of Section 13.1 and also shall be integrated so that they operate without any

electric, electronic, magnetic, mechanical, chemical or other interference between them. This applies whether the systems concerned are supplied by Contractor or its Subcontractors at any tier.

13.3. The warranties specified under this Article shall commence for a given Car upon the issuance of a Certificate of Final Acceptance or a Certificate of Conditional Acceptance, or at installation for Spare Parts. Subject to Section 13.4 hereof, the length of the warranty period for a component of a Car, including, but not limited to, the Amtrak-Owned Spares shall be as follows:

Component	**Warranty Period**
Car Body Structure	30 years
Truck Frames	15 years
All Supplies, Work, including elevators, lifts, retrofits, and other components, including, but not limited to the Amtrak-Owned Spares, Spares, parts and accessories (other than consumable or expendable items or materials within the purview of Section 13.4 hereof).	3 years

Ninety (90) days prior to the delivery of the first unit of Equipment, Contractor shall submit to Amtrak for its review and approval a Warranty Plan. This Plan shall describe how the Contractor will manage warranty activities including staffing, modifications/design changes, warranty spare parts, and any other activity necessary to maintain the required availability of the Fleet. As such:

(e) The Contractor shall establish and maintain procedures for servicing delivered products during the warranty period.

(f) Procedures shall define Contractor and subcontractor methods for verifying that warranty service requirements are met.

(g) Procedures shall delineate the Contractor's servicing and warranty responsibilities in accordance with this Contract.

(h) The Warranty Plan shall define the amount of warranty spare parts required for the entire warranty period, and where these spare parts will be stored for quick access.

(i) The Warranty Plan shall also describe how additional parts can be provided upon short notice in case of unexpected fleet-wide defects. Under no circumstances shall the Contractor use parts intended for ongoing vehicle production and assembly.

(j) In the Warranty Plan, the Contractor shall include a Field Modification Instruction (FMI) Control Plan.

13.4. Contractor is responsible for all costs of labor and material for defect identification and location, and for the removal, repair, or replacement of defective parts, and for alterations, repairs, tests, and adjustments in connection therewith, made to conform the Contract Specification and all other relevant provisions of the Contract. All work performed by Amtrak personnel on behalf of the Contractor in connection with this section and all other applicable sections of the Contract shall be billable in accordance with Amtrak's Billing Guidelines. Replaced and/or repaired items are warranted and guaranteed for the remainder of the warranty period or for one (1) year, whichever period is the greater.

In the event that Amtrak incurs costs, including consultant costs, which are directly attributable to the Contractor fulfilling its warranty obligations or the Contractor's breach of its warranty obligations, Contractor shall be responsible for Amtrak's total extra costs it incurs for the related labor, materials, Equipment and/or consultant services, including consultant efforts reviewing drawings, conducting inspections and monitoring FMI procedures. The remedies included herein are not exclusive and are in addition to those available to Amtrak under the Contract and at law.

13.5. During the respective periods of the warranty, all Car parts or material caused to be damaged as the result of a defect in design, material, or workmanship in other Car parts or material, shall be repaired or replaced at the expense of the Contractor. Failure reports must accompany all repaired parts.

(k) The Contractor shall, within three (3) days from discovery of a breach of warranty or notification by Amtrak of a warranty claim (whichever occurs first), deliver repaired and replacement parts; prior Amtrak authorization is required for return period exceeding three (3) days.

(l) The Contractor shall maintain support material necessary to eliminate any extended removal of cars from revenue service.

(m) Failure analysis reports must accompany all repaired parts.

13.6. In no case shall any correction of defects in design, material, or workmanship take the form of an increase in maintenance requirement beyond that specified in the Contract, described in the original edition of the maintenance instructions, approved in the Baseline design, or submitted by the Contractor at the time of proposal for the Contract.

13.7. Where five (5) percent of the quantity of a warranted item fails or where five (5) percent of Cars per a fleet type are affected during the warranty period as noted in the Specification(s), Amtrak may classify the total of such items as a failure, or fleet defect, including those items for which the warranty period expired before Amtrak recognized the failure. The Contractor is responsible for all costs of labor and material, for defect identification and location, and for removal, repair or replacement of defective parts, and for alterations, repairs, tests and adjustments in connection therewith made to obtain car performance identified in the technical specifications. All such

replaced or repaired items is warranted and guaranteed for the remainder of the warranty period or for one (1) year, whichever period is greater.

13.8. All corrective and warranty work and services shall be performed by Contractor, at Contractor's sole cost and expense, and may occur on Amtrak's property or at another location designated or approved by Amtrak. Amtrak employees may observe any such corrective or warranty work for training and knowledge-transfer purposes. Amtrak will not perform warranty repairs except where expressly authorized in writing by Amtrak, and any such authorized work performed by Amtrak shall be at Contractor's expense, including the costs identified in Exhibit S-Amtrak Billing Guidelines.

13.9. The Contractor shall provide an on-site Warranty Coordinator to handle and coordinate with Amtrak all warranty issues for a period of two (2) years from the date of Conditional Acceptance of each car. The Warranty Coordinator shall respond to all issues within one (1) business day of notification.

13.10. Any repair or retrofit work required to fulfill these guarantees shall be accomplished with minimum disruption to Amtrak's operation and its maintenance facility. Amtrak shall give prompt notice of the defect when and if it discovers it, and reasonable access to the defective part(s). Contractor warranty obligations may terminate if the defective part(s) has been materially changed or altered without the Contractor's knowledge.

13.11. If Equipment is removed from Revenue Service for one (1) week or more for warranty/repair/retrofit work, the duration of the time the Equipment is removed from service will extend the warranty period accordingly.

13.12. Due to the regular maintenance demands on Amtrak facilities and the operations personnel, it may be possible to undertake only minimal adjustment, repair, or replacement work on Equipment prior to Final Acceptance. The Contractor shall, in such an event, be responsible for securing facilities and personnel to complete all additional work required for the duration of the Contract.

13.13. Consumable or expendable items of material, as identified by part number and description by Contractor and agreed to by Amtrak, in writing, prior to final acceptance of the first unit of Equipment, such as brake pads, light bulbs, air filters, windshield wiper blades, etc., are warranted for the normal use of the item unless it is determined by Amtrak that the failure of the expendable or consumable item of material was caused by defective manufacture or design rather than normal wear and tear expected for such items.

13.14. During the Warranty Period whenever the failure rate exceeds that of the totals in Section 13.7, a failure analysis to determine the cause and frequency of defects covered by this warranty shall be performed by the Contractor and submitted to Amtrak for review. Type and process of said failure analysis and conclusions shall be reviewed and approved by Amtrak prior to determining suitable corrective action. Such analysis shall be performed and reported to Amtrak within thirty (30) days from the date Contractor becomes aware of each failure.

13.15. Upon occurrence of a breach of warranty, Contractor shall provide a written report on the scope of any repair or replacement warranty work necessary and plan an optimum manner of accomplishing such work (taking into account Out-of-Service time, skill levels, space restraints, cost and other relevant factors), which must be agreed to and approved by Amtrak. If Contractor fails promptly to remedy the breach, Amtrak may take such actions as it deems appropriate to remedy the breach and Contractor agrees to reimburse Amtrak for all costs and expenses, (including profit and overhead) incurred thereby.

13.16. If, at any time prior to the expiration of the Warranty Period for the Equipment, the cumulative defects or failures of any kind in identical components or systems within the Equipment serving substantially similar functions exceed the applicable percentage of such components or systems shown in the table below or in the case of Safety Critical of Major Components or Failures in such components reaches or exceeds five percent (5%), Contractor shall submit to Amtrak for review and approval within thirty (30) days a "Fleet Modification Program" with respect to all such components or systems in the Equipment. (Note: Within fifteen (15) days of shipment of the first unit of Equipment or some other time agreed to by Amtrak, Contractor shall provide to Amtrak for its approval, a list of Major Components.)

If the Total Number of Components or Systems in the Active Fleet is	**then the Applicable Failure Threshold Percentage Triggering Component Redesign is**
18 or less	20%
19 – 35	15%
36 – 500	10%
501 – 3,500	7.5%
3,501 or over	5%

The Modification Program shall ensure that all such components or systems on a fleet wise basis are no longer defective or at risk of defect or Failure, and are otherwise cured, at no additional cost to Amtrak. The Fleet Modification Program Plan shall include the Contractor's schedule for delivering the required materials, standard hours for installation and installation schedule. Contractor shall provide all required material, instructions and technical support along with reimbursement for Amtrak labor required to carry out the Fleet Modification Program. If Amtrak agrees to perform the labor, Amtrak shall be reimbursed in accordance with Exhibit S Amtrak Billing Guidelines (for the given Fleet Modification Program period. Such Fleet Modification Program Plan shall have as its goal to bring the fleet to optimal operating condition in as short a timeframe as possible with the least amount of financial and other impact to Amtrak.

If Amtrak notifies Contractor in writing that it does not approve of the Fleet Modification Program Plan, Contractor shall revise the proposed Fleet Modification Program Plan until approved by Amtrak, whose approval shall not be unreasonably withheld. Upon approval, the Fleet Modification Program shall be implemented promptly in accordance with a mutually agreed upon schedule.

If the material for a scheduled Fleet Modification Program is not available on the agreed-upon date per the Fleet Modification Program Plan, the Equipment shall then be considered in Car Held for Material (CHFM), status and Contractor shall pay to Amtrak the Performance Guarantee amounts for CHFM set forth in the TSSSA.

In the event that such defects or failures require the removal of major components or assemblies for the purpose of repairs or modifications, and such removals render any Equipment inoperable or unfit for safe and efficient operation in passenger service, Contractor shall furnish an adequate number of spare components or assemblies for the temporary use by Amtrak within twenty (24) hours of notification by Amtrak so as to avoid downtime of the affected Equipment while repairs or modifications are being done.

13.17. Contractor shall maintain a sufficient quantity of Spares and other spare components to enable it to provide for warranty parts replacement within the timeframes set forth in the TSSSA If Contractor fails to provide Spares within these timeframes, the Equipment shall be considered a CHFM, as that term is defined in the TSSSA and in accordance with the same, Contractor shall pay to Amtrak the amount set forth therein for each hour of delay. Any accepted Equipment which during the Warranty Period (including any extensions) that Amtrak has found to be unavailable for service beyond the twenty-four (24) hour period after notification due to the unavailability of Spares or spare components shall be treated as a delayed delivery and subject to the conditions of Liquidated Damages for delay.

13.18. After one (1) or more unit of Equipment has been accepted, if, during the Warranty Period, one (1) or more unit of Equipment is inoperable or unfit for safe and efficient operation in regular service during any thirty (30) day period due to defects in design, materials or workmanship whether or not of the same type or kind, as determined by the COTR, the COTR may require the Contractor, within thirty (30) calendar days after receipt of written notice from the COTR, to submit a Contractor's proposal for a "Remanufacturing Program" or "Campaign" to accomplish the necessary repairs, replacements or modifications at no additional cost to Amtrak with the least disruption to or interference with scheduled Revenue Service. Such Remanufacturing Program or Campaign shall consist of, but not be limited to, at least one of the following:

(n) Arrangement by Contractor to have the necessary repairs, replacements or modifications performed by Amtrak; or

(o) Arrangement by Contractor for the use of suitable facilities, on Amtrak property (if agreement can be reached on their availability) or in the vicinity thereof, to be manned by the Contractor's personnel to perform the necessary repairs, replacements or modifications; or

(p) Arrangement by Contractor to have the necessary repairs, replacements or modifications performed by qualified mutually agreed upon third parties located in the vicinity of Amtrak property, or if the parties cannot promptly mutually agree, by a qualified third party selected by Amtrak.

13.19. Except as otherwise provided in Sections 13.7 or 13.11 hereof, all materials, parts, and Equipment which are repaired or which replace items which were found to have had defects in design, material or workmanship shall be warranted for the remainder of the applicable Warranty Period or for one year from the completion of testing of the Equipment in which the repaired or replaced part is installed, or for one year from the date on which the applicable Equipment is returned to service, whichever provides the longest Warranty Period for the applicable item.

13.20. In the event during the Warranty Period that repairs and/or modifications on all or any Equipment, made necessary by defective design, material or workmanship or they are not otherwise as warranted, are not permanent or completed due to lack of material or inability to provide the proper repair, the Warranty Period for all parts and materials on such Equipment shall be extended by the amount of time the applicable Equipment is not in operation in regular service due to lack of Contractor parts, material or inability to provide the proper repair, as determined by Amtrak. In the event a fleet-wide retrofit is required during the Warranty Period due to defects in design, material or workmanship or parts, material or Equipment were not otherwise as warranted, then if the original Warranty Period for the relevant item is due to expire within three (3) years of the retrofit, the balance of such Warranty Period shall be extended two (2) years from the time then remaining on the warranty.

13.21. If separate or additional warranties covering material and/or Equipment included in a Equipment or the Fleet are furnished by any of its Subcontractors, Contractor shall provide these warranties to Amtrak in addition to the warranties set forth herein, provided that Amtrak shall not be obliged to look to anyone other than the Contractor for fulfillment of all warranty requirements under this Contract. The existence of any separate or additional warranties which run to the Contractor from any of its Subcontractors covering an item of material and/or Equipment included in an Equipment or the Fleet shall not relieve the Contractor of its obligation to repair or replace any of the material and/or Equipment due to defects in design, manufacture or workmanship or if they are not otherwise as warranted during the Warranty Period. Amtrak shall not be required to rely on another party for fulfillment of warranty provisions.

13.22. The Contractor shall, for a period commencing on delivery of the first unit of Equipment and terminating upon the expiration of the final Three-Year Warranty Period (or any extension thereof) maintain field engineers at the designated Amtrak sites as prescribed under the TSSSA (whether or not in effect) to correct faults and defects that may be encountered. These field service personnel shall be supervised and guided by a Field Service Supervisor who shall provide guidance of such warranty-related activities. The Contractor's representatives shall be qualified field engineers, knowledgeable in the repair and maintenance of Equipment and other Supplies covered under this Contract and when on-site shall be located at a portable field office at Amtrak. All utilities and all other supports necessary to maintain the portable office facility shall be provided by the Contractor.

13.23. During the Warranty Period, Contractor shall keep a log of all faults and defects found in each unit of Equipment, and of any adjustments and changes made in order to remedy such faults and defects. The Contractor shall submit to Amtrak a report of warranty work performed during preceding week. The Contractor shall track defects and submit a monthly report including all failures and defective items with running totals on a monthly and cumulative basis.

13.24. The warranties hereunder shall run to Amtrak, any Financing Party and each of their successors and assigns. The remedies provided for breach of warranties are cumulative and not exclusive.

13.25. Corrective Action During the Warranty Period:

Amtrak shall give the Contractor written notices of observed defects or failures. Unless otherwise directed in said notices, Contractor shall commence effort to correct the work at the time specified by Amtrak but in no event later than two (2) working days following notification by Amtrak of the defect or failure. Contractor shall diligently pursue such corrective work to completion. To prevent delays and disruption to Amtrak's operations, Amtrak shall have the right, when practical and feasible in its opinion, after receiving written comments from Contractor, to continue use of any such Supplies, including, but not limited to, the Equipment and subsystems, deemed defective or unsatisfactory, until such Supplies, including, but not limited to, the Equipment can be taken out of service pursuant to the corrective work hereby undertaken by Contractor.

13.26. In the event a defect or failure, in the opinion of Amtrak, constitutes an emergency which could jeopardize or impair the operations and schedules of Revenue Service, then in that event Amtrak shall provide the Contractor both verbal and written notice thereof and the Contractor shall commence corrective work within twenty-four (24) hours of any working day after receipt of Amtrak's incident report/warranty claim. Nothing herein shall be construed as preventing Amtrak's forces or its subcontractors from immediately commencing corrective work, provided such corrective work is performed in accordance with the Operator and Maintenance Manuals furnished by the Contractor as specified in the Contract. Contractor shall reimburse Amtrak for costs of such corrective work, including labor, fringe benefits, overtime and overhead at the prevailing rates when the work is performed. Amtrak shall advise Contractor of the current rates. Any corrective work by Amtrak's forces or its subcontractors shall not be construed to invalidate Contractor's warranties and other provisions contained in the section.

The Contractor shall submit a list of all parts and quantities being proposed that are appropriate and reasonably necessary to support warranty compliance efforts during this period. The list shall be submitted to the Amtrak COTR no later than delivery of the first unit of Equipment for approval. The list shall be submitted to the Amtrak Project Director no later than delivery of the first unit of Equipment approval. All of the items approved shall be stocked by Contractor and made available for use within thirty (30) days after approval of them. Contractor shall stock and make available additional items, spares and replacement parts which Amtrak determines are reasonably necessary or desirable for warranty service. Contractor shall acquire and stock such items, Spares and parts as soon as is practicable, and in accord with the terms governing the acquisition and stocking of Spares and parts under the TSSSA. At the end of the Three-Year Warranty Period for the final unit of Equipment, Contractor shall make available to Amtrak at no cost all remaining inventories of Spares and other parts acquired to provide warranty service.

The warranty provisions described in Article 13 above shall be applicable to each spare part replaced by Contactor for parts used pursuant to Section 13.16 above.

13.27. During the first three years of the Warranty Period, the Contractor shall maintain, a field office with qualified representatives to be available for the corrective work under the warranty. The Contractor's representatives shall be qualified field engineers, knowledgeable in the repair and maintenance of equipment covered under this contract and shall be located at a portable field office at Amtrak. All utilities and all other supports necessary to maintain the portable office facility shall be provided by the Contractor. The field engineers shall be available on twenty-four (24) hours advance notice until the expiration of the warranty period for all equipment covered under this contract and the completion of all warranty work on equipment covered under this contract. The field engineers shall follow up on all warranty claims and shall assist Amtrak in the resolution of any maintenance problems. Should any warranty claim be contested by Contractor, a joint inspection shall be made by Contractor and Amtrak, with a written report made by Contractor to Amtrak concerning the Contractor's proposal to resolve the claim. Amtrak shall review the proposal and if found acceptable, Contractor shall proceed in correcting the defective work. If Amtrak does not accept the proposal, the Contractor shall proceed in accordance with Amtrak's instructions and the matter shall be treated as a contract dispute in accordance with Article 35, Claims and Disputes.

13.28. Spares and repairs provided pursuant to corrective work hereunder shall be subject to prior approval of Amtrak and shall be tendered and performed in the same manner and extent as items originally delivered. Corrective work shall be performed at Amtrak facilities or locations referenced in the TSSSA. Any warranty work shall be accomplished with a minimum of disruption to Amtrak operations and its maintenance and service facilities. Amtrak shall provide the maintenance and service facilities free of charge and provide full access to Contractor whenever corrective work is being performed. Amtrak shall make every reasonable effort to make such facilities and Equipment available to Contractor, consistent with Amtrak's operational requirements. Contractor shall bear the cost of corrective work including necessary disassembly transportation, reassembly, repair of, and replacement of the defective goods, Supplies, including, but not limited to the Equipment and, subsystems, and work.

13.29. In the event the Contractor is unable or fails to immediately commence and diligently pursue and complete the corrective work, Amtrak is by this provision authorized by Contractor, at the option of Amtrak and upon written notice to the Contractor to contract with a third party or to use its own forces for the performance of the warranty work. The costs of such work (including labor and overhead) may be deducted from monies due, or to become due Contractor. If no monies are then owed the Contactor, Amtrak shall invoice Contractor for such costs, and the Contractor shall pay the invoice within thirty (30) calendar days of its receipt. Contractor hereby agrees to reimburse Amtrak for all costs and expenses in connection with such corrective work.

13.30. It is understood and agreed that time is of the essence in respect to all corrective work to be undertaken pursuant to the warranty herein contained.

13.31. Additional Warranties and Agreements Relating to Computer Hardware, software, etc. The warranties below in this Section 13.31 do not limit the warranties otherwise set forth in Section

13 as they may apply to any software or computer systems. Contractor represents, warrants and agrees:

(q) Virus Warranty: No viruses, Trojan horses, back-doors, malware, or similar items ("viruses") are coded or introduced into any Amtrak software or computer system used by Amtrak or any Equipment, Special Tools, or other Supplies or items furnished under the Contract. Contractor agrees that in the event that a virus is found to have been introduced, Contractor shall take all reasonable action at its own expense to eliminate the virus and reduce the effects of the virus on Amtrak's operations. Contractor further agrees to cooperate with Amtrak to mitigate and restore any loss of data or operational efficiency.

(r) Disabling Code Warranty: No time-bombs, drop-dead or disabling devices, back doors or similar items are coded or introduced into any Amtrak software or computer system used by Amtrak or any Equipment, Special Tools, or other Supplies or items furnished under the Contract, and that Contractor shall not install or invoke any code which could have the effect of disabling or otherwise shutting down any portion of Amtrak's software or computer systems or any Equipment, Special Tools, Train Scanner, Simulators or other Supplies or items furnished under the Contract.

(s) Function/Compatibility/Escrow Warranty: All Software, programming and computer hardware, systems and modules and related Technical Documents that Contractor or any Subcontractor furnishes to Amtrak are (i) Fit for Purpose, (ii) capable of performing the functions for which they are intended fully and correctly, (iii) if Software, written in a programming language that is commercially available in the United States and for which compilers, interpreters and other Software tools are commercially available in the United States, (iv) capable of being copied and used by Amtrak for Allowable Uses, and (v) where not delivered outright to Amtrak, being placed into escrow, including current versions, updates and fixes of them, as provided for by Article 31.

14. SPARE PARTS

14.1. Contractor shall submit, as part of its preliminary design proposal, a preliminary spare parts list. Additionally, at least ninety (90) days prior to delivery of the first unit of Equipment it shall submit a complete and comprehensive list of recommended spare parts ("Comprehensive Spare Parts List") for each Car type. In preparing this list, Contractor shall assume that the Equipment shall be maintained at up to four (4) separate Amtrak maintenance locations. The listing shall include the price of each item with indication of which items are biodegradable, and the estimated shelf life of each item.

14.2. The Comprehensive Spare Parts List shall also list the spare parts and items which Contractor plans to inventory, or those of its Subcontractors, and whether such parts are readily available to Amtrak for immediate procurement when needed. Contractor shall also prepare a list that identifies spare parts and/or replacement parts that cannot be procured within a thirty (30) day period from the date of the applicable order (the "Long Lead Spare Parts List"). Spare parts shall

be listed showing the original manufacturer's name, lead time and part number as well as Amtrak part number. Subassemblies shall be broken down into their individual components so that the components can be ordered separately. Where parts are supplied by a company with several departments, the number from the original manufacturing department shall be included in the parts lists. All electronic components shall be available from recognized electronic distributor sources in the United States.

14.3. Contractor shall also prepare a list of spare parts intended to be supplied with the Equipment as on-board consumables ("Consumable Spare Parts List"). Parts listed on the Consumable Spare Parts List shall be listed separately. Hardware, including fasteners, listed in the spare parts list shall be specified by grade, type of thread style, length, diameter, and finish. Amtrak reserves the right to review and approve, or reject, any spare part or numbers of spares from each of these lists. Parts subject to high wear or replacement shall be available from the Original Equipment Manufacturer ("OEM"). During the Service Life of the Equipment, there shall be no restriction to prevent direct procurement from the OEM of parts by Amtrak. Contractor warrants that, for the useful life of the Equipment, it shall supply to Amtrak upon Amtrak's request spare parts for the Equipment or equivalent replacement parts for spare parts no longer in stock, which parts must be capable of being incorporated in the Equipment without material changes to Spare parts must be new and conform to the specification and/or requirements applicable to the Equipment. Contractor shall take immediate action to submit a written order confirmation to Amtrak, stating the time of delivery and price, when Contractor has received Amtrak's orders for spare parts and/or replacement parts. Amtrak's orders for spare parts and/or replacement parts shall be executed and delivered as soon as possible and in no event later than thirty (30) days after the placing of the order, except in the case of spare parts and/or replacement parts that are identified in the Spare Parts List. For those items which Contractor has indicated a lead time on the Spare Parts List of more than thirty (30) days, Contractor shall maintain a nine (9) month supply of such spare parts.

14.4. Spare parts or replacement parts shall be supplied to Amtrak at a reasonable cost not to exceed the lowest price that Contractor charges other purchasers or, in the event the spare parts and materials are unique to the Equipment and this Contract, at their cost to Contractor plus a reasonable mark-up not to exceed three percent (3%), excluding any cost associated with or attributable to non-reoccurring engineering cost or any other cost associated with any asserted obsolescence of a Spare or replacement part; provided, however, that the prices contained in the final spare parts list shall be fixed for a period of one year from the date Amtrak receives the final list.

15. CHANGES

15.1. The Contracting Official may, at any time, without notice to the sureties, if any, by written order, direct any change within the general scope of this Contract.

15.2. A change for purposes of this Article 15 shall not include a directive or other order issued to conform the Equipment to the Specification or other Contract requirements.

15.3. If any such change causes an increase or decrease in the cost of, or the time required for completion of any part of the Equipment or an impact to the cost or time of the TSSSA, Contractor shall submit a proposal in accordance with this Article 15 and the Contracting Official shall make an equitable adjustment in the Contract Amount, the Contract Time, or both, and shall modify the Contract, as appropriate.

15.4. Contractor must immediately proceed with the Contract as changed, unless otherwise directed by the Contracting Official, and further must within forty-five (45) days from the date of receipt of the written order (i) assert in writing its right to an adjustment under this Article and (ii) notify Amtrak of any impact such change shall have. A failure by Contractor to timely assert its right to an adjustment or to timely notify Amtrak of such impact shall be deemed a waiver of Contractor's right to an adjustment with respect to the change or such other Work, and of its or its subsidiary's right to an adjustment under such separate contract.

15.5. If Contractor makes a proposed change request, Contractor, in connection with such request, shall furnish a price breakdown associated with both the Contract and the TSSSA, if impacted, itemized as required by the Contracting Official, impact to schedule, resources, any new risks or impact to existing known risks with applicable mitigation plans. Unless otherwise directed, the breakdown shall be in sufficient detail to permit an analysis of all material, labor, equipment, subcontract, and overhead costs, as well as profit. Any amount claimed for subcontracts shall be supported by a similar price breakdown. In addition, if the proposal includes a time extension, a justification therefore shall also be furnished. All such changes must be recorded in the Program Change Control Log along with applicable analysis documents and final disposition of changes and necessary approvals.

15.6. If Contractor's proposal for a change in the Contract Amount includes the cost of property made obsolete or redundant by the change, the Contracting Official shall have the right to prescribe the manner of the disposition of the property.

15.7. Failure to agree to any adjustment shall be a dispute as defined under Article 35, Claims and Disputes. However, nothing in such Article shall excuse the Contractor from proceeding with the Contract as changed.

15.8. When submitting any Claim exceeding $100,000, Contractor shall provide the following certification:

"I certify that the Claim is made in good faith; that the supporting data are accurate and complete to the best of my knowledge and belief; that the amount requested accurately reflects the contract adjustment for which the contractor believes Amtrak is liable; and that I am duly authorized to certify the Claim on behalf of the Contractor."

(t) The certification requirement does not apply to issues in controversy that have not been submitted as all or part of a claim.

(u) The aggregate amount of both increased and decreased costs shall be used in determining when the dollar thresholds requiring certification are met.

(v) The certification may be executed by any person authorized to bind the Contractor with respect to the claim.

16. TERMINATION FOR DEFAULT

16.1. Amtrak may, by written notice to Contractor, terminate for default this Contract in whole or in part if Contractor fails to perform or comply with any of its material obligations under the Contract, including:

(a) failure to make progress, gain FRA authorization, or meet any milestone so as to endanger timely performance under the Contract;

(b) failure of the Equipment to materially conform with the requirements of this Contract;

(c) failure, without cause, to make undisputed prompt payment to Subcontractors or to make undisputed prompt payment for equipment, materials and/or labor;

(d) noncompliance with the Applicable Laws;

(e) failure to comply with Amtrak's rules and proper instructions;

(f) a bankruptcy event occurs with respect to the Contractor or the Contractor's Guarantor;

(g) Contractor's liability for liquidated damages satisfies the conditions in Section 12.8;

(h) Contractor is prevented from executing the Work or Amtrak is prevented from using the Work as a consequence of any infringement of letters patent, registered design, copyright, trade mark, trade name and the Contractor is unable, within ninety (90) days (or such longer period as the Parties may mutually agree) after notice thereof, to procure the removal at its own expense of the cause of the infringement;

(i) any representation or warranty made by the Contractor or the Contractor Guarantor shall prove to be false or misleading in any material respect as of the time made;

(j) any violation of anticorruption provisions of the Contract, including but not limited to Articles 54, 55, and 56, or any violation of applicable anticorruption laws, including but not limited to the Foreign Corrupt Practices Act; in each case, in connection with this Contract; or

(k) the Contractor Guarantor, if any, breaches any provision of the Contractor Parent Guaranty or Contractor fails to maintain the Letter of Credit, Parent Guaranty or Performance and Payment Bonds as required by Article 6.

For the avoidance of doubt, the parties agree that items (a) – (k) above are material and that items (a) – (k) do not represent an exhaustive list of material defaults.

Except as set out below, Amtrak will give the Contractor written notice of the default and the opportunity to cure the default within ten (10) days (or such greater timeframe that Amtrak may specify) of Contractor's receipt of the written notice of default from Amtrak. Amtrak shall not be required to allow such cure period if Contractor's default is a violation of Applicable Law or impacts safety. Additionally, Amtrak shall not be required to provide written notice of default if Contractor fails to deliver the Equipment within the time specified herein. In the event that Contractor's material default is not excused or cured to the satisfaction of Amtrak, Amtrak may terminate the Contract in whole or in part and reprocure the Supplies, including, but not limited to, the Equipment, from another source, in which event Contractor shall be liable for (1) repayment to Amtrak of any payments made by Amtrak and (2) any Excess Costs to Amtrak relating to the reprocurement. In the event that the Contract is terminated only in part, the remaining part shall remain in full force and effect.

16.2. If Amtrak terminates this Contract in accordance with this provision, Contractor shall not be entitled to receive any further payment for the terminated Work. Further, Amtrak may take possession of all of the materials, equipment and tools on the site(s) and may continue the Work by whatever method Amtrak may deem expedient, including the acquisition, under the terms and in the manner the Contracting Official considers appropriate, of Supplies or services similar to those terminated. Provided that the termination was for default, Contractor shall be liable to Amtrak for any excess costs for those Supplies or services.

16.3. Upon termination of this Contract for default, in whole or in part, Contractor shall, if directed by the Contracting Official, take action including but not limited to:

(a) Stop the terminated Work on the date and to the extent specified in the notice of termination, without creating a hazardous condition;

(b) Place no further subcontracts for materials, Equipment, services, facilities or other items, except as may be necessary for completion of such portion of the Work that is not terminated;

(c) Unless directed otherwise by Amtrak, terminate all subcontracts to the extent that they relate to the performance of terminated Work;

(d) Furnish Amtrak with a release of all claims against Amtrak, including all claims by Subcontractors, and including a release of all Claims related to Work completed in accordance with the Contract, to the extent Amtrak has made payment in respect thereof in accordance with Article 44.

(e) Take such other reasonable action as Contractor may deem necessary, or as Amtrak may direct, for the protection of property which is in the possession of Contractor and in which Amtrak has or may acquire an interest;

(f) Cooperate fully with Amtrak to enable Amtrak to effectively and efficiently continue and complete the Work;

(g) Assign to Amtrak, or an entity designated by Amtrak, in the manner, at the time, and to the extent directed by Amtrak, all of the right, title and interest of Contractor under the subcontracts;

(h) To the extent reasonably required by Amtrak, settle all outstanding liabilities and all claims arising out of the termination without cause of subcontracts, with the approval of Amtrak;

(i) Transfer title to Amtrak, or an entity designated by Amtrak, and deliver in the manner, at the time, and to the extent, if any, directed by Amtrak (1) the fabricated or un-fabricated parts, Work in progress, dies, jigs, fixtures, plans, Drawings, information, contract rights, completed Work, Supplies, and other material and other property produced as a part of, or acquired in connection with the performance of, the terminated Work, including without limitation all books, files and records relating to the Project, and (2) the completed or partially completed plans, Drawings, fabrication Drawings, information, and any other property which, if this Contract had been completed, would have been required to be furnished to Amtrak;

(j) To the extent requested by Amtrak, use its best efforts to sell, in the manner, at the times, to the extent, and at the price or prices directed or authorized by the Contracting Official, any property of the types referred to in Section 16.3(i) above, provided, however, that Contractor (1) shall not extend credit to any purchaser, and (2) may acquire any such property under the conditions prescribed and at a price or prices approved by the Contracting Official; and provided, further, that the proceeds of any such transfer or disposition shall be applied in reduction of any payments to be made by Amtrak to Contractor under this Contract or shall otherwise be credited to the price or cost of the Work covered by the Contract or paid in such other manner as the Contracting Official may direct;

(k) Complete, in accordance with the Contract, performance of such part of the Work as shall not have been terminated by the notice of termination; and

(l) Execute any further documents reasonably required by the Contracting Official to confirm or effectuate the terms of this Article without compromising Contractor's right or remedies.

16.4. In the event Amtrak terminates this Contract for default pursuant hereto, Contractor shall bear all costs and expenses incurred in connection with this Article. In accordance with Section 63.2, this Article shall survive the termination of the Contract.

16.5. If, after termination, it is determined that Contractor was not in default, or that the default was excusable, the rights and obligations of the parties shall be the same as if the termination had been issued for the convenience of Amtrak.

16.6. The rights and remedies of Amtrak in this Article are in addition to any other rights and remedies provided by law or in equity or otherwise provided under this Contract.

17. TERMINATION FOR CONVENIENCE

17.1. Termination for Convenience is the exercise of Amtrak's right to completely or partially terminate performance of work under the Contract when it is in Amtrak's interest to do so, without cause or justification. Amtrak's exercise of this right does not release Contractor from any obligations that it has to Amtrak under any other provision of the Contract Documents nor does it waive any existing claims that Amtrak may have pending at the time of the Termination for Convenience.

17.2. Upon thirty (30) days written notice to Contractor, Amtrak may, at its option and in its sole discretion, terminate the Contract in whole or in part at any time for Amtrak's convenience for whatsoever reason, or no reason, and without regard to fault or breach.

17.3. Upon termination of this Contract for convenience, in whole or in part, Contractor shall, if directed by the Contracting Official, take action including but not limited to:

(a) Stop the terminated Work on the date and to the extent specified in the notice of termination, without creating a hazardous condition;

(b) Place no further subcontracts for materials, Equipment, services, facilities or other items, except as may be necessary for completion of such portion of the Work that is not terminated;

(c) Unless directed otherwise by Amtrak, terminate all subcontracts to the extent that they relate to the performance of terminated Work;

(d) Furnish Amtrak with a release of all claims against Amtrak, including all claims by Subcontractors, and including a release of all Claims related to Work completed in accordance with the Contract, to the extent Amtrak has made payment in respect thereof in accordance with Article 44.

(e) Take such other reasonable action as Contractor may deem necessary, or as Amtrak may direct, for the protection of property which is in the possession of Contractor and in which Amtrak has or may acquire an interest;

(f) Cooperate fully with Amtrak to enable Amtrak to effectively and efficiently continue and complete the Work;

(g) Assign to Amtrak, or an entity designated by Amtrak, in the manner, at the time, and to the extent directed by Amtrak, all of the right, title and interest of Contractor under the subcontracts;

(h) To the extent reasonably required by Amtrak, settle all outstanding liabilities and all claims arising out of the termination without cause of subcontracts, with the approval of Amtrak;

(i) Transfer title to Amtrak or an entity designated by Amtrak, and deliver in the manner, at the time, and to the extent, if any, directed by Amtrak (1) the fabricated or un-

fabricated parts, Work in progress, dies, jigs, fixtures, plans, Drawings, information, contract rights, completed Work, Supplies, and other material and other property produced as a part of, or acquired in connection with the performance of, the terminated Work, including without limitation all books, files and records relating to the Project, and (2) the completed or partially completed plans, Drawings, fabrication Drawings, information, and any other property which, if this Contract had been completed, would have been required to be furnished to Amtrak;

(j) To the extent requested by Amtrak, use its best efforts to sell, in the manner, at the times, to the extent, and at the price or prices directed or authorized by the Contracting Official, any property of the types referred to in Section 16.3(i) above, provided, however, that Contractor (1) shall not extend credit to any purchaser, and (2) may acquire any such property under the conditions prescribed and at a price or prices approved by the Contracting Official; and provided, further, that the proceeds of any such transfer or disposition shall be applied in reduction of any payments to be made by Amtrak to Contractor under this Contract or shall otherwise be credited to the price or cost of the Work covered by the Contract or paid in such other manner as the Contracting Official may direct;

(k) Complete, in accordance with the Contract, performance of such part of the Work as shall not have been terminated by the notice of termination; and

(l) Execute any further documents reasonably required by the Contracting Official to confirm or effectuate the terms of this Article without compromising Contractor's right or remedies.

17.4. Within thirty (30) days after Termination for Convenience, Contractor may submit to Amtrak in a form prescribed by Amtrak, a claim for termination costs. Termination costs may include: (1) Costs incurred in the performance of work performed prior to the termination, (2) a fair and reasonable profit on the incurred costs related to work performed prior to the termination, and (3) reasonable settlement expenses, including costs to ramp down the work. The Contractor and Amtrak may look to FAR 52.249-2 for guidance regarding termination costs, but are not bound by the requirements therein. In no event shall Amtrak's liability for termination costs exceed the unpaid balance of the Contract Amount or the compensation for the portion of the Work terminated, nor shall Amtrak be liable for consequential damages, including but not limited to lost or anticipatory profits, unabsorbed overhead or indirect costs. Contractor agrees to negotiate in good faith with Amtrak regarding any claim after termination. If appropriate, the Contracting Official shall issue a modification to the Contract reflecting any agreed upon adjustments to the Compensation resulting from the negotiation. Contractor's termination and related negotiation shall be subject to the Audit and Inspection Section herein. Contractor's subcontracts, sub-subcontracts, and purchase orders shall contain appropriate provisions for termination for convenience under this Section.

17.5. In the event of the failure of Contractor and Amtrak to agree upon the amount to be paid to Contractor by reason of the termination of Contract pursuant to this Section, the CO shall determine, on the basis of information available to him/her, the amount, if any, due Contractor by

reason of the termination and shall pay to Contractor the amount which the CO determines to be fair and reasonable subject to Contractor's right to assert a claim in compliance with the requirements of the Contract Documents.

18. CONTRACTOR KEY AND OTHER PERSONNEL

18.1. Contractor shall designate, prior to the commencement of the Work, "Key Personnel" who shall include: an individual to whom all Amtrak communications concerning this Contract may be addressed (the "Project Executive" or other title); and "Project Manager" (or other title), who shall report to the Project Executive, and shall be in charge of Contractor's Work related to the Equipment.

18.2. Amtrak considers the Key Personnel to be essential to the performance of the Contract. Accordingly, Contractor agrees that the Key Personnel shall perform as proposed. No substitutions by Contractor of Key Personnel shall be made without the prior written approval of the Contracting Official. Contractor shall notify the Contracting Official twenty (20) days in advance of any proposed substitution. The notification shall include: (i) an explanation of the circumstances necessitating the proposed substitution; (ii) a complete description of the qualifications of the proposed substitute, which shall be equal to or greater than the individual to be replaced; and (iii) any other information requested by the CO. Contractor shall have the right to transfer or replace any personnel other than Key Personnel and to substitute other qualified personnel, provided that such transfer or replacement shall not cause a delay in the performance of the Contract, a downgrading of the quality of the Supplies, or increased cost to Amtrak.

18.3. Amtrak shall have the right to require Contractor to replace any employee, including those not designated as Key Personnel, who Amtrak judges to be incompetent, careless, unsuitable or otherwise objectionable, or whose continued use is deemed contrary to the best interests of Amtrak. Before a written request is issued, it shall be discussed by the Contracting Official or his representative and the Project Executive. Upon receipt of a written request from Amtrak, Contractor shall be required to proceed with the replacement unless it can demonstrate that Amtrak's request is unreasonable. The replacement request shall include the desired replacement date and the reason for the request. Contractor shall affect the replacement in a manner that does not degrade quality of the Work.

18.4. In the event Contractor elects to remove any individual proposed as Contractor's Key Personnel from the Project without the Contracting Official's approval, Contractor shall pay to Amtrak the specified assessment for each individual removed during the time period indicated below.

First Year of Contract:	$1,000,000
Second Year of Contract:	$500,000
Third Year of Contractor:	$100,000
Remaining Period of Contract:	$50,000

18.5. The Contracting Official retains the right to approve any request by Contractor to remove Contractor's Key Personnel from the Project. Said approval shall not be unreasonably withheld. The assessments apply only if Contractor removes Contractor's Key Personnel without the Contracting Official's approval. The assessments do not apply if any of Contractor's Key Personnel leave the Project for reasons limited to retirement, resignation from Contractor's firm (but not including a situation where Contractor's Key Personnel takes another position with Contractor's firm, with any of its affiliated or subsidiary firms, its parent company or any firms affiliated with or subsidiaries of the parent company or any other entity which either owns or controls Contractor's firm, within one year of resignation), death, disability, personal hardship, or termination of the Key Personnel's employment by Contractor due to the Key Personnel's inability to meet performance requirements or for misconduct as defined in Contractor's Employee Handbook or Corporate policies and procedures.

18.6. Contractor shall comply with the applicable provisions of Amtrak Policy 7.39.2 (Contractor Background Check), a copy of which is incorporated herein by reference.

18.7. Amtrak and Contractor agree that, during the term of this Contract and for one year thereafter, neither party shall, either directly or indirectly, on the party's own behalf or on behalf of others, solicit or recruit any person to terminate such person's employment with the other party. This shall not restrict one party from hiring any employee of the other who responds to regular employment solicitation efforts, such as newspaper advertisements, employment agencies, open house or job fair events, or widely distributed announcements of job openings, or who makes a direct inquiry as to employment with Amtrak or Contractor.

19. CONTRACTOR'S REPRESENTATIONS

19.1. Contractor represents that at the time of transfer to Amtrak, or an entity designated by Amtrak, of title of each unit of Equipment, Contractor shall be vested with requisite authority to pass, and covenants that it shall pass such title, free of all liens and encumbrances, security interests, contractual rights (for example, such as those under debt instruments or leases), and all other rights of third parties of every kind and description including, without limitation, any creditors of Contractor (collectively, "Adverse Rights"). Contractor shall execute additional documents reasonably requested by Amtrak, or an entity designated Amtrak.

20. CERTAIN CONDITIONS ON AMTRAK'S OBLIGATIONS

20.1. At the date of acceptance of the last unit of Equipment to be delivered hereunder as part of the Total Order, as applicable, the chief legal officer of Contractor (or other counsel acceptable to Amtrak in the exercise of its reasonable judgment) shall issue to Amtrak an opinion:

(a) to the same effect as the representation contained in Article 19; and

(b) that the Bills of Sale and acknowledgment of receipt delivered to Amtrak pursuant to this Contract are valid and effective to, and accordingly do, confirm in Amtrak the absolute ownership of the Equipment free from all Adverse Rights.

21. SEVERABILITY

21.1. If any term or provision hereof is or becomes invalid or unenforceable, Contractor and Amtrak shall in good faith negotiate to replace the invalid or unenforceable term or provision with a term or provision which is valid and enforceable, and which comes as close as possible to expressing the intention of the invalid or unenforceable term or provision. The remaining valid portion of the Contract shall remain binding upon the parties.

22. CONFIDENTIALITY

22.1. Confidential Information: The term "Confidential Information" shall mean any and all information or proprietary materials (in every form and media) not generally known and which has been or is hereafter disclosed or made available by either Party (the "Disclosing Party") to the other Party (the "Receiving Party") in connection with the efforts contemplated hereunder, including: (i) all trade secrets; (ii) existing or contemplated products, services, designs, technology, processes, technical data, engineering, techniques, methodologies, and concepts and any information related thereto; (iii) information relating to business plans, sales or marketing methods or merchandising techniques, plans or information, and actual or potential customer information, lists or requirements; (iv) financial information or materials; (v) cost data; (vi) user lists and information; (vii) actual or potential vendor lists and information; (viii) procurement requirements; (ix) purchasing information; (x) manufacturing or development information; (xi) pricing policies; (xii) information about employees, independent contractors, interns, officers, directors, shareholders, investors, lenders, accountants, attorneys, and any other agents of either Party; (xiii) information about actual, under development, or what might reasonably be anticipated to be or become business and contractual relationships; (xiv) actual or potential lender, investor or partner lists and information; and (xv) other proprietary business information of either Party. "Confidential Information" as it relates to people or entities includes all contact information, including name, title, position, address, phone numbers, and email addresses. Further, "Confidential Information" includes any and all technical and non-technical information or material in which either Party has rights, opportunities, or obligations, whether or not owned or developed by such Party (or people or entities such Party may have disclosed to or received from pursuant to non-disclosure agreements).

22.2. Contractor agrees that all information furnished or disclosed by Contractor to Amtrak in connection with the performance of the Contract: (i) is furnished or disclosed as part of consideration of the Contract; (ii) shall not, unless otherwise agreed in writing by the CO, be

treated as confidential or proprietary information of Contractor; and (iii) subject to third party copyright restrictions, may be used, modified, copied, or disclosed by Amtrak for any purpose. Generally, routine deliverables provided by the Contractor to Amtrak will not be considered confidential. Contractor expressly waives any and all Claims against Amtrak and releases Amtrak from any and all Claims relating to the use, modification, copying or disclosure of such information by Amtrak, its assigns, or intended beneficiaries. No employee, agent, or representative of Amtrak, other than the CO, is authorized to accept any information which Contractor considers to be proprietary or confidential. Only the CO has authority to enter into an agreement, which shall be in writing, to provide for the confidential treatment of, or limit disclosure of, information furnished or disclosed by Contractor, its employees, agents or representatives.

22.3. Contractor shall: (i) hold Amtrak's Confidential Information in trust and confidence and not disclose or release any Confidential Information to any other person or entity; and (ii) not use the Confidential Information of Amtrak for any purpose whatsoever except as set forth in the Contract Documents or herein. Contractor shall disclose Amtrak's Confidential Information only to those of its employees, independent contractors, permitted subcontractors (including their employees and independent contractors) having a need to know such Confidential Information, provided that such persons and entities are bound by obligations of confidentiality and non-use no less restrictive that those contained herein. Upon completion or termination of the Contract, or as otherwise requested by Amtrak, Contractor shall immediately return all such items and information to Amtrak or make other disposition thereof as directed by Amtrak. Contractor shall not make any news releases, articles, brochures, advertisements, speeches or other information releases relating to the Contract without the prior written approval of the CO.

22.4. Contractor acknowledges that disclosure or use of Amtrak's Confidential Information without express written consent of the CO violates the Uniform Trade Secrets Act and federal Defend Trade Secrets Act. Contractor agrees not to improperly disclose third-party trade secrets or confidential information to Amtrak.

22.5. Contractor shall fully indemnify Amtrak against any and all actions, claims, liability, costs, charges, damages, and expenses suffered or incurred in connection with or arising out of any breach by Contractor of any of the provisions of this Section. Contractor acknowledges that a breach of its obligations hereunder cannot be compensated adequately by an award of damages or other pecuniary remedy, and that Amtrak shall also be entitled in the event of any such breach to the remedies of injunction, specific performance, or other equitable relief in respect of any such breach.

22.6. Contractor agrees that, in the event any Confidential Information of Amtrak is sought by subpoena, required by law or order of a court of competent jurisdiction or regulatory authority, or other process to the extent allowed by applicable law, Contractor shall notify Amtrak in writing as soon as practicable or within three (3) days of receipt of notice of such required disclosure in order to enable Amtrak to seek an appropriate protective order. Further, to the extent allowed by applicable law, Contractor shall reasonably cooperate and assist Amtrak in obtaining a protective order or other appropriate protection of its Confidential Information. If, nonetheless, the

Confidential Information is ordered to be disclosed, Contractor shall furnish only that portion of the Confidential Information that is required legally to be disclosed, and any portion of such Confidential Information required to be disclosed shall be used only for the purposes for which a court issues an order, or for other such purposes required by law.

22.7. Contractor agrees that, in the event any of Contractor's Confidential Information in Amtrak's possession is disclosed to a third party pursuant to a lawful subpoena, is required to be disclosed by law (e.g. FOIA) or order of a court of competent jurisdiction or regulatory authority, or other process to the extent allowed by applicable law, Contractor shall hold Amtrak harmless for such release.

22.8. This Confidentiality Article shall survive the termination or expiration of the Contract.

23. MONTHLY PROGRESS REPORTS

23.1. Timely and systematic reporting is vital to efficient and effective project management. Contractor shall submit to Amtrak written monthly progress reports which are the primary mechanism for providing detailed information about the progress of the project. These reports compile and combine all the information from the project functional areas and disciplines. Each report shall cover all significant activities occurring during the previous month and is due seven (7) calendar days after the end of each month.

23.2. The Monthly Progress Reports shall indicate month and calendar year and include as a minimum the following:

(a) Executive Summary & Narrative

(b) Project Schedule / FAI Schedule

(c) Schedule Status Update (notification of any risk of potential slippage)

(d) Engineering/Design Progress

(e) Project Look Ahead (activities for the next three months)

(f) Change Order Log

(g) Financial Summary

(h) Areas of Concerns/Problems

(i) CDRL Status Update

(j) Drawing Approval Status List

(k) Project Team and/or Organization or Responsibility Changes (as they occur)

24. RETURN OF DATA

24.1. Contractor, at any time upon the request of Amtrak, shall immediately return and surrender to Amtrak all copies of any materials, records, notices, memoranda, recordings, Drawings, specifications and mock ups and any other documents furnished by Amtrak to Contractor and Subcontractor.

25. ACCESS TO WORK

25.1. Amtrak, through its designated representative(s), the FRA, and the Financing Parties shall at all times have access to the Work at the project site(s), or wherever the Work may be in preparation or progress, and Contractor shall provide proper facilities for such access.

26. AMTRAK'S RIGHT TO STOP THE WORK

26.1. If Contractor fails to correct Work which is not in accordance with the requirements of the Contract or persistently fails to carry out Work in accordance with the Contract, the Contracting Official, by written order signed personally or by his authorized representative, may order Contractor to stop the Work or any portion thereof, until the cause for such order has been eliminated; however, the right of the Contracting Official to stop the Work shall not give rise to a duty on the part of Amtrak to exercise this right for the benefit of Contractor or any other person or entity. Contractor shall not be entitled to any extension of the Contract Time or increase in the Contract Amount in connection with any stopping of the Work or portion thereof pursuant to this Article.

27. AMTRAK'S RIGHT TO CARRY OUT THE WORK

27.1. If Contractor fails to carry out the Work in accordance with the Contract and fails, within a ten (10) day period after receipt of written notice from the Contracting Official to cure this default with diligence and promptness, the Contracting Official may give Contractor a second written notice to correct such deficiencies within a seven (7) day period. If Contractor within such seven (7) day period after receipt of such second notice fails to commence and continue to correct any deficiencies, the Contracting Official may, without prejudice to other remedies Amtrak may have, correct, or cause to be corrected, such deficiencies. In so doing, Amtrak or its designee shall utilize any of Contractor's materials, plant and equipment necessary to correct the deficient Work. In such case, an appropriate Change Order shall be issued deducting from payments then or thereafter due Contractor the cost of correcting such deficiencies, including compensation for the Contracting Official's or Amtrak's additional services and expenses made necessary by such default, neglect or failure. If payments then or thereafter due Contractor are not sufficient to cover such amounts, Contractor shall pay the difference to Amtrak. In accordance with Article 65 Amtrak's rights under this Article are in addition to any other rights it may have with respect to defective Work, including those rights of termination as specified elsewhere in the General Provisions.

28. NON-PERFORMANCE BY AMTRAK

28.1. Amtrak's failure to perform any of its responsibilities set forth in the Contract shall not be deemed to be grounds for termination, suspension or slowdown of the Work by Contractor; provided,

however, that Contractor's nonperformance of its obligations to perform the Work shall be excused if and to the extent: (a) Contractor is unable to perform and its inability to perform is caused solely by Amtrak's failure to perform its responsibilities, and (b) Contractor provides Amtrak with reasonable notice of nonperformance and uses all reasonable efforts to perform notwithstanding Amtrak's failure to perform.

29. SUSPENSION OF THE WORK

29.1. After the Work has been started, Contractor shall not suspend the Work without permission of the Contracting Official or his designated representative. When under suspension, the Work shall be put in proper and satisfactory condition, and properly protected as directed by the Contracting Official or his designated representative. In all cases of suspension, the Work shall not again be resumed until permitted by order of the Contracting Official or his designated representative.

29.2. In addition to any other rights afforded to Amtrak under this Contract to suspend the Work, Amtrak shall have the right at any stage of the Work, to suspend operations thereon, or upon any part thereof, either for a time named or indefinitely, by giving Contractor written notice. If such rights of suspension are exercised by Amtrak, the Contracting Official shall grant to Contractor an extension of the Contract Time for the relevant part of the Work equal to the length of the actual delay to the critical path necessarily caused by such suspension and may grant additional time necessary to overcome such delay, but there shall be no adjustment of the Contract Amount in connection with such suspension except as explicitly provided in this Article. In the event that operations on a part of the Work are suspended by Amtrak pursuant to this Article for more than thirty (30) days, in the case of suspension of the Work, the Contract Amount for such part of the Work may be adjusted for any increase in the cost of performance of the Work (excluding profit) necessarily caused by such suspension (it being understood that the economic adjustment formulae in the Contract shall compensate Contractor for increased costs attributable to inflation). However, no adjustment of the Contract Time or Contract Amount shall be made for any suspension: (a) to the extent that performance would have been suspended, delayed or interrupted by any other cause, including the fault or negligence of Contractor or (b) for which equitable adjustment is provided for or excluded under any other provision of the Contract. Amtrak's rights under this Article shall be in addition to any other right under the Contract to suspend the Work.

29.3. No Claim under this Section shall be allowed unless the Claim, is submitted to Amtrak in writing, setting forth any requested extension to the period of performance or increase in Compensation, and the basis therefore, as soon as practicable after the termination of such suspension, but no later than twenty-one (21) days after the termination of such suspension pursuant to the Claims Section.

30. TAXES

30.1. Pursuant to 49 U.S.C. 24301(k), Amtrak is exempt from payment of state or local sales and use taxes on personal property. Based on this statutory exemption, Contractor may be exempt from payment of state or local sales and use taxes on material and property purchased for performance of this Contract. It is Contractor's responsibility to determine applicability of any exemption from

taxation arising from his performance under this Contract and Contractor shall not be entitled to payment for any taxes for which any exemption was applicable.

31. INTELLECCTUAL PROPERTY RIGHTS

31.1. IP Rights

31.1.1. Contractor shall pay any and all royalties and license fees required to be paid to third parties in connection with (a) Contractor's (or its Subcontractors') efforts relating to the Work, and (b) Amtrak's use and exploitation of any portion thereof, including without limitation Amtrak's use of any deliverables, Work Product, or Supplies. In addition, Contractor shall defend and indemnify Amtrak from, and hold Amtrak harmless from and against, any and all costs, expenses, losses and liabilities (including without limitation costs, expenses and attorneys' fees) arising out of or in connection with any and all demands, suits, claims and other similar proceedings brought by third parties alleging infringement, misappropriation or violation of any IP Rights arising in connection with any Work, Work Product, deliverables or Supplies, or Amtrak's use and exploitation of any portion thereof, including without limitation Amtrak's use of any Work, Work Product, deliverables or Supplies; provided that Amtrak provides Contractor with reasonable notice of the same.

31.1.2. With respect to the Work, Contractor shall not use, or permit the use of, or furnish for use by Amtrak any appliance, article, device, method of construction, design or manufacturing, Work Product, Supplies, or any Intellectual Property or IP Rights, unless Contractor has obtained all necessary consents, permissions, or authorizations for such use or uses. Any and all such consents, permissions or authorizations shall include, without limitation, all rights necessary for Contractor to grant the licenses set forth below.

31.2. License and Use Rights

31.2.1. "**Allowable Uses**" shall be limited to (a) the use, maintenance or repair (including wreck repairs) of the Equipment, (b) work performed by or on behalf of Amtrak to complete the Work due to a Contractor default or failure (or, in the case of Subcontractor Intellectual Property, after termination for cause of the relevant Subcontractor), (c) marketing, branding, advertising and training initiatives, and/or (d) other Amtrak equipment acquisitions or other Amtrak business reasons (or, in the case of Subcontractor Intellectual Property, the applicable Subcontractor ceases to be in the business of selling the equipment to which the applicable Subcontractor Intellectual Property relates). The Contractor shall cause its Subcontractors to grant "Allowable Uses") to Amtrak as set forth in this section and these General Provisions.

31.2.2. Contractor Intellectual Property: Contractor hereby grants to Amtrak an irrevocable, perpetual, fully paid-up right and license (with the right to grant sublicenses, except as otherwise set forth herein) to use the Contractor's Intellectual Property: (a) for any and all Allowable Uses, (b) to make and use any and all Work, Supplies, Work Product, deliverables, products, methods and services, and (c) to use, copy, have copied, modify, have modified, incorporate in other products or services, prepare derivative works from,

have derivative works prepared from, and distribute any and all copyrightable works. The right and license set forth in this section shall survive the expiration or termination of this Contract and may be transferred by Amtrak to any third-party.

31.2.3. Subcontractor Intellectual Property: Contractor shall cause each and every Subcontractor to grant to Amtrak an irrevocable, perpetual, fully paid-up right and license (with the right to grant sublicenses) to use the Subcontractor's Intellectual Property (the "Subcontractor Intellectual Property"): (a) for any and all Allowable Uses, (b) to make and use any and all Work, Supplies, Work Product, deliverables, products, methods or services, and to (c) use, copy, have copied, modify, have modified, incorporate in other products or services, prepare derivative works from, have derivative works prepared from, and distribute any and all copyrightable works. The rights and licenses set forth in this section shall survive the expiration or termination of this Contract, and the expiration or termination of any agreements between Contractor and the Subcontractor, and may be transferred by Amtrak to any third party.

31.2.4. Without limiting any right or remedy of Amtrak, if Amtrak or any of its affiliates is enjoined from or likely to be enjoined from using all or any portion of the Work, Work Product, any deliverables or Supplies, or Amtrak's use and exploitation (as defined below) of any portion thereof, as to which Contractor is required to indemnify Amtrak against infringement, misappropriation or other violation, Contractor shall, at Amtrak's request and at Contractor's expense, either (a) procure promptly for Amtrak the right to continue using the foregoing, or (b) promptly replace all or any portion of the foregoing with a non-infringing product or part of equivalent functionality and performance which is satisfactory to Amtrak and the use of which does not violate the terms and conditions of such injunction, or (c) promptly modify all or any portion of the foregoing in a manner satisfactory to Amtrak so as to render use of the foregoing non-infringing and not in conflict with the injunction, and having equivalent functionality and performance.

31.3. Escrow

31.3.1. Escrow Materials and Escrow Agreement: To secure Amtrak's rights hereunder, Contractor shall place copies of its then current system design, Source Code and Object Code, listings and related Documentation including, without limitation, annotated notes (the "Escrow Materials") for the Contractor's Software and Subcontractor's noncommercially available Software with an independent escrow agent reasonably selected by Amtrak, subject to the terms and conditions of the independent escrow agent's standard agreement (the "Escrow Agreement") and in accordance with the provisions of this Article 31.

31.3.2. Release Conditions: As used in the Contract, "Release Condition" shall mean the occurrence of any of the following events with respect to Contractor during the term of Amtrak's rights hereunder:

(a) If Contractor materially breaches an express obligation with respect to the Contract, then Amtrak shall so notify Contractor in writing in accordance with the notice

provisions set forth in the Contract ("Breach Notice"), specifying in reasonable detail the basis for Amtrak's claim of breach. Amtrak shall serve a copy of the Breach Notice simultaneously upon the escrow agent under the Escrow Agreement. At the same time that Amtrak delivers the Breach Notice, it may also deliver notice to the escrow agent under the Escrow Agreement), with a copy to Contractor, requesting a release of the Escrow Materials (a "Release Notice"). The Release Notice will commence the thirty (30) Business Day period under the Escrow Agreement, if such thirty (30) Business Day period is required, for Contractor to issue contrary instructions. Contractor shall (i) cure such breach during the thirty (30) day period immediately following its receipt of the Breach Notice ("Cure Period"); or (ii) if such breach is of a nature such that it is not capable of being cured within such period, (A) provide Amtrak a plan for cure that will cure the breach within sixty (60) days from the date of the Breach Notice (the "Extended Cure Period") and (B) commence acting on such plan during the initial Cure Period. If Contractor fails to meet its obligations under (i) and (ii) above or does not send written notice to Amtrak of a good faith dispute of the breach specified in the Breach Notice, then Contractor hereby agrees that it will not issue contrary instructions to the escrow agent under the Escrow Agreement, and the escrow agent under the Escrow Agreement will be authorized to release the Escrow Materials upon the tolling of the thirty (30) Business Day Period during which Contractor was allowed to issue contrary instructions; provided however if the breach is of such a nature that it could not have been cured during the initial Cure Period and Contractor complied with its obligations under (ii) above, then Contractor may issue Contrary Instructions only to the extent it prohibits the escrow Agent under the Escrow Agreement from releasing the Escrow materials until the end of the Extended Cure Period.

(b) The entry of an order for relief in a proceeding in bankruptcy (other than Chapter 11 of Title 11 of the U.S. Code, as the same may be amended) in which Contractor is the named debtor; (ii) Contractor's making of an assignment for the benefit of Contractor's creditors; (iii) the appointment of a receiver for Contractor; (iv) the filing of (1) any bankruptcy proceeding against Contractor, other than Chapter 11 of Title 11 of the U.S. Code, (2) any proceeding for an assignment for the benefit of Contractor's creditors or (3) any proceeding for appointment of a receiver or custodian of the assets and property of Contractor, which proceeding shall be consented to or acquiesced to be by Contractor or has not been discharged or terminated within ninety (90) days; or (v) the rejection by Contractor or any trustee of Contractor of the License Agreement pursuant to 11 U.S.C. Clause 365. The terms of clause (a) of this Clause 4.1 shall apply if following the filing of a proceeding under Chapter 11 of Title 11 of the U.S. Code, Contractor or its trustee materially breaches an express obligation under the Contract.

(c) Contractor dissolves, liquidates or ceases to provide services or work similar to those provided for under the Contract for a substantial number of its customers for a period of at least thirty (30) days.

(d) The parties have entered into a good faith dispute and Contractor ceases providing services or work similar to those provided for under the Contract prior to the final conclusion of the dispute resolution process set forth in Article 35 "Claims and Disputes"; provided that no such release condition will be deemed to have occurred if (i) Contractor has obtained a court order allowing it to cease performance of the Contract or (ii) Amtrak has failed to pay undisputed invoices or make milestone payments for the Work for ninety (90) days following written receipt of notice of breach from Contractor.

31.3.3. Use of Escrow Materials: Contractor hereby grants Amtrak an irrevocable, perpetual, fully paid-up right license (with the right to grant sublicenses) to use or have used on its behalf the Escrow Materials upon their release to Amtrak only to perform and authorize the performance of the Allowable Uses, which includes without limitation the right to make and use any and all products, methods and services, and to use, copy, have copied, modify, have modified, incorporate in other products, prepare derivative works from, have derivative works prepared from, and distribute any and all copyrightable works, in each case in connection with and limited to Allowable Uses.

31.3.4. Establishment of Escrow: Within one (1) year of conditional acceptance of the first Consist of Cars, Contractor shall cause the Escrow Materials to be placed into escrow. The first ten (10) years of the escrow period, shall be maintained at the sole expense of Contractor under this Contract. After ten (10) years, Contractor shall continue to maintain the escrow, including the payment thereof, under the TSSSA. After the TSSSA terminates, Amtrak shall be responsible for payment of the escrow agent's fees. The deposit made with the escrow agent shall be kept current so as to accurately reflect the then current version of the Escrow Materials and promptly updated by Contractor following each material upgrade, modification or enhancement thereto. Contractor shall designate a mutually acceptable neutral third party that, at the expense and request of Amtrak made from time to time, may audit the materials deposited with the escrow agent for purposes of determining whether Contractor has fulfilled its deposit obligations. Contractor will promptly, at its expense, correct any deficiency disclosed by the audit.

31.3.5. Extension of Obligations: The obligations of Contractor under this Article 31 shall extend to any trustee in bankruptcy, receiver, administrator or liquidator appointed for Contractor, to Contractor as debtor-in-possession ("Trustee"), and to any other successor in interest to Contractor. Without limiting the generality of the foregoing, upon written request of Amtrak, Contractor shall not interfere with the rights of Amtrak as provided in the Contract or the Escrow Agreement to obtain the Escrow Materials from the Trustee or any other person or entity having possession thereof, and shall, if requested under the conditions specified in the Escrow Agreement for release of the Escrow Materials, cause a copy of such Escrow Materials to be made available to Amtrak.

31.4. Trademarks: Contractor shall not use Amtrak's name, trade name, logo, trademarks, or service marks in any context in connection with any advertising, publicity, product, equipment, promotion, or publication without the prior written consent of Amtrak. Contractor agrees to

comply with Amtrak instructions regarding trade dress, packaging, trade names, trademarks, service marks or other indicia of origin which shall appear on any items to be delivered under the Contract. Contractor further agrees that, after delivery of said items to Amtrak, Amtrak may modify the trade dress or packaging thereof, and/or replace, modify, or supplement any indicia of origin appearing thereon, to identify Amtrak as the source of said items.

31.5. Pre-existing Materials of Contractor and Subcontractors: Contractor hereby grants to Amtrak a non-exclusive, irrevocable, perpetual, worldwide, fully paid-up license to use, execute, reproduce, modify, display, transfer, distribute copies of and prepare derivative works based on materials and intellectual property embodied therein, including any and all modifications thereto, owned and developed independently by Contractor prior to the preparation of its proposal used to provide Equipment under the Contract. Contractor shall retain its ownership interest in such pre-existing materials. Contractor shall cause its Subcontractors to grant the licenses described herein.

31.6. Indemnity for Third Party Infringement Claims: The Contractor hereby represents and warrants that: (i) materials that it uses in its performance of the Work under the Contract; (ii) the Work, Work Product, including deliverables, Supplies, and Subcontractor Intellectual Property; and (iii) Amtrak's use of any Work, Work Product, including deliverables, Supplies, and Subcontractor Intellectual Property shall not infringe or misappropriate any U.S. or foreign patent, copyright, trade secret or other intellectual property right of a third party. If any claim is made against Amtrak claiming that its use of the Work, Work Product, including deliverables, Supplies, and Subcontractor Intellectual Property or other materials provided by Contractor hereunder infringes any third party intellectual property right, including but not limited to infringement of patent, copyright, royalty, trademark, service mark, proprietary right, misappropriation or wrongful use of trade secret, or confidential information ("Third-Party Infringement Claim"), Contractor shall, at its own expense, defend, indemnify, and hold harmless Amtrak and its Affiliates (including its directors, officers, employees, agents, subsidiaries, and assigns) ("the "Amtrak Indemnified Party") from and against any and all claims, damages, fees, losses, liabilities, penalties, and costs (including costs of defense and attorneys' fees) ("Losses"). In the event that a Third-Party Infringement Claim is asserted or sought against an Amtrak Indemnified Party, the Amtrak Indemnified Party shall notify the Contractor in writing in respect of such Third-Party Infringement Claim (a "Notice of Infringement Claim") as promptly as practicable; provided, however, that a failure or delay by the Amtrak Indemnified Party to provide a Notice of Infringement Claim as promptly as practicable shall not affect the rights or obligations of such Amtrak Indemnified Party unless the Contractor shall have been actually prejudiced as a result of such failure or delay. The Amtrak Indemnified Party shall enclose with the Notice of Infringement Claim a copy of all papers served with respect to such Third-Party Infringement Claim, if any, and any other documents evidencing such Third-Party Infringement Claim. Contractor shall have the obligation to assume the defense or prosecution of such Third-Party Infringement Claim and any litigation resulting therefrom with counsel of its choice (which counsel shall be reasonably satisfactory to the Amtrak Indemnified Party) and at its sole cost and expense (a "Third-Party Infringement Defense"), but only if the Contractor provides written notice of such assumption to the Amtrak Indemnified Party within sixty (60) days following delivery of the Notice of Infringement Claim and acknowledges in writing in such notice that any Losses that may be assessed against the Amtrak Indemnified Party in connection with such Third-Party Infringement

Claim constitute Losses for which the Amtrak Indemnified Party shall be indemnified pursuant to this Section. Notwithstanding the foregoing, the Contractor shall not have the right to assume the defense of such Third-Party Infringement Claim, if: (i) the Amtrak Indemnified Party shall have been advised by counsel that there are one or more legal or equitable defenses available to it which are different from or in addition to those available to the Contractor, and, in the reasonable opinion of the Amtrak Indemnified Party, counsel for the Contractor could not adequately represent the interests of the Amtrak Indemnified Party because such interests could be in conflict with those of the Contractor; or (ii) the Contractor shall not have assumed the defense of such Third-Party Infringement Claim in a timely fashion. If the Contractor assumes the Third-Party Defense in accordance with this Section: (i) Contractor shall diligently defend such Third-Party Infringement Claim; (ii) the Amtrak Indemnified Party shall have the right, but not the obligation, to participate in any such Third-Party Defense and to retain separate co-counsel at the sole cost and expense of Contractor; (iii) the Amtrak Indemnified Party will not file any papers or consent to the entry of any judgment or enter into any settlement with respect to the Third-Party Infringement Claim without the prior written consent of the Contractor; and (iv) the Contractor will not consent to the entry of any judgment or enter into any settlement with respect to the Third-Party Infringement Claim: (a) to the extent such judgment or settlement provides for equitable or injunctive relief without the prior written consent of the Amtrak Indemnified Party; (b) if such settlement does not include as a term thereof the giving by the third party asserting such claim to the Amtrak Indemnified Party a release from all liability with respect to such claim underlying such judgment or settlement; or (c) if such settlement or judgment contains any admission or statement suggesting any wrongdoing or liability on behalf of the Amtrak Indemnified Party. The Parties will use their commercially reasonable efforts to minimize Losses from Third-Party Infringement Claims and will act in good faith in responding to, defending against, settling or otherwise dealing with such claims. The Parties will also cooperate in any such defense and give each other reasonable access to all information relevant thereto. Notwithstanding the foregoing, Contractor shall have no indemnification obligation toward Amtrak under this provision if the respective Third-Party Infringement Claim is due to any modifications made by Amtrak or a third party acting on behalf of and with the authority of Amtrak or misuses by Amtrak.

31.7. Corrective Actions: If Amtrak's use of the Intellectual Property is enjoined, or if the Contractor's performance of its obligations under this Contract are materially impaired by reason of such Third-Party Infringement Claim, Contractor shall use commercially reasonable efforts, at its expense, to continue its performance hereunder, including without limitation, at its own elections: (i) to substitute an allegedly infringing item or process with a non-infringing item or process of at least the same functionality; (ii) to modify the allegedly infringing item or process so that it no longer infringes but remains at least functionally equivalent; or (iii) to obtain for Amtrak and its Affiliates the right to continue using such allegedly infringing item or process.

31.8. RESERVED

31.8.1. The terms and conditions set forth in this Section 31 shall survive the expiration or termination of the Contract, t and the rights and licenses set forth hereunder may be transferred by Amtrak to any third party.

32. INDEMNIFICATION

32.1. Contractor agrees to defend, indemnify and hold harmless the Indemnified Parties, from and against any claims, losses, liabilities (including without limitation environmental liabilities), penalties, fines, demands, causes of action, suits, costs and expenses incidental thereto, (including costs of defense and attorneys' fees) (collectively "Indemnified Party Claims"), arising in whole or in part from the fault, negligence or wrongful act of Contractor, which any of the Indemnified Parties may hereafter incur, be responsible for or pay as a result of breach of warranty, injury or death of any person, or damage to or loss (including loss of use) of any property, including property of the parties hereto, arising out of or in any degree directly or indirectly caused by or resulting from Supplies, material, deliverables, products or Equipment supplied by, or from activities of, or Work performed by Contractor, Contractor's officers, employees, agents, servants, Subcontractors, or any other person acting for or with the permission of Contractor under the Contract, or as a result of Contractor's failure to perform its obligations in compliance with the Contract.

32.2. In addition to the foregoing, Contractor agrees to defend, indemnify and hold harmless the Indemnified Parties, irrespective of any negligence or fault on the part of the Indemnified Parties, from and against any Claims which any of the Indemnified Parties may hereafter incur, be responsible for or pay as a result of injuries (including death) to any of Contractor's employees, agents or Subcontractors.

32.3. The indemnification obligations under this section shall not be limited by the existence of any insurance policy procured or maintained by Contractor or any Subcontractor or by any limitation on the amount or type of damages, compensation or benefits payable by or for Contractor or any Subcontractor and shall survive the termination of the Contract.

33. AWARD OF SUBCONTRACTS AND OTHER CONTRACTS FOR PORTIONS OF THE WORK

33.1. Within one hundred and eighty (180) days after execution of the Contract with respect to the Work Contractor shall furnish the Contracting Official, in writing, an accurate list showing all proposed Subcontractors' names, addresses, telephone numbers and nature of work. In addition, Contractor shall furnish the names of all persons or entities proposed as contractors of the products identified in the Contract (including those who are to furnish materials or Equipment fabricated to a special design) and, where applicable, the name of the installing Subcontractor. The Contracting Official shall within thirty (30) days reply to Contractor, in writing, stating whether or not the Contracting Official, after due investigation, has reasonable objection to any such proposed person or entity. Failure of the Contracting Official to reply within such period shall constitute notice of no reasonable objection. If Contractor changes a Subcontractor, within fifteen (15) days of the change, Contractor shall provide Amtrak with an updated list.

33.2. Contractor shall not contract with a proposed person or entity to which the Contracting Official has made reasonable and timely objection. Contractor shall not be required to contract with anyone to whom Contractor has made reasonable objection.

33.3. If the Contracting Official has a reasonable objection to a person or entity proposed by Contractor, Contractor shall propose another person or entity to which the Contracting Official or Contractor has no reasonable objection.

33.4. Contractor shall not change a Subcontractor, person or entity previously selected if the Contracting Official makes reasonable objection to such change.

33.5. Notwithstanding the foregoing, with the prior approval of Amtrak, Contractor may replace a Subcontractor or supplier if after such replacement Contractor will still be in compliance with the Buy America(n) requirements, as set forth in Article 47, Buy America(n) Requirements.

34. SUBCONTRACTORS

34.1. All references to Subcontractors herein include Subcontractors at any tier. Nothing contained in the Contract or any contract with a Subcontractor at any tier shall create any contractual relationship between Amtrak and any Subcontractor, or any third-party beneficiary rights in any Subcontractor; provided, however, that Amtrak shall be named as a third-party beneficiary of all contracts with a Subcontractor.

34.2. All work performed for Contractor by a Subcontractor shall be pursuant to an appropriate agreement between Contractor and the Subcontractor which shall contain provisions that:

(a) Preserve and protect the rights of Amtrak under the Contract with respect to the Work to be performed under the subcontract so that the subcontracting thereof shall not prejudice such rights;

(b) Require that such Work be performed in accordance with the requirements of the Contract;

(c) Require submission to Contractor of applications for payment under each subcontract to which Contractor is a party, in reasonable time to enable Contractor to apply for payment;

(d) Require that all claims for additional costs, extensions of time, damages for delays or otherwise with respect to subcontracted portions of the Work shall be submitted to Contractor (via any Subcontractor where appropriate) in sufficient time so that Contractor may comply in the manner provided in the Contract for like Claims by Contractor upon Amtrak;

(e) Contractor's insurance as specified in Article 58 of this Contract shall provide insurance coverage for each Subcontractor working on its behalf.

(f) Preclude Contractor and Subcontractor from naming, impleading or otherwise including Amtrak as a party in any arbitration or lawsuit between Contractor and any Subcontractor, and preclude the Subcontractor from naming, impleading or otherwise including Amtrak in any arbitration or lawsuit arising as a result of any Work performed by or for Contractor under the Contract;

(g) Provide that Contractor's rights under the subcontract shall be assignable to Amtrak at Amtrak's option;

(h) Require the Subcontractor to continue diligently to prosecute the Work, notwithstanding any disputes, including without limitation, disputes between Contractor and Amtrak, or Contractor and any Subcontractor;

(i) Provide that the subcontract is terminable on the same terms as the Contract, but that no termination shall be effective without Amtrak's consent, and the Work covered by the subcontract may be suspended on the same terms as the Work may be suspended pursuant to the Contract;

(j) Include Amtrak as a named indemnitee under any indemnification obligations imposed on the Subcontractor; and

(k) Obligate each Subcontractor specifically to consent to the provisions of this Article 34.

34.3. Whenever the Contract: (i) requires Contractor to include any provisions in an agreement with a Subcontractor, or (ii) requires Contractor to bind a Subcontractor to any obligation or otherwise create any obligation, responsibility, or liability on the part of any Subcontractor, or (iii) confers any rights or benefits on Amtrak with respect to a Subcontractor, the reference to "Subcontractors" shall be deemed to include Subcontractors of any tier, and Contractor shall require Subcontractors to include in all agreements with their suppliers: (a) provisions parallel to those required to be included in the agreement with the Subcontractor, (b) provisions necessary and sufficient to impose parallel obligations, responsibilities and liabilities on the Subcontractors, and (c) provisions necessary to confer such rights and benefits on Amtrak with respect to their suppliers.

34.4. Contractor shall promptly pay all Subcontractors, and shall require each Subcontractor to promptly pay its own Subcontractors. To verify payments to Subcontractors, Contractor shall provide any documentation reasonably requested by Amtrak.

34.5. The Contractor shall include all anticorruption provisions of the Contract in each subcontract and third-party agreement entered into under the Contract, including but not limited to representations and warranties of compliance with applicable anticorruption laws, including but not limited to the Foreign Corrupt Practices Act. Amtrak may require Contractor to terminate any Subcontractor in the event that the Subcontractor's continued performance of the Work would cause Amtrak to (i) violate any Applicable Law; or (ii) lose Amtrak's access to public funding for the Work, including from the Financing Parties.

35. CLAIMS AND DISPUTES

35.1. Submission of Claim and Decision of Contracting Official: If, prior to the date of Final Payment, the Contracting Official and the Contractor fail to agree on any request for adjustment, the Contractor may elect to submit a Claim to the Contracting Official for action. A decision by the Contracting Official, as provided in the "Resolution of Claims and Disputes" Section, shall be

required as a condition precedent to litigation of a Claim between Contractor and Amtrak as to all such matters arising prior to the date Final Payment is due, regardless of (a) whether such matters relate to execution and progress of the Services or (b) the extent to which the Services have been completed.

35.2. Time Limits on Claims: Claims by the Contractor must be made by written notice to Amtrak, identified as a "Claim" under this Section" within twenty-one (21) days after occurrence of the event giving rise to such Claim or within twenty-one (21) days after the Contractor first recognizes, or reasonably should have recognized, the condition giving rise to the Claim, whichever is later. Provided, however, that Contractor shall use its best efforts to furnish the CO, as expeditiously as possible, with notice of any Claim once such Claim is recognized, and shall cooperate with the CO in any effort to mitigate the alleged or potential damages, delay or other adverse consequences arising out of the condition which is the cause of such a Claim. A notice of Claim must clearly identify the alleged cause and the nature of the Claim and shall describe the basis for any request for an extension of the contract period of performance or increase in the contract sum and shall include data and information then available to the Contractor that will facilitate prompt verification and evaluation of the Claim.

35.3. Continuing Contract Performance: Pending final resolution of the Claim, including litigation, unless otherwise directed by Amtrak in writing, Contractor shall proceed diligently with performance of the Contract and Amtrak shall continue to make undisputed payments in accordance with the Contract Documents.

35.4. Waiver of Claims – Final Payment: The making of Final Payment shall constitute a waiver of Claims by the Contractor except for Claims made in writing prior to Final Payment pursuant to the requirements of the Contract Documents and identified by the Contractor in writing to the CO as unresolved at the time of Final Payment.

35.5. Any Claim of Contractor not made in compliance with the requirements of the "Time Limits on Claims" subsection above shall be deemed waived. No Claim by Contractor for a Contract change hereunder shall be allowed if asserted after Final Payment under the Contract.

35.6. Resolution of Claims and Disputes:

(a) Subject to Contractor's compliance with the "Changes in the Services" and "Claims" Sections, the Contracting Official will review Claims and take one or more of the following actions within thirty (30) days of receipt of a Claim: (a) request additional supporting data from Contractor; (b) notify the Contractor in writing when the Contracting Official expects to take action; (c) reject the Claim in whole or in part, stating reasons for rejection; (d) recommend approval of the Claim; or (e) or take other actions as deemed necessary by the Contracting Official.

(b) If a Claim has been resolved, the CO will prepare or obtain appropriate documentation for execution by Amtrak and the Contractor.

(c) Additionally, the decision of the CO shall be final and conclusive unless Contractor

pursues its rights or remedies under law, in accordance with the "Governing Law, Jurisdiction, and Venue" Section. Pending a final decision of a dispute by the court, Contractor shall diligently proceed with the performance of its work under the Contract in accordance with the decision of the CO, pursuant to the "Resolution of Claims and Disputes" Section, except to the extent that the CO's decision is that Contractor is not to proceed with the performance of all or part of the Contract.

36. LIMITATION OF LIABILITY

36.1. Amtrak and Contractor shall not be liable for punitive damages or special, indirect, consequential damages and each party releases the other from any such liability. With the exception of losses (including defense costs) covered by the proceeds of insurance carried by or insuring Contractor or any Subcontractor, Contractor's liability to Amtrak for damages resulting from or arising out of any causes of action (including but not limited to tort) relating to Contractor's performance of the Contract shall not exceed an aggregate amount equal to 100% of the Contract Amount. The foregoing limitation of liability and waiver of consequential damages will not apply to or limit any right of recovery respecting the following:

(a) Losses (including defense costs) arising out of the Work and covered by the proceeds of insurance carried by or insuring Contractor;

(b) Losses (including defense costs) of amounts which would have been reimbursed but for Contractor's failure to carry insurance required to be carried under the Contract;

(c) Losses (including defense costs) of arising out of Contractor's or a Contractor Party's fraud, criminal conduct, intentional misconduct, recklessness, bad faith or gross negligence;

(d) Contractor's indemnities under the Contract;

(e) Contractor's obligation to pay liquidated damages in accordance with the Contract;

(f) Fines assessed against Amtrak by a government authority to the extent that such fines are due to a Contractor Party's violation of Applicable Law; and

(g) Losses arising out of releases of hazardous materials by Contractor or Amtrak.

Notwithstanding the foregoing, the waiver of consequential damages herein shall not apply in the event that the liquidated damages payable to Amtrak pursuant to Section 12.1 reach or exceed twenty percent (20%) of the Contract Amount.

37. REASONABLE DELAYS

37.1. Contractor acknowledges that Work to be accomplished under the Contract may be required to be performed on Amtrak's property simultaneously with ongoing daily railroad operations. Such operations include, but are not limited to, the passage of trains, and the repair, construction, reconstruction, and maintenance of the railroad right-of-way and facilities. Contractor is advised

that these conditions may cause delays and suspension of the Master Project Schedule. Contractor acknowledges that to the extent such delays and suspensions are reasonably foreseeable in light of current railroad operations as of the date hereof and any such delays and suspensions have been taken into account by Contractor and are included in all performance schedules and the Contract Amount and shall give rise to no Claims by Contractor even if they have an impact on the critical path. However, if a delay in the critical path of the Master Project Schedule occurs as a result of railroad operations that were not reasonably foreseeable in light of existing railroad operations heretofore or of which Contractor did not know or have reason to know as of the date of the Contract, then Contractor shall be allowed an extension of the Contract Time equal to the actual delay to the critical path necessarily caused in the completion of the Work and to an adjustment of the Contract Amount for any increase in the cost of performance of the Work (excluding profit) necessarily caused by such delay (it being understood that the economic adjustment formulae in the Contract shall compensate Contractor for increased costs attributable to inflation). However, no adjustment of the Contract Time or Contract Amount shall be made for any delay: (a) to the extent that performance would have been suspended, delayed or interrupted by any other cause, including the fault or negligence of Contractor or (b) for which equitable adjustment is provided for or excluded under any other provision of the Contract.

37.2. If a delay or suspension in the completion of the Work is caused by a delay in a regulatory approval identified to Amtrak in writing by Contractor as being necessary prior to the issuance of the applicable NTP, then Contractor shall be allowed an extension of the Contract Time equal to the length of the actual delay to the critical path necessarily caused by the delay in receipt of the regulatory approval; provided, however, that no such extension shall be allowed if the delay in receipt of regulatory approvals is attributable to the act or omission of Contractor or its Subcontractors.

38. ASSIGNMENT OF CLAIMS

38.1. Claims for moneys due or to become due Contractor from Amtrak under this Contract may be assigned to a bank, trust company, or other financing institution, including any Federal lending agency upon the prior written consent of the Contracting Official, and may thereafter be further assigned and reassigned to any such institution upon the prior written consent of the Contracting Official. Any such assignment or reassignment shall cover all amounts payable under this Contract and not already paid, and shall not be made to more than one party except that any such assignment or reassignment may be made to one party as agent or trustee for two or more parties participating in such financing.

39. SUCCESSORS AND ASSIGNS

39.1. Contractor. Contractor shall neither assign nor delegate its responsibilities under the Contract (or assign its right to be paid amounts due hereunder) without the prior written consent of the Contracting Official. Any assignment without Amtrak's consent shall be void. Amtrak shall have the right to assign all or part of the Contract without obtaining consent from Contractor or its sureties, if any. Subject to the foregoing, the Contract shall be binding upon and shall inure to the benefit of permitted assigns.

39.2. In connection with any assignment of the Contract for collateral purposes to Financing Parties pursuant to Section 39.1, Contractor shall provide to such Financing Parties a consent to assignment agreement in a form as may be reasonably required by such Financing Parties (it being agreed that such Financing Parties may reasonably require provision by competent counsel to Contractor of legal opinions addressing authorization, enforceability and other customary matters related to such consent or direct agreement), covering matters that are customary in project or equipment financings of the applicable type, which, among other things, shall authorize the Financing Parties, as secured parties, to exercise all rights of Amtrak under the Contract, and to subsequently assign such rights in connection therewith without the consent of Contractor and may also cover matters such as Financing Parties' security rights with respect to the Contract, direct notices to Financing Parties, step-in/step-out rights, access by Financing Parties' representative, deferral of Contractor's rights to terminate the Contract in certain circumstances and other matters applicable to such project or equipment financing. In this regard, Contractor shall cooperate with Amtrak in its efforts to obtain such financing, including by supplying information and documentation reasonably requested by the Financing Parties and taking such other actions as the Financing Parties may reasonably request.

40. TIME

40.1. The Contract Time is the period of time allotted in the Contract for completion of the Work or a portion thereof, as applicable.

40.2. The date of commencement of the Work or a portion thereof is the date established in a NTP for such Work or portion thereof.

40.3. The time of beginning, rate of progress, and time of completion are essential conditions of the Contract. If Contractor refuses or fails to prosecute the Work with such diligence as shall insure its completion within the time specified in the Contract, or any extension thereof as herein provided, or if Contractor abandons the Work or if Contractor fails to complete the Work within said time, Contractor shall be liable for liquidated damages as set forth in Article 12, Liquidated Damages. Amtrak may deduct from subsequent payments due Contractor under this or any contract with Contractor or from any sums retained there-under, all or such part of these sums as may be required to pay the aforesaid damages, with Contractor being responsible for any deficiency.

40.4. All phases of the Work shall be completed within the number of days as stated in the NTP. All NTPs shall be submitted to Contractor by facsimile and/or letter and Contractor shall signify the receipt of same by return facsimile or letter. The date of transmittal by Amtrak of a NTP shall constitute its effective date.

40.5. Should an impact of any nature whatsoever to the Master Project Schedule be identified by Contractor; Contractor shall immediately notify Amtrak in writing and provide recommendations for actions to be taken in order to mitigate the delay.

41. FORCE MAJEURE

41.1. For purposes of this Contract, a Force Majeure Event is any one of the following: act of God or the public enemy, act of a governmental authority acting in its sovereign capacity, fire, flood, epidemic, quarantine restriction, unusually severe weather, war, terrorism, riot, earthquake, strike or embargo. In the event that either party's failure to perform in accordance with any schedule or when otherwise required under the Contract arises solely out of a Force Majeure Event that is both out of the control of such party and without the fault or negligence of such party, the time for performance under the Contract will be extended proportionately up to a maximum of thirty (30) days (or longer, in the Contracting Official's sole discretion), consistent with the requirements of this Article 41. Notwithstanding the foregoing, Covid19 shall not be considered a Force Majeure under this provision.

41.2. Within ten (10) days of (i) becoming aware or (ii) the date by which it should reasonably have become aware, of a delay resulting from a cause specified in Section 41.1, whichever is earlier, Contractor shall advise the Contracting Official in writing of a claimed Force Majeure Event. The Contracting Official will then determine whether the event constitutes a Force Majeure as defined in Section 41.1 and will so advise the Contractor in writing. Once performance of the delayed work re-commences, or at the end of the thirty (30) day period (or such longer period as the Contracting Official in his or her sole discretion choose to allow), the Contracting Official will advise the Contractor of the time extension granted due to the Force Majeure Event. Contractor shall make every reasonable effort to minimize the duration of the Force Majeure Event.

41.3. Apart from extension of time, no Claim for additional payment shall be filed by Contractor and no payment or allowance of any kind shall be made to Contractor as compensation for damages occasioned by way of the causes specified in Section 41.1.

41.4. Contractor recognizes it is imperative that the Work proceed uninterrupted and shall endeavor to prevent and shall diligently take all reasonable steps to re-start performance fully in accordance with the Contract, cure any work stoppage or strike of Contractor's employees caused by any labor disputes, including jurisdictional disputes arising out of the assignment of any of the Work. Contractor shall cause parallel provisions to be inserted in all subcontracts at any tier. If Contractor's failure to perform extends for more than fifteen (15) days from the start of the Force Majeure Event, Amtrak may, at its discretion, terminate the Contract without liability or cost at any time after such fifteen (15) days or some greater timeframe that may be specified by Amtrak. In the event of such early termination, if requested by Amtrak, Contractor shall transfer title as directed by Amtrak and deliver to Amtrak in the manner directed by Amtrak, any completed or partially completed deliverables or other work products Contractor has produced or acquired specifically for performance of the Work under the Contract.

41.5. Contractor agrees that no time extension shall be granted for time lost due to normal seasonal weather conditions. In order to qualify for consideration for a time extension due to adverse weather conditions, Contractor must show that the weather conditions during a given quarterly period (summer, fall, winter, spring) were more severe than the most severe year of the previous five years for the project geographical area and, in addition, that these weather conditions critically impacted the final project completion date by delaying the performance of Work. If abnormal weather losses within the meaning of the preceding sentence can be shown to have

affected the Master Project Schedule, a non-compensable time extension shall be granted for that portion of the proven weather-related delays which exceeded the normal weather losses which should have been anticipated for the quarterly period in question, but no Claim for additional payment shall be filed by Contractor and no payment or allowance of any kind shall be made to Contractor as compensation for damages occasioned by way of any such abnormal weather.

41.6. Defaults or delays in performance of the Work by Contractor which are caused by acts or omissions of Subcontractors shall not relieve Contractor of its obligations, except to the extent that the relevant Subcontractor is itself subject to a Force Majeure Event covered hereunder and Contractor cannot reasonably circumvent the effect of the Subcontractors default or delay in performance through the use of alternate sources, work around plans or other means.

41.7. In the event that Amtrak's failure to perform in accordance with any schedule or when otherwise required under the Contract arises solely out and is the direct result of a Force Majeure Event that is both out of Amtrak' control and without the fault or negligence of Amtrak, Amtrak shall not be liable to the Contractor for such failure.

42. PRICING OF ADJUSTMENTS

42.1. When costs are a factor in any determination of a Contract price adjustment pursuant to Article 15, Changes, or any other provision of this Contract, such costs shall be in accordance with the contract cost principles and procedures of Part 31 of the Federal Acquisition Regulation (FAR), as amended by O.M.B. Circular A-87, in effect on the date of this Contract.

43. FEDERAL FUNDING, AUDIT, AND INSPECTION

43.1. Contractor hereby acknowledges and accepts that: (1) federal funds may be expended to it in connection with the tasks, assignments or duties which it performs pursuant to this Contract, and (2) the federal False Claims Act, 31 U.S.C. § 3729 et seq. may apply in connection with applications for payment, claims, requests for equitable adjustment or other requests for payment which Contractor submits to Amtrak under, or in connection with, this Contract.

43.2. Contractor acknowledges and agrees that Amtrak and Amtrak's Office of Inspector General (OIG) may inspect, copy and/or audit Contractor's data and records (in hard copy and/or electronic format) related in any way to the Contract, including without limitation, all data and records relating to: (1) support for any proposal, change order, or request for equitable adjustment submitted to Amtrak by Contractor; (2) Contract compliance and performance, including any work or deliverables in progress; (3) compliance with applicable provisions of Amtrak's federal grant, regulations and statutes; and (4) support for all direct and indirect costs or prices charged to Amtrak. Contractor agrees to maintain all such data and records throughout the term of the Contract and until three (3) years after final payment under the Contract, and agrees to cooperate with all audit activities.

43.3. In connection with audit and inspection activities, Amtrak and Amtrak OIG shall be afforded, upon request, (1) access to Contractor's facilities and to Contract work or deliverables in progress,

(2) the opportunity to interview Contractor's employees concerning any matter relating to the Contract, and (3) adequate and appropriate workspace.

43.4. Contractor agrees to reimburse Amtrak, within sixty (60) calendar days after receipt of a written request, the full amount of any undisputed audit findings or questioned costs, unless otherwise agreed by Amtrak in the course of post-audit negotiations with Contractor.

43.5. Contractor shall include the provisions of this clause in every subcontract or purchase order exceeding $100,000, as well as a provision requiring all subcontractors to include these provisions in any lower tier subcontracts or purchase orders exceeding $100,000. Contractor shall be responsible for subcontractor or lower tier subcontractor's compliance with this clause.

43.6. Nothing in this Contract shall be construed to limit the rights, obligations, authority, or responsibilities of Amtrak's Office of the Inspector General pursuant to the Inspector General Act of 1978, as amended, including the right to seek information by subpoena.

44. PAYMENT PROVISIONS – GENERAL

44.1. With respect to any amount to be paid to Amtrak by Contractor pursuant to the Contract, Amtrak may, at its option, set off that amount as a credit against the Contract Amount payable to Contractor for the Work.

44.2. Amtrak shall pay undisputed charges when such payments are due for the Work. Amtrak may withhold payment of particular charges that Amtrak disputes in good faith, and in that case, Amtrak shall advise Contractor, in writing, of the nature of the dispute and, at Contractor's request, the parties shall immediately commence resolution of the issue in accordance with Article 35, Claims and Disputes.

44.3. RESERVED

45. FAIR EMPLOYMENT PRACTICES/EQUAL EMPLOYMENT OPPORTUNITY

45.1. Contractor agrees to abide by Amtrak's policy and practice to ensure that all business organizations receive fair and equal consideration and treatment without regard to race, color, religion, sex, disability, veteran status or national origin of the owners or principals of the business organization. In addition, Contractor agrees that it shall not discriminate against any employee or applicant for employment because of race, color, religion, sex, disability, veteran status or national origin and that it shall comply in all respects with the Americans with Disabilities Act, 42 U.S.C. 12101 et seq.

45.2. Contractor shall take affirmative action to ensure that applicants and employees are treated fairly without regard to their race, color, religion, sex, disability, veteran status or national origin. Such action shall include, but not be limited to the following: employment, upgrading, demotion or transfer, recruitment or recruitment advertising, layoff or termination, rates of pay or other forms of compensation, and selection for training, including apprenticeship. Contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices setting forth the provisions of this non-discrimination section.

45.3. Contractor shall send to each labor union or representative of workers with which it has a collective bargaining agreement or other contract or understanding, a notice advising the labor union or workers' representative of Contractor's commitments under this section and shall post copies of the notice in conspicuous places available to employees and applicants for employment.

45.4. The Contract may be canceled, terminated, or suspended in whole or in part based on Contactor's failure to comply with this section.

45.5. Contractor shall include the provisions of Sections 45.1 through 45.4 in subcontracts involving services to be performed or Supplies to be furnished under the Contract, unless exempted by rules, regulations, or orders of the U.S. Secretary of Labor.

46. ENVIRONMENTAL COMPLIANCE

46.1. Contractor shall comply with all Applicable Laws concerning the environment and/or waste disposal.

46.2. Contractor shall dispose of any wastes, including hazardous wastes, generated by Contractor, its Subcontractors or agents (either purposefully or accidentally) in connection with its performance of the Contract in accordance with applicable federal, state, and local laws, regulations, ordinances, and orders, at its sole expense, using its own EPA generator number. In no event shall Amtrak be identified as the generator of any such wastes. Amtrak reserves the right to require Contractor to provide to Amtrak a copy of the results of any tests conducted by or for Contractor on any such wastes and, at Amtrak's expense, to perform additional tests or examinations of any such wastes prior to disposal.

46.3. Contractor shall include and enforce this Environmental Compliance Article in all subcontracts or lower tier purchasing agreements.

47. BUY AMERICA(N) REQUIREMENTS

47.1. In accordance with Amtrak's Domestic Buying Preference requirements at 49 U.S.C. 24305(f), Amtrak shall only buy, and accordingly, Contractor shall only supply (a) unmanufactured articles materials, and supplies mined or produced in the United States; or (b) manufactured articles, material, and supplies manufactured in the United States substantially from articles, materials, and supplies mined, produced or manufactured in the United States. For purposes of this provision, substantially means that more than 55% of all components by cost must be domestic. This Section 47.1 shall apply only when the cost of those articles, material, or supplies bought or supplied to Amtrak by Contractor is at least $1,000,000.

47.2. When complying with Section 47.1, Contractor shall comply with the domestic preference requirements of the Build America, Buy America Act (BABA) § 70914, Pub. L. No. 117-58, div. G, tit. IX, subtit. A, 135 Stat. 429, 1298 (2021), as implemented by OMB, USDOT, and FRA.

47.3. In accordance with 2 C.F.R. §200.322, as appropriate and to the extent consistent with law, Contractor shall, to the greatest extent practicable, provide a preference for the purchase, acquisition, or use of goods, products, or materials produced in the United States (including but

not limited to iron, aluminum, steel, cement, and other manufactured products). The requirements of this section must be included in all subcontracts and purchase orders for work or products under this Contract.

(a) For the purposes of 2 C.F.R. §200.322:

1. "Produced in the United States" means, for iron and steel products, that all manufacturing processes, from the initial melting stage through the application of coatings, occurred in the United States.

2. "Manufactured products" means items and construction materials composed in whole or in part of non-ferrous metals such as aluminum; plastics and polymer-based products such as polyvinyl chloride pipe; aggregates such as concrete; glass, including optical fiber; and lumber.

48. CUSTOM DUTIES

48.1. Contractor agrees that, if any items or Supplies are shipped F.O.B. (Free on Board) destination or D.D.P. (Delivered Duty Paid), Contractor shall be the importer of record for all articles that enter into the United States in connection with the Contract. Contractor shall be liable for all duties, fees, and taxes attaching on importation of such articles, including anti-dumping and countervailing duties, if any.

48.2. Contractor agrees that, if the items or Supplies are shipped F.O.B. origin, C.I.F. (Cost, Insurance & Freight) or F.C.A. (Free Carrier), Amtrak shall specify the customs broker and shall be the importer of record for all articles that enter into the United States in connection with the Contract.

48.3. Amtrak shall not pay on behalf of Contractor, or reimburse Contractor for any anti-dumping or countervailing duties for which Contractor may be liable.

49. EXPORT CONTROLS

49.1. Contractor represents and warrants that it shall comply with (1) all United States export laws and regulations issued by any U.S. government authority, including without limitation the U.S. Export Administration Regulations, the International Traffic in Arms Regulations and any regulations administered by the Department of the Treasury's Office of Foreign Assets Control, that govern the export or re-export of any deliverable, technology or technical data provided hereunder, including software, hardware, Equipment, documentation, specifications, Drawings, and schematics (collectively, the "Products") and any of the services, and (2) any applicable laws and regulations of countries other than the United States that govern the importation, use, export or re-export of Products and/or services. Contractor further represents and warrants that it shall (1) obtain appropriate export authorizations, consents or licenses that may apply to Contractor's export or import of any Products or services, and (2) comply with any conditions that are contained in any export or import licenses pertaining to the Products or services. Contractor shall comply with any reporting requirements that may apply to the export or re-export of the Products

and/or services and provide to Amtrak and the appropriate governmental authority any periodic reports containing such information as may be required under applicable law.

49.2. Each party will reasonably cooperate with the other in making the appropriate filings with any governmental authority and will, to the fullest extent permitted by law, provide any information, certificates or documents as are reasonably requested.

49.3. In performing services under this Contract, Contractor warrants and represents that it shall not cause any non-U.S. person who is a citizen of country that has been designated by the U.S. Government as a "terrorist supporting country" (see Country Group E at Supplement No. 1 to Export Administration Regulations Part 740) to perform under this Contract if such performance would violate the regulation.

49.4. With the exception of commodities, software or technologies that are controlled solely for "antiterrorism" reasons under the Export Administration Regulations ("EAR"), Contractor represents and warrants that the deliverables shall not contain any export-controlled technology or technical data under the export control laws or regulations unless approved by Amtrak's Contracting Official in writing. At least thirty (30) days prior to the earlier of the delivery, installation or provision of a deliverable containing any controlled technology or technical data, Contractor shall inform Amtrak's Contracting Official in writing of the EAR Export Control Classification Number(s) ("ECCN") or the International Traffic in Arms Regulations ("ITAR") U.S. Munitions List Classification ("MLC") numbers applicable to such deliverable. In addition, upon delivering or otherwise providing a deliverable with an ECCN or MLC number, Contractor shall place the following legend, or substantially similar one, as applicable on technical data and/or deliverable documentation:

"WARNING—INFORMATION SUBJECT TO EXPORT CONTROL LAWS: This document or software contains information subject to the Export Administration Regulations ("EAR") [or the International Traffic in Arms Regulations ("ITAR")]. This information may not be exported, released, or disclosed to foreign persons, whether within or outside the United States without first complying with the export license requirements of EAR [or ITAR]. Include this notice with any reproduced portion of this document. The EAR Export Control Classification Number(s) ("ECCN") [or the ITAR U.S. Munitions List Classification(s)] is/are: _____."

49.5. If the services under the Contract include the maintenance or servicing of a Product, Contractor shall be responsible for promptly informing Amtrak's Contracting Official of any changes in the ECCN or MCL status of such Product until expiration or termination of the maintenance or serving period for that Product.

49.6. If Contractor is provided, or provided access to, any technology or technical data by or through Amtrak that is restricted under the export control laws or regulations, Contractor shall fully comply with any and all restrictions imposed by Amtrak at no additional cost.

49.7. Contractor is fully responsible for compliance with the provisions herein on behalf of itself and its employees, agents and contractors and those of its Subcontractors, at any tier level, and their respective employees, agents and contractors.

50. TRANSACTIONS INVOLVING EMPLOYEES OF AMTRAK

50.1. Without giving prior written notice to the Contracting Official, Contractor shall not: (a) employ any employee of Amtrak when Contractor knows or has reason to believe that such person after employment by Contractor, shall also continue to remain in the employ of Amtrak; or (b) utilize as a consultant or otherwise, for compensation, the services of any employee of Amtrak in connection with the performance of the Work under this Contract; or (c) procure any portion of the Work under this Contract, or any materials or services required in connection with the performance of this Contract, from any firm (excluding corporations whose stock is listed on a recognized stock exchange) which Contractor knows or has reason to believe is owned or controlled by employees of Amtrak or in which employees of Amtrak have a substantial interest.

50.2. Contractor shall furnish the Contracting Official with such further information as the Contracting Official may request concerning any proposed transactions of Contractor set forth above.

51. AMERICANS WITH DISABILITY ACT

51.1. The Contractor shall comply with all the applicable requirements of the Americans with Disabilities Act of 1990 and regulations promulgated thereafter, including 49 CFR Parts 27, 37 & 38.

52. CONVENANTS AGAINST CONTINGENT FEES

52.1. Contractor warrants that no person or selling agency has been employed or retained to solicit or secure this Contract upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established commercial or selling agencies maintained by Contractor for the purpose of securing business. For breach or violation of this warranty, Amtrak shall have the right to terminate this Contract without liability or in its discretion to deduct from the Contract Amount, or otherwise recover, the full amount of such commission, percentage, brokerage, or contingent fee.

53. ETHICAL BUSINESS PRACTICES

53.1. Contractor, or any employee, agent, or representative of Contractor, shall not offer to any Amtrak employee, agent or representative any cash, gift, entertainment, commission, or kickback for the purpose of securing favorable treatment with regard to award or performance of the Contract or any other contract.

53.2. Contractor, or any employee, agent or representative of Contractor, agrees that it shall neither solicit nor accept any cash, gift, entertainment, commission, or kickback from a vendor, subcontractor or any other person or entity for the purpose of securing favorable treatment with regard to award or performance of any subcontract or contract issued in connection with the Contract.

53.3. Contractor agrees that it shall not: (i) employ the services of any Amtrak employee, their spouse or other member of an employee's immediate family as a consultant, subcontractor, or otherwise, in connection with the performance of the Contract; or (ii) purchase any material or services

required to perform the Contract from any entity owned or controlled (including a substantial financial interest) by any Amtrak employee or member of an employee's immediate family.

53.4. Contractor agrees that it shall direct any officer, employee, agent, or representative of Contractor ("Contractor Agents") to comply with the obligations stated in the foregoing subsections (A)-(C). Contractor further agrees that Contractor shall be responsible for ensuring compliance by Contractor Agents.

53.5. Contractor and its subsidiaries and, to the knowledge of the Contractor, its affiliates, have conducted their respective businesses in compliance with the Foreign Corrupt Practices Act of 1977, as amended, and the rules and regulations thereunder (the "FCPA") and have instituted and maintain policies and procedures designed to ensure, and which are reasonably expected to continue to ensure, continued compliance with the FCPA. Neither Contractor, nor any of its subsidiaries nor, to the knowledge of the Contractor, any director, officer, agent, employee, or other person associated with or acting on behalf of the Contractor has: (i) used any corporate funds for any unlawful contribution, gift, entertainment or other unlawful expenses relating to political activity; (ii) made any direct or indirect unlawful payment to any foreign or domestic government official or employee or to any political party or candidate for political office; (iii) violated or is in violation of any provision of the FCPA; (iv) made any bribe, rebate, payoff, influence payment, kickback, or other unlawful payment; or (v) made any payment of funds to the Contractor or its subsidiaries or received or retained funds in violation of any law, rule or regulation.

53.6. Violation of this Section shall be considered cause for termination of the Contract for Default.

53.7. Contractor shall use commercially reasonable efforts to include the provisions of this Article in each subcontract or third-party agreement entered into under this Contract.

54. CONFLICT OF INTEREST

54.1. Contractor hereby affirmatively represents that it shall not have a Conflict of Interest in performing the Services for Amtrak pursuant to this Contract. Contractor agrees not to (a) engage in activities, or (b) initiate or maintain relationships with persons or entities where such activities or relationships create a conflict of interest. Contractor shall use its best efforts to identify and prevent potential Subcontractor conflicts of interest. Contractor shall inform Amtrak of any activity or relationship that Contractor has reason to believe may create a conflict of interest. Without limiting the generality of the foregoing, Contractor shall not, and shall not knowingly permit any Subcontractor to, enter into any contract, subcontract, or other arrangement in excess of $50,000 (other than for personal employment) related to this Contract or the Work if any of its officers or directors or any members of the immediate family or one of the foregoing has any material interest in the contract, subcontractor arrangement, unless the other party (or parties) to such contract or subcontractor arrangement is the lowest qualified bidder on a publicly advertised, sealed-bid basis and written records of the entire transaction are kept by the Contractor and made available to Amtrak and FRA upon request.

54.2. Contractor represents that it is not a party to any existing agreement which would prevent Contractor from entering into and performing this Contract.

54.3. "Organizational Conflict of Interest" means that because of other activities or relationships with other persons or entities: (i) a person or entity is unable to render impartial assistance or advice to Amtrak, (ii) the person's or entity's objectivity in performing the Contract is or might be otherwise impaired, or (iii) the person or entity has, or attempts to create, an unfair competitive advantage. Contractor agrees not to engage in activities or initiate or maintain relationships with persons or entities where such activities or relationships create an Organizational Conflict of Interest. Contractor shall use its best efforts to identify and prevent potential subcontractor Organizational Conflicts of Interest. Contractor shall inform Amtrak of any activity or relationship that Contractor has reason to believe may create an Organizational Conflict of Interest. Contractor represents that it is not a party to any existing agreement which would prevent Contractor from entering into and performing this Contract.

55. GRATUITIES

55.1. Amtrak may, by written notice to the Contractor, terminate the right of the Contractor to proceed under this Contract if it is found, after notice and hearing, by Amtrak, that gratuities (in the form of anything of value, including but not limited to cash, entertainment, gifts) were offered or given by the Contractor, or any agent or representative of the Contractor, to any officer or employee of Amtrak with a view toward securing a contract or securing favorable treatment with respect to the awarding or amending, or the making of any determinations with respect to the performing of such contract, provided, that the existence of the facts upon which Amtrak makes such findings shall be in issue and may be reviewed in any competent court.

55.2. In the event of a breach under Article 55.1, in addition to its right to terminate, Amtrak shall be entitled (i) to pursue the same remedies against the Contractor as it could pursue in the event of a breach of contract by the Contractor, and (ii) as a penalty in addition to any other damages to which it may be entitled by law, to exemplary damages in an amount (as determined by Amtrak) which shall not be less than three or more than ten times the cost incurred by the Contractor in providing any such gratuities to any such office or employee.

55.3. In accordance with Section 63.1 hereof, the rights and remedies of Amtrak provided in this Article shall not be exclusive and are in addition to any other rights and remedies provided by law or under this Contract.

56. OFFICIALS NOT TO BENEFIT

56.1. No member of or delegate to Congress, or resident commissioner, shall be admitted to any share or part of this Contract, or to any benefit that may arise there-from; but this provision shall not be construed to extend to this Contract if made with a corporation for its general benefit.

56.2. The Contractor warrants that no director, officer, employee or agent of Amtrak is a director, officer, employee or agent of the Contractor, and that to the knowledge and belief of the Contractor, no director, officer, employee, or agent of Amtrak owns any stock or has a substantial interest in the Contractor.

57. NON-WAIVER

57.1. No waiver by Amtrak of any breach on the part of Contractor of any of Contractor's obligations herein contained shall constitute a waiver of any subsequent breach of the same or any other of such obligations, and no payment made hereunder shall be deemed to constitute an acceptance or approval of any defective or unsatisfactory material or workmanship, or a waiver of Amtrak's right to reject the same later. As provided in Section 63.1 hereof, the remedies of Amtrak under this Article are cumulative, and in addition to those provided by law.

58. INSURANCE

58.1. Contractor shall procure and maintain, at its own cost and expense, during the entire period of performance under the Contract, including the Three-Year Warranty Period for the final unit of Equipment (or any extension thereof), the types of insurance specified below. All insurance shall be placed with insurance carriers (i) reasonably acceptable to Amtrak (ii) authorized to do business in the jurisdiction(s) where Work is to be performed and (iii) have financial ratings of A- VIII or better in the Best's Rating Guide, latest edition in effect as of the date of the contract and subsequently in effect at the time of renewal of any insurance policies required hereunder. All insurance shall affirmatively include coverage for acts of terrorism.

Contractor shall furnish Amtrak with a certificate or certificates of insurance and endorsements, giving evidence of the required insurance prior to the issuance of a NTP or commencement of any portion of the Work pursuant to this Contract and upon renewal of any required insurance thereafter. Amtrak shall have the right to review and approve all insurance certificates and endorsements applicable to the Work. However, Amtrak's acceptance, acquiescence or failure to object to Contractor's submitted insurance certificates and endorsements shall in no way relieve Contractor from responsibility for obtaining insurance policies complying with the terms of this Contract. In no event shall Work be performed until the required certificates of insurance and endorsements have been furnished. If the insurance provided is not in compliance with the requirements listed below, Amtrak shall have the right to stop Work until proper evidence of all required insurance is provided. Contractor shall have no right to an adjustment of the Contract Time or the Contract Amount based on Amtrak's exercise of such right, and any delay in the completion of any portion of the Work caused by Amtrak's exercise of such right to stop Work shall be an unexcused delay.

If an indemnified claim arises involving an Indemnified Party and upon the request of Amtrak, Contractor will provide, or cause to be provided to Amtrak, copies of all insurance policies and endorsements implicated in the Indemnified Claim.

All Subcontractors shall be required to maintain the required Insurances hereunder. The Contractor or Contractor's insurance shall provide coverage for each Subcontractor working on its behalf for covered claims caused in whole or part by the Subcontractor.

Unless otherwise specifically provided to the contrary, all insurance coverages specified herein shall name Amtrak and the Financing Parties as additional insureds(collectively, "Additional Insured Parties") using ISO CG 20 10 04 13 and CG 20 37 04 13 or their equivalent, and shall provide that Additional Insured Parties are additional insureds with respect to the Work, shall be primary and noncontributory to any other insurance available to Additional Insured Parties and

their respective employees and agents, and shall include waivers of subrogation rights against Additional Insured Parties and their respective employees and agents. Except as otherwise expressly provided herein, Contractor's insurance obligations under this Article shall not be construed to limit Amtrak's rights whether in warranty, contract or any other applicable legal theory which may arise under provisions of the Contract or at law or in equity.

Contractor shall cause each insurance policy required hereunder to not be cancelled, non-renewed or materially altered without thirty (30) days advance written notice (ten (10) days advance written notice for non-payment of premium) to Amtrak, which must be stated on the certificate of insurance. Such policies must be endorsed to extend notice of cancellation rights to Amtrak, to the extent commercially available.

58.2. Workers' Compensation Insurance: A policy complying with the requirements of the statutes of the jurisdictions in which the Work shall be performed, covering all employees of Contractor. Employers' Liability coverage with limits of liability of not less than $1,000,000 for each accident or illness shall be included. Additional Insured Parties shall not be named as an additional insured under this policy, but the policy shall include a waiver of subrogation against the Additional Insured Parties and their respective employees and agents.

58.3. Commercial General Liability Insurance: A policy issued on an occurrence basis to and covering liability arising out of the Work to be performed by Contractor under the terms of the Contract. Products/Completed Operations Liability, Independent Contractors Liability, Contractual Liability (with railroad exclusions deleted), and Personal Injury/ Advertising Liability coverages are to be included. The policy shall contain a cross- liability endorsement allowing claims and suits between insureds, shall not have any exclusion for liability relating to railroad operations, and shall not require mediation or arbitration of any disputes. Coverage under this policy shall have combined single limits for bodily injury (including disease or death) and property damage (including loss of use) of not less than $325,000,000 per occurrence and $650,000,000 in the aggregate. Amtrak has the right to require an increase in the insurance limits in the event of an increase in the statutory limit in 49 U.S.C § 28103, and the aggregate limit shall be two times the per occurrence limit.

58.4. Automobile Liability Insurance: A policy issued to and covering the liability of Contractor arising out of the use of all owned, non-owned, hired, rented or leased vehicles which bear, or are required to bear, license plates according to the laws of the jurisdiction in which they are to be operated. Coverage under this policy shall have combined single limits of liability of $2,000,000 per occurrence and in the annual aggregate.

58.5. Railroad Protective Liability Insurance: With respect to Contractor's design and testing work activities within fifty (50) feet vertically or horizontally of railroad tracks, Contractor shall procure and maintain Railroad Protective Liability Insurance, written on the AAR-AASHTO (ISO/RIMA) occurrence based form (a claims made form is not acceptable), in the name of Amtrak (National Railroad Passenger Corporation) and other railroads and commuter agencies operating over tracks that are used in design and testing work. The policy shall have limits of liability of not less than $10,000,000 per occurrence and $20,000,000 in the aggregate. If

equivalent or broader wording is not contained in the policy form, the following endorsement must be included:

58.5.1. It is agreed that "Physical Damage to Property" means direct and accidental loss of or damage to all property owned by Amtrak and/or all property in the care, custody and control of Amtrak.

58.5.2. In addition, Endorsement CG 28 31 – Pollution Exclusion Amendment, must be included.

58.6. Professional Liability Insurance: A policy issued to and covering the liability of Contractor for engineering and design errors and omissions in the performance of this Contract. Contractor shall maintain such coverage during the term of this Contract and for at least 3 years following completion and acceptance of the Project. This insurance shall have limits of liability of not less than $25,000,000 per occurrence and in the annual aggregate. The deductible amount shall not exceed $500,000. The Additional Insured Parties shall not be named as an additional insured under this policy.

If professional liability insurance coverage is written on a claims-made basis: (1) the policy retroactive date shall coincide with or precede Contractor's start of contract services (including subsequent policies purchased as renewals or replacements); (2) the policy will allow for the reporting of circumstances or incidents that might give rise to future claims; (3) Contractor will use its best efforts to maintain similar insurance under the same terms and conditions for at least six years following completion of the services under the contract; and (4) if insurance is terminated for any reason, Contractor agrees to purchase an extended reporting provision of at least six years to report claims arising from the Contract.

58.7. Property Insurance: A policy or policies issued to the Contractor covering, Contractor's production facilities, Contractor equipment used in the manufacturing and testing the Equipment, and each Equipment, including all work in process and all component parts not yet installed and spare parts, during the design, manufacture, conveyance (including all inland and ocean transport and loading and unloading through a Stock Throughput Policy or Cargo Policy), storage and testing of each unit of Equipment until the issuance by Amtrak of a Certificate of Conditional Acceptance or Certificate of Final Acceptance (as used in this provision "Acceptance") as defined in Section 8.3 of this Contract. The coverage territory shall be worldwide and the insurance shall provide coverage on an all-risk basis, including the risks of earth movement, windstorm, storm surge and flood, and provide coverage for business interruption and extra expense for the Contractor and contingent business interruption and contingent extra expense, including all supplier and contractor relationships required to fulfill this Contract. Such coverages shall have limits on a per occurrence basis, adequate to cover the full replacement value of the production facilities, including test tracks and equipment with respect to property damage and limits of three hundred million dollars ($300,000,000) for business interruption and extra expense and contingent business interruption and contingent extra expense. The proceeds from such insurance shall be used exclusively to restore damaged Contractor property and to reimburse the Contractor for business interruption and extra expense for an event impacting the fulfillment of the Contractor's obligations in this Contract. In no instance shall the Additional Insured Parties be responsible for loss or damage to Contractor's or Subcontractor's property or equipment including

the Equipment prior to Acceptance. In addition, Contractor shall procure and maintain property insurance for the replacement value of Contractor tools and equipment brought onto Amtrak property. This insurance shall name the Additional Insured Parties as loss payees as their interest may appear.

58.8. Valuable Papers and Records Insurance: A policy covering loss or damage to valuable papers including blueprints, reports, surveys, designs or specifications in connection with this Contract, on an all -risk basis, in an amount no less than 100% of the replacement cost of such property. This insurance shall name the Additional Insured Parties as loss payees as their interest may appear and contain a waiver of subrogation against the Additional Insured Parties.

58.9. Technology Errors and Omissions Insurance: When Contractor's Services includes the delivery of information technology services and/or technology products to Amtrak, technology errors and omissions coverage for liability from errors, omissions or negligent acts in rendering or failing to render computer or information technology services and technology products, violation of software copyright, and the failure of products to perform the intended function or serve the intended purpose. The policy shall not contain a provision that would prevent, preclude or exclude liability triggered by or connected to a network failure, system failure or the disclosure of private information and shall have limits of not less than the amount set forth in the Contract per occurrence and in the aggregate, covering the information technology services performed in connection with Services and continuing in force by renewal or extended reporting provision for not less than the greater of three (3) years after final completion of the Services or the greater time under which a claim may be properly asserted under the applicable statute of limitations or repose. The policy shall have limits of insurance of not less than fifty million dollars ($50,000,000) per occurrence and in the annual aggregate.

58.10. Cyber Liability Insurance: When the Contractor's Services includes access to Amtrak's electronically stored proprietary information and personally identifiable information of Amtrak employees, customers or other third parties, cyber liability insurance for loss, disclosure and theft of data in any form, system failure, and network security failure, including but not limited to, social engineering, phishing, ransomware, denial of service attacks, and transmission of malicious code. Coverage shall include regulatory fines and penalties, the cost of notifying individuals of a security or data breach, the cost of credit monitoring services and any other causally-related crisis management expense for up to one (1) year, shall contain no provision that would prevent, preclude or exclude a claim triggered by or connected with an act of cyber terrorism, shall extend to actual or alleged acts, errors or omissions committed by the Contractor or its agents, subcontractors, independent contractors or employees, shall contain severability for the insured organization for any intentional act exclusions, shall include consequential or vicarious liabilities and direct losses for the wrongful acts or failures of the Contractor, and shall have the "Insured v. Insured" exclusion amended to allow an Indemnified Party to bring a claim against the Named Insured. The policy shall have limits of not less than the amount set forth in the Contract per occurrence and in the aggregate, covering the information technology services performed in connection with Services and continuing in force by renewal or extended reporting provision for not less than the greater of three (3) years after final completion of the work or the greater time under which a claim may be properly asserted under the applicable statute of limitations or repose.

The policy shall have limits of insurance of not less than fifty million dollars per occurrence and in the annual aggregate.

58.11. RESERVED

59. PROTECTION OF PERSONS AND PROPERTY

59.1. Contractor shall be responsible for initiating, maintaining and supervising all safety precautions and programs in connection with the Work.

59.2. Contractor shall take all reasonable precautions for the safety of, and shall provide all reasonable protection to prevent damage, injury or loss to:

(a) All employees involved in the Work and all other persons who may be affected thereby;

(b) All the Work and all materials and Equipment to be incorporated therein, whether in storage on or off the site or under the care or custody of Subcontractors; and

(c) Other property at the Work site(s) or adjacent thereto, including but not limited to trees, shrubs, lawns, walks, pavements, roadways, structures and utilities not designated for removal, relocation or replacement in the course of construction.

59.3. Contractor shall comply with all applicable laws, ordinances, rules, regulations, and lawful orders of any public authority having jurisdiction for the safety of persons or property or to protect them from damage, injury or loss. Contractor shall erect and maintain, as required by existing conditions and progress of the Work, all reasonable safeguards for safety and protection, including posting danger signs and other warnings against hazards, promulgating safety rules and notifying owners and users of adjacent utilities.

59.4. Use or storage of explosives or other hazardous material shall not be permitted without the written approval of the Contracting Official. If use or storage of such materials is approved, Contractor shall exercise the utmost care in such use or storage and shall carry on such activities under the supervision of properly qualified personnel.

59.5. All damage or loss to any property referred to in this Article caused in whole or in part by Contractor, its Subcontractors, or anyone directly or indirectly employed by any of them, or by anyone for whose acts any of them may be liable shall be remedied by Contractor.

59.6. Contractor shall designate a responsible member of his organization at the site(s) whose duty shall be the prevention of accidents. This person shall be Contractor's superintendent unless otherwise designated in writing by Contractor to the COTR.

59.7. Contractor shall not load or permit any part of the Work to be loaded so as to endanger personnel and/or property.

59.8. When working in and around Amtrak property, all personnel employed by Contractor or its Subcontractors shall abide by the applicable safety policies and procedures for the respective property.

59.9. Contractor shall notify Amtrak to arrange for permission to enter upon Amtrak and railroad property. Twenty-one (21) days prior notice must be given to Amtrak for property access when Amtrak protection personnel are required. Prior to entering Amtrak's property, Contractor and its Subcontractors may be required to execute Amtrak's then current Permit to Enter.

59.10. Contractor, his employees and Subcontractors shall attend all required safety seminars as directed by Amtrak.

59.11. Contractor must comply with all Amtrak safety rules and operating rules.

60. GOVERNING LAW

60.1. The Contract shall be governed by and construed in accordance with the laws of the District of Columbia, excluding that portion of District of Columbia law relating to the application of laws of another jurisdiction. Subject to the Claims and Disputes section hereof, each party agrees that all legal proceedings in connection with any dispute arising under or relating to the Contract shall be brought in the United States District Court for the District of Columbia. Contractor hereby accepts the jurisdiction of the United States District Court for the District of Columbia and agrees to accept service of process as if it were personally served within the District of Columbia.

61. COMPLIANCE WITH LAW

61.1. All Work shall comply with all Applicable Laws that bear on the performance of the Work (including without limitation all building codes, zoning and other Laws that bear, or would bear but for any exemption from such Laws enjoyed by Amtrak, on the Work), except as otherwise expressly specified in the Contract or directed by the Contracting Official. If Contractor observes that any of the Contract terms are at variance therewith in any respect, he shall promptly notify the COTR in writing, and any necessary changes shall be made by appropriate Contract Modification, provided that no Contract Modification shall extend the Contract Time or increase the Contract Amount if it is based on a law enacted at the time of Contract execution. Contractor shall be deemed to have had notice of all laws enacted at the time of Contract execution, regardless if the effective date is after Contract execution. Contractor shall be deemed to have included in the Contract Amount the cost of making all Work comply with all laws enacted at the time of Contract execution.

61.2. In the event any governmental requirements are removed, relaxed or changed in any way after the execution of the Contract so as to make Contractor's performance less expensive or less difficult, Amtrak shall have the option to either require Contractor to perform pursuant to the more rigorous requirements, or to receive a reduction in the cost of the items of material or equipment affected for all savings by reason of such change.

61.3. Contractor shall defend, indemnify and hold harmless Amtrak, its directors, officers, agents, servants and employees from any loss, cost, damage or expense incurred by them arising from, occasioned by or in any manner connected with Contractor's failure to perform the Work in compliance with any applicable laws, ordinances, rules, regulations or orders.

62. WRITTEN NOTICE

62.1. Any written notice required of the parties under the provisions of the Contract shall be deemed to have been duly served upon receipt if delivered in person to the individual or representative or officer of the relevant party for whom it was intended, or upon mailing if sent by registered or certified mail to the business address designated in the Contract.

63. RIGHTS AND REMEDIES

63.1. Each of Amtrak's rights and remedies hereunder shall be cumulative, in addition to, and not a limitation of, any duties, obligations, rights and/or remedies provided at law, in equity, or otherwise. Amtrak's failure to exercise any of its rights under the Contract shall not constitute a waiver of any past, present or future right or remedy. No action or failure to act by Amtrak or any of its representative(s), including the Contracting Official, shall constitute approval of, waiver of, or acquiescence to, a breach by Contractor unless specifically agreed in writing. Waiver by Amtrak of any breach by Contractor shall not constitute a waiver of any other breach of the same or any other provision of the Contract. Acceptance of any Supplies of services, or payment, therefore, shall not operate as a waiver of any breach.

63.2. All representations, warranties, guarantees, licenses, indemnifications, agreements to hold Amtrak harmless, and other obligations created by the Contract which by their terms are intended to be fulfilled in whole or in part after termination or completion of the Work or which can, under the particular circumstances at issue, reasonably be fulfilled only after termination or completion of the Work, shall survive termination of the Contract. Contractor shall cause a parallel survival clause to be inserted in all subcontracts.

64. AMTRAK/CONTRACTOR RELATIONSHIP

64.1. The Contracting parties are not employer and employee, and nothing herein shall be construed as creating such relationship between Amtrak and Contractor. Contractor may adopt such arrangements as it may desire, subject to the provisions of the Contract, with regard to the details of the Work and Contractor's personnel or workers, provided however, that the Work shall be done by Contractor in such manner as shall be consistent with the achievement of the result contracted for within the time herein agreed upon.

64.2. It is further understood and agreed that, in no event shall Amtrak be required to make deductions from compensation or report earnings of employees of Contractor under any Social Security Act, or any other state or Federal statute, purporting to levy a tax on payrolls or the compensation of employees; and Contractor hereby agrees to indemnify and save Amtrak harmless from any and all liability, cost, or expense under such law, growing out of performance under the Contract.

65. PRODUCT SAFETY NOTIFICATIONS

65.1. Contractor shall comply with the Occupational Safety and Health Administration's Hazard Communication Regulations 29 CFR 1910.1200 and 29 CFR 1926.59 by providing or making readily available at the worksite, material safety data sheets for all chemicals, compressed gases, products containing hazardous materials, and products that may release hazardous substances (welding rods, solder, insulation materials, transite panels, gaskets, stock metal, etc.) during routine application.

65.2. Contractor shall notify Amtrak immediately by telephone (followed by written confirmation within twenty-four hours) (email acceptable) whenever Contractor becomes aware that any component of the Supplies may contain a defect in design or construction which could in any way (a) become harmful to persons or property, or (b) create or present a risk to the health or safety of the public or to the environment, either by itself or when used by Amtrak within the scope of its intended purpose.

66. LABOR DISPUTES

66.1. Whenever an actual or potential labor dispute delays or threatens to delay the timely performance of the Contract, Contractor shall notify Amtrak immediately and furnish all relevant information. Contractor shall include the substance of this provision in all subcontracts hereunder.

67. CYBERSECURITY

67.1. Contractor shall follow the National Institute of Technology (NIST) Cybersecurity Framework (CSF) to maintain and enforce digital data protection, safety and physical security procedures with respect to the access, use, and possession of Amtrak's Confidential Information and Amtrak data, when providing supplies or services to Amtrak that are: (i) at least equal to industry standards and in compliance with all applicable laws; and (ii) which provide reasonably appropriate technical and organizational safeguards to protect Amtrak against the accidental or unlawful destruction, loss, alteration or unauthorized disclosure or access of such information, data or systems. Contractor shall take all reasonable measures to secure and defend its location and equipment against hackers and others who may seek, without authorization, to modify or access Contractor's systems, Amtrak's systems or the information or data found therein and shall immediately report to Amtrak any breaches of security or unauthorized access to Amtrak's Confidential Information or Amtrak data. Contractor shall use diligent efforts to remedy breaches in a timely manner and deliver to Amtrak a root cause assessment and future incident mitigation plan with regard to any breach of security.

67.2. If Contractor is providing supplies associated with the development and operation of Amtrak company websites on Contractor's IT infrastructure, Contractor agrees to engage a third-party vendor at least annually, at its own expense, and acceptable to Amtrak, to perform penetration testing and vulnerability scans with respect to Contractor's systems. Contractor shall use leading industry practices to perform penetration tests to probe for network and infrastructure weaknesses that could be exploited. Contractor shall provide Amtrak with a written report of any high and

medium level security issues, as defined by NIST Common Vulnerability Scoring System (CVSS), revealed during regular testing and how and when these vulnerabilities will be mitigated.

67.3. Contractor shall comply with the AMTRAK CYBERSECURITY AND PRIVACY TERMS AND CONDITIONS – STANDARD SHORT FORM attached hereto as Attachment 1.

68. CREDIT CARD INFORMATION

68.1. If in performance of this Contract, Contractor will store, process, transmit, or have access to payment account data belonging to Amtrak or entrusted to Amtrak by its business partners, customers, vendors, contractors or employees, Contractor shall (1) comply with the Payment Card Industry's Data Security Standard ("PCI-DSS"), as set forth at https://www.pcisecuritystandards.org/ and as may be updated from time to time by the PCI Security Standards Council, and (2) within thirty (30) days of each anniversary of this Contract, certify in writing (to Amtrak's Contracting Official) Contractor's compliance with PCI-DSS in all aspects of Contractor's performance of this Contract or, alternatively, the basis for Contractor's exemption from PCI-DSS compliance.

68.2. If any software, Supplies, goods, or Equipment (collectively "Goods") provided by Contractor pursuant to this Contract will store, process, transmit, or otherwise have access to credit card account numbers received from Amtrak or Amtrak's customers, such Goods shall comply with the Payment Card Industry's Payment Application - Data Security Standard ("PA-DSS"), as set forth at https://www.pcisecuritystandards.org/ and as may be updated from time to time by the PCI Security Standards Council.

68.3. Contractor acknowledges that it is responsible for compliance with PCI-DSS and PA-DSS, as applicable to Contractor's performance of this Contract.

69. SEPARATE CONTRACTS

69.1. If appropriate, Contractor shall afford other Amtrak Contractors reasonable opportunity for the introduction and storage of their materials and equipment and the execution of their work, and shall properly connect and coordinate its Work with theirs.

69.2. If any part of Contractor's Work is dependent in any way on the work of any other separate contractor, Contractor shall take all reasonable steps to become aware of any defects in the work of such other contractors that renders or would render such work unsuitable for proper execution of Contractor's Work. Contractor shall inspect the critical items of any such contractor's work before relying on or incorporating such work into Contractor's Work. If Contractor reasonably believes that another contractor's work is deficient or otherwise unsuitable for its intended purpose, Contractor shall notify Amtrak, in writing, immediately upon such discovery. Contractor shall waive his right to any claims regarding the unsuitability of such other contractor's work if Contractor fails to timely notify Amtrak of any defects in such other contractor's work that Contractor discovered or reasonably should have discovered.

69.3. Should Contractor or any Subcontractor cause damage to the work or property of any separate Amtrak contractor, Contractor shall, upon due notice, make all reasonable efforts to settle with such other contractor(s). If such separate contractor(s) sues Amtrak or initiates an arbitration proceeding on account of any damage alleged to have been so sustained, Amtrak shall notify Contractor, who shall defend such proceedings at its expense, and if any judgment or award against Amtrak arises there-from, Contractor shall pay or satisfy it and shall reimburse Amtrak for all attorneys' fees and court or arbitration costs which Amtrak incurred.

70. COMMENCEMENT OF STATUTORY LIMITATION PERIOD

70.1. Claims by Contractor shall not be brought after the earliest of (a) Final Payment; (b) one year after the date of the date of delivery of the last unit of Equipment; or (c) one year after the date of Contractor's last substantial Work.

26-FOI-00415 00000006279 "UNCLASSIFIED" 4/30/2026

ATTACHMENT 1

AMTRAK CYBERSECURITY AND PRIVACY TERMS AND CONDITIONS – STANDARD SHORT FORM

1. GENERAL PURPOSE & APPLICABILITY

1.1. General Purpose: Contractors deliver supplies and/or services that may access, create, use, process, transfer, share and/or store Amtrak Data or connect to the Amtrak Infrastructure. These Cybersecurity and Privacy Terms and Conditions (collectively "Attachment") are cybersecurity standards that apply to all Contractors who provide supplies and/or services to Amtrak.

1.2. Compliance: Contractors must comply with all applicable laws, regulations, statutes, industry standards, and compliance framework requirements including, but not limited to: the Payment Card Industry Data Security Standards (PCI-DSS), Health Insurance Portability and Accountability Act (HIPAA), Health Information Technology for Economic and Clinical Health (HITECH) Act, Sarbanes-Oxley Act (SOX), Gramm-Leach-Bliley Act (GLBA), General Data Protection Regulation (GDPR), California Consumer Privacy Act (CCPA), California Privacy Rights Act (CPRA), Colorado Privacy Act (CPA), Connecticut Data Privacy Act (CDPA), Virginia Consumer Data Protection Act (VCDPA), Utah Consumer Privacy Act (UCPA), Illinois Biometric Information Privacy Act (BIPA), ISO/IEC 27001, ISO/IEC 27002, ISO/IEC 27701, ISO/IEC 27032, ISO/IEC 27017, ISO/IEC 27018, NIST SP 800-53, Rev. 5 and other applicable NIST SP 800 series publications, the National Institute of Technology (NIST) Cybersecurity Framework (CSF), and any U.S. State privacy laws to the extent applicable, including as enacted or amended during the term of the Agreement. Contractor shall also comply with any and all laws, regulations, and other compliance requirements and industry standards regarding data protection, data privacy, data security, data integrity, business continuity, incident response, and similar matters applicable to entities designated as "critical infrastructure" including as enacted or amended during the term of the Agreement.

2. CYBERSECURITY & PRIVACY GOVERNANCE

2.1. Cybersecurity Governance: The Contractor must follow industry best practices and maintain a cybersecurity program (the Program) that implements, maintains, improves, and enforces reasonable and appropriate policies, procedures, and controls for the governance, assessment, risk management, workforce management, access control, physical security, continuous monitoring, incident response, and digital data protection in relation to the access, use, and possession of Amtrak Data, including Amtrak Confidential Information and Amtrak Employee Information.

2.2. Cybersecurity Framework Alignment: The Program must provide appropriate organizational, technical, administrative, and physical safeguards that align with the NIST CSF through controls derived from applicable compliance frameworks such as NIST SP 800-53, Rev. 5 and ISO/IEC 27001. Program controls shall and meet or exceed any other applicable industry standards to protect Amtrak, Amtrak Employees, Amtrak Customers, Amtrak Data, and Amtrak Infrastructure against Security Incidents. The Contractor shall test and monitor the effectiveness

of its safeguards. The Contractor shall conduct a risk assessment and review and update the Program at least annually.

2.3. Cybersecurity Awareness Training: Contractor must require and verify that its employees, contractors, consultants, and other downstream third-party staff complete cybersecurity awareness training, privacy awareness training, and any applicable role-based training associated with the collection, processing, or handling of Amtrak Data, no less than once per year. Upon request, Contractor shall provide Amtrak with proof of certification and/or attendance for such annual training activities.

3. AUDITS AND ASSESSMENTS

3.1. Audit Rights and Testing: Notwithstanding anything contrary in the Agreement and with no limitation to audit rights of Amtrak OIG, specifically with regards to security-related audits, the audit terms set forth in this Attachment shall apply.

3.1.1. Contractor agrees that Amtrak or its third-party designee may, but is not obligated to, perform audits and security tests of Contractor's information technology (IT) or systems environment and procedural controls to determine Contractor's compliance with the system, network, data, data privacy, and cybersecurity requirements of this Attachment. Audits and security tests shall be limited to areas relevant to Contractor's contractual engagement with Amtrak. Amtrak audits of the Contractor system shall be initiated during normal business hours and with at least 20 days advance notice or in the event of any Security Incident, not less than five (5) business days after the resolution of such Security Incident. Audit shall be performed under standards established by a recognized standards organization.

3.1.2. Contractor shall provide all information reasonably requested by Amtrak in connection with any audits and shall provide reasonable access and assistance to Amtrak upon request. Contractor shall comply, within reasonable timeframes at its own cost and expense, with all reasonable compliance remediation recommendations that result from such inspections, tests, and audits. Amtrak reserves the right to review, upon request, any original security reports that Contractor has undertaken or commissioned to assess Contractor's own network security for the provided Services. If requested, copies of these reports will be made available for viewing by Amtrak via a method (e.g. remote, in person at Contractor's facility or an Amtrak location, etc.) specified by Amtrak. Contractor will notify Amtrak of any such security reports or similar assessments once they have been completed.

3.1.3. If requested by Amtrak, Contractor shall, on an annual basis: 1) permit security reviews by Amtrak on systems storing or processing Amtrak Data including without limitation the Program; and 2) permit testing of all security processes and procedures during the Term of the Agreement, including without limitation penetration tests. Tests may include coordinated security tests as mutually agreed upon as well as interviews of relevant personnel, review of documentation, and technical inspection of systems and networks

relating to the receipt, maintenance, use, retention, and authorized destruction of Amtrak Data.

3.2. Audit Certifications and Compliance Reports: Contractor shall provide the required compliance reports or audit certifications as applicable, on an annual basis, and at its own cost and expense, to enable Amtrak to fulfill its annual audit and compliance requirements. The delivery of the following reports referenced in this Section shall not fulfill, replace, or negate any of the rights or obligations detailed in Section 3.1 Audit Rights and Testing, Section 3.3 Right to Inspection, or Section 3.4 Regulatory Examinations of this Attachment:

3.2.1. Current year SOC 2 Type 2 report.

3.2.2. Current year ISO/IEC 27XXX audit report(s).

3.2.3. PCI DSS reports on compliance as applicable.

3.2.4. Cloud Security Alliance (CSA) Consensus Assessments Initiative Questionnaire (CAIQ) registry reports for Software as a Service (SaaS) products and/or applications as applicable.

3.2.5. Contractors utilizing the AWS hosting platform to provide services to Amtrak must comply with AWS Foundational Security Best Practices standard as well as CIS AWS Foundations v1.4.0 security standard, or most recent version, and/or any upgrades released by the CIS AWS Foundations Benchmark.

Contractors utilizing the Microsoft Azure hosting platform to provide services to Amtrak must comply with Microsoft Azure Foundational Security Best Practices standard as well as CIS Microsoft Azure Foundations Benchmark v1.4.0 Controls, or most recent version, and/or any upgrades released by the CIS Microsoft Azure Foundations Benchmark Security Standard.

3.3. Right to Inspection: Upon request, Contractor shall provide to Amtrak the opportunity to review copies of the Contractor's policies, procedures, controls catalog, and independent audit report summaries for the implementation of required technical, physical, and administrative safeguards or controls derived from applicable cybersecurity frameworks relating to, and without limitation, the Program (e.g. ISO/IEC 27001, ISO/IEC 27002, ISO/IEC 27701, ISO/IEC 27032, ISO/IEC 27017, ISO/IEC 27018, NIST CSF, NIST SP 800-53, Rev. 5, SOC 2 Type 2).

3.4. Regulatory Examinations: Contractor agrees that any regulator or other governmental entity with jurisdiction over Amtrak and its affiliates may examine Contractor's activities relating to the performance of its obligations under the Agreement and this Attachment to the extent that such authority is granted to such entities under the law. Contractor shall promptly cooperate with and provide all information reasonably requested by the regulator or other governmental entity in connection with any such examination and provide reasonable assistance and access to all equipment, records, networks, and systems reasonably requested by the regulator or other

governmental entity. Contractor agrees to comply with all reasonable recommendations that result from such regulatory examinations within reasonable timeframes.

3.4.1. Within sixty (60) days of the audit results from the regulator or governmental entity, Contractor will provide Amtrak with a mitigation plan to address any risks, threats, concerns, or areas of non-compliance identified in the audit.

4. INFORMATION GOVERNANCE

4.1. Data Management: Contractor may collect, access, use, and otherwise process Amtrak Data solely as necessary to provide Services to or on behalf of Amtrak and in compliance with all applicable privacy and data protection laws, the Agreement, and any notices or disclosures regarding Personal Information made available by or on behalf of Amtrak ("Privacy Requirements"). Unless prior written consent is provided by Amtrak, Contractor: (1) shall not access or use Amtrak Data for any purpose other than to provide the Services, and (2) shall not give any third-party access to the data, except subcontractors subject to data protection and confidentiality requirements no less strict than those imposed on Contractor under this Attachment, or where otherwise required by law or regulation.

4.2. Confidentiality: Contractor agrees to maintain Amtrak Confidential Information in all forms (including paper and electronic) in strictest confidence, using measures no less stringent than those that Contractor uses for its own most confidential or sensitive information. Contractor shall take all reasonable measures to secure and defend its location and equipment against external and internal threat actors and those who may seek, without authorization, to modify or access Contractor's systems, Amtrak's systems, Amtrak Data, or the Confidential Information found therein. Contractor shall require its employees, contractors, consultants, and other downstream third-party staff to enter into written obligations of confidentiality and protection with respect to Amtrak Data no less protective than those contained in the Agreement and this Attachment.

4.3. Obligations Regarding Personal Information: Other than as strictly necessary for the performance of the Services, Contractor will not collect, store, or use the Personal Information of Amtrak, Amtrak Customers, or Amtrak Employees through the performance of the Services. Contractor will identify, monitor, protect, and maintain the Personal Information of Amtrak, Amtrak Customers, and Amtrak Employees in accordance with all laws, regulations, and legal requirements applicable for the collection, access, use, processing, sharing, storage, and deletion of Personal Information, shall not "sell" such Personal Information (as such term is defined by applicable privacy laws), and shall not retain, use, or disclose such Personal Information for any purpose other than as expressly set forth in the Agreement and this Attachment. Contractor shall notify Amtrak in the event Contractor determines that it can no longer comply with applicable Privacy Requirements. Contractor shall provide Amtrak with assistance and cooperation in responding to requests from or on behalf of individuals to exercise legal rights regarding Personal Information and in connection with conducting any privacy impact assessments or similar assessments regarding Personal Information.

4.4. Data Aggregation and Anonymization: In the event that Contractor inadvertently collects any Personal Information through or as a result of Amtrak's, Amtrak Employees', or Amtrak Customers' usage of the Services, including without limitation Internet Protocol Addresses, Contractor must sanitize the data through Anonymization or Aggregation unless retention of Personal Information in an identifiable format is strictly necessary for the performance of the Services, for compliance with applicable law, or for compliance with the Agreement and this Attachment.

4.4.1. For the purposes of this Attachment, "Anonymization" refers to removal of Personal Information and any information reasonably likely to identify an individual person or household; provided such revised data does not include and is not subject to any key, code, or other mechanism that could be used to re-identify such information, and "Aggregation" refers to information that relates to a group or category of persons, households, or entities from which identifying information has been removed, that is not linked or reasonably linkable to any individual person, household, or entity, such as via a device; provided such revised data does not include and is not subject to any key, code, or other mechanism that could be used to re-identify such information.

4.4.2. Without limiting the generality of the requirements for Anonymized or Aggregated data, Contractor shall:

4.4.2.1. Implement technical safeguards that prohibit reversal of Anonymization or Aggregation of Personal Information collected through the Services;

4.4.2.2. Implement business processes that specifically prohibit such a reversal or recreation;

4.4.2.3. Make no attempt to achieve such reversal; and

4.4.2.4. Implement reasonable business processes to prevent inadvertent release of Anonymized or Aggregated Personal Information.

4.5. Machine Learning and Artificial Intelligence: Contractor shall not process or otherwise in any way use Amtrak Data for purposes of training, creating, or otherwise modifying any machine learning, large language model, artificial intelligence, or similar systems that learn and adapt without following explicit instructions through the use of algorithms and statistical models to analyze and draw inferences from patterns in data ("Machine Learning") without Amtrak's prior written authorization in each instance. If Contractor becomes aware of any use of Amtrak Data in violation of the foregoing restriction, Contractor shall promptly notify Amtrak and take steps in cooperation with Amtrak to remediate and/or mitigate such unauthorized use. In addition, Contractor shall not use Machine Learning for the purpose of generating or developing software, computer code, or other materials used in or provided to Amtrak as part of the products or services supplied hereunder without Amtrak's prior written authorization in each instance.

5. INFORMATION MANAGEMENT & PROTECTION

5.1. Asset Management: Contractor must maintain an asset inventory and classification to manage essential information about hardware, software, data flows, interfaces, and data disclosures (e.g., unique identifiers, version numbers, data recipients, physical locations). Contractor must implement asset management controls for any assets that may be used to access Amtrak Data, Amtrak Infrastructure or Amtrak Resources. Contractor shall follow the required security standards and safeguards referenced in this Attachment for the utilization of all hardware and software in the performance of services to Amtrak under the Agreement.

5.2. Access Control: Contractor must restrict access to Amtrak Data and all systems that access, process, or store Amtrak Data through the utilization of a provisioning process that meets or exceeds the standards provided in the NIST CSF, NIST SP 800-53, Rev. 5, and other applicable NIST SP 800-series publications. Access to Amtrak Data must be restricted to only authorized individuals with an express need-to-know for the performance of the Services. Contractor must ensure that only authorized individuals are permitted access to business applications, systems, networks, and computing devices containing or processing Amtrak Data using, without limitation, secured channels via Contractor authorized virtual private network (VPN), jump boxes, secure shell (SSH), multi factor authentication (MFA), or other secure mechanisms.

5.2.1. Contractor personnel access shall be consistent with, and in no case exceed the scope of, any such authorization granted by Amtrak. All Amtrak-authorized connectivity or attempted connectivity to Amtrak's systems or networks shall be in conformity with Amtrak's security policies as may be amended from time to time with notice to the Contractor.

5.2.2. Contractor will review and verify the continued need for Contractor personnel access and level of access to Amtrak Data, systems, networks, and property on a quarterly basis and will retain evidence of the reviews for two (2) years from the date of each review. Contractor shall provide a certification of such review to Amtrak upon request.

5.3. Passwords: Contractor must ensure that its password policies and procedures are compliant with NIST SP 800-63 Digital Identity Guidelines and NIST SP 800-53, Rev. 5 guidance on password creation and authentication. These password policies and procedures must follow NIST best practices in configuration and management, including length and structure. All passwords must remain confidential and must not be shared between the Contractor, its employees, contractors and downstream third-party users.

5.4. Multi-factor Authentication (MFA): Contractor must ensure that multi-factor authentication is implemented for accounts with access to Amtrak Data, Amtrak Infrastructure, and other systems, networks, applications, and computing devices based on the NIST best practices and guidelines found in NIST SP 800-63 and NIST SP 800-53, Rev.5. Contractor must work with Amtrak to implement single sign-on (SSO) solution for MFA accounts as needed for Amtrak employee access to the Services.

5.5. Physical Location of Data: Contractor must notify Amtrak, in writing, thirty (30) days prior to relocating any physical storage location of Amtrak Data to a location or country that is different from the one(s) documented in the Contractor's statement of work, contract, or any Data

Processing Addendum entered into between Amtrak and Contractor, so that any potential privacy or security implications can be addressed.

5.6. Virtualization & Cloud Solutions: If Contractor utilizes a cloud solution, then Contractor must adhere to the same security principles required by the terms in this Attachment, the Cloud Security Alliance Guidance, and applicable government regulations, laws, or directives as used throughout the Contractor's enterprise. The geographic location of the Contractor's infrastructure resources must be identified in writing to Amtrak prior to transferring out Amtrak Data to such resources. Contractor is required to receive prior approval from Amtrak, who has sole control over the data location in any cloud services, and shall cooperate with Amtrak to ensure compliance with local laws that restrict cross-border flow of data.

5.7. Physical Protection: Contractor must actively manage physical security controls and ensure that all buildings throughout the Contractor's enterprise that house critical IT functions (e.g., data centers, network facilities, and key user areas) and store, process or transmit Amtrak Data or any other service-related Amtrak information, or connect to Amtrak Infrastructure, are physically protected from unauthorized access. These physical security controls should follow security best practices and requirements (e.g., ISO/IEC 27002 and NIST SP 800-53, Rev. 5). Contractor must maintain and record facility access logs with access restricted to only those personnel with a business need-to-know. Contractor must review and update these access logs regularly but no less than quarterly.

5.8. Data Encryption: Contractor shall provide industry standard FIPS 140-2 encryption of Amtrak Data and Confidential Information in transit over public or leased circuits. Contractor shall also provide industry standard FIPS 140-2 encryption of Amtrak Data and Confidential Information at rest on local laptops, mobile devices, shared drives, information repositories, and backend data stores. In the event FIPS 140-2 standards regarding encryption are updated or replaced, Contractor shall use encryption that meets or exceeds such updated or replaced standards.

5.8.1. Contractor shall implement and maintain logical data segregation that meets or exceeds industry standards to ensure Amtrak Data is not viewable by unauthorized users.

5.9. Secure Destruction: Upon completion of the delivery of the products and services to be provided under the Agreement, or at any time upon Amtrak's request, Contractor shall return to Amtrak or destroy all Amtrak Data as provided herein. Contractor shall return to Amtrak all hardware and removable media provided by Amtrak containing Amtrak Data. Amtrak Data in such returned hardware and removable media shall not be removed or altered in any way. The hardware must be physically sealed and returned via a bonded courier or as otherwise directed by Amtrak. If any hardware or removable media containing Amtrak Data is owned by Contractor or a third-party, then the Contractor shall securely destroy such data or return it to Amtrak via hardware or removable media as requested by Amtrak. Contractor shall provide to Amtrak a notarized certification of destruction detailing the destruction method used and the data sets involved, the date of destruction, and the entity or individual who performed the destruction. Contractor's destruction or erasure of Amtrak Data pursuant to this Section shall be in compliance with industry standard practices (e.g., Department of Defense Media Sanitization and Data Wipe Standard, NIST SP 800-88).

6. CYBERSECURITY INCIDENT RESPONSE AND MANAGEMENT

6.1. Incident Management: Contractor must document all Security Incidents and maintain a documented cybersecurity event management process that covers incident response, escalation, and remediation of Security Incidents. All such documentation must be retained for a minimum of five (5) years following the conclusion of any Security Incident, unless otherwise required by applicable law.

6.2. Reporting Incidents: Contractor shall immediately but no later than 24 hours after discovery, provide a written notice to Amtrak of any Security Incident.

6.2.1. The written notice shall include the date and time of the Security Incident's occurrence (or the approximate date and time of the occurrence if the actual date and time of the occurrence is not precisely known) and a detailed summary of the facts and circumstances of the Security Incident, including a description of:

6.2.1.1. The date of the Security Incident's discovery and the circumstances surrounding such discovery;

6.2.1.2. Why the Security Incident occurred (e.g., a description of the reason for the system failure);

6.2.1.3. The amount and type(s) of Amtrak Data known or reasonably believed to have been Disclosed;

6.2.1.4. The systems and/or applications likely impacted;

6.2.1.5. The categories and approximate number of data subjects affected, and their country of residence and the categories and approximate number of records affected; and

6.2.1.6. The measures being taken or proposed to be taken by Contractor to address and remedy the Security Incident's occurrence to prevent the same or a similar event from occurring in the future.

6.2.2. Amtrak may impose additional notification requirements for Security Incidents that compromise Amtrak's Data based on applicable state breach notification laws or requirements under applicable domestic and/or international privacy laws.

6.2.3. Contractor shall provide written updates for the Security Incident to Amtrak addressing any new facts and circumstances learned after the initial written notice is provided and shall promptly, but no later than seventy-two (72) hours, provide such updates after learning of those new facts and circumstances. Contractor shall reasonably cooperate with Amtrak in Amtrak's efforts to determine the risk posed by the Security Incident, including providing additional information regarding the Security Incident upon request from Amtrak.

6.3. Response Plan Development and Implementation: Contractor shall develop and implement a "Response Plan," which shall include policies and procedures to address Security Incidents. The Response Plan shall include appropriate provisions for mitigating the harmful effects of Security Incidents and addressing and remedying the occurrence(s) to prevent the recurrence of similar Security Incidents in the future. Contractor shall provide Amtrak access to inspect Contractor's Response Plan upon request. The development and implementation of the Response Plan shall follow industry standard practices, such as those that at a minimum are consistent with the contingency planning requirements of NIST SP 800-61, Rev. 2, Computer Security Incident Handling Guide.

6.3.1. Immediately upon learning of a Security Incident related to the products and services provided to Amtrak, Contractor shall implement its Response Plan and, within twenty-four (24) hours of implementing its Response Plan, shall notify Amtrak in writing of that implementation as described above.

6.4. Notification to Affected Parties: Contractor will, at its sole cost and expense, assist and cooperate with Amtrak with respect to any investigation of a Security Incident, disclosures to affected parties, and other remedial measures as requested by Amtrak in connection with a Security Incident or required under any applicable laws related to a Security Incident.

6.4.1. In the event a Security Incident results in Amtrak Data being Disclosed such that notification is required to be made to any person or entity, including without limitation any customer, shareholder, or current or former employee of Amtrak under any applicable laws, including privacy, data breach notification, and consumer protection laws, or pursuant to a request or directive from a governmental authority, such notification will be provided by Amtrak, except as required by applicable law or approved by Amtrak in writing. Amtrak will have sole control over the timing, content, and method of providing such notification.

6.5. Business Continuity: Contractor shall implement and maintain a business continuity program that meets or exceeds industry standards and that provides a formal framework and methodology, including without limitation, a business impact analysis and risk assessment process to identify and prioritize critical business functions ("Business Continuity Program"). Contractor shall provide Amtrak with evidence of the Business Continuity Program upon request.

6.5.1. Contractor shall conduct a business continuity test every twelve (12) months, including a review of the Business Continuity Program, roles and responsibilities, business documentation requirements, recovery strategies, Mean Time to Recovery (MTTR), Recovery Time Objectives (RTOs), Recovery Point Objectives (RPOs), testing strategy and frequency to ensure that appropriate recovery time frames are maintained to meet Amtrak business requirements for the Services. Contractor shall provide the results of any business continuity tests to Amtrak upon request.

6.5.2. Contractor shall implement and maintain a disaster recovery program that meets or exceeds industry standards and that provides a formal framework and methodology,

including without limitation, a business impact analysis and risk assessment process to identify and prioritize critical business functions. Contractor shall provide Amtrak with evidence of the disaster recovery program upon request.

6.5.3. Contractor shall support Amtrak's business continuity and disaster recovery programs to restore critical business functions in the event of a cybersecurity incident and/or breach.

7. THIRD-PARTY MANAGEMENT

7.1. Outsourcing: Prior to making Amtrak Data available to any third-party contractor, subcontractor, vendor, processor, or supplier, Contractor shall notify Amtrak in writing and provide reasonable information regarding the scope of and reason for such proposed third-party's access to Amtrak Data. Contractor shall provide Amtrak with a reasonable time, not less than thirty (30) days, to object to the engagement of such third party and Contractor and Amtrak shall use reasonable good faith efforts to resolve any such objection by Amtrak, such as by identifying an alternative third party or adjustment to the services. Contractor must operate a formal process to address due care and due diligence considerations in the selection and management of downstream contractors, subcontractors, vendors, processors, and suppliers. Contractor must maintain all necessary agreements with such third parties that specify the security and data privacy requirements to be met before commencing work on behalf of Contractor that could have an impact on Amtrak Data, Amtrak Infrastructure, or any Amtrak business operations with the Contractor. Contractor shall ensure that these agreements align with the terms in this Attachment and must ensure that its contractors, subcontractors, vendors, processors, and suppliers are compliant with equivalent security and data privacy requirements to those contained in this Attachment and as required by applicable law.

7.2. Indemnification: Contractor agrees to indemnify Amtrak for any and all actions taken by its own contractors, subcontractors, vendors, processors, and suppliers. Contractor acknowledges that it will be fully liable for all acts and omissions of these third parties.

8. CYBERSECURITY ASSESSMENT

8.1. Contractor Onboarding Assessment: Amtrak shall have the option, at its sole discretion upon execution of the Agreement, to perform a full cybersecurity assessment on Contractor's Program and technical, physical, management, and security controls. Contractor agrees to comply with all reasonable cybersecurity requirements specified by Amtrak before commencing any work for Amtrak or accessing Amtrak Infrastructure or networks.

9. MISCELLANEOUS

9.1. Order of Precedence: In the event of a conflict between a provision or terms in this Attachment and any other Services Agreement or Contract the provision or interpretation that provides Amtrak, Amtrak Data, Amtrak Employees, Amtrak Customers, and Amtrak Infrastructure stronger protection will control.

9.2. Definitions: The following defined terms have the meanings set forth below and shall only apply to this Attachment. Any terms defined elsewhere in the Agreement will be given equal weight and importance as though set forth in this Attachment. In the event of a conflict, greater weight shall be given to the version which provides greater protection to Amtrak, Amtrak Data, Amtrak Employees, Amtrak Customers, and Amtrak Infrastructure.

9.2.1. "**Amtrak Data**" means (a) all data and information Amtrak provides to Contractor, made accessible by Amtrak to Contractor, or to which Contractor has access or that Contractor (or Contractor Services) accesses, retrieves, collects, or otherwise processes during the course of performance of the Services from or on behalf of Amtrak, Amtrak Employees, Amtrak Customers, or trackers on the Amtrak website; (b) all archives, derivatives, summaries, abstracts, compilations, combinations with other information, modifications or manipulations of the foregoing data or information, Aggregated information, Anonymized or de-identified information, data sets, subsets, and the like related to, or derived from such data or information; (c) all reports generated by the Services, or otherwise generated or provided by Contractor relating to or in connection with the Product or Services; and (d) all Amtrak Confidential Information.

9.2.2. "**Amtrak Infrastructure**" means any information technology system, virtual or physical, that Amtrak or its Affiliates own, control, lease, or rent, and that resides on or outside Amtrak's network. Amtrak Infrastructure includes infrastructure obtained from an IaaS provider and systems that are provided and located on the Amtrak network or hosted on a third-party network as part of a Service.

9.2.3. "**Confidential Information**" means any information that during the Term is disclosed by or on behalf of a Party or its Affiliate (the "Disclosing Party") to the other Party or its Affiliate (the "Receiving Party") and at the time of disclosure: (i) is designated in writing as confidential or proprietary; (ii) is designated orally as confidential or proprietary, and embodied by the Disclosing Party in written or other tangible form, including meeting minutes, memos, diagrams, flow charts, and software; or (iii) should reasonably be understood by the Receiving Party to be confidential to the Disclosing Party under the circumstances.

9.2.4. "**Disclosed**" means any circumstance when the security, integrity, or confidentiality of any Amtrak Data has been compromised, including but not limited to incidents where Amtrak Data has been damaged, lost, corrupted, destroyed, or accessed, acquired, modified, used, or disclosed by any unauthorized person, by any person in an unauthorized manner, or for any unauthorized purpose.

9.2.5. "**MTTR**" or Mean Time to Recovery means the average time it takes to recover from a product or system failure.

9.2.6. "**Personal Information**" means any information that identifies, relates to, describes, is reasonably capable of being associated with, or could reasonably be linked, directly or indirectly, with a particular individual or household and includes, without limitation, any information defined as "personal information," "personal data," "personally identifiable

information" or similar terms under applicable privacy or data protection laws. Personal Information of Amtrak Employees or Customers is considered to be Amtrak Data and Confidential Information, and includes without limitation: Social Security Numbers, personal tax ID numbers, military identification numbers, student identification numbers, passport numbers, driver's license numbers, other government identification numbers, financial account data, payment card information, biometric information, health or medical information, insurance information, educational information, usernames, email addresses, names, home addresses, phone numbers, passwords, unique online identifiers such as cookies and mobile identifiers, access codes, and security questions.

9.2.7. "**Security Incident**" means any circumstance when (i) Contractor knows or reasonably suspects that Amtrak Data hosted or stored by the Contractor has been Disclosed; (ii) Contractor knows or reasonably suspects that an act or omission has compromised or may reasonably have compromised the security of the products and Services provided to Amtrak by Contractor or the physical, technical, administrative, or organizational safeguards protecting Contractor's systems used to store or host Amtrak Data or any Amtrak Infrastructure; (iii) Contractor discovers or reasonably suspects any other incident that impacts or may impact Amtrak's business operations, Amtrak Data, or Amtrak Infrastructure; or (iv) Contractor receives any complaint, notice, or communication which relates directly or indirectly to any of the foregoing involving (A) Contractor's handling of Amtrak Data or Contractor's compliance with the data safeguards in this Attachment or applicable laws or (B) the security of the products and Services provided to Amtrak by Contractor.

9.2.8. "**Services**" mean all necessary or required services, tasks, functions, products and other responsibilities and activities as set forth in, or reasonably inferable from, the Agreement, or any Scope of Work, Order or any such other written document.

9.2.9. "**RPO**" Recovery Point Objective means the point in time to which data must be recovered after an outage.

9.2.10. "**RTO**" Recovery Time Objective means the overall length of time an information system's components can be in the recovery phase before negatively impacting Amtrak's mission or mission/business processes.

REQUEST FOR PROPOSAL ("RFP") – EXHIBIT A-2
UNIVERSAL SINGLE-LEVEL FLEET REPLACEMENT – TECHNICAL SUPPORT, SPARES AND SUPPLIES AGREEMENT (TSSSA)

NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)
1 Massachusetts Ave NW, Washington DC 20001

NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)
UNIVERSAL SINGLE LEVEL FLEET REPLACEMENT

GENERAL PROVISIONS

CONTRACT NO: _____

1. DEFINITIONS

Capitalized terms used in these General Provisions without definition shall have the meaning ascribed to them in this Article 1. Certain additional capitalized terms are defined elsewhere in this Contract. Unless the context otherwise requires, the singular shall include the plural, and the masculine gender shall include the feminine and neuter genders and vice versa.

"**Additional Insured Parties**" has that meaning ascribed to it in Article 47, Section 47.1.

"**Adverse Rights**" has that meaning ascribed to it in Article 11, Contractor's Representations.

"**Amtrak**" refers to the National Railroad Passenger Corporation, which has its headquarters at 1 Massachusetts Avenue, NW, Washington, DC 20001, and any permitted assignee of Amtrak's rights under the Contract.

"**Amtrak OIG**" has that meaning ascribed to it in Article 31, Section 31.1.

"**Amtrak Project Director**" has that meaning ascribed to it in Article 3, Section 3.3.

"**Annual Service Payment**" shall mean the amount paid or payable to Contractor under the TSSSA in a 1 (one) year period.

"**Applicable Laws**" means all applicable federal, state and local laws, codes, ordinances, rules, regulations, judgments, decrees, directives, guidelines, policy requirements, orders or other governmental restrictions of any Government Authority, each as may be amended and in each case including successor provisions. For the avoidance of doubt, "Applicable Laws" includes any applicable Rules of Particular Applicability issued by the FRA and the Foreign Corrupt Practices Act.

"**Breach Notice**" has that meaning ascribed to it in Article 21, Section 21.3.2

"**Business Day**" means a weekday in the United States that is not an Amtrak holiday.

"**Certificate of Final Fleet Acceptance**" refers to the certificate to be furnished by Amtrak to Contractor pursuant to the Equipment Contract.

"**Change**" means any change or variation authorized by Amtrak pursuant to a Contract Modification issued by the Contracting Official or his representative.

"**Change in Control**" means, with respect to Contractor, a transaction or series of transactions where the Persons who (i) directly or indirectly hold fifty percent (50%) or more of the equity ownership of Contractor prior to such transactions or series of transactions cease to directly or indirectly hold fifty percent (50%) or more of the equity ownership of Contractor as a result of such transaction or series of transactions or (ii) directly or indirectly have the power to control

the management and policies of Contractor prior to such transaction or series of transactions, Contractor as a result of such transaction or series of transactions.

"**Change Order**" means a unilateral written order by the Contracting Official directing the Contractor to make a change that Article 7, Changes, authorizes the Contracting Official to order without the Contractor's consent.

"**Claim**" has that meaning ascribed to it in Article 7, Changes, and as further defined in Article 26

"**Conflict of Interest**" means that because of activities or relationships with other persons or entities, (1) a person or entity is unable to render impartial assistance or advice to Amtrak, (2) the person's or entity's objectivity in performing the Work under this Contract is or might be otherwise impaired, or (3) the person or entity has, or attempts to create, an unfair competitive advantage.

"**Consumable Material**" shall mean consumable or expendable items of material, as identified by part number and description by the Contractor and agreed to by Amtrak.

"**Contract**" means the entire agreement between Amtrak and Contractor and supersedes all previous negotiations, representations, understandings and agreements, either written or oral, including the bidding documents, with respect to the subject matter hereof. The terms "Contract Documents" or the "Contract" refers collectively to the following:

a). The TSSSA Contract signed by Amtrak and Contractor;

b). The Contract attachments, and exhibits as identified in the TSSSA, including without limitation the General Provisions and all attachments, and exhibits thereto

c). Contract Modifications; and

d). Any plans, Drawings, specifications, or other documents which may be produced pursuant to this Contract or derived there from.

The terms "Contract," "Agreement" and "Contract Documents" are used interchangeably herein.

"**Contract Amount**" means the total purchase price for the Work including all amounts in respect of Contract Modifications, escalations and option orders or quantities.

"**Contract Modification**" a document executed after the Contract is awarded, to clarify, revise, add to, or delete from the Work. A Contract Modification is: (a) a written amendment to the Contract signed by both parties; or (b) a Change Order.

"**Contract Time**" means the period of time allotted in the Contract for completion of the Work or a portion thereof, as applicable.

"**Contracting Official**" or "**CO**" means the individual authorized in writing by Amtrak to enter into, administer and make changes to the Contract and to make related determinations and findings on behalf of Amtrak, pursuant to Article 3, Section 3.1. This includes a duly appointed successor or an authorized representative of the Contracting Official acting within the limits of his or her authority.

"**Contracting Official's Representative**" or "**COR**" means the individual delegated the authority to act on behalf of the Contracting Official.

"**Contracting Official's Technical Representative**" or "**COTR**" means the individual authorized in writing by Amtrak to carry out the initiating, planning, executing, monitoring/controlling and closing out the Work. The COTR manages the project team and is

accountable for accomplishing the stated project objectives relative to cost, schedule, scope and quality.

"**Contractor**" means the individual, entity, or authorized representative of same, identified as such in the Contract.

"**Contractor Party**" means Contractor or any of its Subcontractors, suppliers, or any of their respective employees, agents or authorized representatives.

"**Contractor Project Manager**" has that meaning ascribed to it in Article 3, Section 3.3.

"**Cure Period**" has that meaning ascribed to it in Article 21, Section 21.3.2.

"**Day**" or "**day**" as used in the Contract means a United States calendar day unless otherwise noted.

"**Design Procurement Documents**" has that meaning ascribed to it in Article 21, Section 21.3.

"**Dispute**" has that meaning ascribed to it in Article 26, Section 26.1.

"**Documentation**" except as applicable to commercially available software, includes all user manuals, systems manuals, training materials, guides, logic diagrams, programmer's notes, flow-charts, algorithms, development tools and development platforms and other materials necessary for Amtrak's understanding and use of the Software for the Allowable Uses in the form prepared by the Contractor, subcontractor, Supplier or Manufacturer in the regular course of its business,

or, to the extent that the Specification requires a different form, then in the form required by the Specification.

"**Dollar**" or "**$**" means a dollar of the United States (US).

"**Drawings**" means, as applicable, two (2) dimensional or three (3) dimensional models, modules or drawings.

"**Equipment**" means all Cars and Spare Vehicles ordered under the Contract, including all options for additional Cars or Spare Vehicles exercised.

"**Equipment Contract**" means the entire agreement between Amtrak and the Contractor for the manufacture and supply of Long-Distance Fleet Replacement Equipment.

"**Equipment Design Documents**" has that meaning ascribed to it in this Article 1.

"**Escrow Materials**" has that meaning ascribed to it in Article 21, Section 21.3.1

"**Excess Costs**" are the difference between the Contract price for the terminated Supplies and/or Work and the total costs incurred by Amtrak to procure replacement Supplies and/or Work.

"**Extended Cure Period**" has that meaning ascribed to it in Article 21, Section 21.3.2.a

"**Event**" has that meaning ascribed to it in Article 5, Section 5.1.3.

"**Federal Railroad Administration**" or "**FRA**" means an agency within the U.S. Department of Transportation.

"**Financing Parties**" means Lender or any Person that advances funds or provides financing (other than as capital contributions) to Amtrak for all or a part of the costs and expenses associated with the Equipment, including without limitation (a) Lenders, banks, financial institutions and capital market participants and (b) any trustee or agent acting on behalf of any Person referred to in the preceding clause (a).

"**Fit for Purpose**" means:

a). In respect of each unit of Equipment, that:

i). all relevant approvals in respect of that Equipment have been obtained and remain in force;

ii). such Equipment:

(a) meets the requirements of the Contract, and

(b) is in a condition which enables Amtrak to operate such Equipment in Revenue Service in accordance with the Contract; and such Equipment is and shall remain fit for the purposes specified in paragraph (a)(ii)(A) above throughout its service life;

b). In relation to each Amtrak-Owned Spare that such Amtrak-Owned Spare when incorporated into a unit of Equipment, does not prevent such Equipment from being Fit for Purpose as defined in paragraph (a)(ii)(A) above; and

c). In relation to each Special Tool that such Special Tool is fit for use by a maintainer of rolling stock to carry out the maintenance and/or Services.

"**Force Majeure Event**" has that meaning ascribed to it in Article 29.

"**Foreign Corrupt Practices Act**" means the United States Foreign Corrupt Practices Act of 1977.

"**General Provisions**" means these terms and conditions.

"**Government Authority**" means (a) any international, foreign, federal, state, county or municipal government, or political subdivision thereof, (b) any governmental or quasi-governmental agency, authority, board, bureau, commission, department, instrumentality or public body or (c) any court or administrative tribunal of competent jurisdiction.

"**Guarantor**" means ____, the company that will execute, deliver and be liable on the Parent Guaranty, or the respective successor, in accordance with Article 57.

"**Indemnified Parties**" means Amtrak and its affiliates, officers, directors, employees, agents, servants, shareholders, successors, assigns subsidiaries, subcontractors, representatives, attorneys, consultants and Financing Parties.

"**Indemnified Party Claims**" has that meaning ascribed to it in Article 22.1.

"**Intellectual Property**" shall mean any recognized protectable intellectual property, such as patents, utility models, copyrights, corporate names, trade names, trademarks, trade dress, service marks, applications for any of the foregoing, discoveries, inventions, software, firmware, trade secrets, mask works, industrial design rights, rights of priority, know how, design flows, methodologies and any and all other intangible protectable proprietary information that is legally recognized. Intellectual Property includes without limitation any and all drawings, designs, specifications, documentation, notes and other works, prepared, developed or acquired in performance of the design services component of the Work (collectively, the "Equipment Design Documents") or in the performance of the Design/Build Services (collectively, the "Design

Procurement Documents") or otherwise delivered to Amtrak in connection with the Work (the "Other Documents").

"**IP Rights**" means any and all of the following rights and interests worldwide: (a) any and all patent applications and patents and unpatented inventions or technology; (b) any and all proprietary knowledge, know-how, data and trade secrets; (c) any and all copyrights, whether registered or unregistered, and applications to register the same; (d) any and all rights in software, data, databases or related documentation; (e) any and all engineering data and information; and (f) any and all other proprietary rights or Intellectual Property rights.

"**Key Personnel**" has that meaning ascribed to it in Article 10, Section 10.1.

"**Lender**" means any entity that lends Amtrak funding for the Contract.

"**Material**" shall mean spare parts, supplies, equipment, components, material for Minor Debris Damage and Consumable Material for use on the Equipment that was supplied by Contractor, excluding special tools, test equipment or fixtures.

"**Measurement Period**" shall have the meaning in the TSSSA.

"**Minor Debris Damage**" shall mean damage to the Equipment as a result of striking debris along the railway. This damage is mild in that repairs can be made relatively quickly with simple tools. Items such as ladders, grab irons, angle cocks, track receivers, light assemblies, windows, hoses, cables, and other exterior components are susceptible to Minor Debris Damage.

"**Modification**" means any variation, modification or addition to the Equipment.

"**Notice to Proceed**" or "**NTP**" means a notice provided to Contractor that it may begin performance of the Contract or a Contract Modification.

"**Option Order**" refers to an option that may be exercised by Amtrak in its sole discretion for purchasing additional Equipment under the terms of the Contract.

"**Other Documents**" has that meaning ascribed to it in this Article.

"**Parent Guaranty**" means a guaranty of payment and performance (and not of collection) issued by Guarantor guarantying the Work under this Contract, including Contractor's present

and future performance, obligations and liabilities under this Contract, in form and substance acceptable to Amtrak in its sole discretion.

"**Performance Guarantees**" shall have the meaning set forth in the TSSSA Statement of Work.

"**Person**" means a person (including Contractor and Amtrak) and shall be construed as including references to an individual, firm, company, corporation, unincorporated association or body of persons or any government authority (including any of its agencies).

"**Project Executive**" has that meaning ascribed to it in Article 10, Section 10.1.

"**Project Manager**" has that meaning ascribed to it in Article 10, Section 10.1.

"**Proposed Supplier Change**" has that meaning ascribed to it in Article 24, Section 24.2.

"**Release Condition**" has that meaning ascribed to it in Article 21, Section 21.3.2

"**Release Notice**" has that meaning ascribed to it in in Article 21, Section 21.3.2.a

"**Revenue Service**" means the time when a unit of Equipment is available to the general public and there is a reasonable expectation of carrying passengers that either directly pay fares, are subsidized by public policy, or provide payment through some contractual arrangement. Equipment operated in fare free service are considered in Revenue Service.

"**RFP**" means that certain National Railroad Passenger Corporation (Amtrak) Request for Proposal for the Amtrak Universal Single Level Fleet Replacement Technical Support, Spares, and Supply Agreement ("TSSSA"), RFP Number DOC5509033158, dated as of 03/31/2026.

"**Services**" shall have mean the Work and other services described in the SOW.

"**Software**" means any and all computer application programs which are incorporated as part of any system, subsystem, assembly, subassembly or components thereof, or any interface system control between or among the systems, subsystems, assemblies, subassemblies, or components thereof, in the Equipment, or which are used in connection with a system (which use involves microprocessors, controllers, drivers, or other electronic data processing elements) or which are used in connection with any related diagnostic or testing equipment, together with all related Documentation, including without limitation, the object code, source code and pseudo-code versions of such assemblies, subassemblies, programs, firmware containing such programs, know-how protocols, listings, instruction sets, indices and other intellectual property necessary for the Amtrak's use of the Software for the Allowable Uses in the form prepared by the Contractor, Subcontractor, Supplier or Manufacturer in the regular course of its business, or to

the extent that the Specification requires a different form, then in the form required by the Specification.

"**Source Code**" means the programming statements and instructions a programmer writes, but which statements and instructions ("code") are not directly executable by the computer that will execute the instructions provided by the programmers until converted into executable or machine language.

"**Spares**" means spare parts, Supplies, Equipment, and components that are fit, form and functionally equal to or better to the original design and consumables or expendables made of new materials and free of defects.

"**Special Tools**" means all specialized tools, gauges, meters, diagnostic equipment (including laptop computer software), etc. that will be necessary to operate, maintain, overhaul, inspect, test, troubleshoot and repair all configurations of the Equipment throughout its design life. Special tools do not include those tools that are commercially available "off the shelf".

"**Specification**" means any specification referenced in this document, including any schedule, exhibit or attachment to it, or any Contract or Subcontract, including without limitation the latest version of Amtrak Mechanical Department Rolling Stock Equipment Specification for Universal Single Level Fleet Replacement, Specification No. 1139, Rev 2, dated as of 03/18/2026, as amended.

"**Statement of Work**" or "**SOW**" means the Amtrak Universal Single Level Fleet Replacement Technical Support, Spares and Supplies Agreement (TSSSA) Statement of Work, Rev 1, dated as of 03/26/2026, as amended.

"**Subcontractor**" means any party that takes portions of the Contract from Contractor or another subcontractor to provide a service and/or Supplies, parts or Material necessary for the performance of the Contract, and as further defined in Article 25, Section 25.3.

"**Subcontractor Intellectual Property**" has that meaning ascribed to it in Article 21, Section 21.3.

"**Subcontractor IP Rights**" shall mean all rights and interests held or otherwise controlled by a Subcontractor worldwide in and to any IP Rights.

"**Supplies**" means the Spares, including, but not limited to, the Amtrak-Owned Spares, Special Tools, supplies, Equipment, including the Equipment, Materials, articles, or other items furnished by or to be furnished by Contractor under the Contract.

"**Technical Proposal**" means the technical proposal submitted by Contractor to Amtrak in response to the RFP, as amended.

"**Termination Event**" has the meaning ascribed to it in Article 8, Section 8.1.

"**Termination Expenses**" has that meaning ascribed to it in Article 9.

"**Technical Specification**" refers to the Amtrak Mechanical Department Rolling Stock Equipment Specification for Universal Single-Level Fleet Replacement, Specification No. 1139, Revision No. 2, dated as of 03/18/2026, as amended.

"**Technical Support and Spares Supply Agreement**" or "**TSSSA**" means the agreement entered into between Amtrak and Contractor under the terms of the Scope of Work.

"**Temporary Permit to Enter**" means a permit issued by Amtrak to permit Contractor to enter Amtrak's property and perform Work or Services under the Contract.

"**Equipment Contract**" means the entire agreement between Amtrak and the Contractor for the manufacture and supply of Single-Level Fleet Replacement Equipment.

"**Trustee**" has that meaning ascribed to it in Article 21, Section 21.3.5.

"**Viruses**" has the meaning ascribed to it in Article 4, Section 4.1.a.

"**Work**" as used herein, means performing the Services by or on behalf of the Contractor and supplying Material by or on behalf of the Contractor required by and exclusively described in the Contract Documents including modification, amendments or extensions thereto by Contract Modifications or other written documentation.

2. INTERPRETATION OF DOCUMENTS

2.1. The Contract constitutes the entire agreement of the parties. Except as provided under the Changes section hereof, neither oral statements nor other writings may be used to supplement, modify, or otherwise affect the provisions of the Contract. Contractor acknowledges that it has not been induced to enter into the Contract by any representations or promises not specifically stated in the Contract. Unless otherwise specified herein, all previous or contemporaneous proposals, letters, promises, representations, documents, agreements, or understandings, whether written or oral, relating to the subject manner of the Contract are hereby declared to be null and void and are superseded by the terms and conditions of the Contract. The terms and conditions of the Contract supersede any and all terms and conditions submitted by Contractor prior to, concurrently with, or pursuant to the Contract. Any additional or different terms proposed by Contractor are expressly rejected unless specifically accepted in writing by the Contracting Official. No other terms and conditions, or changes or modifications to the Contract shall be binding upon Amtrak unless agreed to in writing in accordance with the Changes section herein. As used herein, all references to a given agreement, instrument or other document shall be a reference to that agreement, instrument or other document as modified, amended, supplemented and restated through the date as of which such reference is made. Any term defined or provision incorporated herein by reference to another document, instrument or

agreement shall continue to have the meaning or effect ascribed thereto whether or not such other document, instrument or agreement is in effect.

2.2. Any inconsistencies in Contract provisions or Contract shall be resolved by giving precedence in the following order:

a). Contract Modifications;

b). Supplies and Services Contract;

c). Supplementary General Provisions;

d). TSSSA General Provisions;

e). Technical Support Spares Supply Agreement (TSSSA) Statement of Work; and

f). Contractor's Technical Proposal submitted to Amtrak.

2.3. If any uncertainty remains after reference to the hierarchy set forth in Section 2.2, the Contractor shall then confer with and be governed by the interpretation(s) of the Contracting Official or his authorized representative.

2.4. The captions in these General Provisions are for the convenience of the parties in identification of the several provisions and shall not constitute a part of the Contract nor be considered interpretative hereof.

2.5. It shall be the Contractor's responsibility to study the Contract and to report, at once in writing to the COTR, any errors, inconsistencies or omissions therein. Should the Contractor believe that the correction of the alleged errors, inconsistencies or omissions shall be the cause of additional expenditures or impact the schedule for performance of the Work, or portion thereof, the Contractor shall so advise Amtrak as part of the written notification. Any Work performed by the Contractor prior to receiving a written response from Amtrak with respect to any alleged error, inconsistency or omission shall be at the Contractor's own risk and expense.

3. CONTRACTING OFFICIAL'S REPRESENTATIVE (COR) AND CONTRACTING OFFICIAL'S TECHNICAL REPRESENTATIVE (COTR)

3.1. The Contracting Official may designate Amtrak personnel or agents to act as the Contracting Official's Representative (COR) or technical representative (COTR). Such designation shall be set forth in the Contract or by separate letter signed by the Contracting Official, and shall contain specific instructions as to the extent to which the representative may take action for the Contracting Official.

3.2. Unless otherwise provided in writing by the Contracting Official, the COTR's authority shall be to review and interpret Drawings and Contract technical submissions, review schedules, review

invoices and progress payments, and all other interface functions of a technical or commercial nature between the Contractor and Amtrak. All orders and directives issued by the COTR shall be in writing.

3.3. Contractor shall designate one of its employees as its project manager, who shall be assigned by Contractor to supervise Contractor's Work hereunder and shall serve as Amtrak's point of contact for the resolution of problems ("Contractor Project Manager"). Amtrak shall designate one of its employees as its project director to coordinate issues concerning Contractor's performance of the Work ("Amtrak Project Director"). The Amtrak Project Director shall serve as Contractor's point of contact for the resolution of problems related to the management of the relationship under the Contract. Contractor may not, without the consent of the Amtrak Project Director, replace its Project Manager unless the replacement is a result of the individual: (a) voluntarily resigning from employment with Contractor; (b) being dismissed by Contractor for misconduct or unsatisfactory performance; or (c) being unable to perform duties due to death or disability.

4. WARRANTY, DELIVERY OF MATERIAL AND INSPECTION

4.1. Contractor covenants and warrants to Amtrak that the Material furnished under the Contract shall be the best of its kind or quality, and suitable for the Equipment. The warranties hereunder shall run to Amtrak, its successors and assigns. The warranties provided for under this Contract do not affect the warranties provided under the Equipment Contract.

Additional Warranties and Agreements Relating to Computer Hardware, software, etc. The warranties below do not limit warranties otherwise set forth herein as they may apply to any software or computer systems. Contractor represents, warrants and agrees:

a). Virus Warranty: No viruses, Trojan horses, back-doors, malware, or similar items ("viruses") are coded or introduced into any Amtrak software or computer system used by Amtrak or any Equipment, Special Tools, or other Supplies or items furnished under the Contract. Contractor agrees that in the event that a virus is found to have been introduced, Contractor shall take all reasonable action at its own expense to eliminate the virus and reduce the effects of the virus on Amtrak's operations. Contractor further agrees to cooperate with Amtrak to mitigate and restore any loss of data or operational efficiency.

b). Disabling Code Warranty: No time-bombs, drop-dead or disabling devices, back doors or similar items are coded or introduced into any Amtrak software or computer system used by Amtrak or any Equipment, Special Tools, or other Supplies or items furnished under the Contract, and that Contractor shall not install or invoke any code which could have the effect of disabling or otherwise shutting down any portion of Amtrak's software or computer systems or any Equipment, Special Tools, or other Supplies or items furnished under the Contract.

c). Function/Compatibility/Escrow Warranty: All Software, programming and computer

hardware, systems and modules and related Technical Documents that Contractor or any Subcontractor furnishes to Amtrak are (i) Fit for Purpose, (ii) capable of performing the functions for which they are intended fully and correctly, (iii) if Software, written in a programming language that is commercially available in the United States and for which compilers, interpreters and other Software tools are commercially available in the United States, (iv) capable of being copied and used by Amtrak for Allowable Uses, and (v) where not delivered outright to Amtrak, being placed into escrow, including current versions, updates and fixes of them, as provided for by Article 21.

4.2. Contractor shall ensure that Material is available in accordance with the Scope of Work.

4.3. Contractor shall plan and implement a quality assurance program which shall be maintained throughout the execution of the Contract to assure delivery of Material to Amtrak conforms to the contractual requirements of the Contract.

4.4. Amtrak shall have the right to inspect the Material within a reasonable time after arrival at the designated delivery location. Amtrak's making or failure to make an inspection of the Material does not relieve Contractor of its obligation to furnish the Material strictly in accordance with the terms of the Contract, and shall not operate as a waiver of any rights of Amtrak under the Contract. Such inspection or failure to make such inspection of the Materials shall not constitute Amtrak's approval or acceptance of the Materials.

5. PAYMENT AND TERM

5.1. Payment

5.1.1. Amtrak shall pay Contractor in accordance with the Scope of Work. Amtrak shall pay undisputed charges when such payments are due for the Work. Amtrak may withhold payment of particular charges that Amtrak disputes in good faith, and in that case, Amtrak shall advise Contractor, in writing within sixty (60) days of when Amtrak knew of such dispute, of the nature of the dispute and, at Contractor's request, the parties shall immediately commence resolution of the issue in accordance with Article 26 Claims and Disputes.

5.1.2. Contractor shall invoice Amtrak by submitting an original invoice that is properly payable, along with supporting documentation, to the individual at the address set forth in the Contract. To be considered properly payable, each invoice must show the Amtrak purchase order number, Contractor invoice number, Contractor payment information, provided that invoices for Chargeable Events shall also include the part number. The content and format of invoices may be modified from time to time through mutual written agreement of the parties. Contactor certifies that, by submitting an invoice to Amtrak, any Supplies or Services being billed (1) comply with all specifications and terms and conditions set forth in the Contract Documents, and (2) have been delivered to Amtrak in the quantities shown on the invoice or have been completed per the terms of the Contract

Documents. Except for any other express provisions to the contrary contained in the Contract Documents, Amtrak shall pay all undisputed invoices within ninety (90) days of receipt of an original invoice that is properly payable.

5.1.3. If after a merger with or acquisition of another entity, formation of a new company or a corporate restructuring (an "Event"), Contractor's cost of performance decreases by five percent (5%) or more, Contractor shall share at least fifty percent (50%) of such cost savings with Amtrak. Contractor shall review its cost of performance on an annual basis after any Event and shall, within one hundred eighty (180) days of any annual review or at any later time requested by Amtrak, meet with Amtrak to negotiate in good faith a reduction to the fees charged to Amtrak. The reduction shall be at least fifty percent (50%) of the cost savings accruing to Contractor. Prior to such negotiations, Contractor shall provide any data, records or other documentation reasonably requested by Amtrak to substantiate Contractor's cost of performance. Prior to such negotiations, Contractor shall propose to Amtrak a methodology to account for and verify any proposed cost savings deemed attributable to an Event. If the parties are unable to agree on the proposed methodology, this will constitute a Dispute which will be resolved pursuant to the Claims and Disputes provision herein.

5.2. Term

5.2.1. The Term of the Contract shall begin at the issuance of a Certificate of Conditional Acceptance for the first Unit of Equipment (the "Commencement Date") and unless Amtrak's exercises an option for an additional term shall end twenty (20) years thereafter. Amtrak, in its sole discretion, may terminate the Contract ninety-six (96) months after the Commencement Date. In order to exercise this option to terminate, Amtrak shall provide Contractor a minimum of one-hundred and eighty (180) days' written notice prior to the end of the ninety-sixtieth (96th) month of the Term. Additionally, Amtrak, in its sole discretion, may terminate the Contract one-hundred and fifty-six (156) months after the Commencement Date. In order to exercise this second option to terminate, Amtrak shall provide Contractor a minimum of one-hundred and eighty (180) days' written notice prior to the end of the one-hundred and fifty-sixth (156th) month of the Term. No termination costs will be paid to Contractor for either termination.

5.2.1.1. If Amtrak exercises its right to terminate the Contract in accordance with 5.2.1 above, within thirty (30) days of Amtrak's issuance of the notice described therein, Amtrak and Contractor shall meet to agree to a level of Spares that will be maintained by Contractor through the end of the 96th or 156th month term. Notwithstanding Section 5.3 below, Amtrak shall purchase the agreed upon Spares at the prices set forth in the Master Spares List. For the avoidance of doubt, all other Contractor obligations in Section 5.3 shall apply. Additionally, Amtrak shall pay Contractor a reasonable reimbursement fee for the following

transition services, to the extent requested by Amtrak: management of Spares transfer, transfer of technical support systems, transfer or technology, and relevant data on vehicles and parts. In no event shall such reimbursement fee reflect any consequential damages, lost or anticipatory profits, unabsorbed overhead, or any other indirect costs. Contractor agrees to negotiate in good faith with Amtrak regarding the reimbursement fee for transition services, and any reimbursement fee and related negotiation shall be subject to the Audit and Inspection of Records section of this Contract.

5.3. Upon termination of the Contract for any reason, Contractor shall comply with the requirements of the SOW regarding Transition at Termination of Contract.

6. PERFORMANCE GUARANTEES

6.1. If the delivery deadlines have not been met by Contractor, Contractor shall, in place of actual damages for failing to meet Performance Guarantees, pay to Amtrak a fixed and agreed amount as calculated in accordance with the Scope of Work. Except as otherwise set forth in the Contract Documents, the payment due under this Section 6.1 and the Scope of Work shall be the sole and exclusive remedy for failing to meet the Performance Guarantees.

7. CHANGES

7.1. The Contracting Official may, at any time, without notice to the sureties, if any, by written order, direct any change within the general scope of this Contract. No other Amtrak employee, agent or representative is authorized to do so, unless expressly authorized in writing by the Contracting Official.

7.2. RESERVED.

7.3. If any such change causes an increase or decrease in the cost of the Materials, or the time required for delivery of the Materials or Work, or impacts Contractor's ability to meet the Performance Guarantees, if appropriate, the Contracting Official shall make an equitable adjustment in the Contract Amount, to time, cost, and/or the Performance Guarantees and shall modify the Contract.

7.4. Contractor must immediately proceed with the Contract as changed, unless otherwise directed by the Contracting Official, and further must within thirty (30) days from the date of receipt of the written order (i) assert in writing its right to an adjustment under this Article and (ii) notify Amtrak of any impact such change shall have. A failure by Contractor to timely assert its right to an adjustment or to timely notify Amtrak of such impact shall be deemed a waiver of Contractor's right to an adjustment with respect to the change or such other Work, and of its or its subsidiary's right to an adjustment under such separate contract.

7.5. If Contractor makes a proposed change request, Contractor, in connection with such request, shall furnish a price breakdown, itemized as required by the Contracting Official, impact to schedule, resources, any new risks or impact to existing known risks with applicable mitigation plans. Unless otherwise directed, the breakdown shall be in sufficient detail to permit an analysis of all material, labor, equipment, subcontract, and overhead costs, as well as profit. Any amount claimed for subcontracts shall be supported by a similar price breakdown. In addition, if the proposal includes a time extension, a justification therefore shall also be furnished. All such changes must be recorded in the Program Change Control Log along with applicable analysis documents and final disposition of changes and necessary approvals.

If Contractor's proposal for a change in the Contract Amount includes the cost of property made obsolete or redundant by the change, the Contracting Official shall have the right to prescribe the manner of the disposition of the property.

7.6. Failure to agree to any adjustment shall be a dispute as defined under Article 26, Claims and Disputes. However, nothing in such Article shall excuse the Contractor from proceeding with the Contract as changed.

7.7. When submitting any Claim exceeding one hundred thousand Dollars ($100,000), Contractor shall provide the following certification:

"I certify that the Claim is made in good faith; that the supporting data are accurate and complete to the best of my knowledge and belief; that the amount requested accurately reflects the contract adjustment for which the contractor believes Amtrak is liable; and that I am duly authorized to certify the Claim on behalf of the Contractor."

a). The certification requirement does not apply to issues in controversy that have not been submitted as all or part of a Claim.

b). The aggregate amount of both increased and decreased costs shall be used in determining when the Dollar thresholds requiring certification are met.

c). The certification may be executed by any person authorized to bind the contractor with respect to the Claim.

8. TERMINATION FOR DEFAULT

8.1. Amtrak may, by written notice to Contractor, terminate for default this Contract in whole or in part if Contractor fails to perform or comply with any of its material obligations under the Contract, including without limitation (each, a "Termination Event"):

a). failure to make progress or timely performance under the Contract;

b). failure, without cause, to make undisputed prompt payment to Subcontractors or to make undisputed prompt payment for equipment, materials and/or labor;

c). noncompliance with the Applicable Laws;

d). failure to comply with Amtrak's rules and proper instructions;

e). a bankruptcy event occurs with respect to the Contractor or the Contractor's Guarantor;

f). failure to meet Contractor's performance obligations by reaching the limits of guarantees specified in Section 9, Performance Guarantees and Performance Incentives of the SOW for two (2) consecutive Measurement Periods;

g). Contractor is prevented from executing the Work or Amtrak is prevented from using the Work as a consequence of any infringement of letters patent, registered design, copyright, trademark, trade name and the Contractor is unable, within ninety (90) days (or such longer period as the Parties may mutually agree) after notice thereof, to procure the removal at its own expense of the cause of the infringement;

h). any representation or warranty made by the Contractor or the Contractor Guarantor shall prove to be false or misleading in any material respect as of the time made;

i). any violation of anticorruption provisions of the Contract, or any violation of applicable anticorruption laws, including but not limited to the Foreign Corrupt Practices Act; in each case, in connection with this Contract;

j). the Contractor Guarantor, if any, breaches any provision of the Contractor Parent Guaranty if any, breaches any provision of or disavows the Contractor Parent Guaranty or Contractor fails to provide or maintain in full force and effect the Parent Guaranty as required by Article 57;

k). Contactor's assigns, transfers or pledges the Contract or any right or interest therein except as expressly permitted in Article 28;

l). Contactor fails to provide or maintain the insurance required under hereunder; or

m). The occurrence of any other event or circumstance expressly provided for hereunder as constituting a default by the Contractor.

n). Contractor fails to deliver or execute on a Modification Plan or recovery plan; or

o). The occurrence of any other event or circumstance expressly provided for hereunder as constituting a default by the Contractor.

For the avoidance of doubt, the parties agree that items (a) – (m) above are material and that items (a) – (m) do not represent an exhaustive list of material defaults.

Except as set out below, Amtrak will give the Contractor written notice of the default and the opportunity to cure the default within ten (10) days (or such greater timeframe that Amtrak may specify) of Contractor's receipt of the written notice of default from Amtrak. Amtrak shall not be required to allow such cure period if Contractor's default is a violation of Applicable Laws or impacts safety. Additionally, Amtrak shall not be required to provide written notice of default if the Termination Event is of the type described in Section 8.1(f). In the event that Contractor's material default is not excused or cured to the satisfaction of Amtrak, Amtrak may terminate the Contract in whole or in part and reprocure the Work, in which event Contractor shall be liable for (1) repayment to Amtrak of any payments made by Amtrak and (2) any Excess Costs to Amtrak relating to the reprocurement. In the event that the Contract is terminated only in part, the remaining part shall remain in full force and effect. If the Termination Event is of the type described in Section 8.1(f), without further notice or demand of any kind (all of which are hereby waived), Amtrak shall not be obligated to procure the Work hereunder and Amtrak may otherwise exercise any of the other remedies provided for herein with respect to all or a portion of this Contract as Amtrak in its sole discretion shall elect, to the extent permitted by applicable law then in effect.

8.2. If Amtrak terminates this Contract in accordance with this provision, Contractor shall not be entitled to receive any further payment for the terminated Work. Further, Amtrak may take possession of all of the materials, equipment and tools on the site(s) and may continue the Work by whatever method Amtrak may deem expedient, including the acquisition, under the terms and in the manner the Contracting Official considers appropriate, of Supplies or Services similar to those terminated. Provided that the termination was for default, Contractor shall be liable to Amtrak for any Excess Costs for those Supplies or Services.

8.3. Upon termination of this Contract for default, in whole or in part, Contractor shall, if directed by the Contracting Official, take action including but not limited to:

a). Stop the terminated Work on the date and to the extent specified in the notice of termination (unless such notice is waived as provided herein), without creating a hazardous condition;

b). Place no further subcontracts for materials, equipment, services, facilities or other items, except as may be necessary for completion of such portion of the Work that is not terminated;

c). Unless directed otherwise by Amtrak, terminate all subcontracts to the extent that they relate to the performance of terminated Work;

d). Furnish Amtrak with a release of all claims against Amtrak, including all claims by Subcontractors, and including a release of all Claims related to Work completed in

accordance with the Contract;

e). Take such other reasonable action as Contractor may deem necessary, or as Amtrak may direct, for the protection of property which is in the possession of Contractor and in which Amtrak has or may acquire an interest;

f). Cooperate fully with Amtrak to enable Amtrak to effectively and efficiently continue and complete the Work;

g). Assign or otherwise transfer to Amtrak, or an entity designated by Amtrak, in the manner, at the time, and to the extent directed by Amtrak, all of the right, title and interest of Contractor under the subcontracts;

h). To the extent reasonably required by Amtrak, settle all outstanding liabilities and all claims arising out of the termination without cause of subcontracts, with the approval of Amtrak;

i). Transfer title to Amtrak, or an entity designated by Amtrak, and deliver in the manner, at the time, and to the extent, if any, directed by Amtrak (1) the fabricated or un-fabricated parts, Work in progress, dies, jigs, fixtures, plans, Drawings, information, contract rights, completed Work, Supplies, and other Material and other property produced as a part of, or acquired in connection with the performance of, the terminated Work, including without limitation all books, files and records relating to the Project, and (2) the completed or partially completed plans, Drawings, fabrication Drawings, information, and any other property which, if this Contract had been completed, would have been required to be furnished to Amtrak;

j). To the extent requested by Amtrak, use its best efforts to sell, in the manner, at the times, to the extent, and at the price or prices directed or authorized by the Contracting Official, any property of the types referred to in 8.3(i) above, provided, however, that Contractor (1) shall not extend credit to any purchaser, and (2) may acquire any such property under the conditions prescribed and at a price or prices approved by the Contracting Official; and provided, further, that the proceeds of any such transfer or disposition shall be applied in reduction of any payments to be made by Amtrak to Contractor under this Contract or shall otherwise be credited to the price or cost of the Work covered by the Contract or paid in such other manner as the Contracting Official may direct;

k). Complete, in accordance with the Contract, performance of such part of the Work as shall not have been terminated by the notice of termination; and

l). Execute any further documents reasonably required by the Contracting Official to confirm or effectuate the terms of this Article without compromising Contractor's right or remedies.

8.4. In the event Amtrak terminates this Contract for default pursuant hereto, Contractor shall bear all costs and expenses incurred in connection with this Article. In accordance with Section 53.2, this Article shall survive the termination or expiration of the Contract.

8.5. If, after termination, it is determined that Contractor was not in default, or that the default was excusable, the rights and obligations of the parties shall be the same as if the termination had been issued for the convenience of Amtrak.

8.6. The rights and remedies of Amtrak in this Article are in addition to any other rights and remedies provided by law or in equity or otherwise provided under this Contract, and no termination of this Contract shall constitute a waiver, release or estoppel by Amtrak of any right, action or cause of action it may have against Contractor.

9. TERMINATION FOR CONVENIENCE

9.1. Termination for Convenience is the exercise of Amtrak's right to completely or partially terminate performance of work under the Contract when it is in Amtrak's interest to do so, without cause or justification. Amtrak's exercise of this right does not release Contractor from any obligations that it has to Amtrak under any other provision of the Contract Documents, nor does it waive any existing claims that Amtrak may have pending at the time of the Termination for Convenience.

9.2. Upon thirty (30) days written notice to Contractor, Amtrak may, at its option and in its sole discretion, terminate the Contract in whole or in part at any time for Amtrak's convenience for whatsoever reason, or no reason, and without regard to fault or breach.

9.3. Upon termination of this Contract for convenience, in whole or in part, Contractor shall, if directed by the Contracting Official, take action including but not limited to:

a). Stop the terminated Work on the date and to the extent specified in the notice of termination, without creating a hazardous condition;

b). Place no further subcontracts for materials, Vehicle, services, facilities or other items, except as may be necessary for completion of such portion of the Work that is not terminated;

c). Unless directed otherwise by Amtrak, terminate all subcontracts to the extent that they relate to the performance of terminated Work;

d). Furnish Amtrak with a release of all claims against Amtrak, including all claims by Subcontractors, and including a release of all Claims related to Work completed in accordance with the Contract, to the extent Amtrak has made payment in respect thereof in accordance with the Contract.

e). Take such other reasonable action as Contractor may deem necessary, or as Amtrak may

direct, for the protection of property which is in the possession of Contractor and in which Amtrak has or may acquire an interest;

f). Cooperate fully with Amtrak to enable Amtrak to effectively and efficiently continue and complete the Work;

g). Assign to Amtrak, or an entity designated by Amtrak, in the manner, at the time, and to the extent directed by Amtrak, all of the right, title and interest of Contractor under the subcontracts;

h). To the extent reasonably required by Amtrak, settle all outstanding liabilities and all claims arising out of the termination without cause of subcontracts, with the approval of Amtrak;

i). Transfer title to Amtrak or an entity designated by Amtrak, and deliver in the manner, at the time, and to the extent, if any, directed by Amtrak (1) the fabricated or un-fabricated parts, Work in progress, dies, jigs, fixtures, plans, Drawings, information, contract rights, completed Work, Supplies, and other material and other property produced as a part of, or acquired in connection with the performance of, the terminated Work, including without limitation all books, files and records relating to the Project, and (2) the completed or partially completed plans, Drawings, fabrication Drawings, information, and any other property which, if this Contract had been completed, would have been required to be furnished to Amtrak;

j). To the extent requested by Amtrak, use its best efforts to sell, in the manner, at the times, to the extent, and at the price or prices directed or authorized by the Contracting Official, any property of the types referred to in Section i). above, provided, however, that Contractor (1) shall not extend credit to any purchaser, and (2) may acquire any such property under the conditions prescribed and at a price or prices approved by the Contracting Official; and provided, further, that the proceeds of any such transfer or disposition shall be applied in reduction of any payments to be made by Amtrak to Contractor under this Contract or shall otherwise be credited to the price or cost of the Work covered by the Contract or paid in such other manner as the Contracting Official may direct;

k). Complete, in accordance with the Contract, performance of such part of the Work as shall not have been terminated by the notice of termination; and

l). Execute any further documents reasonably required by the Contracting Official to confirm or effectuate the terms of this Article without compromising Contractor's right or remedies.

9.4. Within thirty (30) days after Termination for Convenience, Contractor may submit to Amtrak in a form prescribed by Amtrak, a claim for termination costs. Termination costs may include: (1) Costs incurred in the performance of work performed prior to the termination, (2) a fair and reasonable profit on the incurred costs related to work performed prior to the termination, and (3) reasonable settlement expenses. The Contractor and Amtrak may look to FAR 52.249-2 for

guidance regarding termination costs, but are not bound by the requirements therein. In no event shall Amtrak's liability for termination costs exceed the unpaid balance of the Compensation, nor shall Amtrak be liable for consequential damages, including but not limited to lost or anticipatory profits, unabsorbed overhead or indirect costs. Contractor agrees to negotiate in good faith with Amtrak regarding any claim after termination. If appropriate, the Contracting Official shall issue a modification to the Contract reflecting any agreed upon adjustments to the Compensation resulting from the negotiation. Contractor's termination and related negotiation shall be subject to the Audit and Inspection Section herein. Contractor's subcontracts, sub-subcontracts, and purchase orders shall contain appropriate provisions for termination for convenience under this Section.

9.5. In the event of the failure of Contractor and Amtrak to agree upon the amount to be paid to Contractor by reason of the termination of Contract pursuant to this Section, the CO shall determine, on the basis of information available to him/her, the amount, if any, due Contractor by reason of the termination and shall pay to Contractor the amount which the CO determines to be fair and reasonable subject to Contractor's right to assert a claim in compliance with the requirements of the Contract Documents.

10. CONTRACTOR KEY AND OTHER PERSONNEL

10.1. Contractor shall designate, prior to the commencement of the Work, "Key Personnel" who shall include: an individual to whom all Amtrak communications concerning this Contract may be addressed (the "Project Executive" or other title); and "Project Manager" (or other title), who shall report to the Project Executive, and shall be in charge of Contractor's Work.

10.2. Amtrak shall have the right to approve the assignment and replacement by Contractor of all Key Personnel. Before assigning an individual to any of the positions designated herein, whether as an initial assignment or a subsequent assignment, Contractor shall notify Amtrak of the proposed assignment, shall introduce the individual to appropriate Amtrak representatives, and shall provide Amtrak with a resume of any other information about the individual reasonably requested by Amtrak. If, after being notified thereof, Amtrak in good faith objects to the proposed assignment within fifteen (15) days, then Contractor agrees to discuss such objections with Amtrak and attempt to resolve such concerns on a mutually agreeable basis. If the parties have not been able to resolve Amtrak's concerns within five (5) days, Contractor shall not assign the individual to that position and shall propose to Amtrak the assignment of another individual of suitable ability, experience and qualifications.

10.3. Amtrak shall have the right to require Contractor to replace any employee, including those not designated as Key Personnel, who Amtrak judges to be incompetent, careless, unsuitable or otherwise objectionable, or whose continued use is deemed contrary to the best interests of Amtrak. Before a written request is issued, it shall be discussed by the Contracting Official or his representative and the Project Executive. Upon receipt of a written request from Amtrak, Contractor shall be required to proceed with the replacement unless it can demonstrate that Amtrak's request is unreasonable. The replacement request shall include the desired

replacement date and the reason for the request. Contractor shall affect the replacement in a manner that does not degrade quality of the Work.

10.4. In the event Contractor elects to remove any individual proposed as Contractor's Key Personnel from the Project without the Contracting Official's approval, Contractor shall pay to Amtrak the specified assessment for each individual removed during the time period indicated below.

First Year of Contract:	$1,000,000
Second Year of Contract:	$500,000
Third Year of Contractor:	$100,000
Remaining Period of Contract:	$50,000

10.5. The Contracting Official retains the right to approve any request by Contractor to remove Contractor's Key Personnel from the Project. Said approval shall not be unreasonably withheld. The assessments apply only if Contractor removes Contractor's Key Personnel without the Contracting Official's approval. The assessments do not apply if any of Contractor's Key Personnel leave the Project for reasons limited to retirement, resignation from Contractor's firm (but not including a situation where Contractor's Key Personnel takes another position with Contractor's firm, with any of its affiliated or subsidiary firms, its parent company or any firms affiliated with or subsidiaries of the parent company or any other entity which either owns or controls Contractor's firm, within one year of resignation), death, disability, personal hardship, or termination of the Key Personnel's employment by Contractor due to the Key Personnel's inability to meet performance requirements or for misconduct as defined in Contractor's Employee Handbook or Corporate policies and procedures.

10.6. Contractor shall comply with the applicable provisions of Amtrak Policy 7.39.2 (Contractor Background Check), a copy of which is incorporated herein by reference.

10.7. Amtrak and Contractor agree that, during the term of this Contract and for one year thereafter, neither party shall, either directly or indirectly, on the party's own behalf or on behalf of others, solicit or recruit any person to terminate such person's employment with the other party. This shall not restrict one party from hiring any employee of the other who responds to regular employment solicitation efforts, such as newspaper advertisements, employment agencies, open house or job fair events, or widely distributed announcements of job openings, or who makes a direct inquiry as to employment with Amtrak or Contractor.

11. CONTRACTOR'S REPRESENTATIONS

Contractor represents that at the time of transfer to Amtrak, or an entity designated by Amtrak, of title to the Supplies, Contractor shall be vested with requisite authority to pass, and covenants that it shall pass such title, free of all liens and encumbrances, security interests, contractual

rights (for example, such as those under debt instruments or leases), title retention and all other rights of third parties of every kind and description including, without limitation, any creditors of Contractor, whether or not filed, recorded or otherwise perfected or effective under applicable law (collectively, "Adverse Rights"). Contractor shall execute additional documents reasonably requested by Amtrak, or an entity designated Amtrak.

12. SEVERABILITY

If any term or provision hereof is or becomes invalid or unenforceable, Contractor and Amtrak shall in good faith negotiate to replace the invalid or unenforceable term or provision with a term or provision which is valid and enforceable, and which comes as close as possible to expressing the intention of the invalid or unenforceable term or provision. The remaining valid portion of the Contract shall remain binding upon the parties.

13. CONFIDENTIALITY

13.1. Confidential Information. The term "Confidential Information" shall mean any and all information or proprietary materials (in every form and media) not generally known and which has been or is hereafter disclosed or made available by either Party (the "Disclosing Party") to the other Party (the "Receiving Party") in connection with the efforts contemplated hereunder, including: (i) all trade secrets; (ii) existing or contemplated products, services, designs, technology, processes, technical data, engineering, techniques, methodologies, and concepts and any information related thereto; (iii) information relating to business plans, sales or marketing methods or merchandising techniques, plans or information, and actual or potential customer information, lists or requirements; (iv) financial information or materials; (v) cost data; (vi) user lists and information; (vii) actual or potential vendor lists and information; (viii) procurement requirements; (ix) purchasing information; (x) manufacturing or development information; (xi) pricing policies; (xii) information about employees, independent contractors, interns, officers, directors, shareholders, investors, lenders, accountants, attorneys, and any other agents of either Party; (xiii) information about actual, under development, or what might reasonably be anticipated to be or become business and contractual relationships; (xiv) actual or potential lender, investor or partner lists and information; and (xv) other proprietary business information of either Party. "Confidential Information" as it relates to people or entities includes all contact information, including name, title, position, address, phone numbers, and email addresses. Further, "Confidential Information" includes any and all technical and non-technical information or material in which either Party has rights, opportunities, or obligations, whether or not owned or developed by such Party (or people or entities such Party may have disclosed to or received from pursuant to non-disclosure agreements).

13.2. Contractor agrees that all information furnished or disclosed by Contractor to Amtrak in connection with the performance of the Contract: (i) is furnished or disclosed as part of consideration of the Contract; (ii) shall not, unless otherwise agreed in writing by the CO, be treated as confidential or proprietary information of Contractor; and (iii) subject to third party copyright restrictions, may be used, modified, copied, or disclosed by Amtrak for any purpose.

Generally, routine deliverables provided by the Contractor to Amtrak will not be considered confidential. Contractor expressly waives any and all Claims against Amtrak and releases Amtrak from any and all Claims relating to the use, modification, copying or disclosure of such information by Amtrak, its assigns, or intended beneficiaries. No employee, agent, or representative of Amtrak, other than the CO, is authorized to accept any information which Contractor considers to be proprietary or confidential. Only the CO has authority to enter into an agreement, which shall be in writing, to provide for the confidential treatment of, or limit disclosure of, information furnished or disclosed by Contractor, its employees, agents or representatives.

13.3. Contractor shall: (i) hold Amtrak's Confidential Information in trust and confidence and not disclose or release any Confidential Information to any other person or entity; and (ii) not use the Confidential Information of Amtrak for any purpose whatsoever except as set forth in the Contract Documents or herein. Contractor shall disclose Amtrak's Confidential Information only to those of its employees, independent contractors, permitted subcontractors (including their employees and independent contractors) having a need to know such Confidential Information, provided that such persons and entities are bound by obligations of confidentiality and non-use no less restrictive that those contained herein. Upon completion or termination of the Contract, or as otherwise requested by Amtrak, Contractor shall immediately return all such items and information to Amtrak or make other disposition thereof as directed by Amtrak. Contractor shall not make any news releases, articles, brochures, advertisements, speeches or other information releases relating to the Contract without the prior written approval of the CO.

13.4. Contractor acknowledges that disclosure or use of Amtrak's Confidential Information without express written consent of the CO violates the Uniform Trade Secrets Act and federal Defend Trade Secrets Act. Contractor agrees not to improperly disclose third-party trade secrets or confidential information to Amtrak.

13.5. Contractor shall fully indemnify Amtrak against any and all actions, claims, liability, costs, charges, damages, and expenses suffered or incurred in connection with or arising out of any breach by Contractor of any of the provisions of this Section. Contractor acknowledges that a breach of its obligations hereunder cannot be compensated adequately by an award of damages or other pecuniary remedy, and that Amtrak shall also be entitled in the event of any such breach to the remedies of injunction, specific performance, or other equitable relief in respect of any such breach.

13.6. Contractor agrees that, in the event any Confidential Information of Amtrak is sought by subpoena, required by law or order of a court of competent jurisdiction or regulatory authority, or other process to the extent allowed by applicable law, Contractor shall notify Amtrak in writing as soon as practicable or within three (3) days of receipt of notice of such required disclosure in order to enable Amtrak to seek an appropriate protective order. Further, to the extent allowed by applicable law, Contractor shall reasonably cooperate and assist Amtrak in obtaining a protective order or other appropriate protection of its Confidential Information. If,

nonetheless, the Confidential Information is ordered to be disclosed, Contractor shall furnish only that portion of the Confidential Information that is required legally to be disclosed, and any portion of such Confidential Information required to be disclosed shall be used only for the purposes for which a court issues an order, or for other such purposes required by law.

13.7. Contractor agrees that, in the event any of Contractor's Confidential Information in Amtrak's possession is disclosed to a third party pursuant to a lawful subpoena, is required to be disclosed by law (e.g. FOIA) or order of a court of competent jurisdiction or regulatory authority, or other process to the extent allowed by applicable law, Contractor shall hold Amtrak harmless for such release.

13.8. This Confidentiality Section shall survive the termination or expiration of the Contract.

14. RETURN OF DATA

Contractor, at any time upon the request of Amtrak, shall immediately return and surrender to Amtrak all copies of any materials, records, notices, memoranda, recordings, Drawings, specifications and any other documents furnished by Amtrak to Contractor and Subcontractor.

15. ACCESS TO WORK

Amtrak, through its designated representative(s), and the Financing Parties shall at all times have access to the Work at the project site(s), or wherever the Work may be in preparation or progress, and Contractor shall provide proper facilities for such access.

16. AMTRAK'S RIGHT TO STOP THE WORK

If Contractor fails to correct Work which is not in accordance with the requirements of the Contract or persistently fails to carry out Work in accordance with the Contract, the Contracting Official, by written order signed personally or by his authorized representative, may order Contractor to stop the Work or any portion thereof, until the cause for such order has been eliminated; however, the right of the Contracting Official to stop the Work shall not give rise to a duty on the part of Amtrak to exercise this right for the benefit of Contractor or any other person or entity. Contractor shall not be entitled to any extension of the Contract Time or increase in the Contract Amount in connection with any stopping of the Work or portion thereof pursuant to this Article.

17. AMTRAK'S RIGHT TO CARRY OUT THE WORK

If Contractor fails to carry out the Work in accordance with the Contract and fails, within a ten (10) day period after receipt of written notice from the Contracting Official to cure this default with diligence and promptness, the Contracting Official may give Contractor a second written notice to correct such deficiencies within a seven (7) day period. If Contractor within such seven (7) day period after receipt of such second notice fails to commence and continue to correct any deficiencies, the Contracting Official may, without prejudice to other remedies

Amtrak may have, correct, or cause to be corrected, such deficiencies. In so doing, Amtrak or its designee shall utilize any of Contractor's materials, plant and equipment necessary to correct the deficient Work. In such case, an appropriate Change Order shall be issued deducting from payments then or thereafter due Contractor the cost of correcting such deficiencies, including compensation for the Contracting Official's or Amtrak's additional services and expenses made necessary by such default, neglect or failure. If payments then or thereafter due Contractor are not sufficient to cover such amounts, Contractor shall pay the difference to Amtrak. In accordance with Article 53, Amtrak's rights under this Article are in addition to any other rights it may have with respect to defective Work, including those rights of termination as specified elsewhere in the General Provisions.

18. NON-PERFORMANCE BY AMTRAK

Amtrak's failure to perform any of its responsibilities set forth in the Contract shall not be deemed to be grounds for termination, suspension or slowdown of the Work by Contractor; provided, however, that Contractor's nonperformance of its obligations to perform the Work shall be excused if and to the extent: (a) Contractor is unable to perform and its inability to perform is caused solely by Amtrak's failure to perform its responsibilities, and (b) Contractor provides Amtrak with reasonable notice of nonperformance and uses all reasonable efforts to perform notwithstanding Amtrak's failure to perform.

19. SUSPENSION OF THE WORK

19.1. After the Work has been started, Contractor shall not suspend the Work without permission of the Contracting Official or his designated representative. When under suspension, the Work shall be put in proper and satisfactory condition, and properly protected as directed by the Contracting Official or his designated representative. In all cases of suspension, the Work shall not again be resumed until permitted by order of the Contracting Official or his designated representative.

19.2. In addition to any other rights afforded to Amtrak under this Contract to suspend the Work, Amtrak shall have the right at any stage of the Work, to suspend operations thereon, or upon any part thereof, either for a time named or indefinitely, by giving Contractor written notice. If such rights of suspension are exercised by Amtrak, the Contracting Official shall grant to Contractor an extension of the Contract Time for the relevant part of the Work equal to the length of the actual delay to the critical path necessarily caused by such suspension and may grant additional time necessary to overcome such delay, but there shall be no adjustment of the Contract Amount in connection with such suspension except as explicitly provided in this Article. In the event that operations on a part of the Work are suspended by Amtrak pursuant to this Article for more than thirty (30) days, in the case of suspension of the Work, the Contract Amount for such part of the Work may be adjusted for any increase in the cost of performance of the Work (excluding profit) necessarily caused by such suspension (it being understood that the economic adjustment formulae in the Contract shall compensate Contractor for increased costs attributable to inflation). However, no adjustment of the Contract Time or Contract

Amount shall be made for any suspension: (a) to the extent that performance would have been suspended, delayed or interrupted by any other cause, including the fault or negligence of Contractor or (b) for which equitable adjustment is provided for or excluded under any other provision of the Contract. Amtrak's rights under this Article shall be in addition to any other right under the Contract to suspend the Work.

19.3. No Claim under this Section shall be allowed unless the Claim, is submitted to Amtrak in writing, setting forth any requested extension to the period of performance or increase in Compensation, and the basis therefore, as soon as practicable after the termination of such suspension, but no later than twenty-one (21) days after the termination of such suspension pursuant to the Claims Section.

20. TAXES

Pursuant to 49 U.S.C. 24301(k), Amtrak is exempt from payment of state or local sales and use taxes on personal property. Based on this statutory exemption, Contractor may be exempt from payment of state or local sales and use taxes on material and property purchased for performance of this Contract. It is Contractor's responsibility to determine applicability of any exemption from taxation arising from his performance under this Contract and Contractor shall not be entitled to payment for any taxes for which any exemption was applicable.

21. INTELLECTUAL PROPERTY RIGHTS

21.1. IP Rights.

21.1.1. Contractor shall pay any and all royalties and license fees required to be paid to third parties in connection with (a) Contractor's (or its Subcontractors') efforts relating to the Work, and (b) Amtrak's use and exploitation of any portion thereof, including without limitation Amtrak's use of any deliverables, Work Product, or Supplies. In addition, Contractor shall defend and indemnify Amtrak from, and hold Amtrak harmless from and against, any and all costs, expenses, losses and liabilities (including without limitation costs, expenses and attorneys' fees) arising out of or in connection with any and all demands, suits, claims and other similar proceedings brought by third parties alleging infringement, misappropriation or violation of any IP Rights arising in connection with any Work, Work Product, deliverables or Supplies, or Amtrak's use and exploitation of any portion thereof, including without limitation Amtrak's use of any Work, Work Product, deliverables or Supplies; provided that Amtrak provides Contractor with reasonable notice of the same.

21.1.2. With respect to the Work, Contractor shall not use, or permit the use of, or furnish for use by Amtrak any appliance, article, device, method of construction, design or manufacturing, Work Product, Supplies, or any Intellectual Property or IP Rights, unless Contractor has obtained all necessary consents, permissions, or authorizations for such use or uses. Any and all such consents, permissions or authorizations shall include,

without limitation, all rights necessary for Contractor to grant the licenses set forth below.

21.2. License and Use Rights.

21.2.1. "Allowable Uses" shall be limited to (a) the use, maintenance or repair (including wreck repairs) of the Equipment, (b) work performed by or on behalf of Amtrak to complete the Work due to a Contractor default or failure (or, in the case of Subcontractor Intellectual Property, after termination for cause of the relevant Subcontractor), (c) marketing, branding, advertising and training initiatives, and/or (d) other Amtrak equipment acquisitions or other Amtrak business reasons (or, in the case of Subcontractor Intellectual Property, the applicable Subcontractor ceases to be in the business of selling the equipment to which the applicable Subcontractor Intellectual Property relates). The Contractor shall cause its Subcontractors to grant "Allowable Uses" to Amtrak as set forth in this section and these General Provisions.

21.2.2. Contractor Intellectual Property: Contractor hereby grants to Amtrak an irrevocable, perpetual, fully paid-up right and license (with the right to grant sublicenses, except as otherwise expressly set forth herein) to use the Contractor's Intellectual Property: (a) for any and all Allowable Uses, (b) to make and use any and all Work, Supplies, Work Product, deliverables, products, methods and services, and (c) to use, copy, have copied, modify, have modified, incorporate in other products or services, prepare derivative works from, have derivative works prepared from, and distribute any and all copyrightable works. The right and license set forth in this section shall survive the expiration or termination of this Contract and may be transferred by Amtrak to any third-party.

21.2.3. Subcontractor Intellectual Property: Contractor shall cause each and every Subcontractor to grant to Amtrak an irrevocable, perpetual, fully paid-up right and license (with the right to grant sublicenses) to use the Subcontractor's Intellectual Property (the "Subcontractor Intellectual Property"): (a) for any and all Allowable Uses, (b) to make and use any and all Work, Supplies, Work Product, deliverables, products, methods or services, and to (c) use, copy, have copied, modify, have modified, incorporate in other products or services, prepare derivative works from, have derivative works prepared from, and distribute any and all copyrightable works. The rights and licenses set forth in this section shall survive the expiration or termination of this Contract, and the expiration or termination of any agreements between Contractor and the Subcontractor, and may be transferred by Amtrak to any third party.

21.2.4. Without limiting any right or remedy of Amtrak, if Amtrak or any of its affiliates is enjoined from or likely to be enjoined from using all or any portion of the Work, Work Product, any deliverables or Supplies, or Amtrak's use and exploitation (as defined below) of any portion thereof, as to which Contractor is required to indemnify Amtrak against infringement, misappropriation or other violation, Contractor shall, at Amtrak's

request and at Contractor's expense, either (a) procure promptly for Amtrak the right to continue using the foregoing, or (b) promptly replace all or any portion of the foregoing with a non-infringing product or part of equivalent functionality and performance which is satisfactory to Amtrak and the use of which does not violate the terms and conditions of such injunction, or (c) promptly modify all or any portion of the foregoing in a manner satisfactory to Amtrak so as to render use of the foregoing non-infringing and not in conflict with the injunction, and having equivalent functionality and performance.

21.3. Escrow.

21.3.1. Escrow Materials and Escrow Agreement. To secure Amtrak's rights hereunder, Contractor shall place copies of its then current system design, Source Code and Object Code, listings and related Documentation including, without limitation, annotated notes (the "Escrow Materials") for the Contractor's Software and Subcontractor's noncommercially available Software with an independent escrow agent reasonably selected by Amtrak, subject to the terms and conditions of the independent escrow agent's standard agreement (the "Escrow Agreement") and in accordance with the provisions of this Article 21.

21.3.2. Release Conditions. As used in the Contract, "Release Condition" shall mean the occurrence of any of the following events with respect to Contractor during the term of Amtrak's rights hereunder:

a). if Contractor materially breaches an express obligation with respect to the Contract, then Amtrak shall so notify Contractor in writing in accordance with the notice provisions set forth in the Contract ("Breach Notice"), specifying in reasonable detail the basis for Amtrak's claim of breach. Amtrak shall serve a copy of the Breach Notice simultaneously upon the escrow agent under the Escrow Agreement. At the same time that Amtrak delivers the Breach Notice, it may also deliver notice to the escrow agent under the Escrow Agreement), with a copy to Contractor, requesting a release of the Escrow Materials (a "Release Notice"). The Release Notice will commence the thirty (30) Business Day period under the Escrow Agreement, if such thirty (30) Business Day period is required, for Contractor to issue contrary instructions. Contractor shall (i) cure such breach during the thirty (30) day period immediately following its receipt of the Breach Notice ("Cure Period"); or (ii) if such breach is of a nature such that it is not capable of being cured within such period, (A) provide Amtrak a plan for cure that will cure the breach within sixty (60) days from the date of the Breach Notice (the "Extended Cure Period") and (B) commence acting on such plan during the initial Cure Period. If Contractor fails to meet its obligations under (i) and (ii) above or does not send written notice to Amtrak of a good faith dispute of the breach specified in the Breach Notice, then Contractor hereby agrees that it will not issue contrary instructions to the escrow agent under the Escrow Agreement, and the escrow agent

under the Escrow Agreement will be authorized to release the Escrow Materials upon the tolling of the thirty (30) Business Day Period during which Contractor was allowed to issue contrary instructions; provided however if the breach is of such a nature that it could not have been cured during the initial Cure Period and Contractor complied with its obligations under (ii) above, then Contractor may issue Contrary Instructions only to the extent it prohibits the escrow Agent under the Escrow Agreement from releasing the Escrow materials until the end of the Extended Cure Period.

b). the entry of an order for relief in a proceeding in bankruptcy (other than Chapter 11 of Title 11 of the U.S. Code, as the same may be amended) in which Contractor is the named debtor; (ii) Contractor's making of an assignment for the benefit of Contractor's creditors; (iii) the appointment of a receiver for Contractor; (iv) the filing of (1) any bankruptcy proceeding against Contractor, other than Chapter 11 of Title 11 of the U.S. Code, (2) any proceeding for an assignment for the benefit of Contractor's creditors or (3) any proceeding for appointment of a receiver or custodian of the assets and property of Contractor, which proceeding shall be consented to or acquiesced to be by Contractor or has not been discharged or terminated within ninety (90) days; or (v) the rejection by Contractor or any trustee of Contractor of the License Agreement pursuant to 11 U.S.C. Clause 365. The terms of clause (a) of this Clause 4.1 shall apply if following the filing of a proceeding under Chapter 11 of Title 11 of the U.S. Code, Contractor or its trustee materially breaches an express obligation under the Contract.

c). Contractor dissolves, liquidates or ceases to provide services or work similar to those provided for under the Contract for a substantial number of its customers for a period of at least thirty (30) days.

d). the parties have entered into a good faith dispute and Contractor ceases providing services or work similar to those provided for under the Contract prior to the final conclusion of the dispute resolution process set forth in Article 36 "Claims and Disputes"; provided that no such release condition will be deemed to have occurred if (i) Contractor has obtained a court order allowing it to cease performance of the Contract or (ii) Amtrak has failed to pay undisputed invoices or make milestone payments for the Work for ninety (90) days following written receipt of notice of breach from Contractor.

21.3.3. Use of Escrow Materials. Contractor hereby grants Amtrak an irrevocable, perpetual, fully paid-up right license (with the right to grant sublicenses) to use or have used on its behalf the Escrow Materials upon their release to Amtrak only to perform and authorize the performance of the Allowable Uses, which includes without limitation the right to make and use any and all products, methods and services, and to use, copy, have copied, modify, have modified, incorporate in other products, prepare derivative works from,

have derivative works prepared from, and distribute any and all copyrightable works, in each case in connection with and limited to Allowable Uses.

21.3.4. Establishment of Escrow. Within one (1) year of conditional acceptance of the first Consist of Cars, Contractor shall cause the Escrow Materials to be placed into escrow. The first ten (10) years of the escrow period, shall be maintained at the sole expense of Contractor under this Contract. After ten (10) years, Contractor shall continue to maintain the escrow, including the payment thereof, under the TSSSA. After the TSSSA terminates, Amtrak shall be responsible for payment of the escrow agent's fees. The deposit made with the escrow agent shall be kept current so as to accurately reflect the then current version of the Escrow Materials and promptly updated by Contractor following each material upgrade, modification or enhancement thereto. Contractor shall designate a mutually acceptable neutral third party that, at the expense and request of Amtrak made from time to time, may audit the materials deposited with the escrow agent for purposes of determining whether Contractor has fulfilled its deposit obligations. Contractor will promptly, at its expense, correct any deficiency disclosed by the audit.

21.3.5. Extension of Obligations. The obligations of Contractor under this Article 31 shall extend to any trustee in bankruptcy, receiver, administrator or liquidator appointed for Contractor, to Contractor as debtor-in-possession ("Trustee"), and to any other successor in interest to Contractor. Without limiting the generality of the foregoing, upon written request of Amtrak, Contractor shall not interfere with the rights of Amtrak as provided in the Contract or the Escrow Agreement to obtain the Escrow Materials from the Trustee or any other person or entity having possession thereof, and shall, if requested under the conditions specified in the Escrow Agreement for release of the Escrow Materials, cause a copy of such Escrow Materials to be made available to Amtrak.

21.4. Trademarks. Contractor shall not use Amtrak's name, trade name, logo, trademarks, or service marks in any context in connection with any advertising, publicity, product, equipment, promotion, or publication without the prior written consent of Amtrak. Contractor agrees to comply with Amtrak instructions regarding trade dress, packaging, trade names, trademarks, service marks or other indicia of origin which shall appear on any items to be delivered under the Contract. Contractor further agrees that, after delivery of said items to Amtrak, Amtrak may modify the trade dress or packaging thereof, and/or replace, modify, or supplement any indicia of origin appearing thereon, to identify Amtrak as the source of said items.

21.5. Pre-existing Materials of Contractor and Subcontractors. Contractor hereby grants to Amtrak a non-exclusive, irrevocable, perpetual, worldwide, fully paid-up license to use, execute, reproduce, modify, display, transfer, distribute copies of and prepare derivative works based on materials and intellectual property embodied therein, including any and all modifications thereto, owned and developed independently by Contractor prior to the preparation of its proposal used to provide Equipment under the Contract. Contractor shall retain its ownership

interest in such pre-existing materials. Contractor shall cause its Subcontractors to grant the licenses described herein.

21.6. Indemnity for Third Party Infringement Claims. The Contractor hereby represents and warrants that: (i) materials that it uses in its performance of the Work under the Contract; (ii) the Work, Work Product, including deliverables, Supplies, and Subcontractor Intellectual Property; and (iii) Amtrak's use of any Work, Work Product, including deliverables, Supplies, and Subcontractor Intellectual Property shall not infringe or misappropriate any U.S. or foreign patent, copyright, trade secret or other intellectual property right of a third party. If any claim is made against Amtrak claiming that its use of the Work, Work Product, including deliverables, Supplies, and Subcontractor Intellectual Property or other materials provided by Contractor hereunder infringes any third party intellectual property right, including but not limited to infringement of patent, copyright, royalty, trademark, service mark, proprietary right, misappropriation or wrongful use of trade secret, or confidential information ("Third-Party Infringement Claim"), Contractor shall, at its own expense, defend, indemnify, and hold harmless Amtrak and its Affiliates (including its directors, officers, employees, agents, subsidiaries, and assigns) ("the "Amtrak Indemnified Party") from and against any and all claims, damages, fees, losses, liabilities, penalties, and costs (including costs of defense and attorneys' fees) ("Losses"). In the event that a Third-Party Infringement Claim is asserted or sought against an Amtrak Indemnified Party, the Amtrak Indemnified Party shall notify the Contractor in writing in respect of such Third-Party Infringement Claim (a "Notice of Infringement Claim") as promptly as practicable; provided, however, that a failure or delay by the Amtrak Indemnified Party to provide a Notice of Infringement Claim as promptly as practicable shall not affect the rights or obligations of such Amtrak Indemnified Party unless the Contractor shall have been actually prejudiced as a result of such failure or delay. The Amtrak Indemnified Party shall enclose with the Notice of Infringement Claim a copy of all papers served with respect to such Third-Party Infringement Claim, if any, and any other documents evidencing such Third-Party Infringement Claim. Contractor shall have the obligation to assume the defense or prosecution of such Third-Party Infringement Claim and any litigation resulting therefrom with counsel of its choice (which counsel shall be reasonably satisfactory to the Amtrak Indemnified Party) and at its sole cost and expense (a "Third-Party Infringement Defense"), but only if the Contractor provides written notice of such assumption to the Amtrak Indemnified Party within sixty (60) days following delivery of the Notice of Infringement Claim and acknowledges in writing in such notice that any Losses that may be assessed against the Amtrak Indemnified Party in connection with such Third-Party Infringement Claim constitute Losses for which the Amtrak Indemnified Party shall be indemnified pursuant to this Section. Notwithstanding the foregoing, the Contractor shall not have the right to assume the defense of such Third-Party Infringement Claim, if: (i) the Amtrak Indemnified Party shall have been advised by counsel that there are one or more legal or equitable defenses available to it which are different from or in addition to those available to the Contractor, and, in the reasonable opinion of the Amtrak Indemnified Party, counsel for the Contractor could not adequately represent the interests of the Amtrak Indemnified Party because such interests could be in conflict with those of the Contractor; or (ii) the Contractor shall not have assumed the

defense of such Third-Party Infringement Claim in a timely fashion. If the Contractor assumes the Third-Party Defense in accordance with this Section: (i) Contractor shall diligently defend such Third-Party Infringement Claim; (ii) the Amtrak Indemnified Party shall have the right, but not the obligation, to participate in any such Third-Party Defense and to retain separate co-counsel at the sole cost and expense of Contractor; (iii) the Amtrak Indemnified Party will not file any papers or consent to the entry of any judgment or enter into any settlement with respect to the Third-Party Infringement Claim without the prior written consent of the Contractor; and (iv) the Contractor will not consent to the entry of any judgment or enter into any settlement with respect to the Third-Party Infringement Claim: (a) to the extent such judgment or settlement provides for equitable or injunctive relief without the prior written consent of the Amtrak Indemnified Party; (b) if such settlement does not include as a term thereof the giving by the third party asserting such claim to the Amtrak Indemnified Party a release from all liability with respect to such claim underlying such judgment or settlement; or (c) if such settlement or judgment contains any admission or statement suggesting any wrongdoing or liability on behalf of the Amtrak Indemnified Party. The Parties will use their commercially reasonable efforts to minimize Losses from Third-Party Infringement Claims and will act in good faith in responding to, defending against, settling or otherwise dealing with such claims. The Parties will also cooperate in any such defense and give each other reasonable access to all information relevant thereto. Notwithstanding the foregoing, Contractor shall have no indemnification obligation toward Amtrak under this provision if the respective Third-Party Infringement Claim is due to any modifications made by Amtrak or a third party acting on behalf of and with the authority of Amtrak or misuses by Amtrak.

21.7. Corrective Actions. If Amtrak's use of the Intellectual Property is enjoined, or if the Contractor's performance of its obligations under this Contract are materially impaired by reason of such Third-Party Infringement Claim, Contractor shall use commercially reasonable efforts, at its expense, to continue its performance hereunder, including without limitation, at its own elections: (i) to substitute an allegedly infringing item or process with a non-infringing item or process of at least the same functionality; (ii) to modify the allegedly infringing item or process so that it no longer infringes but remains at least functionally equivalent; or (iii) to obtain for Amtrak and its Affiliates the right to continue using such allegedly infringing item or process.

21.8. RESERVED

21.9. The terms and conditions set forth in this Article 21 shall survive the expiration or termination of the Contract, and the rights and licenses set forth hereunder may be transferred by Amtrak to any third party.

22. INDEMNIFICATION

22.1. Contractor agrees to defend, indemnify and hold harmless the Indemnified Parties, from and against any claims, losses, liabilities (including without limitation environmental liabilities), penalties, fines, demands, causes of action, suits, costs and expenses incidental thereto,

(including costs of defense and attorneys' fees) (collectively "Indemnified Party Claims"), arising in whole or in part from the fault, negligence or wrongful act of Contractor, which any of the Indemnified Parties may hereafter incur, be responsible for or pay as a result of: (a) breach of warranty, (b) injury or death of any person, or damage to or loss (including loss of use) of any property, including property of the parties hereto, arising out of or in any degree directly or indirectly caused by or resulting from Supplies, Material, deliverables, products or Equipment supplied by, or from activities of, or Work performed by Contractor, Contractor's officers, employees, agents, servants, Subcontractors, or any other person acting for or with the permission of Contractor under the Contract, (c) occasioned by or in any manner connected with Contractor's failure to perform the Work in compliance with any applicable laws, ordinances, rules, regulations or orders, or (d) as a result of Contractor's failure to perform its obligations in compliance with the Contract.

22.2. In addition to the foregoing, Contractor agrees to defend, indemnify and hold harmless the Indemnified Parties, irrespective of any negligence or fault on the part of the Indemnified Parties, from and against any Claims which any of the Indemnified Parties may hereafter incur, be responsible for or pay as a result of injuries (including death) to any of Contractor's employees, agents or Subcontractors.

22.3. The indemnification obligations under this section shall not be limited by the existence of any insurance policy procured or maintained by Contractor or any Subcontractor or by any limitation on the amount or type of damages, compensation or benefits payable by or for Contractor or any Subcontractor and shall survive the termination or expiration of the Contract.

23. LIMITATION OF LIABILITY

23.1. With the exception of losses (including defense costs) covered by the proceeds of insurance carried by or insuring Contractor or any Subcontractor, Contractor's liability to Amtrak for damages resulting from or arising out of any causes of action (including but not limited to tort) relating to Contractor's performance of the Contract shall not exceed an aggregate amount equal to 100% of the Contract Amount. The foregoing limitation of liability will not apply to or limit any right of recovery respecting the following:

a). losses (including defense costs) arising out of the Work and covered by the proceeds of insurance carried by or insuring Contractor;

b). losses (including defense costs) of amounts which would have been reimbursed but for Contractor's failure to carry insurance required to be carried under the Contract;

c). losses (including defense costs) of arising out of fraud, criminal conduct, intentional misconduct, recklessness, bad faith or gross negligence;

d). Contractor's indemnities under the Contract ;

e). Contractor's obligation to pay liquidated damages in accordance with the Contract;

f). fines assessed against Amtrak by a government authority to the extent that such fines are due to a Contractor Party's violation of Applicable Law; and

g). losses arising out of releases of hazardous materials by Contractor or Amtrak.

Notwithstanding any other provision in the Contract, except in respect of the express Performance Guarantees and liquidated damages in the Contract or as otherwise set forth herein, neither party shall be liable to the other party for consequential damages.

24. SOURCING OF SPARES

24.1. In performing the Work, Contractor shall only provide Material of the same or similar standards, functionality, features and quality as the original equipment manufactured component or part provided under the Contract, except where Contractor seeks and is granted Amtrak approval, which shall not be unreasonably withheld.

24.2. If Contractor wishes to change the supplier of any component or Material (a "Proposed Supplier Change"), Contractor shall notify Amtrak in writing of the Proposed Supplier Change including the new supplier's name and the Contractor's suppliers' part numbers, and any other information reasonably requested by Amtrak.

25. SUBCONTRACTORS

25.1. All references to Subcontractors herein include Subcontractors at any tier. Nothing contained in the Contract or any contract with a Subcontractor at any tier shall create any contractual relationship between Amtrak and any Subcontractor, or any third-party beneficiary rights in any Subcontractor; provided, however, that Amtrak shall be named as a third-party beneficiary of all contracts with a Subcontractor. Contractor agrees to obtain Amtrak's prior written approval before subcontracting the Contract or any substantial portion hereof; provided, however, this limitation shall not apply to the purchase of standard commercial supplies or raw material.

25.2. All work performed for Contractor by a Subcontractor shall be pursuant to an appropriate agreement between Contractor and the Subcontractor which shall contain provisions that:

a). Preserve and protect the rights of Amtrak under the Contract with respect to the Work to be performed under the subcontract so that the subcontracting thereof shall not prejudice such rights;

b). Require that such Work be performed in accordance with the requirements of the Contract;

c). Require submission to Contractor of applications for payment under each subcontract to which Contractor is a party, in reasonable time to enable Contractor to apply for payment;

d). Require that all claims for additional costs, extensions of time, damages for delays or otherwise with respect to subcontracted portions of the Work shall be submitted to Contractor (via any Subcontractor where appropriate) in sufficient time so that Contractor may comply in the manner provided in the Contract for like Claims by Contractor upon Amtrak;

e). Contractor's insurance as specified in Article 47 of this Contract shall provide insurance coverage for each Subcontractor working on its behalf.

f). Preclude Contractor and Subcontractor from naming, impleading or otherwise including Amtrak as a party in any arbitration or lawsuit between Contractor and any Subcontractor, and preclude the Subcontractor from naming, impleading or otherwise including Amtrak in any arbitration or lawsuit arising as a result of any Work performed by or for Contractor under the Contract;

g). Provide that Contractor's rights under the subcontract shall be assignable to Amtrak at Amtrak's option;

h). Require the Subcontractor to continue diligently to prosecute the Work, notwithstanding any disputes, including without limitation, disputes between Contractor and Amtrak, or Contractor and any Subcontractor;

i). Provide that the subcontract is terminable on the same terms as the Contract, but that no termination shall be effective without Amtrak's consent, and the Work covered by the subcontract may be suspended on the same terms as the Work may be suspended pursuant to the Contract;

j). Include Amtrak as a named indemnitee under any indemnification obligations imposed on the Subcontractor; and

k). Obligate each Subcontractor specifically to consent to the provisions of this Article 24

25.3. Whenever the Contract: (i) requires Contractor to include any provisions in an agreement with a Subcontractor, or (ii) requires Contractor to bind a Subcontractor to any obligation or otherwise create any obligation, responsibility, or liability on the part of any Subcontractor, or (iii) confers any rights or benefits on Amtrak with respect to a Subcontractor, the reference to "Subcontractors" shall be deemed to include Subcontractors of any tier, and Contractor shall require Subcontractors to include in all agreements with their suppliers: (a) provisions parallel to those required to be included in the agreement with the Subcontractor, (b) provisions necessary and sufficient to impose parallel obligations, responsibilities and liabilities on the Subcontractors, and (c) provisions necessary to confer such rights and benefits on Amtrak with respect to their suppliers.

25.4. Contractor shall promptly pay all Subcontractors, and shall require each Subcontractor to promptly pay its own Subcontractors. To verify payments to Subcontractors, Contractor shall provide any documentation reasonably requested by Amtrak.

25.5. The Contractor shall include all anticorruption provisions of the Contract in each subcontract and third-party agreement entered into under the Contract, including but not limited to representations and warranties of compliance with applicable anticorruption laws, including but not limited to the Foreign Corrupt Practices Act. Amtrak may require Contractor to terminate any Subcontractor in the event that the Subcontractor's continued performance of the Work would cause Amtrak to (i) violate any Applicable Law; or (ii) lose Amtrak's access to public funding for the Work, including from the Financing Parties.

26. CLAIMS AND DISPUTES

26.1. Submission of Claim and Decision of Contracting Official: If, prior to the date of Final Payment, the Contracting Official and the Contractor fail to agree on any request for adjustment, the Contractor may elect to submit a Claim to the Contracting Official for action. A decision by the Contracting Official, as provided in the "Resolution of Claims and Disputes" Section, shall be required as a condition precedent to litigation of a Claim between Contractor and Amtrak as to all such matters arising prior to the date Final Payment is due, regardless of (a) whether such matters relate to execution and progress of the Services or (b) the extent to which the Services have been completed.

26.2. Time Limits on Claims: Claims by the Contractor must be made by written notice to Amtrak, identified as a "Claim" under this Section" within thirty (30) days after occurrence of the event giving rise to such Claim or within thirty (30) days after the Contractor first recognizes, or reasonably should have recognized, the condition giving rise to the Claim, whichever is later. Provided, however, that Contractor shall use its best efforts to furnish the CO, as expeditiously as possible, with notice of any Claim once such Claim is recognized, and shall cooperate with the CO in any effort to mitigate the alleged or potential damages, delay or other adverse consequences arising out of the condition which is the cause of such a Claim. A notice of Claim must clearly identify the alleged cause and the nature of the Claim and shall describe the basis for any request for an extension of the contract period of performance or increase in the contract sum and shall include data and information then available to the Contractor that will facilitate prompt verification and evaluation of the Claim.

26.3. Continuing Contract Performance: Pending final resolution of the Claim, including litigation, unless otherwise directed by Amtrak in writing, Contractor shall proceed diligently with performance of the Contract and Amtrak shall continue to make undisputed payments in accordance with the Contract Documents.

26.4. Waiver of Claims - Final Payment: The making of Final Payment shall constitute a waiver of Claims by the Contractor except for Claims made in writing prior to Final Payment pursuant to

the requirements of the Contract Documents and identified by the Contractor in writing to the CO as unresolved at the time of Final Payment.

26.5. Any Claim of Contractor not made in compliance with the requirements of the "Time Limits on Claims" subsection above shall be deemed waived. No Claim by Contractor for a Contract change hereunder shall be allowed if asserted after Final Payment under the Contract.

26.6. Resolution of Claims and Disputes:

26.6.1. Subject to Contractor's compliance with the "Changes in the Services" and "Claims" Sections, the Contracting Official will review Claims and take one or more of the following actions within thirty (30) days of receipt of a Claim: (a) request additional supporting data from Contractor; (b) notify the Contractor in writing when the Contracting Official expects to take action; (c) reject the Claim in whole or in part, stating reasons for rejection; (d) recommend approval of the Claim; or (e) or take other actions as deemed necessary by the Contracting Official.

26.6.2. If a Claim has been resolved, the CO will prepare or obtain appropriate documentation for execution by Amtrak and the Contractor.

26.6.3. Additionally, the decision of the CO shall be final and conclusive unless Contractor pursues its rights or remedies under law, in accordance with the "Governing Law, Jurisdiction, and Venue" Section. Pending a final decision of a dispute by the court, Contractor shall diligently proceed with the performance of its work under the Contract in accordance with the decision of the CO, pursuant to the "Resolution of Claims and Disputes" Section, except to the extent that the CO's decision is that Contractor is not to proceed with the performance of all or part of the Contract.

27. ASSIGNMENT OF CLAIMS

Claims for moneys due or to become due Contractor from Amtrak under this Contract may be assigned to a bank, trust company, or other financing institution, including any Federal lending agency upon the prior written consent of the Contracting Official, and may thereafter be further assigned and reassigned to any such institution upon the prior written consent of the Contracting Official. Any such assignment or reassignment shall cover all amounts payable under this Contract and not already paid, and shall not be made to more than one party except that any such assignment or reassignment may be made to one party as agent or trustee for two or more parties participating in such financing.

28. SUCCESSORS AND ASSIGNS

28.1. Contractor shall not assign, transfer or pledge (whether by operation of law or otherwise) the Contract nor delegate its responsibility under the Contract without the prior written consent of the Contracting Official which may be withheld in Amtrak's sole discretion, nor shall

Contractor assign any moneys due or to become due to him there-under, except as provided in Article 28. Amtrak may assign its rights and delegate its responsibilities, in whole or in part, under the Contract (including rights under required insurance policies and bonds) (i) to any entity succeeding to all or substantially all of Amtrak's interests in the assets [associated with the Northeast Corridor] or which otherwise is to be the operator of the Equipment, (ii) to any Amtrak lessor of the Equipment, or (iii) to the Financing Parties. For purposes of this Section 29.1, a "Change in Control" shall be deemed to be an assignment.

28.2. In connection with any assignment of the Contract for collateral purposes to Financing Parties pursuant to Section 28.1, Contractor shall provide to such Financing Parties at is sole cost and expense a consent to assignment agreement in a form as may be reasonably required by such Financing Parties (it being agreed that such Financing Parties may reasonably require provision by competent counsel to Contractor of legal opinions addressing authorization, enforceability and other customary matters related to such consent or direct agreement), covering matters that are customary in project or equipment financings of the applicable type, which, among other things, shall authorize the Financing Parties, as secured parties, to exercise all rights of Amtrak under the Contract, and to subsequently assign such rights in connection therewith without the consent of Contractor and may also cover matters such as Financing Parties' security rights with respect to the Contract, direct notices to Financing Parties, step-in/step-out rights, access by Financing Parties' representative, deferral of Contractor's rights to terminate the Contract in certain circumstances and other matters applicable to such project or equipment financing. In this regard, Contractor shall cooperate with Amtrak in its efforts to obtain such financing, including by supplying information and documentation reasonably requested by the Financing Parties and taking such other actions as the Financing Parties may reasonably request.

29. FORCE MAJEURE

29.1. For purposes of this Contract, a Force Majeure Event is any one of the following: act of God or the public enemy, act of a governmental authority acting in its sovereign capacity, fire, flood, epidemic, quarantine restriction, unusually severe weather, war, terrorism, riot, earthquake, strike or embargo. In the event that either party's failure to perform in accordance with any schedule or when otherwise required under the Contract arises solely out of a Force Majeure Event that is both out of the control of such party and without the fault or negligence of such party, the time for performance under the Contract will be extended proportionately up to a maximum of 30 days (or longer, in the Contracting Official's sole discretion), consistent with the requirements of this Article 29.

29.2. Within ten (10) days of (i) becoming aware or (ii) the date by which it should reasonably have become aware, of a delay resulting from a cause specified in Section 29.1, whichever is earlier, Contractor shall advise the Contracting Official in writing of a claimed Force Majeure Event. The Contracting Official will then determine whether the event constitutes a Force Majeure as defined in Section 29.1 and will so advise the Contractor in writing. Once performance of the delayed work re-commences, or at the end of the thirty (30) day period (or such longer period as

the Contracting Official in his or her sole discretion choose to allow), the Contracting Official will advise the Contractor of the time extension granted due to the Force Majeure Event. Contractor shall make every reasonable effort to minimize the duration of the Force Majeure Event.

29.3. Apart from extension of time, no Claim for additional payment shall be filed by Contractor and no payment or allowance of any kind shall be made to Contractor as compensation for damages occasioned by way of the causes specified in Section 29.1.

29.4. Contractor recognizes it is imperative that the Work proceed uninterrupted and shall endeavor to prevent and shall diligently take all reasonable steps to re-start performance fully in accordance with the Contract, cure any work stoppage or strike of Contractor's employees caused by any labor disputes, including jurisdictional disputes arising out of the assignment of any of the Work. Contractor shall cause parallel provisions to be inserted in all subcontracts at any tier. If Contractor's failure to perform extends for more than fifteen (15) days from the start of the Force Majeure Event, Amtrak may, at its discretion, terminate the Contract without liability or cost at any time after such fifteen (15) days or some greater timeframe that may be specified by Amtrak. In the event of such early termination, if requested by Amtrak, Contractor shall transfer title as directed by Amtrak and deliver to Amtrak in the manner directed by Amtrak, any completed or partially completed deliverables or other work products Contractor has produced or acquired specifically for performance of the Work under the Contract.

29.5. Contractor agrees that no time extension shall be granted for time lost due to normal seasonal weather conditions. In order to qualify for consideration for a time extension due to adverse weather conditions, Contractor must show that the weather conditions during a given quarterly period (summer, fall, winter, spring) were more severe than the most severe year of the previous five years for the project geographical area and, in addition, that these weather conditions critically impacted the final project completion date by delaying the performance of Work. If abnormal weather losses within the meaning of the preceding sentence can be shown to have affected the Project Schedule, a non-compensable time extension shall be granted for that portion of the proven weather-related delays which exceeded the normal weather losses which should have been anticipated for the quarterly period in question, but no Claim for additional payment shall be filed by Contractor and no payment or allowance of any kind shall be made to Contractor as compensation for damages occasioned by way of any such abnormal weather.

29.6. Defaults or delays in performance of the Work by Contractor which are caused by acts or omissions of Subcontractors or unavailability of parts or Spares shall not relieve Contractor of its obligations, except to the extent that the relevant Subcontractor is itself subject to a Force Majeure Event covered hereunder and Contractor cannot reasonably circumvent the effect of the Subcontractors default or delay in performance through the use of alternate sources, work around plans or other means.

29.7. Force Majeure Events shall also not include (a) a failure of the Equipment or Supplies, (b) sabotage by employees or any contractors, subcontractors or suppliers of the party claiming the

Force Majeure Event, (c) increases in commodity, manufacturing or delivery costs or (d) changes in foreign currency exchange rates.

30. PRICING OF ADJUSTMENTS

When costs are a factor in any determination of a Contract price adjustment pursuant to Article 7, Changes, or any other provision of this Contract, such costs shall be in accordance with the contract cost principles and procedures of Part 31 of the Federal Acquisition Regulation (FAR), as amended by O.M.B. Circular A-87, in effect on the date of this Contract.

31. FEDERAL FUNDING, AUDIT, AND INSPECTION

31.1. Contractor hereby acknowledges and accepts that: (1) federal funds may be expended to it in connection with the tasks, assignments or duties which it performs pursuant to this Contract, and (2) the federal False Claims Act, 31 U.S.C. § 3729 et seq. may apply in connection with applications for payment, claims, requests for equitable adjustment or other requests for payment which Contractor submits to Amtrak under, or in connection with, this Contract.

31.2. Contractor acknowledges and agrees that Amtrak and Amtrak's Office of Inspector General (OIG) may inspect, copy and/or audit Contractor's data and records (in hard copy and/or electronic format) related in any way to the Contract, including without limitation, all data and records relating to: (1) support for any proposal, change order, or request for equitable adjustment submitted to Amtrak by Contractor; (2) Contract compliance and performance, including any work or deliverables in progress; (3) compliance with applicable provisions of Amtrak's federal grant, regulations and statutes; and (4) support for all direct and indirect costs or prices charged to Amtrak. Contractor agrees to maintain all such data and records throughout the term of the Contract and until three (3) years after final payment under the Contract, and agrees to cooperate with all audit activities.

31.3. In connection with audit and inspection activities, Amtrak and Amtrak OIG shall be afforded, upon request, (1) access to Contractor's facilities and to Contract work or deliverables in progress, (2) the opportunity to interview Contractor's employees concerning any matter relating to the Contract, and (3) adequate and appropriate workspace.

31.4. Contractor agrees to reimburse Amtrak, within sixty (60) calendar days after receipt of a written request, the full amount of any undisputed audit findings or questioned costs, unless otherwise agreed by Amtrak in the course of post-audit negotiations with Contractor.

31.5. Contractor shall include the provisions of this clause in every subcontract or purchase order exceeding $100,000, as well as a provision requiring all subcontractors to include these provisions in any lower tier subcontracts or purchase orders exceeding $100,000. Contractor shall be responsible for subcontractor or lower tier subcontractor's compliance with this clause.

31.6. Nothing in this Contract shall be construed to limit the rights, obligations, authority, or responsibilities of Amtrak's Office of the Inspector General pursuant to the Inspector General Act of 1978, as amended, including the right to seek information by subpoena.

32. PAYMENT PROVISIONS – GENERAL

32.1. With respect to any amount to be paid to Amtrak by Contractor pursuant to the Contract, Amtrak may, at its option, set off that amount as a credit against the Contract Amount payable to Contractor for the Work.

32.2. Amtrak shall pay undisputed charges when such payments are due for the Work. Amtrak may withhold payment of particular charges that Amtrak disputes in good faith, and in that case, Amtrak shall advise Contractor, in writing, of the nature of the dispute and, at Contractor's request, the parties shall immediately commence resolution of the issue in accordance with Article 26, Claims and Disputes.

32.3. Contractor represents that the prices specified in the Contract and any prices for options do not or will not exceed the current and/or generally offered selling price for the same or substantially similar Material, supplies, or services to any other purchasers, taking into account quantity and geographical factors.

33. RESERVED.

34. FAIR EMPLOYMENT PRACTICES/EQUAL EMPLOYMENT OPPORTUNITY

34.1 Contractor agrees to abide by Amtrak's policy and practice to ensure that all business organizations receive fair and equal consideration and treatment without regard to race, color, religion, sex, disability, veteran status or national origin of the owners or principals of the business organization. In addition, Contractor agrees that it shall not discriminate against any employee or applicant for employment because of race, color, religion, sex, disability, veteran status or national origin and that it shall comply in all respects with the Americans with Disabilities Act, 42 U.S.C. 12101 et seq.

34.2 Contractor shall take affirmative action to ensure that applicants and employees are treated fairly without regard to their race, color, religion, sex, disability, veteran status or national origin. Such action shall include, but not be limited to the following: employment, upgrading, demotion or transfer, recruitment or recruitment advertising, layoff or termination, rates of pay or other forms of compensation, and selection for training, including apprenticeship. Contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices setting forth the provisions of this non-discrimination section.

34.3 Contractor shall send to each labor union or representative of workers with which it has a collective bargaining agreement or other contract or understanding, a notice advising the labor

union or workers' representative of Contractor's commitments under this section and shall post copies of the notice in conspicuous places available to employees and applicants for employment.

34.4 The Contract may be canceled, terminated, or suspended in whole or in part based on Contactor's failure to comply with this section.

34.5 Contractor shall include the provisions of Articles 34.1 through 34.4 in subcontracts involving Services to be performed or Supplies to be furnished under the Contract, unless exempted by rules, regulations, or orders of the U.S. Secretary of Labor.

35. ENVIRONMENTAL COMPLIANCE

35.1 Contractor shall comply with all Applicable Laws concerning the environment and/or waste disposal.

35.2 Contractor shall dispose of any wastes, including hazardous wastes, generated by Contractor, its Subcontractors or agents (either purposefully or accidentally) in connection with its performance of the Contract in accordance with applicable federal, state, and local laws, regulations, ordinances, and orders, at its sole expense, using its own EPA generator number. In no event shall Amtrak be identified as the generator of any such wastes. Amtrak reserves the right to require Contractor to provide to Amtrak a copy of the results of any tests conducted by or for Contractor on any such wastes and, at Amtrak's expense, to perform additional tests or examinations of any such wastes prior to disposal.

35.3 Contractor shall include and enforce this Environmental Compliance Article in all subcontracts or lower tier purchasing agreements.

36. BUY AMERICA(N) REQUIREMENTS

36.1 In accordance with Amtrak's Domestic Buying Preference requirements at 49 U.S.C. 24305(f), Amtrak shall only buy, and accordingly, Contractor shall only supply (a) unmanufactured articles materials, and supplies mined or produced in the United States; or (b) manufactured articles, material, and supplies manufactured in the United States substantially from articles, materials, and supplies mined, produced or manufactured in the United States. For purposes of this provision, substantially means that more than 55% of all components by cost must be domestic. This Section 5.1 shall apply only when the cost of those articles, material, or supplies bought or supplied to Amtrak by Contractor is at least $1,000,000.

36.2 When complying with Section 5.1, Contractor shall comply with the domestic preference requirements of the Build America, Buy America Act (BABA) § 70914, Pub. L. No. 117-58, div. G, tit. IX, subtit. A, 135 Stat. 429, 1298 (2021), as implemented by OMB, USDOT, and FRA.

36.3 In accordance with 2 C.F.R. §200.322, as appropriate and to the extent consistent with law, Contractor shall, to the greatest extent practicable, provide a preference for the purchase,

acquisition, or use of goods, products, or materials produced in the United States (including but not limited to iron, aluminum, steel, cement, and other manufactured products). The requirements of this section must be included in all subcontracts and purchase orders for work or products under this Contract.

a). For the purposes of this Section 36.3:

1. "Produced in the United States" means, for iron and steel products, that all manufacturing processes, from the initial melting stage through the application of coatings, occurred in the United States.

2. "Manufactured products" means items and construction materials composed in whole or in part of non-ferrous metals such as aluminum; plastics and polymer-based products such as polyvinyl chloride pipe; aggregates such as concrete; glass, including optical fiber; and lumber.

37. CUSTOM DUTIES

37.1 Contractor agrees that, if any items or Supplies are shipped F.O.B. (Free on Board) destination or D.D.P. (Delivered Duty Paid), Contractor shall be the importer of record for all articles that enter into the United States in connection with the Contract. Contractor shall be liable for all duties, fees, and taxes attaching on importation of such articles, including anti-dumping and countervailing duties, if any.

37.2 Contractor agrees that, if the items or Supplies are shipped F.O.B. origin, C.I.F. (Cost, Insurance & Freight) or F.C.A. (Free Carrier), Amtrak shall specify the customs broker and shall be the importer of record for all articles that enter into the United States in connection with the Contract.

37.3 Amtrak shall not pay on behalf of Contractor, or reimburse Contractor for any anti-dumping or countervailing duties for which Contractor may be liable.

38. EXPORT CONTROLS

38.1 Contractor represents and warrants that it shall comply with (1) all United States export laws and regulations issued by any U.S. government authority, including without limitation the U.S. Export Administration Regulations, the International Traffic in Arms Regulations and any regulations administered by the Department of the Treasury's Office of Foreign Assets Control, that govern the export or re-export of any deliverable, technology or technical data provided hereunder, including software, hardware, equipment, documentation, specifications, Drawings, and schematics (collectively, the "Products") and any of the Services, and (2) any applicable laws and regulations of countries other than the United States that govern the importation, use, export or re-export of Products and/or Services. Contractor further represents and warrants that it shall (1) obtain appropriate export authorizations, consents or licenses that may apply to

Contractor's export or import of any Products or Services, and (2) comply with any conditions that are contained in any export or import licenses pertaining to the Products or Services. Contractor shall comply with any reporting requirements that may apply to the export or re-export of the Products and/or Services and provide to Amtrak and the appropriate governmental authority any periodic reports containing such information as may be required under applicable law.

38.2 Each party will reasonably cooperate with the other in making the appropriate filings with any governmental authority and will, to the fullest extent permitted by law, provide any information, certificates or documents as are reasonably requested.

38.3 In performing Services under this Contract, Contractor warrants and represents that it shall not employ or make use of any non-U.S. person who is a citizen of country that has been designated by the U.S. Government as a "terrorist supporting country" (see Country Group E at Supplement No. 1 to Export Administration Regulations Part 740).

38.4 With the exception of commodities, software or technologies that are controlled solely for "antiterrorism" reasons under the Export Administration Regulations ("EAR"), Contractor represents and warrants that the deliverables shall not contain any export-controlled technology or technical data under the export control laws or regulations unless approved by Amtrak's Contracting Official in writing. At least thirty (30) days prior to the earlier of the delivery, installation or provision of a deliverable containing any controlled technology or technical data, Contractor shall inform Amtrak's Contracting Official in writing of the EAR Export Control Classification Number(s) ("ECCN") or the International Traffic in Arms Regulations ("ITAR") U.S. Munitions List Classification ("MLC") numbers applicable to such deliverable. In addition, upon delivering or otherwise providing a deliverable with an ECCN or MLC number, Contractor shall place the following legend, or substantially similar one, as applicable on technical data and/or deliverable documentation:

"WARNING—INFORMATION SUBJECT TO EXPORT CONTROL LAWS. This document or software contains information subject to the Export Administration Regulations ("EAR") [or the International Traffic in Arms Regulations ("ITAR")]. This information may not be exported, released, or disclosed to foreign persons, whether within or outside the United States without first complying with the export license requirements of EAR [or ITAR]. Include this notice with any reproduced portion of this document. The EAR Export Control Classification Number(s) ("ECCN") [or the ITAR U.S. Munitions List Classification(s)] is/are: _____."

38.5 If the Services under the Contract include the maintenance or servicing of a Product, Contractor shall be responsible for promptly informing Amtrak's Contracting Official of any changes in the

ECCN or MCL status of such Product until expiration or termination of the maintenance or serving period for that Product.

38.6 If Contractor is provided, or provided access to, any technology or technical data by or through Amtrak that is restricted under the export control laws or regulations, Contractor shall fully comply with any and all restrictions imposed by Amtrak at no additional cost.

38.7 Contractor is fully responsible for compliance with the provisions herein on behalf of itself and its employees, agents and contractors and those of its Subcontractors, at any tier level, and their respective employees, agents and contractors.

39. TRANSACTIONS INVOLVING EMPLOYEES OF AMTRAK

39.1 Without giving prior written notice to the Contracting Official, Contractor shall not: (a) employ any employee of Amtrak when Contractor knows or has reason to believe that such person after employment by Contractor, shall also continue to remain in the employ of Amtrak; or (b) utilize as a consultant or otherwise, for compensation, the services of any employee of Amtrak in connection with the performance of the Work under this Contract; or (c) procure any portion of the Work under this Contract, or any materials or Services required in connection with the performance of this Contract, from any firm (excluding corporations whose stock is listed on a recognized stock exchange) which Contractor knows or has reason to believe is owned or controlled by employees of Amtrak or in which employees of Amtrak have a substantial interest.

39.2 Contractor shall furnish the Contracting Official with such further information as the Contracting Official may request concerning any proposed transactions of Contractor set forth above.

40. AMERICANS WITH DISABILITY ACT

The Contractor shall comply with all the applicable requirements of the Americans with Disabilities Act of 1990 and regulations promulgated thereafter, including 49 CFR Parts 27, 37 & 38.

41. CONVENANTS AGAINST CONTINGENT FEES

Contractor warrants that no person or selling agency has been employed or retained to solicit or secure this Contract upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established commercial or selling agencies maintained by Contractor for the purpose of securing business. For breach or violation of this warranty, Amtrak shall have the right to terminate this Contract without liability or in its discretion to deduct from the Contract Amount, or otherwise recover, the full amount of such commission, percentage, brokerage, or contingent fee.

42. ETHICAL BUSINESS PRACTICES

42.1 Contractor agrees that it shall not give, promise, or offer to any Amtrak employee, agent or

representative any cash, gift, entertainment, commission, or kickback, or anything of value.

42.2 Contractor agrees that it shall neither solicit nor accept any cash, gift, entertainment, commission, kickback or anything of value from a Subcontractor or any other person or entity.

42.3 Contractor agrees that it shall not (1) knowingly employ the services of any Amtrak employee or member of an employee's immediate family as a consultant, Subcontractor, or otherwise, in connection with the performance of Services under the Contract, or (2) purchase any material or Services required to perform the Contract from any entity owned or controlled (including a substantial financial interest) by any Amtrak employee or member of an employee's immediate family.

42.4 Contractor represents and warrants that (i) it has not committed any violations of any applicable anticorruption laws in connection with the Contract; (ii) it is not aware of any violations of any applicable anti-corruption laws in connection with the Contract; (iii) it will not commit any violations of any applicable anti-corruption laws in connection with the Contract; and (iv) it has in place a compliance program reasonably designed to detect and prevent violations of any anti-corruption laws in connection with the Contract; and (v) the Contractor, its parent, and its affiliates are not subject to any deferred prosecution agreements with any U.S. or foreign government authority. For the avoidance of doubt, applicable anticorruption laws include, but are not limited to, the Foreign Corrupt Practices Act.

42.5 Contractor shall certify that it has performed due diligence reasonably calculated to identify anticorruption risk on any subcontractor or any consultants, representatives, or agents retained in connection with this Contract.

42.6 Contractor shall use commercially reasonable efforts to include the provisions of this Article in each subcontract or third-party agreement entered into under this Contract.

43. CONFLICT OF INTEREST

43.1 Contractor hereby affirmatively represents that it shall not have a Conflict of Interest in performing the Services for Amtrak pursuant to this Contract. Contractor agrees not to (a) engage in activities, or (b) initiate or maintain relationships with persons or entities where such activities or relationships create a conflict of interest. Contractor shall use its best efforts to identify and prevent potential Subcontractor conflicts of interest. Contractor shall inform Amtrak of any activity or relationship that Contractor has reason to believe may create a conflict of interest. Without limiting the generality of the foregoing, Contractor shall not, and shall not knowingly permit any Subcontractor to, enter into any contract, subcontract, or other arrangement in excess of fifty thousand Dollars ($50,000) (other than for personal employment) related to this Contract or the Work if any of its officers or directors or any members of the immediate family or one of the foregoing has any material interest in the contract, subcontractor arrangement, unless the other party (or parties) to such contract or subcontractor arrangement is the lowest qualified bidder on a publicly advertised, sealed-bid basis and written records of the entire transaction are

kept by the Contractor and made available to Amtrak and FRA upon request.

43.2 Contractor represents that it is not a party to any existing agreement which would prevent Contractor from entering into and performing this Contract.

44. GRATUITIES

44.1 Amtrak may, by written notice to the Contractor, terminate the right of the Contractor to proceed under this Contract if it is found, after notice and hearing, by Amtrak, that gratuities (in the form of anything of value, including but not limited to cash, entertainment, gifts) were offered or given by the Contractor, or any agent or representative of the Contractor, to any officer or employee of Amtrak with a view toward securing a contract or securing favorable treatment with respect to the awarding or amending, or the making of any determinations with respect to the performing of such contract, provided, that the existence of the facts upon which Amtrak makes such findings shall be in issue and may be reviewed in any competent court.

44.2 In the event of a breach under Article 44.1, in addition to its right to terminate, Amtrak shall be entitled (i) to pursue the same remedies against the Contractor as it could pursue in the event of a breach of contract by the Contractor, and (ii) as a penalty in addition to any other damages to which it may be entitled by law, to exemplary damages in an amount (as determined by Amtrak) which shall not be less than three or more than ten times the cost incurred by the Contractor in providing any such gratuities to any such office or employee.

44.3 In accordance with Section 53.1 hereof, the rights and remedies of Amtrak provided in this Article shall not be exclusive and are in addition to any other rights and remedies provided by law or under this Contract.

45. OFFICIALS NOT TO BENEFIT

45.1 No member of or delegate to Congress, or resident commissioner, shall be admitted to any share or part of this Contract, or to any benefit that may arise there-from; but this provision shall not be construed to extend to this Contract if made with a corporation for its general benefit.

45.2 The Contractor warrants that no director, officer, employee or agent of Amtrak is a director, officer, employee or agent of the Contractor, and that to the knowledge and belief of the Contractor, no director, officer, employee, or agent of Amtrak owns any stock or has a substantial interest in the Contractor.

46. NON-WAIVER

46.1 No waiver by Amtrak of any breach on the part of Contractor of any of Contractor's obligations herein contained shall constitute a waiver of any subsequent breach of the same or any other of such obligations, and no payment made hereunder shall be deemed to constitute an acceptance or approval of any defective or unsatisfactory material or workmanship, or a waiver of Amtrak's right to reject the same later. As provided in Section 53.1 hereof, the remedies of Amtrak under

this Article are cumulative, and in addition to those provided by law.

47. INSURANCE

47.1 Subject to the provisions of Article 47, and to the extent not required by the Equipment Contract during the term of the TSSSA, Contractor shall procure and maintain, at its own cost and expense, during the entire period of performance under the Contract, the types of insurance specified below. All insurance shall be placed with insurance carriers reasonably acceptable to Amtrak and authorized to do business in the jurisdiction(s) where Work is to be performed. All insurance shall affirmatively include coverage for acts of terrorism. Amtrak shall have the right to review and approve all insurance certificates applicable to the Work. However, Amtrak's acceptance, acquiescence or failure to object to Contractor's submitted insurance certificates shall in no way relieve Contractor from responsibility for obtaining insurance policies complying with the terms of this Contract. Contractor shall furnish Amtrak with a certificate or certificates of insurance giving evidence of the required insurance prior to the issuance of a NTP or commencement of any portion of the Work pursuant to this Contract and upon renewal of any required insurance thereafter. In no event shall Work be performed until the required certificates of insurance have been furnished. If the insurance provided is not in compliance with the requirements listed below, Amtrak shall have the right to stop Work until proper evidence of all required insurance is provided. Contractor shall have no right to an adjustment of the Contract Time or the Contract Amount based on Amtrak's exercise of such right, and any delay in the completion of any portion of the Work caused by Amtrak's exercise of such right to stop Work shall be an unexcused delay. All Subcontractors shall be required to maintain the required insurance for the Contractor or Contractor's insurance shall provide coverage for each Subcontractor working on its behalf for covered claims caused in whole or part by the Subcontractor. Contractor shall provide thirty (30) days prior written notice to Amtrak in the event coverage is changed or the policy is canceled or not renewed. Unless otherwise specifically provided to the contrary, all insurance coverages specified herein shall name Amtrak and the Financing Parties as additional insureds (collectively, "Additional Insured Parties") using ISO CG 20 10 04 13 and CG 20 37 04 13 or their equivalent, and shall provide that Additional Insured Parties are additional insureds with respect to covered "liability caused in whole or in part arising out of" the Work, shall be primary and noncontributory to any other insurance available to Additional Insured Parties and their respective employees and agents, and shall include waivers of subrogation rights against Additional Insured Parties and their respective employees and agents. Except as otherwise expressly provided herein, Contractor's insurance obligations under this Article shall not be construed to limit Amtrak's rights whether in warranty, contract or any other applicable legal theory which may arise under provisions of the Contract or at law or in equity. If an indemnified claim arises involving an Indemnified Party and upon the request of Amtrak, Contractor will provide, or cause to be provided to Amtrak, copies of all insurance policies and endorsements implicated in the Indemnified Claim.

47.2 Workers' Compensation Insurance. A policy complying with the requirements of the statutes of the jurisdictions in which the Work shall be performed, covering all employees of Contractor.

Employers' Liability coverage with limits of liability of not less than $1,000,000 for each accident or illness shall be included. Additional Insured Parties shall not be named as an additional insured under this policy but the policy shall include a waiver of subrogation against the Additional Insured Parties and their respective employees and agents.

47.3 Commercial General Liability Insurance. A policy issued on an occurrence basis to and covering liability arising out of the Work to be performed by Contractor under the terms of the Contract. Products/Completed Operations Liability, Independent Contractors Liability, Contractual Liability (with railroad exclusions deleted), and Personal Injury/ Advertising Liability coverages are to be included. The policy shall contain a cross liability endorsement allowing claims and suits between insureds, shall not have any exclusion for liability relating to railroad operations, and shall not require mediation or arbitration of any disputes. Coverage under this policy shall have combined single limits for bodily injury (including disease or death) and property damage (including loss of use) of not less than $325,000,000 per occurrence and $650,000,000 in the aggregate. Amtrak has the right to require an increase in the insurance limits in the event of an increase in the statutory limit in 49 U.S.C § 28103, and the aggregate limit shall be two times per the occurrence limit.

47.4 Automobile Liability Insurance. A policy issued to and covering the liability of Contractor arising out of the use of all owned, non-owned, hired, rented or leased vehicles which bear, or are required to bear, license plates according to the laws of the jurisdiction in which they are to be operated, and which are not covered under Contractor's Commercial General Liability Insurance. Coverage under this policy shall have combined single limits of liability of not less than $2,000,000 per occurrence and in the annual aggregate.

47.5 Railroad Protective Liability Insurance. Contractor shall procure and maintain Railroad Protective Liability Insurance, written on the AAR-AASHTO (ISO/RIMA) occurrence based form (a claims made form is not acceptable), in the name of Amtrak (National Railroad Passenger Corporation) and other railroads and commuter agencies operating over tracks that are used in design and testing work. The policy shall have limits of liability of not less than $10,000,000 per occurrence and $20,000,000 in the aggregate. If equivalent or broader wording is not contained in the policy form, the following endorsement must be included:

47.5.1 It is agreed that "Physical Damage to Property" means direct and accidental loss of or damage to all property owned by Amtrak and/or all property in the care, custody and control of Amtrak.

47.5.2 In addition, Endorsement CG 28 31 – Pollution Exclusion Amendment, must be included.

47.6 Professional Liability Insurance. A policy issued to and covering the liability of Contractor for engineering and design errors and omissions in the performance of this Contract. Contractor shall maintain such coverage during the term of this Contract and for at least three (3) years following completion and acceptance of the Project. This insurance shall have limits of liability of not less

than $25,000,000 per occurrence and in the annual aggregate. The deductible amount shall not exceed $500,000. The Additional Insured Parties shall not be named as an additional insured under this policy.

If professional liability insurance coverage is written on a claims-made basis: (1) the policy retroactive date shall coincide with or precede Contractor's start of contract services (including subsequent policies purchased as renewals or replacements); (2) the policy will allow for the reporting of circumstances or incidents that might give rise to future claims; (3) Contractor will use its best efforts to maintain similar insurance under the same terms and conditions for at least six years following completion of the Services under the Contract; and (4) if insurance is terminated for any reason, Contractor agrees to purchase an extended reporting provision of at least six years to report claims arising from the Contract.

47.7 Property Insurance. A policy issued to and covering Contractor equipment used in Contract performance under this Contract. The insurance shall provide coverage on an all-risk basis and shall have limits adequate to cover the full replacement value of the Supplies and Contractor's Equipment. This insurance shall name the Additional Insured Parties as loss payees, as their interest may appear, and contain a waiver of subrogation against Additional Insured Parties.

47.8 Valuable Papers and Records Insurance: A policy covering loss or damage to valuable papers including blueprints, reports, surveys, designs or specifications in connection with this Contract, on an all-risk basis, in an amount no less than 100% of the replacement cost of such property. This insurance shall name the Additional Insured Parties as loss payees as their interest may appear and contain a waiver of subrogation against the Additional Insured Parties.

47.9 Technology Errors and Omissions Insurance. When Contractor's Services includes the delivery of information technology services and/or technology products to Amtrak, technology errors and omissions coverage for liability from errors, omissions or negligent acts in rendering or failing to render computer or information technology services and technology products, violation of software copyright, and the failure of products to perform the intended function or serve the intended purpose. The policy shall not contain a provision that would prevent, preclude or exclude liability triggered by or connected to a network failure, system failure or the disclosure of private information and shall have limits of not less than the amount set forth in the Contract per occurrence and in the aggregate, covering the information technology services performed in connection with Services and continuing in force by renewal or extended reporting provision for not less than the greater of three (3) years after final completion of the Services or the greater time under which a claim may be properly asserted under the applicable statute of limitations or repose. The policy shall have limits of insurance of not less than fifty million dollars per occurrence and in the annual aggregate.

47.10 Cyber Liability Insurance. When the Contractor's Services includes access to Amtrak's electronically stored proprietary information and personally identifiable information of Amtrak employees, customers or other third parties, cyber liability insurance for loss, disclosure and theft of data in any form, system failure, and network security failure, including but not limited

to, social engineering, phishing, ransomware, denial of service attacks, and transmission of malicious code. Coverage shall include regulatory fines and penalties, the cost of notifying individuals of a security or data breach, the cost of credit monitoring services and any other causally-related crisis management expense for up to one (1) year, shall contain no provision that would prevent, preclude or exclude a claim triggered by or connected with an act of cyber terrorism, shall extend to actual or alleged acts, errors or omissions committed by the Contractor or its agents, subcontractors, independent contractors or employees, shall contain severability for the insured organization for any intentional act exclusions, shall include consequential or vicarious liabilities and direct losses for the wrongful acts or failures of the Contractor, and shall have the "Insured v. Insured" exclusion amended to allow an Indemnified Party to bring a claim against the Named Insured. The policy shall have limits of not less than the amount set forth in the Contract per occurrence and in the aggregate, covering the information technology services performed in connection with Services and continuing in force by renewal or extended reporting provision for not less than the greater of three (3) years after final completion of the work or the greater time under which a claim may be properly asserted under the applicable statute of limitations or repose. The policy shall have limits of insurance of not less than fifty million dollars per occurrence and in the annual aggregate.

48. RESERVED.

49. PROTECTION OF PERSONS AND PROPERTY

49.1 Contractor shall be responsible for initiating, maintaining and supervising all safety precautions and programs in connection with the Work.

49.2 Contractor shall take all reasonable precautions for the safety of, and shall provide all reasonable protection to prevent damage, injury or loss to:

a). All employees involved in the Work and all other persons who may be affected thereby;

b). All the Work and all materials and equipment to be incorporated therein, whether in storage on or off the site or under the care or custody of Subcontractors; and

c). Other property at the Work site(s) or adjacent thereto, including but not limited to trees, shrubs, lawns, walks, pavements, roadways, structures and utilities not designated for removal, relocation or replacement in the course of construction.

49.3 Contractor shall comply with all applicable laws, ordinances, rules, regulations, and lawful orders of any public authority having jurisdiction for the safety of persons or property or to protect them from damage, injury or loss. Contractor shall erect and maintain, as required by existing conditions and progress of the Work, all reasonable safeguards for safety and protection, including posting danger signs and other warnings against hazards, promulgating safety rules and notifying owners and users of adjacent utilities.

49.4 Use or storage of explosive or other hazardous material shall not be permitted without the written approval of the Contracting Official. If use or storage of such materials is approved, Contractor shall exercise the utmost care in such use or storage and shall carry on such activities under the supervision of properly qualified personnel.

49.5 All damage or loss to any property referred to in this Article caused in whole or in part by Contractor, its Subcontractors, or anyone directly or indirectly employed by any of them, or by anyone for whose acts any of them may be liable shall be remedied by Contractor.

49.6 Contractor shall designate a responsible member of his organization at the site(s) whose duty shall be the prevention of accidents. This person shall be Contractor's superintendent unless otherwise designated in writing by Contractor to the COTR.

49.7 Contractor shall not load or permit any part of the Work to be loaded so as to endanger personnel and/or property.

49.8 When working in and around Amtrak property, all personnel employed by Contractor or its Subcontractors shall abide by the applicable safety policies and procedures for the respective property.

49.9 Contractor shall notify Amtrak to arrange for permission to enter upon Amtrak and railroad property. Twenty-one (21) days prior notice must be given to Amtrak for property access when Amtrak protection personnel are required. Prior to entering Amtrak's property, Contractor and its Subcontractors may be required to execute Amtrak's then current Permit to Enter.

49.10 Contractor, his employees and Subcontractors shall attend all required safety seminars as directed by Amtrak.

49.11 Contractor must comply with all Amtrak safety rules and operating rules.

50. GOVERNING LAW

The Contract shall be governed by and construed in accordance with the laws of the District of Columbia, excluding that portion of District of Columbia law relating to the application of laws of another jurisdiction. Subject to the Claims and Disputes section hereof, each party agrees that all legal proceedings in connection with any dispute arising under or relating to the Contract shall be brought in the United States District Court for the District of Columbia. Contractor hereby accepts the jurisdiction of the United States District Court for the District of Columbia and agrees to accept service of process as if it were personally served within the District of Columbia. In accordance with Section 53.2, this Article shall survive the termination or expiration of the Contract.

51. COMPLIANCE WITH LAW

51.1 All Work shall comply with all Applicable Laws that bear on the performance of the Work (including without limitation all building codes, zoning and other Laws that bear, or would bear but for any exemption from such Laws enjoyed by Amtrak, on the Work), except as otherwise expressly specified in the Contract or directed by the Contracting Official. If Contractor observes that any of the Contract terms are at variance therewith in any respect, he shall promptly notify the COTR in writing, and any necessary changes shall be made by appropriate Contract Modification, provided that no Contract Modification shall extend the Contract Time or increase the Contract Amount if it is based on a law enacted at the time of Contract execution. Contractor shall be deemed to have had notice of all laws enacted at the time of Contract execution, regardless if the effective date is after Contract execution. Contractor shall be deemed to have included in the Contract Amount the cost of making all Work comply with all laws enacted at the time of Contract execution.

51.2 In the event any governmental requirements are removed, relaxed or changed in any way after the execution of the Contract so as to make Contractor's performance less expensive or less difficult, Amtrak shall have the option to either require Contractor to perform pursuant to the more rigorous requirements, or to receive a reduction in the cost of the items of material or equipment affected for all savings by reason of such change.

52. WRITTEN NOTICE

Any written notice required of the parties under the provisions of the Contract shall be deemed to have been duly served upon receipt if delivered in person to the individual or representative or officer of the relevant party for whom it was intended, or upon mailing if sent by registered or certified mail to the business address designated in the Contract.

53. RIGHTS AND REMEDIES

53.1 Each of Amtrak's rights and remedies hereunder shall be cumulative, in addition to, and not a limitation of, any duties, obligations, rights and/or remedies provided at law, in equity, or otherwise. Amtrak's failure to exercise any of its rights under the Contract shall not constitute a waiver of any past, present or future right or remedy. No action or failure to act by Amtrak or any of its representative(s), including the Contracting Official, shall constitute approval of, waiver of, or acquiescence to, a breach by Contractor unless specifically agreed in writing. Waiver by Amtrak of any breach by Contractor shall not constitute a waiver of any other breach of the same or any other provision of the Contract. Acceptance of any Supplies of Services, or payment therefore, shall not operate as a waiver of any breach.

53.2 All representations, warranties, guarantees, licenses, indemnifications, agreements to hold Amtrak harmless, and other obligations created by the Contract which by their terms are intended to be fulfilled in whole or in part after termination or completion of the Work or which can, under the particular circumstances at issue, reasonably be fulfilled only after termination or completion of the Work, shall survive termination or expiration of the Contract. Contractor shall cause a parallel survival clause to be inserted in all subcontracts.

54. AMTRAK/CONTRACTOR RELATIONSHIP

54.1 The Contracting parties are not employer and employee, and nothing herein shall be construed as creating such relationship between Amtrak and Contractor. Contractor may adopt such arrangements as it may desire, subject to the provisions of the Contract, with regard to the details of the Work and Contractor's personnel or workers, provided however, that the Work shall be done by Contractor in such manner as shall be consistent with the achievement of the result contracted for within the time herein agreed upon.

54.2 It is further understood and agreed that, in no event shall Amtrak be required to make deductions from compensation or report earnings of employees of Contractor under any Social Security Act, or any other state or Federal statute, purporting to levy a tax on payrolls or the compensation of employees; and Contractor hereby agrees to indemnify and save Amtrak harmless from any and all liability, cost, or expense under such law, growing out of performance under the Contract.

55. PRODUCT SAFETY NOTIFICATIONS

55.1 Contractor shall comply with the Occupational Safety and Health Administration's Hazard Communication Regulations 29 CFR 1910.1200 and 29 CFR 1926.59 by providing or making readily available at the worksite, material safety data sheets for all chemicals, compressed gases, products containing hazardous materials, and products that may release hazardous substances (welding rods, solder, insulation materials, transite panels, gaskets, stock metal, etc.) during routine application.

55.2 Contractor shall notify Amtrak immediately by telephone (followed by written confirmation within twenty-four hours) (facsimile acceptable) whenever Contractor becomes aware that any component of the Supplies may contain a defect in design or construction which could in any way (a) become harmful to persons or property, or (b) create or present a risk to the health or safety of the public or to the environment, either by itself or when used by Amtrak within the scope of its intended purpose.

56. LABOR DISPUTES

Whenever an actual or potential labor dispute delays or threatens to delay the timely performance of the Contract, Contractor shall notify Amtrak immediately and furnish all relevant information. Contractor shall include the substance of this provision in all subcontracts hereunder.

57. PARENT GUARANTY

57.1 If Contractor is a subsidiary of another entity, then Amtrak's obligations under the Contract shall be contingent upon Amtrak's receipt of a satisfactory Parent Guaranty executed by the ultimate parent entity of Contractor or a related entity acceptable to Amtrak guarantying payment and performance of Contractor's obligations and liabilities under this Contract. In the event the

ultimate parent entity of Contractor is changed, the new ultimate parent entity or a related entity acceptable to Amtrak shall become the Guarantor, and the existing Parent Guaranty shall be substituted with a Parent Guaranty provided by the new ultimate parent entity of Contractor , a related entity or a replacement guaranty acceptable to Amtrak.

57.2 If Guarantor is incorporated or organized in a jurisdiction outside the United States of America, the Parent Guaranty delivered to Contractor shall be accompanied by an opinion addressed to Amtrak from counsel acceptable to Amtrak who are authorized to practice law in the Guarantor's jurisdiction, to the effect that the Parent Guaranty has been duly authorized, executed and delivered, is within the corporate power and authority of the Guarantor, requires no permits, filings, payments, consents or authorizations from any governmental authority or private party for its execution and delivery which have not been obtained by Contractor and/or Guarantor, complies with Applicable Laws, is legal, valid, binding, and a judgment or arbitration award properly obtained in the United States against Guarantor on the Parent Guaranty will be recognized and enforceable in the jurisdiction of the Guarantor without a de novo hearing on the merits of the judgment obtained.

57.3 Contractor shall provide to Amtrak a copy of the Guarantor's most recent annual audited financial statements prior to Amtrak's issuance of a NTP and also within one hundred twenty (120) days after the end of each of the Guarantor's fiscal years thereafter until three years after Amtrak's issuance of a Certificate of Final Fleet Acceptance. Any non-public financial statements submitted to Amtrak shall be treated as Amtrak treats its own confidential information if marked as such. The year-end financial statements of Guarantor shall be prepared in accordance with US Generally Accepted Accounting Principles or other similar accounting principles. If Guarantor restructures or divests itself of assets causing a substantial reduction in its net worth, it shall provide Amtrak written notice thirty (30) days prior to the public announcement of any restructuring, unless Guarantor's notification to Amtrak would violate financial securities laws or regulations then in place, in which case such notification shall not be required. In that event, or in response to publicly disclosed or privately provided financial information regarding Guarantor, Amtrak may by written notice to Contractor require a meeting with senior officials of Contractor to discuss Guarantor's financial situation and what assurances Amtrak has of the Guarantor's ability to honor the Parent Guaranty and other obligations including the Contractor's ability to complete the Work and delivery of the Supplies under the terms of this Contract. If Amtrak is or remains insecure about Guarantor's financial condition or Contractor's ability to complete the Contract in accordance with its terms, Amtrak may by further written notice to Contractor, require Contractor to transfer title to Amtrak (but not risk of loss) to all present Equipment and Supplies in process notwithstanding their state of completion or that they remain in the possession of Contractor. Upon Amtrak's written notice given under the prior sentence, title to all Equipment and Supplies in process of Contractor relating to this Contract for which Amtrak has been invoiced and such invoices have been paid as required by this Contract, shall automatically be deemed to have transferred to Amtrak at the time of such notice.

57.4 The Parent Guaranty may be enforced by either Amtrak or a Financing Party, provided that the enforcement of the Parent Guaranty by any such Financing Party shall only be permitted for Contractor defaults and damages and amounts owed by Contractor to Amtrak under this Contract, and not for defaults by Amtrak under any of its funding agreements or otherwise outside of the scope of this Contract. In the event that Amtrak transfers the Contract, the obligations of the Guarantor pursuant to the Parent Guaranty shall not exceed Contractor's unsatisfied obligations under the Contract.

57.5 If at any time the Credit Rating of Guarantor falls below "BBB" by Standard & Poor's or "BBB" by Moody's or Guarantor is placed on credit watch for a possible downgrade below such levels, Contractor shall provide to Amtrak a replacement Letter of Credit within five (5) days of such occurrence. "Credit Rating" means the long-term corporate credit rating or the senior unsecured and uncredit-enhanced debt rating of such Person.

58. SEGREGATION OF EQUIPMENT AND SUPPLIES

Following receipt of payment by Contractor for Equipment and Supplies as required by this Contract for which Amtrak has been invoiced and that have been manufactured and allocated to this Contract but have not been delivered to Amtrak, Contractor shall use its commercially reasonable efforts, using its existing information technology systems to segregate such Equipment and Supplies from its other inventory and designate Amtrak as the sole beneficiary of such Equipment and Supplies.

59. CREDIT CARD INFORMATION

59.1 If in performance of this Contract, Contractor will store, process, transmit, or have access to payment account data belonging to Amtrak or entrusted to Amtrak by its business partners, customers, vendors, contractors or employees, Contractor shall (1) comply with the Payment Card Industry's Data Security Standard ("PCI-DSS"), as set forth at https://www.pcisecuritystandards.org/ and as may be updated from time to time by the PCI Security Standards Council, and (2) within thirty (30) days of each anniversary of this Contract, certify in writing (to Amtrak's Contracting Official) Contractor's compliance with PCI-DSS in all aspects of Contractor's performance of this Contract or, alternatively, the basis for Contractor's exemption from PCI-DSS compliance.

59.2 If any software, Supplies, goods, or equipment (collectively "Goods") provided by Contractor pursuant to this Contract will store, process, transmit, or otherwise have access to credit card account numbers received from Amtrak or Amtrak's customers, such Goods shall comply with the Payment Card Industry's Payment Application - Data Security Standard ("PA-DSS"), as set forth at https://www.pcisecuritystandards.org/ and as may be updated from time to time by the PCI Security Standards Council.

59.3 Contractor acknowledges that it is responsible for compliance with PCI-DSS and PA-DSS, as applicable to Contractor's performance of this Contract.

60. SEPARATE CONTRACTS

60.1 If appropriate, Contractor shall afford other Amtrak Contractors reasonable opportunity for the introduction and storage of their materials and equipment and the execution of their work, and shall properly connect and coordinate its Work with theirs.

60.2 If any part of Contractor's Work is dependent in any way on the work of any other separate contractor, Contractor shall take all reasonable steps to become aware of any defects in the work of such other contractors that renders or would render such work unsuitable for proper execution of Contractor's Work. Contractor shall inspect the critical items of any such contractor's work before relying on or incorporating such work into Contractor's Work. If Contractor reasonably believes that another contractor's work is deficient or otherwise unsuitable for its intended purpose, Contractor shall notify Amtrak, in writing, immediately upon such discovery. Contractor shall waive his right to any claims regarding the unsuitability of such other contractor's work if Contractor fails to timely notify Amtrak of any defects in such other contractor's work that Contractor discovered or reasonably should have discovered.

60.3 Should Contractor or any Subcontractor cause damage to the work or property of any separate Amtrak contractor, Contractor shall, upon due notice, make all reasonable efforts to settle with such other contractor(s). If such separate contractor(s) sues Amtrak or initiates an arbitration proceeding on account of any damage alleged to have been so sustained, Amtrak shall notify Contractor, who shall defend such proceedings at its expense, and if any judgment or award against Amtrak arises there-from, Contractor shall pay or satisfy it and shall reimburse Amtrak for all attorneys' fees and court or arbitration costs which Amtrak incurred.

61. COMMENCEMENT OF STATUTORY LIMITATION PERIOD

Claims by Contractor shall not be brought after the earliest of (a) final payment under the Contract; (b) one year after the date of final completion of the project; or (c) one year after the date of Contractor's last substantial Work.

62. CYBERSECURITY

62.1 Contractor shall follow the National Institute of Technology (NIST) Cybersecurity Framework (CSF) to maintain and enforce digital data protection, safety and physical security procedures with respect to the access, use, and possession of Amtrak's Confidential Information and Amtrak data, when providing supplies or services to Amtrak that are (a) at least equal to industry standards and in compliance with all applicable laws; and (b) which provide reasonably appropriate technical and organizational safeguards to protect Amtrak against the accidental or unlawful destruction, loss, alteration or unauthorized disclosure or access of such information, data or systems. Contractor shall take all reasonable measures to secure and defend its location and equipment against hackers and others who may seek, without authorization, to modify or access Contractor's systems, Amtrak's systems or the information or data found therein and shall immediately report to Amtrak any breaches of security or unauthorized access to Amtrak's

Confidential Information or Amtrak data. Contractor shall use diligent efforts to remedy breaches in a timely manner and deliver to Amtrak a root cause assessment and future incident mitigation plan with regard to any breach of security.

62.2 If Contractor is providing services to develop and operate Amtrak company websites on Contractor's IT infrastructure, Contractor agrees to engage a third-party vendor at least annually, at its own expense, and acceptable to Amtrak, to perform penetration testing and vulnerability scans with respect to Contractor's systems. Contractor shall use leading industry practices to perform penetration tests to probe for network and infrastructure weaknesses that could be exploited. Contractor shall provide Amtrak with a written report of any high and medium level security issues, as defined by NIST Common Vulnerability Scoring System (CVSS), revealed during regular testing and how and when these vulnerabilities will be mitigated.

62.3 Contractor shall comply with the AMTRAK CYBERSECURITY AND PRIVACY TERMS AND CONDITIONS – STANDARD SHORT FORM attached hereto as Attachment 1.

26-FOI-00415 00000006273 "UNCLASSIFIED" 4/30/2026

ATTACHMENT 1

AMTRAK CYBERSECURITY AND PRIVACY TERMS AND CONDITIONS – STANDARD SHORT FORM

1. GENERAL PURPOSE & APPLICABILITY

1.1. General Purpose: Contractors deliver supplies and/or services that may access, create, use, process, transfer, share and/or store Amtrak Data or connect to the Amtrak Infrastructure. These Cybersecurity and Privacy Terms and Conditions (collectively "Attachment") are cybersecurity standards that apply to all Contractors who provide supplies and/or services to Amtrak.

1.2. Compliance: Contractors must comply with all applicable laws, regulations, statutes, industry standards, and compliance framework requirements including, but not limited to: the Payment Card Industry Data Security Standards (PCI-DSS), Health Insurance Portability and Accountability Act (HIPAA), Health Information Technology for Economic and Clinical Health (HITECH) Act, Sarbanes-Oxley Act (SOX), Gramm-Leach-Bliley Act (GLBA), General Data Protection Regulation (GDPR), California Consumer Privacy Act (CCPA), California Privacy Rights Act (CPRA), Colorado Privacy Act (CPA), Connecticut Data Privacy Act (CDPA), Virginia Consumer Data Protection Act (VCDPA), Utah Consumer Privacy Act (UCPA), Illinois Biometric Information Privacy Act (BIPA), ISO/IEC 27001, ISO/IEC 27002, ISO/IEC 27701, ISO/IEC 27032, ISO/IEC 27017, ISO/IEC 27018, NIST SP 800-53, Rev. 5 and other applicable NIST SP 800 series publications, the National Institute of Technology (NIST) Cybersecurity Framework (CSF), and any U.S. State privacy laws to the extent applicable, including as enacted or amended during the term of the Agreement. Contractor shall also comply with any and all laws, regulations, and other compliance requirements and industry standards regarding data protection, data privacy, data security, data integrity, business continuity, incident response, and similar matters applicable to entities designated as "critical infrastructure" including as enacted or amended during the term of the Agreement.

2. CYBERSECURITY & PRIVACY GOVERNANCE

2.1. Cybersecurity Governance: The Contractor must follow industry best practices and maintain a cybersecurity program (the Program) that implements, maintains, improves, and enforces reasonable and appropriate policies, procedures, and controls for the governance, assessment, risk management, workforce management, access control, physical security, continuous monitoring, incident response, and digital data protection in relation to the access, use, and possession of Amtrak Data, including Amtrak Confidential Information and Amtrak Employee Information.

2.2. Cybersecurity Framework Alignment: The Program must provide appropriate organizational, technical, administrative, and physical safeguards that align with the NIST CSF through

controls derived from applicable compliance frameworks such as NIST SP 800-53, Rev. 5 and ISO/IEC 27001. Program controls shall and meet or exceed any other applicable industry standards to protect Amtrak, Amtrak Employees, Amtrak Customers, Amtrak Data, and Amtrak Infrastructure against Security Incidents. The Contractor shall test and monitor the effectiveness of its safeguards. The Contractor shall conduct a risk assessment and review and update the Program at least annually.

2.3. Cybersecurity Awareness Training: Contractor must require and verify that its employees, contractors, consultants, and other downstream third-party staff complete cybersecurity awareness training, privacy awareness training, and any applicable role-based training associated with the collection, processing, or handling of Amtrak Data, no less than once per year. Upon request, Contractor shall provide Amtrak with proof of certification and/or attendance for such annual training activities.

3. AUDITS AND ASSESSMENTS

3.1. Audit Rights and Testing: Notwithstanding anything contrary in the Agreement and with no limitation to audit rights of Amtrak OIG, specifically with regards to security-related audits, the audit terms set forth in this Attachment shall apply.

3.1.1. Contractor agrees that Amtrak or its third-party designee may, but is not obligated to, perform audits and security tests of Contractor's information technology (IT) or systems environment and procedural controls to determine Contractor's compliance with the system, network, data, data privacy, and cybersecurity requirements of this Attachment. Audits and security tests shall be limited to areas relevant to Contractor's contractual engagement with Amtrak. Amtrak audits of the Contractor system shall be initiated during normal business hours and with at least 20 days advance notice or in the event of any Security Incident, not less than five (5) business days after the resolution of such Security Incident. Audit shall be performed under standards established by a recognized standards organization.

3.1.2. Contractor shall provide all information reasonably requested by Amtrak in connection with any audits and shall provide reasonable access and assistance to Amtrak upon request. Contractor shall comply, within reasonable timeframes at its own cost and expense, with all reasonable compliance remediation recommendations that result from such inspections, tests, and audits. Amtrak reserves the right to review, upon request, any original security reports that Contractor has undertaken or commissioned to assess Contractor's own network security for the provided Services. If requested, copies of these reports will be sent via bonded courier to the Amtrak security contact. Contractor will notify Amtrak of any such security reports or similar assessments once they have been completed.

3.1.3. If requested by Amtrak, Contractor shall, on an annual basis: 1) permit security reviews by Amtrak on systems storing or processing Amtrak Data including without limitation the

Program; and 2) permit testing of all security processes and procedures during the Term of the Agreement, including without limitation penetration tests. Tests may include coordinated security tests as mutually agreed upon as well as interviews of relevant personnel, review of documentation, and technical inspection of systems and networks relating to the receipt, maintenance, use, retention, and authorized destruction of Amtrak Data.

3.2. Audit Certifications and Compliance Reports: Contractor shall provide the required compliance reports or audit certifications as applicable, on an annual basis, and at its own cost and expense, to enable Amtrak to fulfill its annual audit and compliance requirements. The delivery of the following reports referenced in this Section shall not fulfill, replace, or negate any of the rights or obligations detailed in Section 3.1 Audit Rights and Testing, Section 3.3 Right to Inspection, or Section 3.4 Regulatory Examinations of this Attachment:

3.2.1. Current year SOC 2 Type 2 report.

3.2.2. Current year ISO/IEC 27XXX audit report(s).

3.2.3. PCI DSS reports on compliance as applicable.

3.2.4. Cloud Security Alliance (CSA) Consensus Assessments Initiative Questionnaire (CAIQ) registry reports for Software as a Service (SaaS) products and/or applications as applicable.

3.2.5. Contractors utilizing the AWS hosting platform to provide services to Amtrak must comply with AWS Foundational Security Best Practices standard as well as CIS AWS Foundations v1.4.0 security standard, or most recent version, and/or any upgrades released by the CIS AWS Foundations Benchmark.

Contractors utilizing the Microsoft Azure hosting platform to provide services to Amtrak must comply with Microsoft Azure Foundational Security Best Practices standard as well as CIS Microsoft Azure Foundations Benchmark v1.4.0 Controls, or most recent version, and/or any upgrades released by the CIS Microsoft Azure Foundations Benchmark Security Standard.

3.3. Right to Inspection: Upon request, Contractor shall provide to Amtrak the opportunity to review copies of the Contractor's policies, procedures, controls catalog, and independent audit report summaries for the implementation of required technical, physical, and administrative safeguards or controls derived from applicable cybersecurity frameworks relating to, and without limitation, the Program (e.g. ISO/IEC 27001, ISO/IEC 27002, ISO/IEC 27701, ISO/IEC 27032, ISO/IEC 27017, ISO/IEC 27018, NIST CSF, NIST SP 800-53, Rev. 5, SOC 2 Type 2).

3.4. Regulatory Examinations: Contractor agrees that any regulator or other governmental entity with jurisdiction over Amtrak and its affiliates may examine Contractor's activities relating to

the performance of its obligations under the Agreement and this Attachment to the extent that such authority is granted to such entities under the law. Contractor shall promptly cooperate with and provide all information reasonably requested by the regulator or other governmental entity in connection with any such examination and provide reasonable assistance and access to all equipment, records, networks, and systems reasonably requested by the regulator or other governmental entity. Contractor agrees to comply with all reasonable recommendations that result from such regulatory examinations within reasonable timeframes.

3.4.1. Within sixty (60) days of the audit results from the regulator or governmental entity, Contractor will provide Amtrak with a mitigation plan to address any risks, threats, concerns, or areas of non-compliance identified in the audit.

4. INFORMATION GOVERNANCE

4.1. Data Management: Contractor may collect, access, use, and otherwise process Amtrak Data solely as necessary to provide Services to or on behalf of Amtrak and in compliance with all applicable privacy and data protection laws, the Agreement, and any notices or disclosures regarding Personal Information made available by or on behalf of Amtrak ("Privacy Requirements"). Unless prior written consent is provided by Amtrak, Contractor: (1) shall not access or use Amtrak Data for any purpose other than to provide the Services, and (2) shall not give any third-party access to the data, except subcontractors subject to data protection and confidentiality requirements no less strict than those imposed on Contractor under this Attachment, or where otherwise required by law or regulation.

4.2. Confidentiality: Contractor agrees to maintain Amtrak Confidential Information in all forms (including paper and electronic) in strictest confidence, using measures no less stringent than those that Contractor uses for its own most confidential or sensitive information. Contractor shall take all reasonable measures to secure and defend its location and equipment against external and internal threat actors and those who may seek, without authorization, to modify or access Contractor's systems, Amtrak's systems, Amtrak Data, or the Confidential Information found therein. Contractor shall require its employees, contractors, consultants, and other downstream third-party staff to enter into written obligations of confidentiality and protection with respect to Amtrak Data no less protective than those contained in the Agreement and this Attachment.

4.3. Obligations Regarding Personal Information: Other than as strictly necessary for the performance of the Services, Contractor will not collect, store, or use the Personal Information of Amtrak, Amtrak Customers, or Amtrak Employees through the performance of the Services. Contractor will identify, monitor, protect, and maintain the Personal Information of Amtrak, Amtrak Customers, and Amtrak Employees in accordance with all laws, regulations, and legal requirements applicable for the collection, access, use, processing, sharing, storage, and deletion of Personal Information, shall not "sell" such Personal Information (as such term is defined by applicable privacy laws), and shall not retain, use, or disclose such Personal Information for any purpose other than as expressly set forth in the Agreement and this Attachment. Contractor shall

notify Amtrak in the event Contractor determines that it can no longer comply with applicable Privacy Requirements. Contractor shall provide Amtrak with assistance and cooperation in responding to requests from or on behalf of individuals to exercise legal rights regarding Personal Information and in connection with conducting any privacy impact assessments or similar assessments regarding Personal Information.

4.4. Data Aggregation and Anonymization: In the event that Contractor inadvertently collects any Personal Information through or as a result of Amtrak's, Amtrak Employees', or Amtrak Customers' usage of the Services, including without limitation Internet Protocol Addresses, Contractor must sanitize the data through Anonymization or Aggregation unless retention of Personal Information in an identifiable format is strictly necessary for the performance of the Services, for compliance with applicable law, or for compliance with the Agreement and this Attachment.

4.4.1. For the purposes of this Attachment, "Anonymization" refers to removal of Personal Information and any information reasonably likely to identify an individual person or household; provided such revised data does not include and is not subject to any key, code, or other mechanism that could be used to re-identify such information, and "Aggregation" refers to information that relates to a group or category of persons, households, or entities from which identifying information has been removed, that is not linked or reasonably linkable to any individual person, household, or entity, such as via a device; provided such revised data does not include and is not subject to any key, code, or other mechanism that could be used to re-identify such information..

4.4.2. Without limiting the generality of the requirements for Anonymized or Aggregated data, Contractor shall:

4.4.2.1. Implement technical safeguards that prohibit reversal of Anonymization or Aggregation of Personal Information collected through the Services;

4.4.2.2. Implement business processes that specifically prohibit such a reversal or recreation;

4.4.2.3. Make no attempt to achieve such reversal; and

4.4.2.4. Implement reasonable business processes to prevent inadvertent release of Anonymized or Aggregated Personal Information.

4.5. Machine Learning and Artificial Intelligence: Contractor shall not process or otherwise in any way use Amtrak Data for purposes of training, creating, or otherwise modifying any machine learning, large language model, artificial intelligence, or similar systems that learn and adapt without following explicit instructions through the use of algorithms and statistical models to analyze and draw inferences from patterns in data ("Machine Learning") without Amtrak's prior written authorization in each instance. If Contractor becomes aware of any use of Amtrak Data

in violation of the foregoing restriction, Contractor shall promptly notify Amtrak and take steps in cooperation with Amtrak to remediate and/or mitigate such unauthorized use. In addition, Contractor shall not use Machine Learning for the purpose of generating or developing software, computer code, or other materials used in or provided to Amtrak as part of the products or services supplied hereunder without Amtrak's prior written authorization in each instance.

5. INFORMATION MANAGEMENT & PROTECTION

5.1. Asset Management: Contractor must maintain an asset inventory and classification to manage essential information about hardware, software, data flows, interfaces, and data disclosures (e.g., unique identifiers, version numbers, data recipients, physical locations). Contractor must implement asset management controls for any assets that may be used to access Amtrak Data, Amtrak Infrastructure or Amtrak Resources. Contractor shall follow the required security standards and safeguards referenced in this Attachment for the utilization of all hardware and software in the performance of services to Amtrak under the Agreement.

5.2. Access Control: Contractor must restrict access to Amtrak Data and all systems that access, process, or store Amtrak Data through the utilization of a provisioning process that meets or exceeds the standards provided in the NIST CSF, NIST SP 800-53, Rev. 5, and other applicable NIST SP 800-series publications. Access to Amtrak Data must be restricted to only authorized individuals with an express need-to-know for the performance of the Services. Contractor must ensure that only authorized individuals are permitted access to business applications, systems, networks, and computing devices containing or processing Amtrak Data using, without limitation, secured channels via Contractor authorized virtual private network (VPN), jump boxes, secure shell (SSH), multi factor authentication (MFA), or other secure mechanisms.

5.2.1. Contractor personnel access shall be consistent with, and in no case exceed the scope of, any such authorization granted by Amtrak. All Amtrak-authorized connectivity or attempted connectivity to Amtrak's systems or networks shall be in conformity with Amtrak's security policies as may be amended from time to time with notice to the Contractor.

5.2.2. Contractor will review and verify the continued need for Contractor personnel access and level of access to Amtrak Data, systems, networks, and property on a quarterly basis and will retain evidence of the reviews for two (2) years from the date of each review. Contractor shall provide a certification of such review to Amtrak upon request.

5.3. Passwords: Contractor must ensure that its password policies and procedures are compliant with NIST SP 800-63 Digital Identity Guidelines and NIST SP 800-53, Rev. 5 guidance on password creation and authentication. These password policies and procedures must follow NIST best practices in configuration and management, including length and structure. All passwords must remain confidential and must not be shared between the Contractor, its employees, contractors and downstream third-party users.

5.4. Multi-factor Authentication (MFA): Contractor must ensure that multi-factor authentication is implemented for accounts with access to Amtrak Data, Amtrak Infrastructure, and other systems, networks, applications, and computing devices based on the NIST best practices and guidelines found in NIST SP 800-63 and NIST SP 800-53, Rev.5. Contractor must work with Amtrak to implement single sign-on (SSO) solution for MFA accounts as needed for Amtrak employee access to the Services.

5.5. Physical Location of Data: Contractor must notify Amtrak, in writing, thirty (30) days prior to relocating any physical storage location of Amtrak Data to a location or country that is different from the one(s) documented in the Contractor's statement of work, contract, or any Data Processing Addendum entered into between Amtrak and Contractor, so that any potential privacy or security implications can be addressed.

5.6. Virtualization & Cloud Solutions: If Contractor utilizes a cloud solution, then Contractor must adhere to the same security principles required by the terms in this Attachment, the Cloud Security Alliance Guidance, and applicable government regulations, laws, or directives as used throughout the Contractor's enterprise. The geographic location of the Contractor's infrastructure resources must be identified in writing to Amtrak prior to transferring out Amtrak Data to such resources. Contractor is required to receive prior approval from Amtrak, who has sole control over the data location in any cloud services, and shall cooperate with Amtrak to ensure compliance with local laws that restrict cross-border flow of data.

5.7. Physical Protection: Contractor must actively manage physical security controls and ensure that all buildings throughout the Contractor's enterprise that house critical IT functions (e.g., data centers, network facilities, and key user areas) and store, process or transmit Amtrak Data or any other service-related Amtrak information, or connect to Amtrak Infrastructure, are physically protected from unauthorized access. These physical security controls should follow security best practices and requirements (e.g., ISO/IEC 27002 and NIST SP 800-53, Rev. 5). Contractor must maintain and record facility access logs with access restricted to only those personnel with a business need-to-know. Contractor must review and update these access logs regularly but no less than quarterly.

5.8. Data Encryption: Contractor shall provide industry standard FIPS 140-2 encryption of Amtrak Data and Confidential Information in transit over public or leased circuits. Contractor shall also provide industry standard FIPS 140-2 encryption of Amtrak Data and Confidential Information at rest on local laptops, mobile devices, shared drives, information repositories, and backend data stores. In the event FIPS 140-2 standards regarding encryption are updated or replaced, Contractor shall use encryption that meets or exceeds such updated or replaced standards.

5.8.1. Contractor shall implement and maintain logical data segregation that meets or exceeds industry standards to ensure Amtrak Data is not viewable by unauthorized users.

5.9. Secure Destruction: Upon completion of the delivery of the products and services to be provided under the Agreement, or at any time upon Amtrak's request, Contractor shall return to Amtrak

or destroy all Amtrak Data as provided herein. Contractor shall return to Amtrak all hardware and removable media provided by Amtrak containing Amtrak Data. Amtrak Data in such returned hardware and removable media shall not be removed or altered in any way. The hardware must be physically sealed and returned via a bonded courier or as otherwise directed by Amtrak. If any hardware or removable media containing Amtrak Data is owned by Contractor or a third-party, then the Contractor shall securely destroy such data or return it to Amtrak via hardware or removable media as requested by Amtrak. Contractor shall provide to Amtrak a notarized certification of destruction detailing the destruction method used and the data sets involved, the date of destruction, and the entity or individual who performed the destruction. Contractor's destruction or erasure of Amtrak Data pursuant to this Section shall be in compliance with industry standard practices (e.g., Department of Defense Media Sanitization and Data Wipe Standard, NIST SP 800-88).

6. CYBERSECURITY INCIDENT RESPONSE AND MANAGEMENT

6.1. Incident Management: Contractor must document all Security Incidents and maintain a documented cybersecurity event management process that covers incident response, escalation, and remediation of Security Incidents. All such documentation must be retained for a minimum of five (5) years following the conclusion of any Security Incident, unless otherwise required by applicable law.

6.2. Reporting Incidents: Contractor shall immediately but no later than 24 hours after discovery, provide a written notice to Amtrak of any Security Incident.

6.2.1. The written notice shall include the date and time of the Security Incident's occurrence (or the approximate date and time of the occurrence if the actual date and time of the occurrence is not precisely known) and a detailed summary of the facts and circumstances of the Security Incident, including a description of:

6.2.1.1. The date of the Security Incident's discovery and the circumstances surrounding such discovery;

6.2.1.2. Why the Security Incident occurred (e.g., a description of the reason for the system failure);

6.2.1.3. The amount and type(s) of Amtrak Data known or reasonably believed to have been Disclosed;

6.2.1.4. The systems and/or applications likely impacted;

6.2.1.5. The categories and approximate number of data subjects affected, and their country of residence and the categories and approximate number of records affected; and

6.2.1.6. The measures being taken or proposed to be taken by Contractor to address and remedy the Security Incident's occurrence to prevent the same or a similar event from occurring in the future.

6.2.2. Amtrak may impose additional notification requirements for Security Incidents that compromise Amtrak's Data based on applicable state breach notification laws or requirements under applicable domestic and/or international privacy laws.

6.2.3. Contractor shall provide written updates for the Security Incident to Amtrak addressing any new facts and circumstances learned after the initial written notice is provided and shall promptly, but no later than seventy-two (72) hours, provide such updates after learning of those new facts and circumstances. Contractor shall reasonably cooperate with Amtrak in Amtrak's efforts to determine the risk posed by the Security Incident, including providing additional information regarding the Security Incident upon request from Amtrak.

6.3. Response Plan Development and Implementation: Contractor shall develop and implement a "Response Plan," which shall include policies and procedures to address Security Incidents. The Response Plan shall include appropriate provisions for mitigating the harmful effects of Security Incidents and addressing and remedying the occurrence(s) to prevent the recurrence of similar Security Incidents in the future. Contractor shall provide Amtrak access to inspect Contractor's Response Plan upon request. The development and implementation of the Response Plan shall follow industry standard practices, such as those that at a minimum are consistent with the contingency planning requirements of NIST SP 800-61, Rev. 2, Computer Security Incident Handling Guide.

6.3.1. Immediately upon learning of a Security Incident related to the products and services provided to Amtrak, Contractor shall implement its Response Plan and, within twenty-four (24) hours of implementing its Response Plan, shall notify Amtrak in writing of that implementation as described above.

6.4. Notification to Affected Parties: Contractor will, at its sole cost and expense, assist and cooperate with Amtrak with respect to any investigation of a Security Incident, disclosures to affected parties, and other remedial measures as requested by Amtrak in connection with a Security Incident or required under any applicable laws related to a Security Incident.

6.4.1. In the event a Security Incident results in Amtrak Data being Disclosed such that notification is required to be made to any person or entity, including without limitation any customer, shareholder, or current or former employee of Amtrak under any applicable laws, including privacy, data breach notification, and consumer protection laws, or pursuant to a request or directive from a governmental authority, such notification will be provided by Amtrak, except as required by applicable law or approved by Amtrak in writing. Amtrak will have sole control over the timing, content, and method of providing such notification.

6.5. Business Continuity: Contractor shall implement and maintain a business continuity program that meets or exceeds industry standards and that provides a formal framework and methodology, including without limitation, a business impact analysis and risk assessment process to identify and prioritize critical business functions ("Business Continuity Program"). Contractor shall provide Amtrak with evidence of the Business Continuity Program upon request.

6.5.1. Contractor shall conduct a business continuity test every twelve (12) months, including a review of the Business Continuity Program, roles and responsibilities, business documentation requirements, recovery strategies, Mean Time to Recovery (MTTR), Recovery Time Objectives (RTOs), Recovery Point Objectives (RPOs), testing strategy and frequency to ensure that appropriate recovery time frames are maintained to meet Amtrak business requirements for the Services. Contractor shall provide the results of any business continuity tests to Amtrak upon request.

6.5.2. Contractor shall implement and maintain a disaster recovery program that meets or exceeds industry standards and that provides a formal framework and methodology, including without limitation, a business impact analysis and risk assessment process to identify and prioritize critical business functions. Contractor shall provide Amtrak with evidence of the disaster recovery program upon request.

6.5.3. Contractor shall support Amtrak's business continuity and disaster recovery programs to restore critical business functions in the event of a cybersecurity incident and/or breach.

7. THIRD-PARTY MANAGEMENT

7.1. Outsourcing: Prior to making Amtrak Data available to any third-party contractor, subcontractor, vendor, processor, or supplier, Contractor shall notify Amtrak in writing and provide reasonable information regarding the scope of and reason for such proposed third-party's access to Amtrak Data. Contractor shall provide Amtrak with a reasonable time, not less than thirty (30) days, to object to the engagement of such third party and Contractor and Amtrak shall use reasonable good faith efforts to resolve any such objection by Amtrak, such as by identifying an alternative third party or adjustment to the services. Contractor must operate a formal process to address due care and due diligence considerations in the selection and management of downstream contractors, subcontractors, vendors, processors, and suppliers. Contractor must maintain all necessary agreements with such third parties that specify the security and data privacy requirements to be met before commencing work on behalf of Contractor that could have an impact on Amtrak Data, Amtrak Infrastructure, or any Amtrak business operations with the Contractor. Contractor shall ensure that these agreements align with the terms in this Attachment and must ensure that its contractors, subcontractors, vendors, processors, and suppliers are compliant with equivalent security and data privacy requirements to those contained in this Attachment and as required by applicable law.

7.2. Indemnification: Contractor agrees to indemnify Amtrak for any and all actions taken by its own contractors, subcontractors, vendors, processors, and suppliers. Contractor acknowledges that it will be fully liable for all acts and omissions of these third parties.

8. CYBERSECURITY ASSESSMENT

8.1. Contractor Onboarding Assessment: Amtrak shall have the option, at its sole discretion upon execution of the Agreement, to perform a full cybersecurity assessment on Contractor's Program and technical, physical, management, and security controls. Contractor agrees to comply with all reasonable cybersecurity requirements specified by Amtrak before commencing any work for Amtrak or accessing Amtrak Infrastructure or networks.

9. MISCELLANEOUS

9.1. Order of Precedence: In the event of a conflict between a provision or terms in this Attachment and any other Services Agreement or Contract the provision or interpretation that provides Amtrak, Amtrak Data, Amtrak Employees, Amtrak Customers, and Amtrak Infrastructure stronger protection will control.

9.2. Definitions: The following defined terms in have the meanings set forth below and shall only apply to this Attachment. Any terms defined elsewhere in the Agreement will be given equal weight and importance as though set forth in this Attachment. In the event of a conflict, greater weight shall be given to the version which provides greater protection to Amtrak, Amtrak Data, Amtrak Employees, Amtrak Customers, and Amtrak Infrastructure.

9.2.1. "**Amtrak Data**" means (a) all data and information Amtrak provides to Contractor, made accessible by Amtrak to Contractor, or to which Contractor has access or that Contractor (or Contractor Services) accesses, retrieves, collects, or otherwise processes during the course of performance of the Services from or on behalf of Amtrak, Amtrak Employees, Amtrak Customers, or trackers on the Amtrak website; (b) all archives, derivatives, summaries, abstracts, compilations, combinations with other information, modifications or manipulations of the foregoing data or information, Aggregated information, Anonymized or de-identified information, data sets, subsets, and the like related to, or derived from such data or information; (c) all reports generated by the Services, or otherwise generated or provided by Contractor relating to or in connection with the Product or Services; and (d) all Amtrak Confidential Information.

9.2.2. "**Amtrak Infrastructure**" means any information technology system, virtual or physical, that Amtrak or its Affiliates own, control, lease, or rent, and that resides on or outside Amtrak's network. Amtrak Infrastructure includes infrastructure obtained from an IaaS provider and systems that are provided and located on the Amtrak network or hosted on a third-party network as part of a Service.

9.2.3. "**Confidential Information**" means any information that during the Term is disclosed by or on behalf of a Party or its Affiliate (the "Disclosing Party") to the other Party or its Affiliate (the "Receiving Party") and at the time of disclosure: (i) is designated in writing as confidential or proprietary; (ii) is designated orally as confidential or proprietary, and embodied by the Disclosing Party in written or other tangible form, including meeting minutes, memos, diagrams, flow charts, and software; or (iii) should reasonably be understood by the Receiving Party to be confidential to the Disclosing Party under the circumstances.

9.2.4. "**Disclosed**" means any circumstance when the security, integrity, or confidentiality of any Amtrak Data has been compromised, including but not limited to incidents where Amtrak Data has been damaged, lost, corrupted, destroyed, or accessed, acquired, modified, used, or disclosed by any unauthorized person, by any person in an unauthorized manner, or for any unauthorized purpose.

9.2.5. "**MTTR**" or Mean Time to Recovery means the average time it takes to recover from a product or system failure.

9.2.6. "**Personal Information**" means any information that identifies, relates to, describes, is reasonably capable of being associated with, or could reasonably be linked, directly or indirectly, with a particular individual or household and includes, without limitation, any information defined as "personal information," "personal data," "personally identifiable information" or similar terms under applicable privacy or data protection laws. Personal Information of Amtrak Employees or Customers is considered to be Amtrak Data and Confidential Information, and includes without limitation: Social Security Numbers, personal tax ID numbers, military identification numbers, student identification numbers, passport numbers, driver's license numbers, other government identification numbers, financial account data, payment card information, biometric information, health or medical information, insurance information, educational information, usernames, email addresses, names, home addresses, phone numbers, passwords, unique online identifiers such as cookies and mobile identifiers, access codes, and security questions.

9.2.7. "**Security Incident**" means any circumstance when (i) Contractor knows or reasonably suspects that Amtrak Data hosted or stored by the Contractor has been Disclosed; (ii) Contractor knows or reasonably suspects that an act or omission has compromised or may reasonably have compromised the security of the products and Services provided to Amtrak by Contractor or the physical, technical, administrative, or organizational safeguards protecting Contractor's systems used to store or host Amtrak Data or any Amtrak Infrastructure; (iii) Contractor discovers or reasonably suspects any other incident that impacts or may impact Amtrak's business operations, Amtrak Data, or Amtrak Infrastructure; or (iv) Contractor receives any complaint, notice, or communication which relates directly or indirectly to any of the foregoing involving (A) Contractor's handling of Amtrak Data or Contractor's compliance with the data

safeguards in this Attachment or applicable laws or (B) the security of the products and Services provided to Amtrak by Contractor.

9.2.8. "**Services**" mean all necessary or required services, tasks, functions, products and other responsibilities and activities as set forth in, or reasonably inferable from, the Agreement, or any Scope of Work, Order or any such other written document.

9.2.9. "**RPO**" Recovery Point Objective means the point in time to which data must be recovered after an outage.

9.2.10. "**RTO**" Recovery Time Objective means the overall length of time an information system's components can be in the recovery phase before negatively impacting Amtrak's mission or mission/business processes.

NATIONAL RAILROAD PASSENGER CORPORATION
(AMTRAK)

SUPPLEMENTARY GENERAL PROVISIONS
FOR NONCONSTRUCTION CONTRACTS (ANNUAL GRANTS/IIJA SUPPLEMENTAL GRANTS)

1.0 Equal Employment Opportunity. Contractor shall comply and shall cause its subcontractors and lower tier subcontractors to comply with the regulations at 41 CFR Part 60, "Office of Federal Contract Compliance Programs, Equal Employment Opportunity, Department of Labor." The equal opportunity clause provided under 41 CFR 60-1.4(b) is hereby incorporated by reference. Contractor shall prohibit discrimination based on race, color, religion, national origin, sex (including gender identity), disability, or age.

2.0 Rights In Intangible Property.

2.1 **Definition.** Intangible property, as defined herein means property having no physical existence, such as trademarks, copyrights, patents and property applications.

2.2 **Title to Intangible Property.** Intangible property acquired or created in the performance of this Contract vests in Amtrak upon acquisition or creation, as applicable. The requirements of this Section 2.0 shall apply only to intellectual property acquired or created under a planning, experimental, developmental, or research grant or contract.

2.3 **Copyright.** Amtrak may copyright any work that is subject to copyright and was created or for which ownership was acquired under this Contract. For any work acquired or created under a planning, experimental, developmental, or research grant or contract, Contractor agrees that the Federal Railroad Administration has reserved a royalty-free, nonexclusive and irrevocable right to reproduce, publish, or otherwise use the work for Federal purposes and to authorize others to do so for Federal Government purposes.

2.4 **Patents.** The following provisions will apply to patents under this Contract:

2.4.1 If the Contract involves the performance of experimental, developmental, or research work, the rights of the Federal Government and Amtrak shall be in accordance with 37 CFR Part 401, "Rights to Inventions Made by Nonprofit Organizations and Small Business Firms Under Government Grants, Contracts and Cooperative Agreements," and any implementing regulations issued by the Federal Railroad Administration (FRA).

2.4.2 If any invention, improvement, or discovery of Contractor or any of its subcontractors is conceived or first actually reduced to practice in the course of or under a planning, experimental, developmental, or research grant or contract, Contractor agrees to grant Amtrak and the Federal Railroad Administration, a royalty-free, nonexclusive, and irrevocable license to use and to authorize others to use the patented device or process for Federal Government purposes.

2.5 **Research Data.** For any research data (as defined in 2 CFR Part 200.315(e)) acquired under this Contract, the Federal Railroad Administration has a right to:

2.5.1 Obtain, reproduce, publish, or otherwise use the research data produced under this Agreement for Federal Government purposes; and

2.5.2 Authorize others to receive, reproduce, publish, or otherwise use such research data for Federal Government purposes.

3.0 Byrd Anti-Lobbying Amendment. Contractors that apply or bid for an award exceeding $100,000 shall file the required certification at 49 CFR Part 20, and attached hereto as Appendix A. Each tier contractor certifies to the tier above that it will not and has not used Federal appropriated funds to pay any person or organization for influencing or attempting to influence an officer or employee of any agency, a member of Congress, officer or employee of Congress, or an employee of a member of Congress in connection with obtaining any Federal contract, grant or any other award covered by 31 U.S.C. 1352. Each tier contractor shall also disclose any lobbying with non-Federal funds that takes place in connection with obtaining any Federal award. Such disclosures are forwarded from tier to tier up to Amtrak.

4.0 Debarment And Suspension. For contracts that exceed $350,000, Contractor shall certify to Amtrak that Contractor is not listed on the government-wide exclusions in the System for Award Management (SAM), in accordance with OMB guidelines at 2 CFR Part 180 that implement Executive Orders 12549 and 12689, "Debarment and Suspension". SAM exclusions contain the names of parties debarred, suspended, or otherwise excluded by agencies, as well as parties declared ineligible under statutory or regulatory authority other than E.O. 12549. Contractor shall comply and cause its subcontractors to comply with U.S. DOT regulations, 2 CFR Part 180 and 2 CFR Part 1200, "Nonprocurement Suspension and Debarment," Contractor shall execute the "Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion" set forth in Appendix B. Contractor agrees to obtain the same such certification on debarment and

suspension from its subcontractors and lower tier subcontractors.

5.0 Domestic Buying Preference/Buy American Act.

5.1 In accordance with Amtrak's Domestic Buying Preference requirements at 49 U.S.C. 24305(f), Amtrak shall only buy, and accordingly, Contractor shall only supply (a) unmanufactured articles materials, and supplies mined or produced in the United States; or (b) manufactured articles, material, and supplies manufactured in the United States substantially from articles, materials, and supplies mined, produced or manufactured in the United States. For purposes of this provision, substantially means that more than 55% of all components by cost must be domestic. This Section 5.1 shall apply only when the cost of those articles, material, or supplies bought or supplied to Amtrak by Contractor is at least $1,000,000.

5.2 When complying with Section 5.1, Contractor shall comply with the domestic preference requirements of the Build America, Buy America Act (BABA) § 70914, Pub. L. No. 117-58, div. G, tit. IX, subtit. A, 135 Stat. 429, 1298 (2021), as implemented by OMB, USDOT, and FRA.

5.3 In accordance with 2 C.F.R. §200.322, as appropriate and to the extent consistent with law, Contractor shall, to the greatest extent practicable, provide a preference for the purchase, acquisition, or use of goods, products, or materials produced in the United States (including but not limited to iron, aluminum, steel, cement, and other manufactured products). The requirements of this section must be included in all subcontracts and purchase orders for work or products under this Contract.

(a) For the purposes of this Section 5.3:

(1) "Produced in the United States" means, for iron and steel products, that all manufacturing processes, from the initial melting stage through the application of coatings, occurred in the United States.

(2) "Manufactured products" means items and construction materials composed in whole or in part of non-ferrous metals such as aluminum; plastics and polymer-based products such as polyvinyl chloride pipe; aggregates such as concrete; glass, including optical fiber; and lumber.

6.0 Cargo Preference--Use Of United States-Flag Vessels. As required by U.S. DOT, Maritime Administration regulations, "Cargo Preference -- U.S.-Flag Vessels," 46 CFR Part 381, if equipment, materials or commodities may be transported by ocean vessel in carrying out the activities funded under this Contract, Contractor agrees:

6.1 To utilize privately owned United States-flag commercial vessels to ship at least 50 percent of the gross tonnage (computed separately for dry bulk carriers, dry cargo liners, and tankers) involved, whenever shipping any equipment, materials, or commodities pursuant to this Contract, to the extent such vessels are available at fair and reasonable rates.

6.2 To furnish within 20 days following the date of loading for shipments originating within the United States or within 30 working days following the date of loading for shipments originating outside the United States, a legible copy of a rated, "On-Board" commercial ocean bill-of-lading in English for each shipment of cargo described in paragraph (a) above to Amtrak (through the prime contractor in the case of subcontractor bills-of-lading) and to the Division of Cargo Preference and Domestic Trade, Maritime Administration, 1200 New Jersey Avenue, SE, Washington, DC 20590, marked with appropriate identification.

6.3 To insert the substance of the provisions of this Section in all subcontracts issued pursuant to this Contract.

7.0 Drug-Free Work Place. Contractor agrees to comply with U.S. DOT regulations, "Government-wide Requirements for Drug-Free Workplace (Grants)", 49 CFR Part 32, and FRA regulations, "Control of Alcohol and Drug Use", 49 CFR Part 219.

8.0 Compliance With 2 C.F.R. § 200.321. Contractor shall comply with the requirements of 2 CFR § 200.321 consistent with all Executive Orders (EO) including, EO 14173 titled "Ending Illegal Discrimination and Restoring Merit-Based Opportunity' and EO 14151, titled "Ending Radical and Wasteful Government DEI Programs and Preferencing." Contractor shall insert this provision in all subcontracts issued pursuant to this Contract.

9.0 Record Retention And Access.

9.1 Contractor shall retain all financial records, supporting documents, statistical records and all other Contractor records pertinent to this Contract for a period of three years after contract closeout as set forth in 2 CFR 200.333-200.337.

9.2 Authorized representatives of the Federal Railroad Administration, Inspectors General, and the Comptroller General of the United States shall have access to and the right to examine, audit and copy any of Contractor's directly pertinent books, documents, papers, or other records involving transactions related to this Contract as long as the records are retained.

9.3 In cases where litigation, a claim, or an audit is initiated prior to the expiration of the three-year period, records must be retained until completion of the action and resolution of the issues or the end of the three-year period, whichever is later.

9.4 In accordance with the May 2013 Executive Order on Making an Open and Machine Readable the New Default for Government Information, the Contractor shall, whenever practicable, collect, transmit, and store Contract-related information in open and machine readable formats rather than in closed formats or on paper.

10.0 Environmental Protection. *This section applies if the Contract exceeds $150,000*. Contractor will conduct work under this Contract, and will require that work that is conducted as a result of this Contract be in compliance with the following provisions, as modified from time to time, all of which are incorporated herein by reference: the Clean Air Act, 42 U.S.C. 7401 *et seq*., and the Federal Water Pollution Control Act, 33 U.S.C. 1251 *et seq*., and all regulations issued thereunder. Where applicable, Contractor shall comply with the Wild and Scenic Rivers Act of 1968 (16 U.S.C. 1271 *et seq*.).

11.0 Application To Lower-Tier Subcontractors. Contractor shall insert in each subcontract the provisions set forth in these Supplementary General Provisions and also a provision requiring the subcontractors to include these provisions in any lower tier subcontracts. Contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the provisions set forth herein. Contractor shall also include in each subcontract that exceeds $350,000, and cause its subcontractors to include in each lower tier subcontract that exceeds $350,000 provisions that allow for administrative, contractual or legal remedies in instances which a contractor or subcontractor violates or breaches contract terms.

12.0 Contract Termination Provisions. All subcontracts in excess of $10,000 shall address termination for cause and termination for convenience, including the manner by which termination will be effected and the basis for settlement.

13.0 Allowable Costs. Contractor's expenditures will be reimbursed only if they conform with Federal guidelines or regulations and Federal cost principles as set forth in Federal Acquisition Regulation, 48 CFR Chapter I, Subpart 31.2, "Contracts with Commercial Organizations", which are incorporated herein by reference. If any costs are disallowed, as determined by an audit by Amtrak or the Federal Government, Contractor agrees to reimburse Amtrak for such disallowed costs within sixty (60) days of advice to Contractor of the determination of disallowance.

14.0 Americans With Disabilities Act. Contractor shall comply and cause its subcontractors and lower tier subcontractors to comply with the requirements of the Americans with Disabilities Act of 1990, as amended (42 U.S.C. § 12101 *et seq*.), the Rehabilitation Act of 1973, as amended (29 U.S.C. 794 *et seq*.) and the implementing Department of Transportation regulations at 49 CFR Parts 27, 37 and 38.

15.0 Capital Acquisition. The FY 2016 Appropriations Act requires Amtrak to include a statement in any contract for a capital acquisition that exceeds $10,000,000 in life cycle costs that funding for the acquisition is subject to the availability of funds appropriated by Congress in an Appropriations Act, even though Amtrak is not subject to the Anti-Deficiency Act, does not receive appropriations directly from Congress, and possesses other sources of revenue that may fund the capital acquisition.

16.0 Prohibition on Certain Telecommunications and Video Surveillance Services or Equipment. Contractor shall provide no equipment, services, or systems under the Contract that causes Amtrak to be in violation of 2 CFR §200.216 (Prohibition on certain telecommunications and video surveillance services or equipment). As of the effective date of 2 CFR §200.216, companies that may be implicated by this provision are: Huawei Technologies Company, ZTE Corporation, Hytera Communications Corporation, Hangzhou Hikvision Digital Technology Company, or Dahua Technology Company (or any subsidiary or affiliate of such entities). Contractor shall include this provision in all subcontracts it issues.

17.0 Application of Federal Laws and Regulations. Contractor understands that Federal laws, regulations, policies, and related administrative practices may be modified from time to time. Contractor agrees that the most recent of such Federal requirements will govern this Contract at any particular time, except if there is sufficient evidence in this Contract of a contrary intent.

APPENDIX A TO SUPPLEMENTARY GENERAL PROVISIONS
FOR
NONCONSTRUCTION CONTRACTS

CERTIFICATION REGARDING LOBBYING

The undersigned certifies, to the best of his or her knowledge and belief that:

(1) No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of an agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.

(2) If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form LLL "Disclosure Form to Report Lobbying," in accordance with its instructions.

(3) The undersigned shall require that the language of this certification be included in the award documents for all subawards at all tiers (including subcontracts, subgrants, and contracts under grants, loans, and cooperative agreements) and that all subrecipients shall certify and disclose accordingly.

This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by section 1352, title 31, U.S. Code. Any person who fails to file the required certification shall be subject to a civil penalty of not less than $10,000 and not more than $100,000 for each such failure.

REPRESENTATIONS AND CERTIFICATIONS

As a part of its Bid/Offer, Bidder/Offeror provides the following information:

1. Bidder/Offeror Information

A. Legal Name of Bidder/Offeror: _____

B. Employer Identification Number of Bidder/Offeror: _____

C. Bidder/Offeror operates as a (check as applicable): Individual _____, Partnership _____, Joint Venture _____, Corporation _____, or Limited Liability Company _____. If Bidder/Offeror operates as a Joint Venture, a copy of the executed Joint Venture Agreement must accompany this form.

D. Bidder/Offeror is organized under the laws of: _____.

2. Parent Company Information

A. Bidder/Offeror is ____ is not ____ owned or controlled by a parent company. For purposes herein, a parent company is one which (i) owns more than 50% of the voting rights in the Bidder/Offeror, or (ii) is able to formulate, determine, or veto basic business policy decisions of Bidder/Offeror through the use of various means, including, minority voting rights, proxy voting, or contractual arrangements.

B. Parent Company Name (if applicable): _____

C. Employer Identification Number of Parent Company (if applicable): _____

3. Small Business

A. Bidder/Offeror is ____ is not ____ a small business concern as defined by the United States Small Business Administration.

4. Worker Safety Record

In the past three years, Bidder/Offeror has ____ has not ____ admitted or been found to have committed, any willful or repeat violations of Federal or State worker safety laws, rules or regulations. Provide the specifics with respect to any such violations on an attached sheet of paper.

Bidder/Offeror agrees that, if it provides false or incomplete information herein, Amtrak has the right to reject its Bid/Offer and/or to terminate any resulting contract without liability.

I hereby certify that the information provided herein is true and complete.

Table of Figures

Figure 1-1: Target Revenue Capacities 1-7

1.1 Overview

a). The purpose of this Technical Specification is to define the performance and technical requirements for a fleet of new single level rail cars for use across Amtrak's network.

b). The Cars shall be delivered in accordance with Exhibit V.

i). Cars shall be arranged to optimize both revenue and non-revenue capacities in accordance with the target capacities presented in this Chapter.

(1) In the optimization process, the Contractor shall strive to propose a car arrangement that maximizes revenue potential for Amtrak while simultaneously offering flexibility to efficiently develop the design and manufacturing processes.

c). Cars shall be modular in design to the best extent possible in order to be optimized for Amtrak's evolving needs over the life of the equipment while being interoperable with Amtrak's legacy fleets.

d). The Cars shall be used in locomotive hauled service and shall be compatible with Amtrak's current fleet of locomotives.

i). Cars may be operated with multiple locomotives at one end of the consist or locomotives at either end.

ii). Cars are primarily targeted for service with Amtrak's legacy fleet of locomotives.

iii). Cars are to be interoperable with Amtrak's legacy equipment, especially the Viewliner I & II fleets as the Cars will initially be deployed on Eastern routes to replace the Amfleet II fleet.

iv). The Standard Coach, Standard Sleeper, and Utility cars shall be able to convert from gangways to type 1 diaphragms or vice-versa on both ends of the cars.

v). The Premium Coach and Accessible Sleeper shall be able to convert from gangways to type 1 diaphragms or vice-versa on the non-vestibule end. All cars shall be shipped with gangways and diaphragms from the factory, and the required configuration will be outlined in Exhibit V.

vi). The cars must achieve full interoperability with both Viewliner I and II car types, including mechanical and functional interface compatibility with their diaphragm systems. If cars are shipped with diaphragms they will later transition to gangways, supporting smooth operation with the newly procured cars as the Viewliner fleet is gradually retired. Amtrak will provide details prior to car shipment to what depot the gangway or diaphragm will be shipped pending what configuration the car leaves the factory.

(1) Cars must be interoperable with Amtrak's legacy Single Level fleet of cars and locomotives. Viewliner II Baggage cars will be used in all consists unless the option for a Utility Car is exercised.

e). The Cars shall allow Amtrak to operate throughout the United States of America and portions of Canada/Mexico. The Single Level Fleet shall operate in both low and high platform territories.

f). Technical characteristics and performance parameters for these Cars are described herein, as are the design review, inspection, testing and documentation requirements for producing and supporting these Cars.

g). Accessibility and Universal Design for people with disabilities is a priority to Amtrak, Amtrak requires that the Cars meet or exceed the requirements of the Americans with Disabilities Act (ADA) revision 2010 while incorporating elements of RVAAC to the best extent possible. Amtrak considers Universal Design as a norm and envisions an accessible core design where all passengers using wheeled mobility devices have access to all amenities offered on the consist.

h). All design review, inspection, qualification and testing required by this contract shall be performed specifically for this contract. Reports from previous contracts or procurements will not be accepted unless otherwise reviewed and approved by Amtrak.

i). Throughout this technical specification, requirements are applicable to all chapters where relevant. For instance, requirements specified in Chapter 11 are equally applicable to Chapter 31, and vice versa.

1.2 Regulations

a). The Cars must be fully compliant with all applicable United States Federal and Transport Canada regulations for safety, operations, design, accessibility, testing and materials standards.

b). The Cars shall be designed and constructed in accordance with Federal Railroad Administration and APTA design standards, to minimize passenger and train crew potential injuries in the event of collision.

c). In addition, applicable industry standards, including but not limited to APTA and AAR standards, shall apply as determined by Amtrak and referenced in this Specification.

d). A complete listing of all regulations, standards, recommended practices and specifications that are referenced in this document can be found in Chapter 2.

e). The list of referenced documentation in Chapter 2 is not to be interpreted as a comprehensive and exhaustive list of all regulations and standards to which the Contractor must adhere to in the design and manufacture of the Cars.

f). The Contractor shall be solely responsible for complying with all standards, recommended practices and regulations that apply to the design and production of these Cars.

1.3 Concept and Definition

a). As defined in this Specification, all cars shall be configured with standard H Type couplers, air brake hoses, and passenger car head end power on both ends.

b). To allow for operation with existing rolling stock equipment, cars shall be designed with Power/Communications/locomotive MU control electrical trainlines and air connections to allow the Cars to have interoperability with existing Amtrak rolling stock.

i). The inter-car connection architecture shall be designed/provisioned to allow upgrades to other inter-car connection types when Amtrak's existing fleet of rail cars are retired.

ii). Reliability is key to Amtrak, and the inter-car connections shall be robust and future-proof.

c). The Contractor shall comply with regulatory requirements and meet the performance requirements that are outlined in this Specification.

d). The Cars must be designed and constructed to be suitable for unrestricted service in all service areas governed by Amtrak's Clearance Diagram, Single Level D-05-1355 Rev E.

e). The Cars shall be designed, tested and qualified for bi-directional operation at a maximum speed of 125 mph and 5" cant deficiency.

f). The Cars must also comply with all applicable provisions of Title 49 CFR, as administered by the Federal Railroad Administration (FRA), in effect at the time of Notice to Proceed.

g). The Cars shall be designed with adequate storage for food service equipment, cleaning supplies, linens, tools, and other necessary on-board equipment as required for the intended service and/or as specifically required by this specification.

h). Details for the accommodations to be incorporated within the cars are presented in Chapters 11 and 31.

1.4 Accessibility Requirements

a). In addition to compliance with the requirements of the ADA and other accessibility requirements in this specification, the Contractor shall comply with the terms of the Application for Equivalent Facilitation (EF) submitted by Amtrak and approved by the USDOT (Exhibits R-1 and R-2). The approved EF was based on a trainset configuration and will need to be revised to reflect the equipment configuration under this procurement. The Contractor with the support of Amtrak shall prepare and submit a revised EF application and shall work with Amtrak, FRA and disability community to obtain an accessibility solution that is accepted by all parties involved.

b). An accessible path is required to navigate from the side loading door entry vestibule to any car in the accessible core to the designated accessible seating or sleeping location(s) in all car types. The accessible path will go from end to end of all cars in the accessible core.

c). Accessible Core

i). To clarify one of the key requirements of Equivalent Facilitation, all accessible coach spaces and all accessible bedrooms shall be located in an Accessible Core which shall comply with the following definition and requirements.

ii). Accessible Core Definition:

(1) Centrally located grouping of car types within the consist with a fully accessible path via 32” aisle.

(2) The purpose of the Accessible Core is to provide an equitable experience with access to all onboard amenities for all passengers.

(3) The accessible core is critical to achieving "equal or better" accessibility requirements through alternative design standards detailed in the Equivalent Facilitation approved by the FRA.

(4) Successful deployment of the Accessible Core should allow for non-accessible and repeatable coach and sleeper cars with high-capacity accommodations outside of the Core.

iii). Accessible Core Requirements:

(1) The Café, Premium Accessible Coach, Accessible Sleeper, Diner/Lounge and Diner Cars shall be designed to be end-to-end accessible as these car types make up the accessible core.

(2) Core must include all accessible coach positions and all accessible bedrooms in order to provide priority placement with the shortest possible path to experiential amenities (e.g. Diner/Lounge, Café, etc.).

(3) Core must include at least two (2) accessible restrooms to provide redundancy along the accessible path.

(4) Core must include/comply with all accessibility requirements defined in the Equivalent Facilitation Alternative Design Standards

(5) Each Premium Accessible Coach must include at least three (3) accessible spaces and at least three (3) transfer seats but in reality, all aisle seats shall serve as transfer seats.

(6) Each Accessible Sleeper must include at least two (2) accessible bedrooms with restrooms.

(7) Each Diner Car with one (1) RVAAC accessible position.

(8) Each Diner/Lounge with three (3) RVAAC accessible positions – one (1) in the Diner seating area and two (2) in the Lounge seating area.

(9) Each Café Car with two (2) RVAAC accessible positions.

(10) Each Standard Coach with two (2) RVAAC accessible positions.

d). Seating shall be modular to allow for the addition of a second accessible location at either end of the Premium Accessible Coach car. All accessible amenities shall

be included for both locations such as a reading light and a workstation table.

e). If Amtrak exercises option for High Capacity Coach Cars (Chapter 30) and additional café cars, Amtrak prefers to provide six (6) RVAAC accessible seating locations with proximity to the Café Car with two (2) being provided in each adjacent car to the Café and two (2) being provided in the Café car as designed for the Intercity Trainset (Airo) fleet. As this fleet will be manufactured as single cars, the provision for the requirement for 1.4c) shall be included in all cars and the modular concept for additional accessible seating locations shall be provided as an option. A conceptual diagram shall be provided in Exhibit F for reference.

f). As an option, the Contractor shall provide provisions for up to four (4) RVAAC accessible seating locations in each car type which shall be modular in design which includes any restraints, adjustable height tables, call systems, outlets, reading lights and any associated wall panels.

1.5 Restroom and Bathroom Constraints

a). In coach cars with at least one accessible location, an accessible restroom must be provided in addition to the standard restroom.

1.6 Car Types and Car Capacities

a). Amtrak intends to have a Standard Coach car, a Premium Accessible Coach car, a Standard Sleeper Car, an Accessible Sleeper car, a Diner car, a Diner/Lounge car, a Café car, a Utility car as an option, and a High-Capacity Coach as an option that will operate with existing Amtrak equipment. The carshell design shall have the ability for modularity for additional options and shall allow for future reconfiguration of any car type to meet Amtrak's operational requirements in the future.

b). The Contractor shall optimize revenue and non-revenue capacities, minimize the number of unique Car shells, and comply with accessibility requirements of the CFR.

c). The target capacities are outlined for each car type in the base order in Figure 1-1.

Figure 1-1: Target Revenue Capacities

Target Capacities by Car Type	Base							Options	
	Standard Coach	Accessible Premium Coach	Café	Diner	Diner /Lounge	Accessible Sleeper	Standard Sleeper	High Capacity Coach (Option)	Utility Car (Option)
Coach Seats (2+2, 37" pitch)								66	
Coach Seats (2+2, 42" pitch)	60								
Premium Coach Seats (2+1)		33							
RVAAC Accessible seating location	1	3						1	
Accessible Bedroom with RR & Shower 60" turning circle						2			
Club Bedroom with RR & Shower						4			
Roomettes							7		
SoloSuites							12		
Roomette (Crew)						1	1		6
Standard RR	1	1					2	1	
Accessible RR 60" turning circle	1	1						1	
Standard RR (Crew)						1			2
Communal Shower						1	1		1
Café Booth Seats			36						
Café Mobility Positions			2						
Diner Booth Seats				18	36				
Diner Mobility Positions				1	1				
Lounge Seats					30				
Lounge Mobility Positions					2				
Checked Baggage									1,600 cu ft
Conductor's Office			1						

*Standard Coach Cars and High-Capacity Coach Cars shall be designed to permit the replacement of seating with a second accessible seating location at the same end of the car.

1.7 Car Configurations

a). All pneumatic trainlines, Head End Power (HEP) trainline, communications/door control trainline and push-pull trainline functionality shall be provided when coupled to other legacy Amtrak cars and locomotives.

i). All cars shall be fully compatible for movement when locomotive pulled or pushed, or when coupled to conventional freight cars as in a freight train.

b). The Cars shall be designed and arranged to permit safe, unrestricted passenger movement (walkable and wheeled) between all adjacent cars while the consist is in motion, through fully enclosed, weather-protected inter-car passageways suitable for passenger use.

c). Designs shall be modular to the extent practical, to minimize the amount of additional design required to adapt cars to future service class/type needs.

i). Carshell structures and attachment points of interior fixtures shall be designed to permit any service type defined in this Specification to be converted to any other service type defined in this Specification without requiring modifications to the carbody.

ii). The vehicle design shall provide Amtrak with flexibility to configure the vehicle arrangement to suit the applicable service route, including the ability to replace modules to adapt furnishings such as luggage tower, bicycle storage, food service equipment, coach seating assemblies, business seating assemblies, accessible seating assemblies, and tables.

iii). All outlets with USB ports must adhere to the latest industry standards approved by Amtrak six (6) months prior to the shipment of the first car and must be easily replaceable/interchangeable. Custom designs are prohibited. These USB ports should be capable of charging phones, tablets, computers, other personal electronic devices, and defend against hacking. The outlet design should be maintenance-friendly to facilitate easy replacement as technology evolves.

d). The carbody and all its structural elements, including trucks and running gear, shall have a minimum design life of 40-years and 10 million miles of operation at full seated passenger load.

i). The design and selection of materials shall prevent corrosion damage, including the effects of extreme weather conditions, during the 40-year design life. All interfaces between dissimilar metals will be treated to prevent galvanic corrosion.

e). Safety, reliability and maintainability shall be primary performance goals for the Cars and shall be incorporated into the design and design review process.

i). Use of specialized tools, hardware, or equipment shall be minimized. The need for a specialized tool must be approved by Amtrak.

ii). Any specialized tools, hardware or equipment needed for maintenance shall be included as a special tool deliverable with the first cars.

iii). Ease of access for inspection, maintenance and repairs shall be a major design consideration. The cars should be designed to allow inspections to be performed without requiring the car to be positioned over a pit with the ability to inspect the cars with scanning technology via cameras and other means that may be possible in the future.

iv). To ensure a car can complete its entire journey without needing to be set out enroute, system redundancies and debris-strike-hardening shall be implemented in all aspects of the car's design. Diagnostic systems shall be incorporated to allow remote monitoring of critical systems like HVAC, waste/water, LVPS, battery charger, and brakes. These systems shall be designed with the intention that proactive analysis will determine failure points that would limit the risk of setting out the equipment.

(1) Train crew and maintenance personnel shall be able to review system status and diagnostics for any car in the consist from the conductor's office display to streamline troubleshooting and reduce repair time.

v). All entrance areas shall be weather resistant to the extent that no water or snow intrusion can accumulate in those areas and must be properly mitigated when the side loading doors are open. This includes any door pockets or areas that might be exposed with alighting passengers.

vi). All designs shall be capable of operating with wayside scanning for visual analysis to determine wear conditions and/or running gear component failures.

f). Components used on this equipment shall be identical and interchangeable across the entire production run.

i). Components shall not be drilled or sized to fit.

ii). Components shall not be paired or married to a parent assembly without the specific review and approval by Amtrak.

g). In addition to the overall concept described above, the design and construction of the Cars shall also address the following:

i). The Standard Coach, Premium Accessible Coach, Diner/Lounge, Sleeper cars, Café, and Utility cars (Option) shall have one side loading door, trap door, and folding steps on each side of the car on one end of the car. Diner car side loading doors shall be in the center of the car for employee use. Alternative proposals can be submitted by the contractor for Amtrak's review and approval.

ii). The High-Capacity Coach (Option) car shall have two side loading doors, trap doors and folding steps on each side of the car with one being located on either end of the car.

iii). Where components have been specified by manufacturer and part number in this Specification, the Contractor may propose alternate manufacturers' components, for review and approval by Amtrak.

(1) Proposed alternative components must be functionally interchangeable with components called out herein.

(2) For safety critical items, introduction of alternative components will only be considered if such components have an established performance record in intercity passenger service, and/or have undergone an appropriate qualification program that demonstrates an acceptable level of safety, serviceability and reliability for passenger cars. This documentation shall be submitted to Amtrak for review and approval.

(3) Acceptance of proposed alternative components shall be solely at the discretion of Amtrak.

iv). Design reviews shall be employed to assess all proposed designs for compliance with specification requirements including safety, maintainability, ergonomics, functionality, and passenger comfort.

(1) Specific requirements for the design review process are described in Chapter 3.

v). Design reviews shall be supported by virtual and physical mock-ups. The mock-ups will allow Amtrak and its representatives to review the configuration and layout of the proposed design, to experience the workability, comfort, access and functionality and to fine-tune the design for maximum benefit.

(1) Specific requirements for the provision of mock-ups are provided in Chapter 3.

vi). Passenger Experience

(1) The Contractor shall focus on design aspects including but not limited to aesthetics, customer experience, functional design, usability, interaction, ergonomics and comfort reviews which align with the vision and requirements provided in Exhibit F.

(2) In the course of the design process, the Contractor shall have the following design authority and constraints:

(a) The Contractor shall comply with the design of the accommodations to ensure that they meet the required functionality and capacity.

(b) Throughout the Design Review process, the Contractor shall provide details with regard to color material and finish (CMF) to ensure the final accepted product design successfully delivers against Amtrak’s brand palette, brand DNA and the unique experience and spaces on our cars.

(c) At the start of Preliminary Design Review, Amtrak will provide the Contractor with its conceptual vision for the exterior livery of the cars. The Contractor should expect to work collaboratively with Amtrak throughout the design review process to arrive at a final livery design during Final Design Review.

(d) The Contractor shall be responsible for working collaboratively with Amtrak throughout the Design Review Process to successfully implement Amtrak's overall vision.

vii). Materials and workmanship shall meet the requirements of Chapter 19, and all equipment shall be designed to operate in the environmental conditions specified in Amtrak Specification 963.

viii). As detailed in this chapter, the Contractor shall develop proposals, renderings, and a comprehensive package for color palettes, storyboards, layout arrangements, interior materials, and exterior graphics for approval or modification by Amtrak.

(1) The features, components, layouts, graphics and customization of the cars shall be selected by Amtrak during design reviews.

(2) A builder's plate shall be provided in a concealed location in the vestibule and on the center sill. Precise location of these plates shall be subject to Amtrak approval.

(a) The contractor's name or the name of their suppliers shall not be visible to the riding public on either the interior or exterior of the equipment. This includes, but is not limited to, manufacturer stamps on windows or identification tags on seats, which are strictly prohibited.

ix). Amtrak shall provide unit numbers, reporting marks, and naming no less than 24 months after notice to proceed.

1.8 Duty Cycle

a). Cars shall be designed for continuous operation for up to 72 hours in a single run and shall support long-distance operations of at least 1600 miles within a 24-hour period.

1.9 Dimensions, Clearances and Track Geometry

a). Carbody dimensions and weights

i). The cars shall be designed and built to conform to the following overall AW0 weight limitations:

(1) A static axle load of no more than 38,500 lbs.

(2) Track dynamic (P2) forces per axle shall be limited to 68,000 lbs., calculated using the formula and parameters defined in Chapter 7.

(3) The Cars shall be weighed at the Contractor's facility, and shall have weight distribution and balance as follows:

(a) End-to-end balance of cars within 5% (both at full supplies and no supplies).

(b) Lateral balance (side to side) of all cars within 5% (both at full supplies and no supplies).

b). Length

i). Cars may be configured in consists up to 1,530 ft in length.

(1) If option cars are exercised to be utilized on Auto Train, consist lengths could be substantially higher, close to 5,000 ft. Contractor shall provide analysis that all systems will operate as intended at this length.

ii). All car functions shall operate per the standards of this specification within this train length range, except as noted below, including but not limited to trainline, communications, power, and carbody strength.

iii). Trainline functions may operate at reduced levels (tolerance to be approved by Amtrak) at consist lengths greater than 1,530 ft (due to trainline voltage drop).

iv). The brake system shall be designed for normal operation at all consist lengths up to 1,530 ft in total length, excluding any locomotive(s).

c). Clearances

i). The Cars shall fully conform to Amtrak's Clearance Diagram, Single level D-05-1355 Rev E under all operating conditions.

ii). The Clearance Drawing is based upon the assumption that a car is nominally 85 ft long with truck center spacings of 59.5 ft.

iii). No carbody-mounted appliances shall extend beyond the clearance envelope.

d). Track Geometry

i). The Cars shall be designed, tested and certified for revenue operation at all speeds up to 125 mph and 5" cant deficiency.

ii). The Cars shall be designed, tested and certified for operation on all classes of track (per 49 CFR Part 213) from FRA Class 1 to Class 8, at the maximum allowable speed on each class of track.

e). The Cars shall be qualified and capable of dead-in-tow operation at speeds up to 125 mph and 5" cant deficiency.

f). Track quality shall be assumed to be minimally compliant for each class of track, per FRA regulations and AREMA standards.

g). Ride quality standards and testing methods are specified in Chapters 7 and 20.

h). The Cars shall operate on standard gauge (56.5 in.) track.

i). The braking performance of the Cars shall comply with Chapter 9 and Amtrak braking performance drawing S-603.

j). The Cars shall be capable of negotiating a 250 ft radius (23 degree) horizontal curve, coupled to other equipment, without damage to the track or any portion of the Cars, including trucks and suspension, couplers, draft gears, air and electrical connections, gangways, diaphragms or carbody.

k). The Cars shall be capable of negotiating a 2000 ft radius vertical curve (concave or convex), coupled to other equipment, without damage to the track or any portion of the Cars, including trucks and suspension, couplers, draft gears, air and electrical connections, gangways, diaphragms or carbody.

l). The Cars shall be dynamically stable at all speeds up to and including 5 mph above maximum design speed.

m). No wheel of the Cars shall experience more than 50% wheel unloading when the train is stopped on a 7 in. super-elevation.

n). The Cars shall be capable of operating at a minimum of 5” cant deficiency, without requiring tilt, according to 49 CFR Part 213.329.

o). The Cars shall be capable of safely passing other cars that are operating at maximum authorized track speed in either direction on adjacent tracks with 12 ft centers.

p). The Cars shall be capable of negotiating a number 8 crossover between two tracks with 12 ft centers and a number 7 crossover between two tracks with 13 ft centers, coupled to other equipment, without damage or separation of any inter-car connections including air hoses and electrical connectors, and without damage to gangways or diaphragms.

q). The Cars shall be capable of negotiating facing number 8 turnouts per Amtrak Drawing No. AM 73195-A arranged to form a "S" curve with a minimum of 12 ft between track centers, coupled to other equipment, without damage or separation of any inter-car connections including air hoses and electrical connectors, and without damage to gangways or diaphragms.

r). The Cars shall be capable of negotiating two 400-foot radius reverse curves with zero tangent in-between, coupled to other equipment, without damage or separation of any inter-car connections including air hoses and electrical connectors, and without damage to gangways or diaphragms.

1.10 Catenary Wire

a). The Cars shall be immune to the effects of any electrical interference from 12 kV and 25 kV catenary systems, including induced electrical currents into the carbody and potential ground return currents through the trucks and wheelset journal bearings.

1.11 Passenger Station Platforms

a). The Cars shall be designed to serve high- and low-level boarding station platforms. While an individual car configuration may be optimized for a specific platform height, each Car shall include onboard access provisions that enable passenger boarding and alighting at any of the platform heights identified below,

without reliance on track-side equipment or station-installed infrastructure.

i). Low-level station platforms may be either below Top of Rail, at Top of Rail, 8 inches above Top of Rail and 61 inches from centerline of track, or 15 inches above Top of Rail and 64 inches from centerline of track.

ii). High level station platforms are 48” above Top of Rail.

iii). Many platforms at or below TOR are controlled by freight railroads who will protect their clearances. Careful consideration must be provided for these platforms as well.

iv). Some stops do not have platforms, so passengers may board or alight in the street and/or grade crossings. This must be considered in the design.

v). Note: California DOT may proceed with 22” platforms at their stations in the future. This equipment shall not interfere with any 22” platform design.

1.12 Environment

a). The Cars design shall comply with the environmental requirements of Amtrak Specification 963.

b). The equipment shall be designed and built for use in the North American passenger rail environment.

c). Special considerations for the high humidity and salt content in the air from the coastal marine areas, excessively fine dust, sandstorms, cotton wood seed ingestion, diesel exhaust intake, excessive snow amounts from the Mountain West, fine powder snow, wet heavy snow, sleet, freezing rain, and freezing temperatures exceeding -40°F and high temperatures exceeding 125°F (51.7°C) shall be incorporated into the design.

d). To the maximum extent possible, exterior equipment, cables, hoses and pipes shall be protected against debris strikes. Each mitigation, however, will need to be balanced with impacts to maintainability and shall be submitted to Amtrak for review and approval during the design review process.

1.13 Standard Keys

a). A total of two types of standard keys shall be used on the various car types, a coach (Conductor’s) key and a maintenance key, along with provisions in galleys of the Food Service cars for use of crew-supplied padlocks.

1.14 Documentation Requirements

a). All documents shall, as a minimum, contain the following:

i). A title page with a clear and concise title block, which includes all pertinent references to the Contract and an accurate description of enclosed information.

ii). Display approval signatures of the original document on the title page to serve as an easy reminder of the approval signatures required for all future revisions.

iii). Display Amtrak's contract number on the title page.

iv). Display the originating company's name and address on the title page.

v). Display the overall revision level on the title page and display the varying revision level on each consecutive page.

vi). Display the unique document number on each page of the document.

vii). Record the specific changes of a revision on a dedicated page that includes space for new approval signatures for that revision without requiring the removal of previous approval signatures.

viii). Record the revision levels of individual pages on a dedicated page for verification of proper document composition.

ix). Contain a table of contents and an itemized listing of tables and figures.

2.5 Definitions 2-16
2.6 Acronyms and Abbreviations 2-28

2.1 Overview

a). Regulations, standards and specifications that are referenced in this document are listed below as a guide to the Contractor but shall not be construed as complete.

b). The Contractor is responsible for ensuring that all applicable regulations, standards and specifications in effect at time of Award are followed when complying with the requirements of this specification.

c). Nothing in this specification shall relieve the Contractor from ensuring that all applicable regulations, standards and specifications are followed. The Contractor shall provide the Compliance Matrix required by Chapter 3 as proof of compliance for those items so governed before the first batch of cars are accepted.

2.2 Supplemental Regulations, Standards, Specifications and Drawings

a). Regulations, standards, specifications and drawings, which may pertain to this specification, are listed below as information. The following list is furnished as a guide to the Contractor but shall not be construed as complete or actually used. When any of the following are superseded by an approved revision, the revision shall apply.

b). Unless specified otherwise, the Contractor shall be responsible for acquiring and maintaining copies of all applicable references from the appropriate source.

i). Amtrak shall not be obligated to provide these referenced documents unless specifically stated.

ii). The Contractor will be responsible for determining if there are newer versions of the referenced specifications/regulations/standards and obtaining them.

2.3 Regulations

a). ADA (Americans with Disabilities Act)

i). 36 CFR 1192.99: Floors, Steps and Thresholds

ii). 36 CFR 1192.113: Doorways

iii). 36 CFR 1192 Appendix: Advisory Guidelines

iv). 49 CFR Subtitle A, Figure 4: Intercity Rail Car (with accessible restroom)

v). 49 CFR 38.101: Lighting

vi). 49 CFR 38.117: Floors, Steps and Thresholds

vii). 49 CFR 38.123: Restrooms

viii). 49 CFR 38.125: Mobility and Accessibility

ix). 49 CFR 38.159: Mobility Aid Accessibility

x). Americans with Disabilities Act of 1990 and regulations promulgated thereafter, including 49 CFR 27, 37 & 38.

xi). Rail Vehicles Access Advisory Committee (RVAAC) of the United States Access Board

(1) Final Report: https://www.access-board.gov/advisory-committee-reports/rail/rvaac-report/

b). Canadian Transportation Agency

i). General Order O-10: Railway Safety Appliance Standards

c). DOE (U.S. Department of Energy)

i). Energy Policy Act (EPAct) of 2005

d). EPA (Environmental Protection Agency)

i). Title 40:

(1) Part 40 CFR Protection of Environment

(2) Part 82: Protection of Stratospheric Ozone

(3) Part 201: Noise Emission Standards for Transportation Equipment; Interstate Rail Carriers

(4) Part 1033: Control of Emissions from Locomotives

e). FAA (U.S. Federal Aviation Administration)

i). AC 43.13-1A, Section 449: Stripping Insulation

f). FDA (U.S. Food and Drug Administration)

i). 21 CFR 1250: Interstate Conveyance Sanitation

(1) 1250.41: Submittal of Construction Plans

ii). 2017 U.S. Food & Drug Administration: Food Code

iii). Handbook of Sanitation of Railroad Passenger Cars, 1964

g). FRA (Federal Railroad Administration)

i). 14 CFR 25.853: Compartment Interiors

ii). 21 CFR Part 1250: Interstate Conveyance Sanitation

iii). Title 49, 49CFR Transportation, Section II, Parts 200-299

iv). 210: Railroad Noise Emission Compliance Regulations

v). 213: Track Safety Standards

(1) 213.329: Curves, Elevation and Speed Limitations

vi). 213.333: Automated Vehicle Inspection Systems

vii). 213.345: Vehicle Qualification Testing

viii). 213.57: Curves; Elevation and Speed Limitations

ix). 221: Rear End Marking Device-Passenger, Commuter and Freight Trains

x). 222: Use of Locomotive Horns at Public Highway-Rail Grade Crossings

xi). 222.21: When Must a Locomotive Horn be Used?

xii). 223: Safety Glazing Standards--Locomotives, Passenger Cars and Cabooses

xiii). 231: Railroad Safety Appliance Standards

xiv). 236: Rules, Standards, and Instructions Governing the Installation, Inspection, Maintenance, and Repair of Signal and Train Control Systems, Devices, and Appliances

xv). 236 Subpart I: Positive Train Control Systems

xvi). 238: Passenger Equipment Safety Standards

(1) 238.103: Fire Safety

(2) 238.105: Train Electronic Hardware and Software Safety

(3) 238.107: Inspection, Testing and Maintenance Plan

(4) 238.111: Pre-revenue Service Acceptance Testing Plan

(5) 238.112: Door Emergency Egress and Rescue Access Systems

(6) 238.113: Emergency Window Exits

(7) 238.114: Rescue Access Windows

(8) 238.115: Emergency Lighting

(9) 238.121: Emergency Communication

(10) 238.123: Emergency Roof Access

(11) 238.131: Exterior Side Door Safety Systems

(12) 238.205: Anti-Climbing Mechanism

(13) 238.207: Link Between Coupling Mechanism and Car Body

(14) 238.215: Rollover Strength

(15) 238.217: Side Structure

(16) 238.219: Truck-to-Carbody Attachment

(17) 238.227: Suspension System

(18) 238.231: Brake System

(19) 238.233: Interior Fittings and Surfaces

(20) 238.235: Doors (Emergency Egress)

(21) 238.303: Exterior Calendar Day Mechanical Inspection of Passenger Equipment

(22) 238.307: Periodic Mechanical Inspection of Passenger Cars and Unpowered Vehicles Used in Passenger Trains

(23) 238.435: Interior Fittings and Surfaces

(24) 238.441: Emergency Roof Access

(25) 238 Appendix B: Test Methods and Performance Criteria for the Flammability and Smoke Emission Characteristics of Materials Used in Passenger Cars and Locomotive Cabs

(26) 238 Subpart B: Safety Planning and General Requirements

(27) 238 Subpart C: Specific Requirements for Tier 1 Passenger Equipment

xvii). 239: *Passenger* Train Emergency Preparedness

(1) 239.101: Emergency Preparedness Plan

(2) 239.107: Emergency Exits

xviii). 243: Training, Qualification, and Oversight for Safety-Related Railroad Employees

xix). 571.208, Subpart 6: Federal Motor Vehicle Safety Standards: Occupant Crash Protection

h). FTA (Federal Transit Administration)

i). FTA-PA-27-5194-12.1: Quality Management System Guidelines

i). Transport Canada

i). TC O-0-10: Installation of Air Reservoirs

ii). TC O-0-16: Railway Passenger Handling Safety Rules

iii). TC O-0-26: Passenger Car Safety Rules

iv). TC O-0-76: Locomotive Safety Rules

v). TC O-07-01: Passenger Train Brakes

j). USPHS (U.S. Public Health Service)

i). U.S. Public Health Service Food Code 2017

2.4 Standards

a). AAMA (American Architectural Manufacturers Association

i). 501.1-05: Standard Test Method For Water Penetration Of Windows, Curtain Walls And Doors Using Dynamic Pressure

b). AAR (Association of American Railroads)

i). C-II: Design, Fabrication, and Construction of Freight Cars

ii). M-101: Axles Carbon Steel, Heat-Treated

iii). M-107/M-208: Wheels, Carbon Steel

iv). M-114: Helical Springs, Heat-Treated Steel

v). M-201: Steel Castings

vi). M-601: Hose, Wrapped, Air Brake, “End Hose”

vii). M-618: Hose, Air, Wire-Reinforced

viii). M-934: Freight Car Journal Roller Bearings

ix). M-1001: Design, Fabrication, and Construction of Freight Cars

x). RP-585: Wiring and Cable Specification

xi). S-100, Section B: Bushings, Stainless Steel Tube–Coupler Shanks and Yokes

xii). S-400: Brake Equipment-Installation Specifications

xiii). S-471: Brake Pipe Restriction Test

xiv). S-4200: ECP Cable-based Brake Systems – Performance Specifications

xv). S-4210: ECP Cable-based Brake System Cables, Connectors and Junction Boxes – Performance Specifications

c). AHRI (Air-Conditioning, Heating, and Refrigeration Institute)

i). 700: Specifications for Fluorocarbon Refrigerants

d). Aluminum Association

i). AA-ADM-105: Aluminum Design Manual: Specifications and Guidelines for Aluminum Structures

ii). Aluminum Company of America (ALCOA) Technical Report 524, Specification Covering Use of Aluminum in Passenger Carrying Railway Vehicles

iii). Aluminum Standards and Data

e). ANSI (American National Standards Institute)

i). B16.18: Cast Copper Alloy Solder Joint Pressure Fittings

ii). C82.2: For Lamp Ballasts-- Method of Measurement of Fluorescent Lamp Ballasts

iii). S1.4: Specification for Sound Level Meters

iv). S3.2-2009: Method for Measuring the Intelligibility of Speech over Communication Systems

v). Z26.1: Safety Code for Safety Glazing Materials for Glazing Motor Vehicles Operating on Land Highways

f). ANSI (American National Standards Institute)/ASME (American Society of Mechanical Engineers)

i). B1.13M: Metric Screw Threads

ii). B16.22: Wrought Copper and Copper Alloy Solder-Joint Pressure Fittings

iii). B18.1.2: Large Rivets (1/2 Inch Nominal Diameter and Larger)

iv). B31.1: Power Piping

g). ANSI (American National Standards Institute)/IEEE (Institute of Electrical and Electronics Engineers)

i). 730: Software Quality Assurance Plans

ii). 1016: IEEE Standard for Information Technology-Systems Design-Software Design Descriptions

iii). C37.13: IEEE Standard for Low-Voltage AC Power Circuit Breakers Used in Enclosures

iv). C37.14: IEEE Standard for DC (3200V and below) Power Circuit Breakers Used in Enclosures

v). C37.16: Low-Voltage Power Circuit Breakers and AC Power Circuit Protectors

h). APTA (American Public Transportation Association)

i). Passenger Rail Equipment Safety Standards (PRESS) for Rail Programs

ii). Manual for the Development of System Safety Program Plans for Commuter Railroads

iii). Manual of Standards and Recommended Practices for Rail Passenger Equipment

i). ASHRAE (American Society of Heating, Refrigeration and Air Conditioning Engineers)

i). 41.1-1986 (R2006): Standard Method for Temperature Measurement

ii). 37-2009: Methods of Testing for Rating Electrically Driven Unitary Air-Conditioning and Heat Pump Equipment

iii). 23-2016: Guideline for the Design and Application of Heating, Ventilation, and Air-Conditioning Equipment for Rail Passenger Vehicles

j). ASME (American Society of Mechanical Engineers)

i). Boiler and Pressure Vessel Code

ii). Code for Pressure Piping

iii). B1.13M: Metric Screw Threads: M Profile

k). ASTM (American Society for Testing and Materials)

i). A6: Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling

ii). A53/A53M-07: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

iii). A380-06: Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems

iv). A488/A488M-07: Standard Practice for Steel Castings, Welding, Qualifications of Procedures and Personnel

v). A502-03: Standard Specification for Rivets, Steel Structural

vi). A572, A568, A588, A606, A715, A710: High Strength Low Alloy Structural Steel

vii). A588: Standard Specification for High-Strength Low-Alloy Structural Steel

viii). A606: Standard Specification for Steel, Sheet and Strip, High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, with Improved Atmospheric Corrosion Resistance

ix). A666: Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar

x). A710: Standard Specification for Precipitation-Strengthened Low-Carbon Nickel-Copper-Chromium-Molybdenum-Columbium Alloy Structural Steel Plates

xi). A715: Standard Specification for Steel Sheet and Strip, High-Strength, Low-Alloy, with Improved Formability

xii). A802: Standard Practice for Steel Castings, Surface Acceptance Standards, Visual Examination

xiii). B26/B26M-09: Standard Specification for Aluminum-Alloy Sand Castings

xiv). B32-08: Standard Specification for Solder Metal

xv). B75-02: Standard Specification for Seamless Copper Tube

xvi). B85/B85M-09: Standard Specification for Aluminum-Alloy Die Castings

xvii). B108/B108M: Standard Specification for Aluminum-Alloy Permanent Mold Castings

xviii). B117: Standard Practice for Operating Salt Spray (Fog) Apparatus

xix). B247-09: Standard Specification for Aluminum and Aluminum-Alloy Die Forgings, Hand Forgings, and Rolled Ring Forgings

xx). B633-07: Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel

xxi). C177-10: Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus

xxii). C542-05: Standard Specification for Lock-Strip Gaskets

xxiii). C1166-06: Standard Test Method for Flame Propagation of Dense and Cellular Elastomeric Gaskets and Accessories

xxiv). D395-03: Standard Test Methods for Rubber Property-Compression Set

xxv). D412-06ae2: Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers—Tension

xxvi). D523-08: Standard Test Method for Specular Gloss

xxvii). D573-04: Standard Test Method for Rubber—Deterioration in an Air Oven

xxviii). D618-08: Standard Practice for Conditioning Plastics for Testing

xxix). D638-08: Standard Test Method for Tensile Properties of Plastics

xxx). D624-00: Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomers

xxxi). D746-07: Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact

xxxii). D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials

xxxiii). D952: Standard Test Method for Bond or Cohesive Strength of Sheet Plastics and Electrical Insulating Materials

xxxiv). D1149-07: Standard Test Methods for Rubber Deterioration-Cracking in an Ozone Controlled Environment

xxxv). D2240-05: Standard Test Method for Rubber Property—Durometer Hardness

xxxvi). D2261: Standard Test Method for Tearing Strength of Fabrics by the Tongue (Single Rip) Procedure

xxxvii). D3574-95: Seat Cushion Testing Requirements

xxxviii). D3774-96(2008)e1: Standard Test Methods for Width of Textile Fabric

xxxix). D3775-08: Standard Test Method for Warp (End) and Filling (Pick) Count of Woven Fabrics

xl). D3776/D3776M - 09a: Standard Test Methods for Mass Per Unit Area (Weight) of Fabric

xli). D3884: Standard Test Method for Abrasion Resistance of Textile Fabrics

xlii). D4956-07: Standard Specification for Retroreflective Sheeting for Traffic Control

xliii). E94-04: Standard Guide for Radiographic Examination

xliv). E119-10b: Standard Test Methods for Fire Tests of Building Construction and Materials

xlv). E162-09: Standard Test Method for Surface Flammability of Materials Using a Radiant Heat Energy Source

xlvi). E165-02: Standard Test Method for Liquid Penetrant Examination

xlvii). E168-06: Standard Practices for General Techniques of Infrared Quantitative Analysis

xlviii). E446-98(2004)e1: Standard Reference Radiographs for Steel Castings Up to 2 in. [51 mm] in Thickness

xlix). E662-09: Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials

l). E709-01: Standard Guide for Magnetic Particle Examination

li). E709-08: Standard Guide for Magnetic Particle Testing

lii). E802-95: Standard Reference Radiographs for Gray Iron Castings Up to 4 1/2 in.
(114 mm) in Thickness

liii). F1344-10: Standard Specification for Rubber Floor Tile

l). AWS (American Welding Society)

i). AWS Welding Handbook

ii). B2.1/B2.1M: Specification for Welding Procedure and Performance Qualification

iii). B2.2/B2.2M: Specification for Brazing Procedure and Performance Qualification

iv). B2.3/B2.3M: Specification for Soldering Procedure and Performance Qualification

v). C1.1M/C1.1:2000 (R2006): Recommended Practices for Resistance Welding

vi). C7.2: Recommended Practices for Laser Beam Welding, Cutting and Drilling

vii). C7.4/7.4M: Process Specification and Operator for Laser Beam Welding

viii). D1.1/D1.1M: Structural Welding Code – Steel

ix). D1.2/D1.2M: Structural Welding Code, Aluminum

x). D1.3/D1.3M: Structural Welding Code – Sheet Steel

xi). D1.6/D1.6M: Structural Welding Code, Stainless Steel

xii). D1.9/D1.9M: Structural Welding Code— Titanium

xiii). D17.2/D17.2M: Specification for Resistance Welding in Aerospace Applications

xiv). D17.3/D17.3M: Specification for Friction Stir Welding of Aluminum Alloys for Aerospace Applications

m). Boeing

i). BSS-7239: Test Method for Toxic Gas Generation by Materials on Combustion

n). Bombardier

i). SMP 800-C: Toxic Gas Generation of “Flex 35 Rev. D” Rubber Compound

o). British Railways Board Group Standard

i). GM/TT0088, Issue 1: Geometric Interfaces Between Railway Wheelsets and Track

p). CENELEC (European Committee for Electrotechnical Standardization)

i). EN 50128: Railway Applications - Communications, Signaling and Processing Systems - Software for Railway Control and Protection Systems

q). CSA (Canadian Standards Association)

i). C22.2, No. 197-M1983: PVC Insulating Tape

r). EIA (Electronic Industries Alliance)

i). 649-A 2004: National Consensus Standard for Configuration Management

s). European Norms

i). DIN EN 13452-1: Railway Applications – Braking - Mass Transit Brake Systems – Part 1: Performance Requirements

ii). BS EN 50126: Railway Applications. The Specification and Demonstration of Reliability, Availability, Maintainability and Safety (RAMS)

iii). BS EN 50155: Railway applications. Rolling stock. Electronic equipment

t). GSA (General Services Administration) – Federal Standards

i). QQ-B-654A: Brazing Alloys, Silver

ii). QQ-P-416F: Plating, Cadmium (Electrodeposited) (S/S by SAE-AMS-QQ-P-416)

iii). TT-P-38E: Paint, Aluminum, Ready-mixed

iv). TT-P-664D: Primer Coating, Alkyd, Corrosion-inhibiting, Lead and Chromate Free, Con-compliant (S/S by SSPC-PAINT25)

v). WW-C-563A: Conduit, Metal, Rigid, Electrical, Thin Wall Steel Type (Electrical Metallic Tubing), Straight Lengths, Elbow, & Bends (S/S by UL797)

vi). WW-C-566C: Conduit, Metal, Flexible (S/S by A-A-55810)

vii). WW-T-799F: Tube, Copper, Seamless, Water (For use with Solder-flared- or Compression-type Fittings) (S/S by ASTM-B88)

u). IEC (International Electrotechnical Commission)

i). 60571: Electronic Equipment used on Rail Vehicles

ii). 61373: Railway Application, Rolling Stock Equipment, Shock and Vibration Tests

v). IEEE (Institute of Electrical and Electronics Engineers)

i). 16: Standard for Electrical and Electronic Control Apparatus on Rail Vehicles

ii). 1016: Standard for Information Technology-System Design-Software Design Descriptions

iii). 1568-2003: Recommended Practice for Electrical Sizing of Nickel-Cadmium Batteries for Rail Passenger Vehicles

iv). C37.13: Standard for Low Voltage AC Power Circuit Breakers Used in Enclosures

v). C37.14: Standard for Low Voltage DC Power Circuit Breakers Used in Enclosures

vi). C37.16: Standard for Preferred Ratings, Related Requirements, and Application Recommendations for Low-Voltage AC (635 V and below) and DC (3200 V and below) Power Circuit Breakers

vii). P1477: Passenger Information System for Rail Transit Vehicles

w). IESNA (Illuminating Engineering Society of North America)

i). LM-79-08: Electrical and Photometric Measurements of Solid-State Lighting Products

x). IFI (Industrial Fasteners Institute)

i). Inch Fastener Standards, 7th Edition

ii). Metric Fastener Standards, 3rd Edition

y). IPC (Association Connecting Electronics Industries)

i). 2221: Generic Standard on Printed Board Design

z). ISO (International Organization for Standardization)

i). 2631: Mechanical Vibration and Shock – Evaluation of Human Exposure to Whole Body Vibration

ii). 9001:2000: Quality Management Systems-Requirements

iii). 15609-4: Specification and Qualification of Welding Procedures for Metallic Materials – Welding Procedure Specification – Part 4: Laser Beam Welding

aa). MIL (Military Standards)

i). MIL-C-5015: Connectors, Electrical, Circular Threaded, AN Type, General Specification for FSC 5935

ii). MIL-C-7438G: Core Material, Aluminum, for Sandwich Construction

iii). MIL-DTL-3950G: Detail Specification: General Specification for Switches, Toggle, Environmentally Sealed

iv). MIL-DTL-55302F: Detail Specification, Connectors, Printed Circuit Subassembly and Accessories

v). MIL-HDBK-132A: Protective Finishes for Metal and Wood Surfaces

vi). MIL-HDBK-505: Department of Defense Handbook: Definitions of Item Levels, Item Exchangeability, Models, and Related Terms

vii). MIL-I-46058C: Insulating Compound, Electrical (for Coating Printed Circuit Assemblies)

viii). MIL-P-13949: Sheet, Printed Wiring Board

ix). MIL-P-23469/2B: Pin-Rivet, Grooved, Brazier Head; Straight Shank, Six Locking Grooves, Aluminum Alloy, Corrosion-Resistant and Carbon Steels

x). MIL-P-8053C: Plywood, Metal-Faced

xi). MIL-S-83502: Socket, Plug-in, Electronic Components, Round to Style (T05)

xii). MIL-DTL-83731B: Detail Specification: General Specification for Switches, Toggle, Unsealed and Sealed

xiii). MIL-S-83734: Sockets, Plug-in Electronic Components (Right Angle Leads, for 14 and 16 Pin Dual-in-Line Packages)

xiv). MIL-PRF-8805D: Performance Specification: General Specifications for Switches and Switch Assemblies, Sensitive, Snap Action (Basic, Limit, Push Button and Toggle Switches)

xv). MIL-STD-882E: Standard Practices for System Safety

xvi). MIL-STD-883H: Department of Defense Test Method Standard: Microcircuits

xvii). MIL-STD-1472: Human Engineering

xviii). MIL-T-16366F: Terminals. Electric Lug and Conductor Splices, Crimp-Style

xix). MIL-T-55164C: General Specification for Terminal Boards, Molded Barrier, Screw and Stud Types, and Associated Accessories

bb). NFPA (National Fire Protection Association)

i). 10: Standard for Portable Fire Extinguishers

ii). 70: National Electric Code

iii). 130: Standard for Fixed Guideway Transit and Passenger Rail Systems

cc). SAE (Society of Automotive Engineers)

i). AMS-T-81914/1: Tubing, Plastic, Flexible, Convoluted, Polytetrafluoroethylene, Standard Convolutions

ii). AS7928: General Specification for Terminals, Lug: Splices, Conductor: Crimp Style, Copper

iii). J995_199907: Mechanical and Material Requirements for Steel Nuts

iv). Civilian American and European Surface Anthropometry Resource Project (CAESAR I)

dd). Amtrak Specifications to be provided by Amtrak

i). AMT-3: Air Brake and Train Handling Rules and Instructions 223: 480VAC Head End Power Jumper & Receptacle Hardware for Passenger Cars & Standby Equipment

ii). 315: Public Address/Intercom System

iii). 323: High Performance Wire and Cable for Use on Passenger Vehicles

iv). 352: Flammability, Smoke Emissions and Toxicity for use on Railway Passenger Cars and Locomotive Cabs

v). 353: Vendor Maintenance Manuals

vi). 354: Builder Operating & Maintenance Manual Family

vii). 429: Specification for Describing Environmental and Operating Conditions

viii). 498: 480, 240, 208, 120 VAC and 72VDC Switchboard Panels

ix). 528: 480, 240, 208, and 120 VAC 72VDC Relay and Contactor Panel

x). 563: Specification for Material and Workmanship for Replacement Truck Springs

xi). 665: Seat Cushion Assemblies

xii). 685: Disposable Air Filter

xiii). 696: Valve and Exterior Equipment Identification Tags & Labels and Operating Instructions

xiv). 697: National On-Board Signage Manual

xv). 700: Schematic, Wiring and Piping Diagram Drawings

xvi). 742-1: Paints and Coatings

xvii). 759: Replacement of Copper Waste Piping with Non-Metallic Pipe

xviii). 771-1: Specification for General Requirements for Wheels

xix). 794-1: Specification for Low Location Exit Path Marking Systems for use on Amtrak Passenger Cars

xx). 907: Specification for Passenger Car Wheelsets

xxi). 963: Operational and Environmental Conditions for Rail Rolling Stock

xxii). 967: Manufacture and Acceptance of Passenger Seating for Intercity Rail Cars

xxiii). 973: Specification for Passenger Car Disc Brake Pad Qualification Test

xxiv). 1004: Specification for Thermally Actuated Automatic Drain Valve for Freeze Protection on Passenger Cars

xxv). 1118: Specification for Shunt Improvement Device

ee). Drawings to be provided by Amtrak

i). Amtrak

(1) A-63-7675-15: Trainline Standard: 27 Point MU System

(2) A-63-7676-1: Trainline Standard 27 PT Communication System

(3) B-144: Standard Amtrak Coach Key (J.L. Howard Part No. 2555)

(4) C-01-1498: 27-Pin Communication Jumper Cable

(5) C-63-7422: 27-Pin MU Jumper Cable

(6) C-63-7437: 27-Pin MU Receptacles

(7) C-96-7591: Standard Trash Container (Amtrak Part No. 24-045-18737)

(8) D-00-1359: Speed Sensor and Cable Assembly

(9) D-00-7075: Temperature Probe and Connectors

iii). Supplemental Documentation

(1) Amtrak Intercity Trainset Technical Specification Clarification and Detail – Digital Technology

2.5 Definitions

a). The definitions and abbreviations defined below are used throughout this technical specification.

b). Wherever in the Contract Documents terms are used, the definition, intent and meaning shall be interpreted as follows:

i). **A**

(1) **A-End** (of the car) — Defined as the end of the car opposite from the B-end of all cars except the Cab car.

(2) **Accessible** — To be compliant with the applicable standards and regulations for accessibility as defined by the Americans with Disabilities Act of 1990 (ADA) as amended.

(3) **Accessible Toilet Room (ATR)** —Toilet room in the passenger rail cars, designed to be compliant with all applicable standards for accessibility as defined by the Americans with Disabilities Act of 1990 (ADA) as amended.

(4) **Actuator** — A self-contained brake system component that generates the force to apply the brake shoe or brake pad to the wheel or disc. An actuator typically consists of a cylinder, piston and piston rod.

(5) **Adhesion, Coefficient of** — During rolling contact, the ratio between longitudinal tangential force at the wheel-rail interface and normal force.

(6) **Amtrak** — The National Railroad Passenger Corporation, which has its headquarters at 1 Massachusetts Avenue, NW, Washington, DC 20001, and any permitted assignee of Amtrak's rights under the Contract.

(7) **Analysis** — Written report of the systematic examination of the design, performance and condition of parts, components and systems against Contract and Technical Specification requirements.

(8) **Approval** — Review and acceptance, in writing, by Amtrak. Amtrak approval in no way relieves the Contractor of meeting all requirements of the specification.

(9) **Approved Equivalent** — The term "approved equivalent" shall mean an item, which is fully equivalent or superior in terms of form, fit, function, performance and properties, to the specified item.

(10) **Assembly** — A collection of subassemblies and components typically performing a variety of functions within the context of a larger system.

(11) **Authorize** — To give authority or power to proceed.

(12) **Availability** — The percentage of the car fleet usable for revenue service at the beginning of each day's schedule. Also, on per car basis, the percentage of time a car is usable for service:

$$\text{Availability} = \frac{\text{MTBF}}{\text{MTBF} + \text{MTTR}}$$

ii). **B**

(1) **Baseline Design** — The design of the car or any of its components, apparatus, systems, subsystems, or materials, which has received both drawing approval and first article approval by Amtrak.

(2) **Baseline Work** — All activities, which shall be performed on the cars in order to comply with the requirements of this Specification.

(3) **B-End** (of the car) — The end of the car where the hand brake is located on all car types.

(4) **Bill of Materials** — A list of the components, sub-assemblies, assemblies, and systems required to manufacture the final railcar. The bill of material includes quantities, weights, material, manufacturer's name, and manufacturer's part number.

(5) **Braking, Blended** — In braking, the simultaneous control of dynamic (rheostatic and/or regenerative) and friction braking, with the effort of each continuously proportioned to achieve the required total braking effort.

(6) **Braking, Dynamic** — An electric primary braking system on locomotives so equipped, whereby the traction motors act as generators and the current derived thereof is modulated. This includes both rheostatic and regenerative modes.

(7) **Buff** — Compressive forces acting longitudinally through the carbody's primary structure.

(8) **Burn-In** — Operating a component, system, or device in a test mode, often in an extreme or cycled temperature environment, for a specified period of time or distance, to confirm reliable operation.

iii). **C**

(1) **Calibration** — Comparing the performance of a measuring device of unknown accuracy against one of known accuracy.

(2) **Cant Deficiency** — The condition when a rail vehicle's actual speed through a curve is greater than the speed at which the components of wheel-to-rail force, normal to the plane of the track, would be equalized for the outside and the inside rails.

(3) **Car/Cars** — The railroad passenger cars to be provided by the Contractor pursuant to this Contract.

(4) **Carbuilder** — See Contractor.

(5) **Characteristics** — Any distinct property, or attribute, of the material, or services, that can be described, and measured, to determine conformance, or non-conformance, to Contract requirements.

(6) **Commissioning** — Activities involved in delivering, adjusting, and testing the cars to demonstrate compliance with Specification requirements and prepare the cars for revenue service.

(7) **Component** — Usually self-contained, a component is comprised of parts, devices and structure and performs a distinctive function necessary to the operation of a system or subsystem.

(8) **Concept Drawings** — An initial set of drawings showing the general car layout and arrangement.

(9) **Conformed Specification** — These Specifications as revised to include and reflect all approved change orders, variances and waivers implemented throughout the duration of the Contract.

(10) **Contract Deliverable Requirements List (CDRL)** — List of documents and other deliverable items that the Contractor is required to deliver to Amtrak. CDRL is also used to refer to a specific item on the list.

(11) **Contractor's Drawings** — Items such as general drawings, detail drawings, graphs, diagrams, sketches, calculations, and catalog cuts which are prepared by the Contractor to detail its work.

(12) **Crash Energy Management, CEM** — Carbody design such that the structures crush in a controlled manner and absorbs energy with the goal to significantly improve crashworthiness.

(13) **Customer** — Amtrak

iv). **D**

(1) **Days** — Days shall mean a United States calendar day unless otherwise specified.

(2) **Delivery, Delivered** — The arrival of the completed vehicle at Amtrak's designated facility, ready for commissioning and acceptance testing.

(3) **Defect** — Any instance of non-conformance with a specification for material, appearance, finish, function, performance or manufacture.

(4) **Detrucking** — The complete disconnection and removal as required of all structural, mechanical, pneumatic, and electrical connections between the truck assembly and carbody in order to facilitate the complete jacking of the car to remove the carbody weight from the truck assembly.

(5) **Device** — Any component, subsystem or system, whether electrical, mechanical, pneumatic or hydraulic.

v). **E**

(1) **Equal/Equivalent** — Whenever the words "equal", "approved equal", "equivalent" or "approved equivalent" are used in connection with a specified component, material, system characteristic or performance requirement, the Contractor shall prepare and submit for Amtrak approval an analysis that demonstrates that a design, component or system characteristic as proposed by the Contractor has equal or superior appearance, performance interchangeability, availability and compliance with specification requirements to that of the design, component or system as originally specified. This equivalency shall take the form of a specification variance and shall only be permitted with the specific written approval of Amtrak. The reason for the variance request must be included in the analysis as submitted.

vi). **F**

(1) **Fail-Safe** — A characteristic of a system which ensures that no malfunction will create a condition that is not known to be safe.

(2) **Failure** — A condition in which equipment, components or systems do not function as specified, designed or intended.

(3) **Failure Mode and Effects Analysis (FMEA)** — A procedure for analysis of potential failure modes within a system for the classification by severity or determination of the failure's effect upon the system.

(4) **Failure Rate** — The frequency of failure, expressed as failures per hour or failures per mile. Failure rate is the mathematical reciprocal of MTBF or MDBF.

(5) **Fault Tree Analysis** — A failure analysis in which an undesired state of a system is analyzed using Boolean logic to combine a series of lower-level events. This analysis method is mainly used in the field of safety engineering to quantitatively determine the probability of a safety hazard.

(6) **Field Modification Instructions (FMI)** — Instructions for applying and installing engineering solutions to resolve fleet-wide defects and/or upgrade installations and/or systems to vehicles that have already been shipped from the factory.

(7) **First Article** — The first one of any production components of the base item or vehicle that is manufactured using production parts, components, processes and procedures.

(8) **First Article Inspection (FAI)** — The examination and approval by Amtrak of an initial part, major assembly, subassembly, system, subsystem, apparatus, or material, manufactured or assembled by either the Contractor or Subcontractors. The first article approval establishes the baseline design, configuration and the minimum level of quality for the balance of the production run.

(9) **Fleet** — All equipment under the contract including all options for additional exercise.

(10) **Fleet Defect** — Identified when 5% of the quantity of a warranted item fails or where 5% of cars per a fleet type are affected, including those items for which the warranty period expired before Amtrak recognizes the failure.

(11) **Free Travel** — The vertical lineal distance between the top of rail and a car body reference point as measured under static conditions when comparing an empty car (AW0) and fully loaded car (AW3).

vii). **H**

(1) **Hazard** — A real or potential condition that can cause injury, death, damage to or loss of equipment, personnel, or property or damage to environment.

(2) **Head End Power (HEP)** — Electrical Power (480 VAC, 3-phase, 60 Hz power) produced by a locomotive or power car, or supplied from stationary substation, which is used as the primary electrical power source by the cars.

viii). **I**

(1) **Independent Failure** — A failure which is not the result of another failure, either directly or indirectly.

(2) **Indicated** — As shown on the Contract Drawings, as described in the Specifications, or as required by other Contract Documents.

(3) **Inspection** — The careful examination, measurement, and testing of the characteristics and performance of materials, components and systems to ensure conformance with Contract requirements.

(4) **Inspection Equipment** — Any tool, gauge, fixture, apparatus, or other device used for inspection purposes.

(5) **Inspector** — The person or firm designated and authorized to perform quality control inspections.

(6) **Interface** — The points where two or more physical subsystems or systems meet to transfer load, energy or information.

ix). **L**

(1) **Left-Hand Side** — The side of the car on the left, when standing inside the car at the B-end facing the A-end.

(2) **Line Replaceable Unit (LRU)** — A modular component designed to be replaced quickly at an operating location to restore the car to an operational ready condition.

(3) **Lowest Level Replaceable Unit (LLRU)** — The lowest unit (component) of a system or subsystem, which is removable and replaceable from an installed position by standard attachments (e.g., bolts and nuts, quick-disconnects, etc.).

x). **M**

(1) **Maintainability** — A measure of a car's ability to be properly maintained considering the ease and frequency of maintenance tasks, ability to efficiently use applied labor, and accessibility of equipment to be maintained by Amtrak's maintenance staff. Maintainability is sometimes quantified by the Mean Time To Repair (MTTR).

(2) **Material** — An all-inclusive term used to denote raw materials, parts, components, assemblies, and equipment used in the finished product.

(3) **Mean Time Between Failures (MTBF)** — The mean operating time between consecutive independent failures, measured in calendar days as a ratio of the cumulative time to the number of failures under stated conditions.

$$\text{MTBF} = \frac{\text{Total Operating Time (hours)}}{\text{Total Number of Failures}}$$

(4) **Mean Distance Between Failures (MDBF)** — The mean operating mileage between consecutive independent failures computed as a ratio of the cumulative mileage to the number of failures under stated conditions.

$$\text{MDBF} = \frac{\text{Total Operating Distance (miles)}}{\text{Total Number of Failures}}$$

(5) **Mean Time Between Component Failures (MTBCF)** — The mean time between individual component failures

$$\text{MTBCF} = \frac{\text{Total Operating Distance (miles)}}{\text{Total Number of Component Failures}}$$

(6) **Mean Distance Between Service Failures (MDBSF)** — The mean operating mileage between service failures caused by equipment or system failures.

$$\text{MDBSF} = \frac{\text{Total Operating Distance (miles)}}{\text{Total Number of Service Failures}}$$

(7) **Mean Distance Between Train Delays (MDBTD)** — The mean operating mileage between train delays caused by equipment or system failures.

(8) **Mean Time To Repair (MTTR)** — The average time required to repair a failed component or device and return it to production status, including time needed for the maintainer to access, remove, replace/repair, close, and test-out the failed component or device. MTTR shall not include logistics time. Expressed mathematically, it is the total corrective maintenance time for failures divided by the total number of corrective maintenance actions for failures during a given period of time.

$$\text{MTTR} = \frac{\text{Total Repair Time (hours)}}{\text{Total Number of Repairs}}$$

(9) **Mileage, Operating** — The total distance traveled by the cars during scheduled and unscheduled movements.

(10) **Modify** — To change the design, placement, or other aspect(s) of an item to provide for a different form, fit or function or to resolve deficiencies or improve performance.

xi). **N**

(1) **New** — An item, OEM or approved equal, which has not previously seen service in whole or in part.

(2) **No-Motion** — The vehicle speed at or below the lowest speed detectable by the vehicle control systems. Also known as “zero speed”.

(3) **Normal** — As in, example, "normal operating conditions" or "operating normally" -- A condition in which relevant vehicle equipment is not in a failure mode and the environment is as specified.

(4) **Notice** — A written announcement from Amtrak.

(5) **Notice to Proceed (NTP)** — A written notice from Amtrak to the Contractor to officially start work on the Contract.

xii). **O**

(1) **Open Items** — Items not resolved on the car and documented as incomplete. It is the Contractor responsibility to resolve and close these issues. Open items may be documented at any time during the Contract duration.

(2) **Original Equipment Manufacturer (OEM)** — The original manufacturer of a hardware subsystem, component or completed vehicle.

xiii). **P**

(1) **Pilot Car(s)** — the first car (of each type) to be fully assembled at the Contractor's final assembly facility.

(2) **Procurement (Work)** — The furnishing of all equipment, items, materials, parts, systems, data, design, services, incidentals, labor and management and performance of the contractual requirements defined in the Contract Documents, including changes thereto, in order to produce and deliver the specified cars, spare parts, hardware and software goods, and services.

(3) **Proof** (used as a suffix) — Apparatus as designated as splash-proof, dust-proof, etc., when so constructed, protected, or treated that its successful operation is not interfered with when subjected to the specified material or condition.

(4) **Push-Pull Operations** — A method of controlling the actions of the propulsion, braking and other systems of a train from a control cab, located in either the locomotive or the cab car, for bi-directional operation.

xiv). **R**

(1) **Railroad —** Amtrak, or the owner(s) of the operating railroad over which Amtrak's trains operate, and/or the property and/or improvements used in connection with such operating railroads, as defined by 49 CFR Part 238.

(2) **Rapid Prototype Car(s)** — the first car (of each type) to be prototyped for form and fit issues that can be identified prior to production at the Contractor's final assembly facility.

(3) **Redundancy** — The existence of more than one means for accomplishing a given function. The ability to accomplish a given function by two or more independent means.

(4) **Reliability** — The ability of a system to perform the required function under stated operating conditions for a stated period of time. This is defined as the failure rate of an item expressed as a percentage or in time of operating hours. The desired result is to have high reliability (100%) with a low failure rate (0%).

(5) **Remanufacture** — To rebuild and recertify to OEM standards for functionality and appearance. Parts that cannot be remanufactured shall be renewed.

(6) **Renew** — To replace with a new equivalent component (regardless of condition of part being renewed).

(7) **Repair** — Correct specific damage to return to original condition or functionality.

(8) **Revenue Service** — When a rail car is available to the general public and there is a reasonable expectation of carrying passengers that either directly pay fares, are subsidized by public policy, or provide payment through some contractual arrangement. Vehicles operated in fare free service are considered in Revenue Service.

(9) **Right-Hand Side** — The side of the car on the right, when standing inside the car at the B-end facing the A-end.

xv). **S**

(1) **Safe** — Secure from potential harm, injury, danger or risk; free from danger or risk.

(2) **Safety** — The condition in which persons and equipment are free from threat, danger, harm, or loss arising from improper design, manufacture, assembly or function, or a failure of the car or any of its components or systems.

(3) **Safety Critical** — A system, or any portion thereof, means the correct performance of which is essential to safety of personnel or Vehicle, or both; or the incorrect performance of which could cause a hazardous condition, or allow a hazardous condition which was intended to be prevented by the function or system to exist.

(4) **Service** — (as in service use, service braking.) The operation of the cars under normal conditions.

(5) **Service Failure** — Refer to Exhibit G for definition.

(6) **Services** — Work and incidental material specified in a Contract such as inspection, nondestructive examination, calibration, testing, welding, analysis, etc.

(7) **Shipment** — The physical movement of the cars from the Contractor's production facility to the Contractor’s designated acceptance facility or other designated destination.

(8) **Shop Drawings** — Drawings or sketches prepared by the Contractor for use in its manufacturing facility, assembly facility, or shop, to fabricate, assemble, and/or install parts of the vehicles, whether

manufactured by it from raw materials or purchased from others in a ready-to-use condition.

(9) **Slide, Wheel** — During braking, the condition when the rotational speed of the wheel is slower than that of the actual pure rolling contact between tread and rail.

(10) **Slip, Wheel** — During acceleration, the condition existing when the rotational speed of the wheel is faster than that of pure rolling contact between tread and rail.

(11) **Special Tools** — All specialized tools, gauges, meters, diagnostic Vehicle (including laptop computer software), etc. that will be necessary to operate, maintain, overhaul, inspect, test, troubleshoot and repair all configurations of the rolling stock throughout its design life. Special tools do not include those tools that are commercially available “off the shelf”.

(12) **Specified or As specified** — As stated in this document or other referenced documents.

(13) **Speed, Design** — The specified maximum possible operating speed of the car. The car and all components shall be suitable for safe operation at all speeds up to and including this speed.

(14) **Standards and Specifications** — When industry, government, association, or society standards or specifications are referred to, the applicable issue at the time of Notice to Proceed (NTP) signing shall be used.

(15) **Step, Signal** — A signal having a constant value prior to the step and a different constant value immediately thereafter.

(16) **Stop, Emergency** — The stopping of a vehicle or train by an emergency brake application.

(17) **Subassembly** — A collection of components used to perform a distinct function, usually in conjunction with other subassemblies and components, as part of a larger system. Subassemblies are usually replaceable as units, such as circuit boards, bearings and valves.

(18) **Subsystem** — A defined portion of a system.

(19) **Superelevation** — The vertical difference between the top surface of the outside and inside rails of a curve.

(20) **System** — A combination of hardware, people, and or software systems, in any combination which are integrated to perform a specific operational function.

xvi). **T**

(1) **Tamperproof** — Fasteners are designated as tamperproof when they are selected so that they cannot be easily loosened with common tools such as screwdrivers or pliers.

(2) **Tare** — A term in weights and measurements which refers to the weight of an empty container. The tare weight can be subtracted when a filled container is weighed to determine the weight of the contents alone.

(3) **Test, Installation and Removal** — Tests are maintainability related tests which are used to ensure equipment, as designed, can be easily removed and replaced.

(4) **Test, Proof of Design** — Proof-of-Design tests are engineering tests which are used to ensure equipment, as designed, meets the functional and performance requirements of the vehicle specifications.

(5) **Test Plan** — A document that defines the plan and schedule for conducting all the tests required on the vehicle.

(6) **Test Procedure** — A step-by-step procedure that identifies the equipment, exact sequence of events and criteria used to ensure that components and systems function properly.

(7) **Test, Production** — A series of tests applied to each component or vehicle to ensure all systems and components perform according to design and specification.

(8) **Tight (used as a suffix)** — Apparatus is designed as watertight, dust-tight, etc., when so constructed that the design will exclude the specified material from affecting the functioning condition or performance of the component or system.

(9) **Time, Warm-up** — The elapsed time from application of power to an operable device until it is capable of performing its intended function.

(10) **Train** — Any number of cars coupled to a locomotive or a source of self-propulsion, and moving as one.

(11) **Train Delay** — A train delay is defined as a car-related failure that causes a train in service to be: more than 15 minutes late at its destination terminal; canceled either at its originating point or en-route; or reduced in size or revenue capacity due to requiring a failed car to be removed from the train.

(12) **Tram** — A condition of ideal truck geometry in which the axles are perfectly parallel and the wheels longitudinally in perfect alignment. The centers of the journal bearings represent the corners of a perfect rectangle. Tram is checked by measuring the diagonal and longitudinal distances between reference points on the axle bearing housing.

xvii). **U**

(1) **U.S. Department of Transportation (USDOT)** — Means the Secretary of the USDOT and other persons who may at the time be acting in the capacity of the Secretary, or authorized representative or any person otherwise authorized to perform the functions to be performed hereunder, including representatives of the Federal Transit Administration (FTA) and Federal Railroad Administration (FRA).

xviii). **V**

(1) **Vehicle History Book** — A document specific to an individual rail vehicle containing records of technical and parts data pertinent to that individual vehicle.

(2) **Verification** — Examination and testing by the QA Representative to confirm decisions made by those performing the work concerning conformance of material to Contract requirements.

(3) **Vehicle** — Same as car or locomotive.

xix). **W**

(1) **Warp, Track** — The difference in crosslevel of any two points within the specific distance along the track. The warp parameter in the track geometry is used to specify the maximum in the crosslevel difference of the track in any segment (tangents, curves and spirals).

(2) **Weatherproof** — Able to withstand exposure to all weather and environmental conditions without damage or loss of function.

(3) **Weights, Assigned** — The loaded car categories assigned by Amtrak as the basis for structural repair design and for subsystem and vehicle testing as indicated. Four weight categories are assigned:

(a) AWO: Actual weight of empty car, ready for revenue service, but with neither crew nor passengers aboard. Includes full fresh water supply, empty waste system and full complement of provisions in the Food service car.

(b) AW1: Car at seated load and no standees.

(i) Seated Load is defined as all the passenger seats occupied plus one crew member per car.

(c) AW2: Car at normal full load.

(i) Normal Full Load is defined as seated load plus one standee per 3 ft2 of clear floor space.

(d) AW3: Car at crush load.

(i) Crush Load is defined as seated load plus one standee per 1.5 ft2 of clear floor space. Each passenger or standee is assumed to weigh an average of 180 pounds.

(4) **Weight, Dry** — The measured axle weight of an empty passenger rail car (measured dry). Fully assembled but with no water or provisions.

xx). **Z**

(1) **Zero Speed** — See “No motion”.

c). Clarifications

i). Whenever in the specifications or on the plans the words **"required," "determined," "directed," "specified," "authorized," "ordered," "given," "designated," "indicated," "considered necessary," "deemed necessary," "permitted," "reserved," "suspended," "established," "approval," "approved," "disapproved," "acceptable," "unacceptable," "suitable," "accepted," "satisfactory," "condemned,"** or words of like import are used, it shall be understood as if such words were followed by the words in writing, **"by Customer," "to Customer," "Amtrak"** unless otherwise specifically stated.

ii). Wherever the words "**provided,**" "**supplied,**" or "**installed**" are used in the specifications in reference to work to be performed by the Contractor, it shall be understood to mean "**furnished and delivered completed and ready for revenue service**."

2.6 Acronyms and Abbreviations

a). The following is a list of acronyms and abbreviations in this specification. The list is not intended to be all-inclusive.

i). **A**

(1)	**AALA**	American Association of Laboratory Accreditation
(2)	**AAR**	Association of American Railroads
(3)	**AC**	Alternating Current
(4)	**ADA**	Americans with Disabilities Act of 1990 as amended
(5)	**AED**	Automated External Defibrillator
(6)	**AEI**	Automatic Equipment Identification
(7)	**AESS**	Automatic Engine Stop Start
(8)	**amp**	ampere
(9)	**ANSI**	American National Standard Institute
(10)	**APTA**	American Public Transportation Association
(11)	**ASHRAE**	American Society of Heating, Refrigeration and Air

Conditioning Engineers

(12) **ASME** American Society of Mechanical Engineers

(13) **ASSE** American Society of Sanitary Engineers

(14) **ASTM** American Society for Testing and Materials

(15) **ATC** Automatic Train Control

(16) **ATOR** Above Top of Rail

(17) **ATR** Accessible Toilet Room

(18) **ATS** Automatic Train Stop

(19) **AW0** Empty vehicle operating weight, Ready-to-Run (Assigned Weight “0” load)

(20) **AW1** Car at seated load and no standees

(21) **AW2** Car at normal full load

(22) **AW3** Car at crush load

(23) **AWS** American Welding Society

ii). **B**

(1) **BC** Battery Charger

(2) **B.C.P.** Brake Cylinder Pressure

(3) **BP** Brake Pipe

(4) **Btu** British Thermal Unit

iii). **C**

(1) **C** Celsius

(2) **CAD** Computer-Aided Design

(3) **CCJPA** Capitol Corridor Joint Powers Authority

(4) **CCTV** Close Circuit TV

(5) **CCU** Communication Control Unit

(6) **CDU** Central Diagnostics Unit

(7) **CDRL** Contract Deliverable Requirements List

(8) **CDT** Central Diagnostics Terminal

(9) **CEM** Crash Energy Management

(10) **CFC** Chlorinated Fluorocarbons

(11) **cfm** Cubic Feet per Minute

(12) **CFR** Code of Federal Regulations

(13) **CO** Central Office

(14) **COMM** Communication

(15) **COTS** Clean, Oil, Test and Stencil

(16) **CPM** Critical Path Method

iv). **D**

(1) **DB** Dry Bulb

(2) **dB** Decibel

(3) **dB/sec** Decibels per second

(4) **dBA/sec** Decibels (Acoustic) per second

(5) **DC** Direct Current

(6) **dBA** Decibels (Acoustic)

(7) **DCS** Data Communication System

(8) **DC** Direct Current

(9) **DCS** Data Communication System

(10) **DR** Design Review

(11) **DTE** Diagnostic Test Equipment

(12) **DTN** Data Trainline Network

(13) **DVD** Digital Versatile Disc

(14) **DVD-RW** Digital Versatile Disc – Rewriteable

v). **E**

(1) **EAB** Electronic Air Brake

(2) **ECP** Electronically Controlled Pneumatic

(3) **ECR** Engineering Change Request

(4) **EEPROM** Electrically Erasable Programmable Read Only Memory

(5) **ECR** Engineering Change Request

(6) **e.g.** exempli gratia (for example)

(7) **EMC** Electromagnetic Compatibility

(8) **EMD** Electro Motive Diesel (a locomotive and component manufacturer)

(9) **EMI** Electromagnetic Interference

(10) **EMIS** Equipment Maintenance Information

(11) **EPA** U.S. Environmental Protection Agency Equipment Maintenance Information

(12) **EPROM** Erasable Programmable Read Only Memory

(13) **ER** equalizing reservoir

(14) **etc.** et cetera (and so forth)

(15) **ETMS** Electronic Train Management System

vi). **F**

(1) **F** Front (end of locomotive or cab car designator as defined by 49 CFR Part 229.11)

(2) **F** Fahrenheit

(3) **FAI** First Article Inspection

(4) **Fc** foot-candle

(5) **FCC** Federal Communication Commission

(6) **FDA** U.S. Food & Drug Administration

(7) **FDR** Final Design Review

(8) **FEA** Finite Element Analysis

(9) **FEM** Finite Element Model

(10) **FMEA** Failure Mode and Effects Analysis

(11) **FMECA** Failure Modes and Effects Criticality Analysis

(12) **FMI** Field Modification Instruction

(13) **Fpm** feet per minute

(14) **FRA** Federal Railroad Administration
(U.S. Department of Transportation)

(15) **FRP** Fiberglass Reinforced Plastic

(16) **Ft** Foot

(17) **ft2** square foot

(18) **ft3** cubic foot

(19) **FTA** Federal Transit Administration
(U.S. Department of Transportation)

vii). **G**

(1) **g** Acceleration due to gravity

(2) **gal** Gallon

(3) **GB** Gigabyte

(4) **GFCI** Ground Fault Circuit Interrupter

(5) **GHz** Gigahertz

(6) **gpm** gallons per minute

(7) **GPS** Global Positioning System

viii). **H**

(1) **HAZ** Heat-Affected Zones

(2) **HBPS** Holding Brake Pressure

(3) **HDL** Hydrodynamic Labyrinth

(4) **HDMI** High Definition Multimedia Interface

(5) **HEP** Head End Power

(6) **Hg** Mercury (pressure or vacuum – measured in inches)

(7) **HPPL** High Pressure Photoluminescent

(8) **hr** Hour

(9) **Hz** Hertz

(10) **HVAC** Heating, Ventilation, and Air Conditioning

ix). **I**

(1) **i.e.** id est (that is)

(2) **IC** Intercommunication

(3) **IDR** Intermediate Design Review

(4) **IEC** International Electrotechnical Commission

(5) **IEEE** Institute of Electrical and Electronic Engineers

(6) **IGBT** Insulated Gate Bipolar Transistor

(7) **in.** Inch

(8) **in^2** square inch

(9) **IPC** Illustrated Parts Manual

(10) **IPS** Iron Pipe Size

(11) **ISO** International Organization for Standardization

(12) **ISP** Internet Service Provider

(13) **IVDN** Inter-Vehicle Data Network

(14) **IWS** Instrumented Wheelset

x). **J**

(1) **JEDEC** Joint Electronics Device Engineering Council

xi). **K**

(1) **K** Kelvin

(2) **kg** Kilogram

(3) **kHz** Kilohertz

(4) **km** Kilometer

(5) **ksi** 1000 pounds per square inch (psi)

(6) **kW** kilowatt

xii). **L**

(1) **LAHT** Low Alloy High Tensile

(2) **lb** Pound

(3) **lbf** pounds of force

(4) **lbs/ft2** pounds per square foot

(5) **LCC** Life Cycle Cost Analysis

(6) **LCD** Liquid Crystal Display

(7) **LDTS** Local Diagnostic and Test System

(8) **LED** Light Emitting Diode

(9) **LLEPM** Low Location Exit Pathway Markings

(10) **LLRU** Lowest Level Replaceable Unit

(11) **lm** Lumen

(12) **Log** Inspection and Test Log

(13) **LRU** Line Replaceable Unit

(14) **LSA** Lead Service Attendant

(15) **lx** Lux

(16) **LVPS** Low Voltage Power Supply

xiii). **M**

(1) **m** Meter

(2) **mA** Milliampere

(3) **MAP** Maintenance Analysis Program

(4) **MB** Megabyte

(5) **Mbps** Megabits Per Second

(6) **MCAT** Minimally Compliant Analytical Track

(7) **MCSCM** Mechanical Committee of Standard Coupler Manufacturers

(8) **MDBCF** Mean Distance Between Component Failures

(9) **MDBF** Mean Distance Between Failures

(10) **MDBSF** Mean Distance Between Service Failures

(11) **MDBTD** Mean Distance Between Train Delays

(12) **mg/sq.in.** milligrams per square inch

(13) **MHz** Megahertz

(14) **MIG** Metal Inert Gas

(15) **MIL** Military Specification

(16) **min** Minute, minutes

(17) **mm** Millimeter

(18) **MP3** MPEG Audio Layer 3

(19) **MPa** Megapascal

(20) **mph** miles per hour

(21) **mphps** miles per hour per second

(22) **mphpsps** miles per hour per second per second

(23) **MR** Main Reservoir

(24) **MSDS** Material Safety Data Sheet

(25) **msec** Milliseconds

(26) **MTBF** Mean Time Between Failures

(27) **MTTR** Mean Time To Repair

(28) **MU** Multiple Unit

(29) **mV** Millivolt

xiv). **N**

(1) **N/A** Not Applicable

(2) **NAS** Network Attached Storage

(3) **NBS** National Bureau of Standards

(4) **NC** Normally Closed

(5) **NDE** Non-Destructive Examination

(6) **NEC** Northeast Corridor

(7) **NEMA** National Electrical Manufacturers Association

(8) **NFLNo** Field Lubrication

(9) **NFPA** National Fire Protection Association

(10) **NIC** Network Interface Card

(11) **Ni-CAD** nickel-cadmium

(12) **NO** Normally Open

(13) **NPT** National Pipe Thread

(14) **NRPC** National Railroad Passenger Corporation (Amtrak)

(15) **NPRD** Non-Electronic Parts Reliability Database

(16) **NSF** National Sanitation Foundation

(17) **NTP** Notice-to-Proceed

(18) **NTSB** National Transportation Safety Board

xv). **O**

(1) **OCU** Operator Control Unit

(2) **ODBC** Open Data Base Connectivity

(3) **ODK** Operator Display Keypad

(4) **OEM** Original Equipment Manufacturer

(5) **OFE** Oxygen Free Electronic

(6) **OSHA** Occupational Safety and Health Administration

(7) **OTIS** Onboard Train Information System

(8) **oz** ounce

xvi). **P**

Table of Figures

Figure 3-1: Design Review Submittal Statuses....3-19
Figure 3-2: Design Review Summary Matrix....3-31

3.1 Overview

a). This chapter includes Project Management requirements for schedule, drawings, document control, and other program support functions.

b). All correspondence, drawings, data, manuals or other written communications pertaining to this Contract shall be in the English language.

c). All dimensions shall be shown in standard imperial units of inches and decimals, with a metric equivalent shown in parentheses adjacent to the imperial dimension. If a component or subassembly uses metric units as the primary system of measurement, then imperial equivalents shall be provided in parentheses.

3.2 Project Management Plan (PMP)

a). The Contractor is required to develop a Project Management Plan (PMP) which shall define how the project is to be executed, monitored and controlled.

b). The PMP shall be submitted to Amtrak for review and approval no later than 30 days after NTP. **[CDRL 3-01]**

c). The PMP shall include as a minimum the following elements:

i). Project Description

ii). Organizational Chart including all staff supporting the program

(1) Key positions including Senior to Mid-level Management shall identify the individual and his/her contact information.

(2) First Level Management and resource staff positions shall be shown to clarify staffing levels, but do not need to include the individual's information. However, the planned date of filling each of these positions shall be identified.

iii). Roles, responsibilities and authority of all key and decision-making personnel

iv). Contact information for principal subcontractors

v). Document control processes

vi). Communication processes

vii). Risk Management processes

viii). Material Procurement Management Plan that includes draft list of major sub-suppliers

ix). Project Schedule Management Plan, the contractor will provide a narrative describing how the schedule will be managed throughout the period of

performance of the Contract. Specifically, the policies, procedures, and documentation for planning, developing, managing, executing, and controlling the project schedule.

x). Reference to document names and numbers for processes such as:

(1) Configuration Management

(2) Change Management

(3) Field Service Support

(4) Warranty Support

d). For the duration of the Contract, the Contractor shall revise and resubmit the PMP to properly reflect the processes and procedures implemented in the performance of the contracted work.

i). The Contractor shall revise the PMP when it varies significantly from implemented practice but at a minimum every twelve months.

ii). Should Amtrak become aware of significant discrepancies between the PMP and the Contractor's practice, it would request a revision and resubmittal.

e). The Contractor's Project Manager shall be the prime contact person to Amtrak.

i). All Subcontractor formal correspondence shall be through the Contractor's Project Manager.

f). Any proposed changes to key personnel named in the Project Organizational Chart shall be formally submitted in advance of implementation for Amtrak review and approval.

3.3 System Integration Plan (SIP) and Interface Control Document (ICD)

a). The Contractor's Systems Integration Plan (SIP) shall be based on the Preliminary Systems Integration Plan submitted as part of the Contractor's proposal.

b). The SIP shall include the Contractor's processes and procedures for validating and verifying that system integration is embedded in the design and manufacturing processes of the cars.

c). The SIP shall identify a System Integration Lead who shall be responsible for all mechanical, electrical and digital integration between systems and sub-systems.

i). The System Integration Lead shall be maintained on the project throughout the design review process until acceptance of the pilot cars.

d). The SIP shall detail the system integration between all systems, cars, locomotives and with Amtrak's infrastructure.

e). The SIP shall explain how integration with suppliers' systems will be managed.

f). The SIP shall be submitted to Amtrak for review and approval no later than sixty (60) days prior to the Preliminary Design Review meeting. **[CDRL 3-02]**

g). The SIP shall detail the implementation of a single Interface Control Document (ICD) which will cover each type and class of car.

h). Any interfaces and/or protocols between two (2) or more systems or components shall be tracked through the ICD.

i). Any interface mitigation resolution shall be documented in the ICD.

j). The ICD shall include, as a minimum:

i). System

ii). Interface type

iii). Interface from

iv). Interface to

v). Description/Requirement

vi). Method of Validation

vii). Other information as required to ensure proper integration

k). The ICD shall be submitted to Amtrak for review and approval, no later than sixty (60) days prior to the first Preliminary Design Review meeting and then quarterly thereafter until a minimum of 10 cars have been accepted. **[CDRL 3-03]**

l). The ICD shall be maintained throughout the production process and shall be revised, as necessary, to reflect engineering changes and field modifications. Any subsequent updates to the ICD shall be submitted to Amtrak for review and approval.

m). Prior to the ICD submittal to Amtrak, the Contractor's System Integrator shall review and approve all design documents that describe interfaces between and among components, systems and cars.

3.4 Coordination with TSSSA Contract

a). The Management Teams for the cars and the TSSSA contracts shall both be overseen by a single Fleet Director.

b). The Fleet Director shall be maintained through the delivery of the final piece of equipment on the base cars contract.

c). The Fleet Director shall attend, at a minimum, all car monthly status meetings.

d). The Equipment and TSSSA Team shall present to Amtrak as a single entity with conflicting priorities between the groups never impacting the progress of the program as a whole.

e). The Fleet Director shall ensure that both teams are working cohesively optimizing system reliability and transitioning to TSSSA technical services.

i). The Fleet Director shall ensure TSSSA Technical staff are in attendance at Design Review meetings to ensure long-term maintenance concerns are considered.

ii). The Fleet Director shall ensure that the TSSSA technical services personnel have extensive experience gained through the production of the Car Contract.

3.5 Galley Design Specialist

a). Throughout Design Review and Car production, the Contractor shall maintain a galley design specialist to support the development, simulation and optimization of the food service areas on the cars.

b). The galley design specialist may be a direct employee of the Contractor or a consultant but shall be a recognized expert in the field of restaurant design and on-board food service in the transportation industry.

c). The galley design specialist shall participate in design reviews, mock-up evaluation, workshops and qualification testing of on-board food service areas.

d). The galley design specialist shall be considered a key member of the Contractor’s design team.

3.6 Accessibility Specialist

a). Throughout the Design Review and Car production, the Contractor shall maintain an accessibility specialist to support the development, evaluation, and optimization of all passenger-facing areas to ensure compliance with applicable accessibility requirements and best practices.

b). The accessibility specialist may be a direct employee of the Contractor or a consultant but shall be a recognized expert in transportation accessibility, including demonstrated experience with ADA and applicable accessibility standards for passenger rail vehicles.

i). Amtrak will participate in the selection, vetting, and final approval process of this individual.

c). The accessibility specialist shall participate in design reviews, mock-up evaluations, workshops, and qualifications testing to verify compliance with accessibility requirements and to ensure equitable passenger access and usability throughout the vehicle.

d). The accessibility specialist shall be considered a key member of the Contract’s

design team.

3.7 Interface with Subcontractors, Designers, and Suppliers

a). The Contractor shall inform all designers and subcontractors of all specified requirements and ensure that appropriate engineering management tools are utilized to coordinate and provide communication among the designers of interrelated systems.

b). Subcontractors shall be made aware of additional requirements listed throughout other chapters of this technical specification.

c). Subject to Amtrak review and approval, the Contractor may request major Subcontractors be granted access to the Project's collaborative website.

d). All applications of material or equipment by the Contractor shall be with the full concurrence of the Subcontractor that the application is suitable and within the recommended limits of operation of the material or equipment.

e). The Contractor shall have all relevant designers and Subcontractors available when required for:

i). Meetings

ii). Resolution of Production or Manufacturing problems

iii). Testing

iv). Resolution of design, integration, or quality deficiencies

v). Resolution of Systems Reliability problems, and

vi). All other similar situations.

f). During all phases of this project, Amtrak shall have access to all designers and Subcontractors through coordination with the Contractor's Project Manager.

g). The Contractor shall coordinate all the project administration, scheduling, design, validation, commissioning and warranty activities with Amtrak's project management team.

h). At Amtrak's sole discretion, suppliers' technical staff must attend all relevant design reviews throughout the process to ease the communication flow between Amtrak, the Contractor and Suppliers.

3.8 Documentation Control

a). Amtrak shall use its Document Management System (DMS) as the documentation control system for the TSSSA program.

b). While the Contractor may opt to use its own document control system internally, it

shall use the DMS when submitting documents and contract letters to Amtrak and shall adhere to the processes inherent to that system.

c). During the course of the TSSSA program, Amtrak will have the right to transition to a different documentation management program.

3.9 Initial Meetings

a). Within 15 calendar days after NTP, a series of Kick-off Meetings shall be conducted for the Contractor to accomplish the following:

i). Review Contractor's Project mobilization activities

ii). Introduce the Key personnel of the team

iii). Establish communication protocols

iv). Establish the document coding schemes

v). Establish formats for Project Schedule and Monthly Reports

vi). Establish the format for an Open Items Tracking Matrix

vii). Establish project control methodology

viii). Confirm plans for initial activities prior to start of formal progress reporting, including all CDRLs due in the next 90 calendar days.

ix). Confirm that the Contractor is familiar with Amtrak's Operations and Maintenance environment; and

x). Identify any Contractor early needs for information or decisions required from Amtrak.

b). Five (5) days before scheduled Kickoff Meeting, the Contractor shall submit the Kickoff Meeting Presentation. **[CDRL 3-04]**

c). Within 30 days after NTP, a detailed Specification Review (section by section) shall be conducted to address:

i). Any outstanding questions the Contractor may have regarding the Technical and Commercial Specifications requirements.

ii). In addition to the Contractor, all key subsystem suppliers shall participate.

iii). The Contractor and applicable subcontractors and suppliers shall be required to sign off indicating its understanding of each specification section.

3.10 Project Review Meetings (PRM)

a). PRMs will be held at least monthly and will provide a forum to assess specific issues or to review issues that may have an impact on the design.

b). These review meetings will analyze and address both technical and commercial issues for which agreement could not be reached during DRMs.

c). The meetings will be attended by Contractor and Amtrak, and possibly external stakeholders designated by Amtrak or Contractor, e.g. FRA.

d). These meetings have two objectives, first to allow the participants to maintain a close involvement in the project's development, and second to allow Contractor's project team to answer questions and resolve issues that arise during the project.

e). The PRM shall achieve these goals by:

i). Reviewing Contractor's project progress report and ensuring that appropriate responsibility for actions is agreed upon.

ii). Ensuring that the Cars comply with the quality, safety and technical matters of the Contract.

iii). Identifying contractual matters which could potentially affect Contractor's performance.

iv). Identifying any major concerns regardless of source and ensuring that appropriate actions are agreed to facilitate resolution of such concerns.

v). Review any emerging issues.

f). The agenda for these meetings will not be fixed but will be customized for critical issues at hand.

g). Amtrak shall circulate an agenda at least one week prior to each meeting. Appropriate data packages covering the information to be discussed shall be submitted by Amtrak and Contractor prior to the upcoming meeting.

h). Attendees:

i). Amtrak and Contractor's Project Director shall attend the meeting.

ii). Other members of Amtrak and Contractor's organizations may attend as required.

iii). Contractor shall ensure that persons knowledgeable in the topics to be discussed, including the appropriate subcontractors, are present as required at these meetings.

i). All participants will have an opportunity to include on the agenda any issues that they deem important and in need of resolution at the meeting.

j). Meeting notes and action lists will be produced by Amtrak for each review meeting to allow issues to be followed up at subsequent meetings.

i). Amtrak shall provide the draft minutes and action list to the Contractor for review.

ii). After revision, the minutes and action list shall be formally submitted to the Contractor and entered into the contract record.

3.11 Project Schedule (PS)

a). The Contractor shall be required to use Oracle Primavera P6 to produce the Project Schedule (PS) Baseline, and all schedule updates, revisions, look ahead schedules, recovery schedules, and Time Impact Analysis schedules.

b). Baseline Project Schedule (PS): The Baseline PS and an associated narrative shall be submitted to Amtrak no later than 30 days after NTP for Amtrak's review and approval. **[CDRL 3-05]**

c). The PS and associated narrative shall detail the Contractor's approach to meeting the required contractual project milestones.

d). The PS requirement is established to ensure adequate planning, scheduling, management, and execution of the Work by the Contractor and to enable Amtrak to evaluate Work progress.

e). The PS shall encompass the Contractor's total execution of its Contract with Amtrak and shall be updated and submitted monthly to reflect actual versus planned progress for each item listed.

f). Work items shall be discrete items of Work accomplished during the performance of the Contract and that, when complete, produce definable, recognizable entities or stages within the project.

g). The Baseline PS shall include detail activities for all scope and deliverables listed in the Contract, including but not limited to:

i). All Contractual deliverables and key milestones and events, including those identified in the Contract Specification

ii). Projected Payment Milestones dates

iii). Necessary points of required input from Amtrak or third parties

iv). Activities for procurement of each subcontractor, with a milestone for Contract signing for each subcontractor

v). Contractor and Subcontractor/Supplier submittals including review cycles

vi). Project Design Review meetings

vii). Drawing packages requiring approval, with separate activities for "preparation", "submission", and "Amtrak review".

viii). Any regulatory approval periods shall be visible activities with durations

ix). All major off-site inspections and approval tests

x). All major steps of car body and truck fabrication

xi). All major subsystem fabrication and deliveries

xii). All assembly milestones

xiii). All deliverables

xiv). All progress milestone payments

xv). All CDRLs including but not limited to; design drawings, procedures, functional descriptions, and other documents required to be prepared by the Contractor and reviewed and accepted by Amtrak.

xvi). Activities for each test required by Contract, for each car

xvii). Activities for conditional acceptance of each car

h). Where a given contractual deliverable or requirement must be completed for each car, separate activities must be included for each car.

i). Additional Baseline PS requirements:

i). The Baseline PS start date shall be the Contract NTP date, and the schedule shall not show any activities with dates prior to NTP.

ii). The Baseline PS shall include a 7-day calendar week, which is applied to all contractual milestones.

iii). The Baseline PS shall also include a 5-day work week calendar with holidays which is applied to all work activities.

iv). All activities in the schedule, with the exception of NTP, shall be assigned at least one appropriate predecessor activity.

v). All activities in the schedule, with the exception of the Final Completion milestone, shall be assigned at least one appropriate successor activity.

vi). The majority of logic relationships must be “finish-to-start”.

vii). While the use of lags is acceptable, overuse is not; only a small percentage of logic relationships may use a lag. Negative lags, or leads, are not acceptable.

viii). No date constraints may be used. Float constraints, such as “Finish on or Before” may be used if appropriate.

j). The Baseline PS shall include a detailed schedule narrative including:

i). The general approach to the project and schedule, design, fabrication, manufacturing, assembly and methods, inspection, testing, shipping, delivery, and approval.

ii). A description of the critical path, and all near-critical paths, which are paths in the logic network with 2 weeks or less of total float.

iii). A listing and descriptions of all project risks to the schedule.

iv). Any required mitigation to address project delays.

v). A section describing the status of all key / contractual milestones.

3.12 Project Progress Schedule Updates

a). The PS and an associated narrative shall be updated and submitted on a monthly basis by the Contractor to accurately reflect current project progress status.

b). Actual start dates and actual finish dates are to be entered, and remaining durations reduced as appropriate.

c). All initial baseline dates shall remain listed on the schedule status reports in order to measure performance.

d). All actual dates must be before the data (schedule revision) date.

e). Activity IDs can never be changed in a schedule update.

f). The data (schedule revision) date of each schedule update shall be the first day of the month, and the schedule update shall be submitted to Amtrak on or before the 10th of each month.

g). A schedule narrative shall be provided each month, and shall include:

i). The status of all contractual / key milestones

ii). A discussion of the overall current schedule status and causes of any schedule impacts, with suggested mitigations.

iii). A discussion of progress made during the update period.

iv). A listing of work planned in the coming update period.

v). A description of the current critical path, and near-critical paths, with reasons given for any change to the previous update’s critical path

vi). In the event that a schedule revision identifies slippage beyond a contractually required milestone, the narrative shall include a detailed description of the reason for the slippage and the mitigation proposed by the Contractor to bring the PS back into compliance.

vii). Non-compliance with key milestones such as pilot car delivery or car production may result in a request for a Recovery Schedule per Section 3.9.

viii). A section that lists all Amtrak schedule comments, with responses to those comments.

ix). An appendix which lists all changes made to the schedule, with a reason given for each change. The changes that must be listed and explained are:

(1) Added activities

(2) Deleted activities

(3) Changes to original durations

(4) Added logic ties

(5) Deleted logic ties

(6) Any changes to constraints

(7) Changes to activity descriptions

(8) Changes to calendar assignments.

h). Revised PS submittals do not relieve the Contractor of any schedule requirements as outlined by the Contract.

i). Changes to any schedule related Contract requirements can only be obtained by the formal change order process in the General Provisions.

3.13 Recovery Schedule

a). If any schedule update is forecasting for the project to be late, Amtrak may require the Contractor to submit a recovery schedule to Amtrak for review and approval.

i). The Recovery Schedule shall be submitted within 21 calendar days of the request.

ii). The recovery schedule shall be accompanied by a narrative that describes in detail how the Contractor is planning to recover time.

iii). All changes made to the schedule to recover time must be listed and explained.

3.14 Design Review Overview

a). Purpose

i). Design Review will be a robust mechanism through which the Contractor shall develop, submit and receive approval for the designs necessary for the manufacture and supply of the Cars.

ii). Design Review is intended to:

(1) Determine whether Contractor has identified and understands the technical requirements;

(2) Determine whether Contractor has identified an adequate approach to demonstrate that each design requirement has been or will be met;

(3) Determine whether Contractor has identified all interfaces and has a comprehensive System Integration approach;

(4) Observe the relationship between Contractor and major suppliers and to ascertain that Contractor provides adequate technical oversight;

(5) Determine the state of Contractor's Quality Assurance program; and

(6) Determine the readiness of the design and Contractor to proceed to the next stage of the design, manufacturing and testing.

iii). The Contractor must recognize that the Design Review Process shall not be used to seek approval or authorization for deviations from any Contract requirements for the design of the Cars.

(1) Such changes will be handled in accordance with the General Provisions to the Contract, including without limitation Article 15 ("Changes") and Schedule 3 Change Request Process.

b). General

i). The design review process shall begin no later than three months after NTP.

ii). The overall Design Review Process shall consist of three sequential stages (see Section 3.10 for additional detail):

(1) Preliminary Design Review (PDR)

(2) Intermediate Design Review (IDR)

(3) Final Design Review (FDR).

iii). Design review activities shall continue throughout the entire pre-production period, with each succeeding stage presenting greater amounts of detail and reflecting the progress of the designs.

iv). As a minimum, each design review package shall be completed and approved, including Contractor’s resubmission of design documents with revisions in accordance with detailed review comments, before progressing to the next review process.

v). The Contractor shall be solely responsible for the vehicle design, including all sub-systems and materials.

(1) The Contractor shall be responsible to ensure that all systems, components, parts, and other equipment furnished by different subcontractors shall function as intended when installed and integrated in each car.

(2) The Contractor shall provide equipment meeting all specified performance levels and be compatible with all elements of the railway system on which Amtrak will operate the equipment, for the useful life of the equipment.

(3) Safety, reliability, ease of maintenance and compatibility with any of Amtrak's existing locomotives is imperative.

(4) The Contractor shall submit the design of all components being purchased from third party suppliers for review and discussion at the design review sessions.

c). Design Review Area Features

i). The features / Systems / Sub-systems that will be subject to design reviews, include, but are not limited to, the following:

(1) Transverse disciplines:

(a) Gauge/clearance calculation

(b) Safety

(c) RAM (Reliability, Availability and Maintainability)

(d) EMC (Electro Magnetic Compatibility)

(e) ADA (Americans with Disabilities Act) and accessibility

(f) Acoustics

(g) Dynamic behavior

(h) Fire and smoke performance

(i) Serviceability/Maintainability

(j) Climatic adaptation

(k) Aerodynamics and cross wind calculations

(2) Mechanical disciplines:

(a) Virtual Mock-Up Review

(b) Weight calculations

(3) Interiors and Industrial Design:

(a) Interior car arrangement

(b) Aesthetic design

(c) Customer experience

(d) Usability

(e) Interaction and functional design

(f) Ergonomics and human factors

(g) Color material and finish (CMF)

(h) Branding and Brand Application

(i) Mock-Up Review

(j) Accessibility review

(4) Sub-systems:

(a) CBS (Car Body Shell) for each different carbody arrangement, including floor System and FEA (Finite Element Analysis) calculations

(b) Smoke detection system/fire extinguisher

(c) HVAC (including air flow calculation) passenger cars

(d) Lighting

(e) Luggage racks and storage

(f) Passenger Seats, all types

(g) Booth Seats, all types

(h) Sleeping Accommodation, all types including accessible and non-accessible.

(i) Toilets

(j) Showers

(k) Food preparation areas, including all food service cars.

(l) Glazing

(m) Signage

(n) Public address, passenger information, intercommunication, Wi-Fi and entertainment

(o) Digital technologies

(p) Diagnostics

(q) Cybersecurity

(r) Communications

(s) Doors (Passenger access and interior doors) and steps

(t) Diaphragm/Gangway & articulation

(u) Couplers and draft gear

(v) Battery and battery charger

(w) Brake System

(x) Wheel slide protection

(y) TCMS (Train Control and Monitoring System)

(z) Electrical cubicles & harnesses

(aa) Truck to Carbody Connection

(bb) Trucks

(cc) Maintainability Demonstrations

(dd) Mock-Up Review

(5) Interoperability with legacy equipment (i.e. Locomotive fleet, Viewliner I and II fleets, Midwest Venture fleets, etc.)

d). Design Review Process Governance

i). The Contractor and Amtrak will work closely together in a collaborative way to ensure that the final design of the cars meets the contractual requirements and resolve any technical problems or issues that may arise during the project.

ii). This collaboration will be via:

(1) A continuous involvement by Contractor with Amtrak and stakeholders to resolve and validate all of the design-related issues that arise during the project, through the review meetings.

(2) Specific meetings where detailed analyses are reviewed by the parties for complete areas.

(3) A review of deliverables (including, where appropriate, but not limited to, drawings, 3D data or models, assembly drawings, technical descriptions, calculation notes, studies, electric diagrams, pneumatic diagrams, test procedures and operation and maintenance documentation) to be submitted for review.

e). Design Review Plan

i). Within 30 days of NTP, the Contractor shall submit for Amtrak review and approval a Design Review Plan (DRP) detailing the performance of the engineering design objectives, detailed submittal schedule, functions, processes and procedures throughout the design process. **[CDRL 3-06]**

ii). Design Review will begin once the DRP has been accepted by Amtrak.

iii). At a minimum, Design Review will continue throughout the entire pre-production period until acceptance of the pilot cars to ensure:

(1) No objection by Amtrak to the proposed car design in order to enable Contractor to procure materials and equipment to support the start of production of the cars.

(2) Amtrak's acceptance of a comprehensive, final set of fully representative drawings, 3D Models and Sub-system technical/functional Specifications.

iv). The Design Review Plan shall include at a minimum:

(1) Definition of the organization and relationships within the engineering team, with identification of the subgroups as organized by function or system.

(2) Definition of the relationship of the engineering team to the overall organization of the Contractor.

(3) The relationship between the engineering team and collaborative teams such as the testing team and the production process team.

(4) Critical path/workflow plan for completion of all engineering functions.

(5) A well-defined list of deliverables for each design review stage that Contractor will submit to Amtrak to comply with the requirements of this Contract and in coordination with the PS.

(6) The schedule for the progress and completion of major design activities including, but not limited to:

(a) All stages of design reviews;

(b) Mock-up review;

(c) Finalization of engineering;

(d) Test plan development;

(e) Car shell stress and structural performance analyses;

(f) Proof of design testing; and

(g) Delivery of all required engineering documentation.

(7) Oversight of subcontractor and supplier engineering functions and integration of supplier engineering into the Contractor's design and design process.

(8) Manufacturing engineering plan, including assembly station work scope, parts flow and estimated labor hours/station staffing plan. A comprehensive manufacturing engineering plan shall be submitted to Amtrak for review.

(9) Car shell engineering plan, including design, finite elements analysis, quasi-static and dynamic testing, measurement of critical dimensions, acceptance and shipment, and inspection/repair procedures.

(10) Completed car weight control plan.

f). Design Review Packages

i). At least 30 days prior to the start of the design review process, the Contractor must submit to Amtrak for review and approval a detailed Drawing Tree. **[CDRL 3-07]**

(1) The drawing tree shall include all production, assembly and component drawings that are expected to be produced at all levels including unique drawing identification for each level.

(2) It is the intention that this drawing tree will be utilized to ensure all drawings have been submitted to Amtrak for review and approval throughout the design review process.

(3) The top 4 levels of drawings will be provided by the Contractor at Preliminary Design Review.

(4) Subsequent levels will be submitted for additional detail during Intermediate Design Review.

(5) Final Design Review will not be approved until a full package of all production drawings is submitted and approved by Amtrak.

ii). Design review documentation will be submitted on an ongoing basis prior to the formal design package being submitted.

iii). For each Design Review Meeting, the Contractor shall submit a design review package at least thirty (30) days prior to the performance of the corresponding DRM.

(1) Amtrak will review the design review package with the goal of providing advance comments to the Contractor prior to the DRM.

iv). No DRM will be held without the entirety of the design package in question having been provided to Amtrak.

v). In the event of a late or insufficient documentation submittal, Amtrak shall determine if a delay of the corresponding meeting is necessary.

vi). If, for any reason, any particular design review package and its approval falls on the critical path and/or may put the Contract Time Plan at risk, Contractor will promptly notify Amtrak with sufficient advance notice in order that appropriate review prioritizing actions will be mutually agreed and implemented to expedite the design review.

vii). In all submissions and at all sessions, the Contractor and supplier presentations shall be organized to show exactly how the design meets each specific requirement of the Technical Specification.

g). Design Review Meetings (DRM)

i). All design review meetings shall be held at an Amtrak facility unless otherwise mutually agreed to by Amtrak and the Contractor.

ii). Amtrak will record the minutes of each design review meeting, and within two weeks of the meeting shall provide a package that shall include the meeting minutes and a copy of all documents that the Contractor presented and/or discussed at the meeting.

(1) Meeting minutes shall also include a summary of action items generated at the meeting. Items shall be referred to as action items if action or a decision is pending at the time that the minutes are issued.

iii). An action items matrix shall be maintained by Amtrak that includes both Contractor and Amtrak open action items.

(1) The action items matrix shall include technical references, the open item description, action required, responsibility and status (open or closed).

(2) The open items on the action items matrix shall be reviewed at each design review meeting and regularly after Final Design Review (FDR) meetings until all items are closed.

iv). Each design review meeting shall include adequate time to properly walk through the entire System Functional Description along with a detailed review of the design review submittal package at a minimum while utilizing drawings, 3D models and virtual reality to further explain the designs being presented.

v). Subsequent design review meetings shall be scheduled if the first design review meeting is deemed unacceptable by Amtrak.

h). Formal Design Review Response/Comments

i). Amtrak will complete the design review and issue its formal review comments/submission as expeditiously as possible.

ii). Amtrak's formal design review response will take into account the issues progressed/closed out-during the DRM as well as any open action documentation received following the DRM.

iii). Amtrak's formal response to the design review package will include a status as per 3.13.i). which will govern the Contractor's authorization to progress.

iv). The required review by Amtrak of all Contractor submitted design documentation does not relieve the Contractor of any of its contractual design responsibility.

i). Design Review Submission Statuses

i). Upon review of design submittals, Amtrak shall respond to the Contractor with comments and a submittal status. Status categories are as follows:

Figure 3-1: Design Review Submittal Statuses

For Information	The submittal has been reviewed for information and does not require a formal status
Rejected	The submittal does not demonstrate the minimum level of content, completeness, or quality. The submittal must be completely revised and resubmitted. The Contractor shall not progress to the next phase of the design process or manufacturing.
Revise and Resubmit	Specific comments are provided for the Contractor to address in the revision and resubmittal of the submittal. The Contractor shall not progress to the next phase of the design process or manufacturing.
Conditionally Accepted	Specific comments are provided for the Contractor to address in the revision and resubmittal of the submittal. However, the design has reached a completeness to allow progress to the next phase of the design process and/or manufacturing. However, design progression or

	manufacture related to the remaining open comments are at the Contractor's risk.
Accepted	The design submittal is considered closed. The Contractor may progress to the next phase of the design process and/or manufacturing.

j). Weekly Engineering Meetings

i). The Contractor shall participate in weekly engineering meetings to discuss current, relevant technical issues, challenges with the ongoing systems' design and any other pertinent technical concerns.

ii). At times during the design review process, additional specific engineering meetings may be required.

k). Additional Design Review Communications

i). In addition to Project Review Meetings (PRM), Design Review Meetings (DRM) and Weekly Engineering Meetings, the Contractor's technical project team shall maintain continuous communication with Amtrak and its stakeholders; however, all agreements shall be handled via formal communication.

(1) This communication may be by telephone, e-mail, video conference, or face-to-face meetings.

(2) This communication will be used to highlight potential issues, including Contractor assumptions, conceptual design solutions, and comments on the emerging designs.

(3) These communications are intended to provide an efficient process for providing directions on a regular basis, allowing the participants to maintain a close involvement in the project.

(4) The Contractor is reminded, however, that design acceptance must be documented in formal Contract correspondence.

l). Changes to Approved Designs

i). If the Contractor wishes to propose a deviation from a previously approved design, a request for change shall be submitted to Amtrak for review and acceptance prior to introducing any change to the accepted configuration.

(1) The Request for Change shall be made per the requirements of the General Provisions and shall include revised drawings and data substantiating the suitability of the design. Amtrak reserves the right to request a prototype or mockup of the proposed change to verify the fix solves the problem when implemented, prior to providing approval.

ii). Any component changes to form, fit, or function subsequent to design reviews shall be updated in the documentation and resubmitted to Amtrak.

(1) The implementation of any change which deviates from the design, arrangement and/or configuration previously approved by Amtrak without prior submission and approval by Amtrak may require rework or replacement back to the approved design.

(2) The determination of the necessity for rework shall be solely at the discretion of Amtrak.

3.15 Amtrak Involvement

a). Amtrak shall be an integral part of all aspects of the design, inspection, testing and approval program for the cars.

b). Amtrak shall designate staff or representatives to participate in the design review and inspection process on behalf of Amtrak.

c). Amtrak shall have the right to invite or permit to participate in any design review, audit or test anyone Amtrak deems appropriate.

d). Individuals or entities designated by Amtrak including, but not limited to the Federal Railroad Administration (FRA), shall be afforded all desired access to the project, including design reviews, witnessing of tests and audits.

e). Only those individuals, designated in writing by the Contracting Officer's Technical Representative (COTR), shall have the authority to take actions on behalf of Amtrak that relate to the DRP, including, but not limited to, approvals, acceptances and providing design review comments.

f). The Contractor shall not recognize the actions of those individuals not so designated in writing.

g). Amtrak will give Contractor reasonable notice of stakeholder participation but reserves the right to include participants without notice.

h). Amtrak's participation, review and acceptance shall be necessary for:

i). Design review and evaluation

ii). Supplier selection

iii). QA program review and approval

iv). Supplier Quality Audits

v). First article inspection and acceptance

vi). Inspection of all phases of car production

vii). Repair Procedures

viii). Testing

ix). Car acceptance

x). Sample selection

xi). Post-delivery training

xii). Warranty administration

3.16 Design Review Stages

a). General

i). The requirements for the three Design Review phases are summarized in Sections:

(1) 3.16c). Preliminary Design Review (PDR)

(2) 3.16d). Intermediate Design Review (IDR)

(3) 3.16e). Final Design Review (FDR)

ii). Progression from PDR to IDR and IDR to FDR, may be done on a system-by-system basis, with the approval of Amtrak, otherwise the progression shall follow the requirements of Sections 3.16c), 3.16d), and 3.16e).

iii). Mockups, Virtual Reality, product accommodations and CMF reviews shall be incorporated into the three design reviews.

b). Compliance Matrix **[CDRL 3-08]**

i). Beginning with PDR, the Contractor shall maintain a matrix showing all technical requirements of the contract and the Contractor's proposed design and/or component to meet each requirement. This matrix shall be a continuation of the matrix submitted during the proposal that serves as a traveling document to ensure all technical requirements are met and provides specific detail as to how each requirement is met.

ii). The compliance matrix shall be maintained throughout the three Design Review stages.

iii). Contractor will report the progress against the compliance matrix as one of the first steps of each design review meeting.

iv). The compliance matrix portion of the design review for each Sub-system/design area will cover regulatory compliance, compliance with industry standards and compliance with the technical requirements of the contract.

v). The matrix shall include the detail of where in the design review documentation each compliance is validated.

vi). The compliance matrix shall outline all non-compliances with the technical specification at the time of Contract Award. Any non-compliance identified after Contract Award shall be handled via the Change Review Process.

vii). Non-compliances identified after Contract Award may not be accepted by Amtrak.

viii). Post-Contract Award non-compliances that are accepted by Amtrak and result in a savings to the Contractor shall be commercially credited to Amtrak.

c). Preliminary Design Review (PDR)

i). The PDR of a system design will be conducted to achieve an approved 30% completion of the system's design and will provide a comprehensive overview of its development. **[CDRL 3-09]**

ii). Review of the car concept in the PDR stage of the project will include as a minimum, presentation of layouts, car body structure, external livery, interior design proposals, brief technical description of features / Systems / Sub-systems, truck concept and materials (e.g. electric, pneumatic).

iii). The PDR presentations will include a review of the design concept, written descriptions of the functionality, schematics and/or block diagrams of the System wiring, arrangement drawings and technical specifications and drawings of each major System and component as applicable to this design phase and the deliverables listed in Section 3.14.

iv). The objective is to conduct an initial analysis of proposed design solutions based on parameters such as functionality, performance, maintainability, software logic, ease of cleaning, reliability, security, etc., so that potential changes are identified as early as possible.

v). Amtrak retains the right to redline, comment, and request changes to improve design and/or functionality.

vi). PDR submittals and activities shall comprise but are not limited to the following:

(1) Compliance Matrix **[CDRL 3-10]**

(2) Drawing Tree and Schedule **[CDRL 3-11]**

(a) A drawing schedule, based on the required Drawing Tree, for all distinct releases covering the design of all areas and subsystems of the cars in conformance with the Contractor's configuration management plan shall be prepared prior to the start of the PDR and submitted to Amtrak for approval.

(b) Each release shall be given a proper title for the top drawing and a drawing number.

(c) Arrangement drawings to be developed during the PDR shall also appear on this schedule with a title and number.

(d) The drawing schedule shall be immediately updated to reflect any revisions.

(e) At a minimum, the Contractor shall provide the initial release drawings of the top 4 levels of the drawing tree for review during PDR.

(3) System Functional Description **[CDRL 3-12]**

(a) A detailed system functional description including dimensions and layout drawings.

(4) Arrangement Drawings and Related Documents **[CDRL 3-13]**

(a) During PDR arrangement drawings and related documents of the cars and all major subsystem hardware items as described above shall be submitted to Amtrak for review and approval. Drawings shall show at a minimum:

(i) Overall dimensions, orientation, center of gravity, weight, points of normal support, and method of support during mounting and removal.

(ii) Location of all doors, access panels and covers in relation to any enclosed equipment.

(iii) Required space for opening of all doors and access panels.

(iv) Location and space requirements for ventilation intake and exhaust openings and cable entrances.

(v) Location and space requirement for all major equipment.

(vi) Conceptual interior and exterior renderings, including CMF and product accommodation.

(vii) CMF Palette

(5) Detailed Technical Specification **[CDRL 3-14]**

(a) No later than 30 days prior to the first PDR meeting, the Contractor shall submit detailed technical specifications for all major systems and components.

(6) Review Program

(a) The Contractor shall submit to Amtrak an interim detailed technical specification **[CDRL 3-15]** covering the methods, materials and arrangements proposed for construction of the pilot cars.

(i) The document shall be similar in style and format to this Technical Specification, which shall take precedence in the event of any differences.

1. If the pilot cars return to the Contractor's facility after testing for rebuilding and modifications to bring the cars up to the latest configuration, any equipment requiring renewal, such as brake components to reset the COTS date, must also be addressed. The Pilot car rebuild plan, and schedule shall be submitted to Amtrak for approval)

(ii) An appendix shall give a complete tabulation of all suppliers and the products each is supplying and shall also include an update to the pre-award Buy America submittal, indicating any revisions to the manufacturer of goods and country of origin. **[CDRL 3-16]**

(b) After approval by Amtrak, it shall be updated by the Contractor every 30 days to continuously represent the current configuration of the details of the car, including all specification changes and addendums.

(c) A monthly revision sheet shall contain a complete listing of the original and revised text, and details of the approval given by Amtrak.

(d) During the design review process, Amtrak may request a 3D model of specific components such as a restroom module or a coach seat.

(i) 3D files shall be provided in a neutral file format such as STEP or IGES.

(ii) 3D files shall be provided within 10 days of request.

(7) Weight Analysis **[CDRL 3-17]**

(a) After receipt of the approved minutes of the first design review meeting the Contractor shall submit to Amtrak a report on the estimated car weight. The document shall then be revised and resubmitted to Amtrak at intervals agreed to with the car builder until the complete weighing of the pilot car.

(b) This shall include the most recent weights for the car body without trucks, each truck, and the complete car.

(c) It shall also include a list of weights for every subsystem on the car, indicating its percentage of the total car weight, and if these subsystem weights are based on actual scale weights of complete equipment.

(d) The Contractor shall weigh all components as early as possible.

d). Intermediate Design Review (IDR)

i). The IDR will be held when the design of the cars is approximately 60% complete. **[CDRL 3-18]**

ii). The IDR will represent an advancement of the design of the cars from the PDR to development of draft production drawings, arrangements, component and material specifications, and schematics for all Systems (Sub-systems and components) on each car type as applicable to this design phase and as agreed by the parties in the design review program.

iii). This information will be used by Amtrak to evaluate the proposed design of the cars to a level of detail sufficient that Contractor will be able to proceed with the development of the car design to the 95% draft final stage.

iv). The intent of the IDR is to present and provide all Sub-systems and their credentials, review of in-depth System and functional descriptions, review of main layouts (e.g. roof, under frame, body sides, traction System, software logic, auxiliaries, interiors etc.), calculations and simulations, consumptions and functionality (e.g. electrical diagrams).

v). IDR submittals and activities shall comprise but are not limited to the following:

(1) The continuation and updating of all activities specified as ongoing in the PDR, i.e., weights analysis, updated technical specifications, functional analysis, drawing schedule, arrangement drawings and supplier identification.

(2) Submission of all documentation identified for IDR on the Design Review Summary Matrix below.

(3) Detailed Drawings and Related Documents

(a) The Contractor shall submit as a minimum the following detailed drawings and related documents to Amtrak for review and approval:

(i) All drawings identified in the approved Drawing Tree, properly dimensioned, detailed, to scale and in accordance with the approved drawing schedule. **[CDRL 3-19]**

(ii) Provide all updated drawings that reflect changes from the PDR meetings as well as provide at least two additional levels of the drawing tree for review and approval by Amtrak. **[CDRL 3-20]**

(iii) During IDR, it is expected that drawings shall present manufacturer and model information for all material called out on the BOM of each drawing. Identification of a generic or unspecified component will not be acceptable.

(iv) Draft single line control schematic **[CDRL 3-21]** and functional block diagrams for each subsystem **[CDRL 3-22]**, and electrical wiring diagrams and schematics **[CDRL 3-23]** for all electrical circuits.

(v) A complete set of draft drawings related to clearance. **[CDRL 3-24]**

1. These shall include static and dynamic envelopes relative to the wayside allowances, including clearances for all parts of the truck, and general arrangement drawings with all static dimensions including camber, low level platforms, high level platforms, curves, etc.

(vi) Single line piping and flow diagrams for all pneumatic circuits, displaying all valves and control components. **[CDRL 3-25]**

(vii) Manufacturer's data and specification sheets on all control items. **[CDRL 3-26]**

(viii) Updated Compliance Matrix **[CDRL 3-27]**

(ix) Update interior and exterior renderings **[CDRL 3-28]** **[CDRL 3-29]**

(x) CMF Palette **[CDRL 3-30]**

(xi) Interior Material Samples **[CDRL 3-31]**

(xii) Layout of Product Accommodations **[CDRL 3-32]**

(xiii) Draft maintenance requirements and necessary procedures for all equipment in each subsystem. **[CDRL 3-33]**

1. These shall be listed from daily inspection and periodic inspection to complete overhaul, with frequency and time needed to service being tabulated, and shall highlight all FRA-required

inspections.

vi). Amtrak comments from the PDR stage shall be reviewed, and the Contractor shall provide documentation that Amtrak's comments were incorporated into the car design.

(1) All drawings, specifications, schematics, and other project documentation shall be updated for the IDR.

(2) Once reviewed, the drawings and designs shall be updated to incorporate Amtrak comments.

e). Final Design Review (FDR)

i). The Final Design Review (FDR) of the system components shall be held at the 95% or greater percent level of design and IDR has been closed out. **[CDRL 3-34]**

ii). FDR in summary will provide for an in-depth review of System and function descriptions, schematics of the system wiring, drawings of each assembly, sub-assembly, component, and sub-component showing dimensions and structural elements, calculations and simulations, weight estimates, consumptions, full functionality, final layouts, specifications, drawings, diagrams, test procedures and software functionality details.

iii). FDR submittals and activities will represent a continuation and updating of all activities specified as ongoing in the PDR, IDR and mock-up review as applicable to this design review stage.

iv). Redlines and comments from the IDR and mockup review shall be reviewed.

v). Amtrak retains the right to provide additional comments during this process as production progresses and concerns are brought to Amtrak's attention.

vi). FDR submittals and activities shall comprise but are not limited to the following:

(1) The continuation and updating of all activities specified as ongoing in the PDR, IDR, and mockup review, i.e.:

(a) Critical Path Method

(b) Weights Analysis **[CDRL 3-35]**

(c) Detailed Technical Specification **[CDRL 3-36]**

(d) Functional Analysis **[CDRL 3-37]**

(e) Drawing Schedule **[CDRL 3-38]**

(f) Arrangement Drawings **[CDRL 3-39]**

(g) Supplier Identification **[CDRL 3-40]**

(2) Detailed Drawings and Related Documents — The Contractor shall submit as a minimum the following detailed drawings and related documents to Amtrak for review and approval:

(a) All drawings identified in the approved Drawing Tree, properly dimensioned, detailed, to scale and in accordance with the approved drawing schedule. **[CDRL 3-41]**

(b) Single line control schematic **[CDRL 3-42]** and functional block diagrams **[CDRL 3-43]** for each subsystem, and electrical wiring diagrams and schematics for all electrical circuits. **[CDRL 3-44]**

(i) All test points shall be displayed.

(ii) The functional block diagrams shall identify the "normal" functional paths as well as the functional paths made available through cutouts, bypasses, and redundant circuits.

(iii) The diagrams shall identify, as a minimum, the critical hardware that permits safe movement of the car, safe ingress/egress of passengers, and essential environmental needs of the passengers and Operator.

(iv) The functional block diagrams shall display the levels of hardware (as defined in Military Specification MIL-HDBK-505) that identify the Lowest Level Replacement Unit (LLRU).

(c) A complete set of drawings related to clearance **[CDRL 3-45]**. These shall include static and dynamic envelopes relative to the wayside allowances, including clearances for all parts of the truck, and general arrangement drawings with all static dimensions including camber, low level platforms, high level platforms, curves, etc.

(d) Single line piping and flow diagrams for all pneumatic circuits, displaying all valves and control components. **[CDRL 3-46]** All test points shall be displayed.

(e) Graphs and curves giving response and functional characteristics of the cars, subsystems, and major items. **[CDRL 3-47]**

(f) Manufacturer's data and specification sheets on all control items. **[CDRL 3-48]**

(g) Maintenance requirements and necessary procedures for all equipment in each subsystem. **[CDRL 3-49]**

(i) These shall be listed from daily inspection and periodic inspection to complete overhaul, with frequency and time needed to service being tabulated, and shall highlight all FRA-required inspections.

(3) Stress Analysis – A Finite Element stress analysis (FEA) of the car body shall be submitted to Amtrak for approval, see Chapter 6 for more detail. **[CDRL 3-50]**

(4) Final Interior and Exterior Renderings **[CDRL 3-51] [CDRL 3-52]**

(5) CMF Boards and Samples **[CDRL 3-53]**

f). Design Review Summary Matrix

i). The Contractor shall be required to submit all documentation required by the requirements of 49 CFR 238.110 as listed in the Notice of Proposed Rule Modification for submittal to the FRA as required. **[CDRL 3-54]**

3.17 Mockup Development and Review

a). Mockup and Rendering Review Plan

i). The Contractor shall develop and submit a Mockup and Rendering Review Plan no later than thirty (30) days after NTP. **[CDRL 3-55]**

ii). The Plan shall describe all mockups and renderings to be developed by the Contractor, the locations where the mockups will be built and reviewed, and the schedule for completion and review of the mockups and renderings.

iii). Contractor may propose as an option to provide full-scale completed cars to satisfy the mockup requirements, subject to review and approval. For more mockup and rendering requirements see Sections 3.13 and 3.14.

b). Mockups Overview

i). Purpose

(1) The Contractor shall produce full-scale mock-ups for the purpose of presenting the design concepts for the exterior and interior of each car type.

(2) The mock-ups shall be used to demonstrate compliance with the specification requirements for passenger amenities and arrangements, passenger and crew ergonomics, access to equipment and controls, verification of lines of sight, accessibility of equipment for maintenance and passenger accessibility in compliance with ADA, Accessibility Specification for Transportation Vehicle, and 2010 (or newer) ADAAG Standard, and specification requirements.

(3) The mock-ups shall also be used to help Amtrak finalize the Contractor's implementation of Amtrak's design vision and CMF as shown in Exhibit F.

(4) The mock-ups shall be used to identify potential problem areas and facilitate the development of alternative solutions.

ii). General

(1) The Contractor shall provide full-scale mock-ups of each of the different car types included in the procurement.

(2) There shall be two types of each mock-up:

(a) Soft mock-ups shall be refined throughout PDR and IDR.

(b) The hard mock-up shall be refined throughout IDR and FDR.

(3) Each car class/variant shall be represented by its own stand-alone mock-up rather than conflating elements from several car variants into one “mixed” mock-up.

(4) The mock-ups shall be of sufficient size to include all requirements included in this chapter, including, but not limited to those in Section 3.17e).

(a) Soft Mock-ups must also meet the requirements of Section 3.17c).

(b) Hard Mock-ups must also meet the requirements of Section 3.17d).

(5) Each mock-up interior shall be complete and fully operational with respect to details and shall show the location and arrangement of all components, devices and amenities including all lighting and PIDS.

(6) In the case of repetitive, identical features, such as roomettes or sleeper modules, the Contractor may build out one module interior and represent the others as closed off as viewed from the aisle.

(7) The Contractor may build additional mockups for Amtrak review at different points in the design review process, to assist in the development and finalization of the design.

iii). Location

(1) The Contractor is responsible for supplying the facility for the mockups for the duration of the mock-up period.

(2) The mock-ups will be required to be built and presented within the Washington DC Metro Area, or at a location approved by Amtrak.

(3) The mock-ups must be presented in a space that is accessible and has accessible facilities.

(4) The location proposed for the mock-ups shall be attainable by public transportation.

(5) The location selected for the mock-ups shall be submitted to Amtrak for review and approval.

(6) Amtrak shall visit the proposed mock-up site prior to its acceptance of the proposed location.

iv). Materials and Finishes

(1) The initial presentation of the mock-ups may use materials that provide an indication of the equipment and component layout.

(2) As the design progresses, the materials and equipment shall be replaced with the final design components, except as specifically allowed by Amtrak.

(3) Equipment, controls and indicators may be represented by placeholders sized, shaped and colored as they would be on actual consoles.

(4) Except as otherwise indicated, all equipment shall be functional; but not required to meet the performance requirements.

(a) When powered, all indicators, lights, doors, fans etc., shall operate.

(5) Electronic equipment shall be wired to permit function (e.g., indicators illuminating or fans running) when powered by an external power supply.

v). Electrical Power

(1) The mock-up shall be provided with power supplies for the conditioning and conversion of power.

(2) Only 120 or 240 Vac power shall be necessary to be supplied to the mock-up.

(3) The Contractor shall specify the required amperage and install circuit protection for the incoming power.

vi). Accessibility

(1) The mock-ups themselves should be fully accessible and provide safe access for people with disabilities, including individuals who use wheeled mobility devices and individuals who are deaf, hearing impaired, blind and low vision.

(2) Mock-ups should be built with any necessary ramps to access points.

(3) Mock-ups should include the ability to test accessibility with user groups of people who use mobility devices.

(a) They shall provide an accurate representation of accessible space, including the features required in this area like table, reading light, seat reservation display and any PIDS.

(b) A seat should be available to safely test a transfer maneuver.

(c) The on-board mobility lift shall be installed and be functional as part of the mock-ups.

(4) Soft mock-ups for accessible rooms and accessible restrooms should be built in such a way to test and validate various handhold locations and sizes, as well as all interaction points like switches and buttons.

(a) These features should be easily swappable and moveable in a single focus group setting.

(5) Accessible restrooms should be in a suitable condition for testing by people who use wheeled mobility devices who will need to test transferring to toilets.

(6) Accessible turning circles will have all functional devices and apparatuses in place along the circumference of the turning circle. This will allow “real-world” test with all potential barriers in place. Accessible pathways, turning circles and accessible space requirements should be represented and marked on the floors of the mock-ups, including, but not limited to:

(a) Any access from platform to an accessible space or accessible bedroom.

(b) Routes from accessible spaces to accessible restrooms.

(c) Access between cars.

(d) Accessible aisle through the Café, Diner/Lounge, Diner, and all other accessible cars.

vii). Review Process

(1) Mockups shall be complete a minimum of 15 days prior to the first stakeholder review at each applicable design review stage.

(a) There shall be at least 2 rounds of soft mockup reviews.

(b) There shall be at least 2 rounds of hard mockup reviews.

(2) Each mockup review phase will span several weeks with up to 300+ external stakeholders reviewing and providing feedback to the current state of the designs.

(3) Amtrak expects to make various visits to view the mock-ups throughout the design review process.

(a) Visits are expected to include stakeholders from both inside and outside the Amtrak organization.

viii). Approval

(1) Approval of the mock-ups shall occur when the design elements demonstrated in the mock-ups have been frozen.

(2) Amtrak will continue to visit and reference the mock-ups until the FAI of the first car or the FAI of each different car type is completed, whichever is later.

ix). Disposal of Completed Mock-ups

(1) The Contractor is responsible for disposing of the mockups when the mockup deliverable is approved and closed by Amtrak.

(2) Contractor must request and receive permission from Amtrak prior to disposing of completed Mock-ups, as Amtrak retains the right to keep portions of, or the whole mockups as they see fit.

c). Soft Mock-Ups **[CDRL 3-56] [CDRL 3-57]**

i). Purpose

(1) The purpose of the soft mock-ups is to evaluate special layouts and designs, and to identify potential problem areas and facilitate the development of alternative solutions.

ii). Materials and Finishes

(1) Soft mock-ups are not expected to be manufactured using final proposed materials.

(2) Soft Mock-ups can be built from MDF/Plywood, foam core, machined foam board, comfort foam.

(3) Seat and bed surfaces should have a covering of soft foam.

(4) Interior elements should be painted white and grey.

(5) Power ports, light switches, and all other user interfaces can be represented as labels but should be accurately placed for review by Amtrak.

(6) Soft Mock-ups for each accommodation room type shall be constructed of materials with sufficient strength so that ergonomics, human factors and accessibility of beds can be evaluated safely and thoroughly by Amtrak.

(a) Options for size, shape and position of steps and handholds should be allowed for during a review process.

iii). Seating Areas

(1) Soft mock-ups of seating areas shall include accurate representations of seats in both reclined and upright positions, tables, cup holders and seat trays to assess spacing and relative positions.

(2) Representation of typical coach and premium coach sections should be shown – with representation of, side wall, ceiling, luggage rack, window sizes and window mask treatments and seat reservation display. This should be at least 1 window module in length.

(3) Accurate aisle width should be represented with seating installed or configured so this can be tested.

(4) All food service seating areas shall include accurate representations of all seat types including tables and accessible seating locations.

iv). Rooms

(1) An individual module for each room type shall be provided, including representative exterior side wall, module walls, ceilings, and room doors to accurately represent the interior volumes.

(2) Seated and sleeping conditions can be supplied as separate mock-ups or plug and play adaptations (assuming this can easily and quickly be changed during a design review) for all key room types.

v). Mechanical Features

(1) Separate mechanical rigs will be required to demonstrate and prove out key mechanical features sets, which shall include at a minimum:

(a) Seat to bed conversions

(b) Bunk deployment

(c) Divider

vi). Storage Areas and Components

(1) A preliminary functional example of an overhead luggage rack shall be provided mounted at the design height and including the adjacent ceiling panel, built so that the loading and removal of baggage may be performed.

(2) A mock-up of the luggage tower should be shown in respect of its condition against a sidewall, bulkhead and aisle built so that the loading and removal of baggage may be performed.

(3) Stowage pockets, luggage shelves and luggage area should be dimensionally accurate and suitable construction to test storage of luggage, bottles etc.

vii). Lighting

(1) Lighting should be represented in the correct positions and controlled by the grouping as specified in the technical specification.

viii). Bedroom Seat Comfort Mock-Up

(1) A standalone seat comfort mock-up shall be provided for Amtrak review.

(2) The bedroom seat comfort mock-up shall prove out seat comfort and ergonomics for all bedroom seats.

(3) The bedroom seat comfort mock-up must accurately represent seat dimensions, cushion density and cushion profiles.

ix). Food Service

(1) All food service soft mockups (Kitchen, Café, and Servery) should be designed in modular format with key equipment as separate representative blocks.

(2) The equipment positions will need evaluation and will be subject to user testing.

x). Vestibule

(1) The vestibule Soft Mockup shall show the general arrangement of the entrance area for a car.

xi). Restrooms and Shower Rooms

(1) Standard restrooms, shower rooms and accessible restrooms can be supplied as isolated mockups; however, they must provide an accurate representation of interior volumes, handholds, and suitable strength to test toilet seats etc.

d). Hard-Mockups **[CDRL 3-58] [CDRL 3-59]**

i). Purpose

(1) Hard mock-ups shall be used to help Amtrak finalize material, color and finish.

(2) Comments from the mockup reviews shall be incorporated into the design and presented to Amtrak for review and acceptance.

ii). Materials and Finishes

(1) Hard mock-ups should be finished with final materials and finishes where possible.

(a) Some materials can be represented with indicative materials and finishes with the approval of Amtrak.

(2) The hard mock-ups shall include all finishes, colors, patterns, textures, fasteners and hardware represented in the Contractor's proposal design.

(a) All materials utilized should be the final material choice unless otherwise approved by Amtrak.

(3) All mockups shall be constructed of materials with sufficient strength so that they can be evaluated safely and thoroughly by Amtrak.

(a) This includes the ability to sit on seats, lean on countertops, open and close doors, simulate operation of controls, appliances and equipment; and view the mockup from a variety of angles.

(4) The final mock-ups shall include all finishes, colors, patterns, textures, fasteners and hardware represented in the Contractor's proposal design.

(5) All materials utilized should be the final material choice unless otherwise approved by Amtrak.

(6) Approved decals and signage must be included.

(7) Except as otherwise indicated, all equipment shall be functional; but not required to meet the performance requirements.

(a) When powered, all indicators, lights, doors, fans etc., shall operate.

(b) Electronic equipment shall be wired to permit function (e.g., indicators illuminating or fans running) when powered by an external power supply.

(c) Passenger Displays shall be functional.

(d) Lighting shall be identical to what is installed in each car type.

iii). Food service areas shall include all equipment and countertops.

iv). Equipment, electrical lockers and equipment lockers

(1) All on-board and undercar lockers shall be mocked up with all switches, breakers, relay panels, access panels, doors, controls, indicators and components simulated to evaluate access, visibility, maintainability and removal.

(2) All equipment shall be accurately represented to allow for the evaluation of maintainability.

e). Required Elements of Mockup Deliverables

i). Each mock-up shall include, at a minimum, the following elements as applicable for the respective car type:

(1) At least four rows of seats

(2) Workstation table between the facing seats

(3) Dining Tables and seats

(4) Café Tables and seats

(5) Lounge seats and tables

(6) Accessible Toilet Room

(a) A fully equipped Accessible Toilet Room (ATR) shall be included for the purpose of evaluating and confirming that the design arrangement of the ATR meets all ADA/ADAAG requirements for layout, circulation and access to controls and appliances.

(7) Overhead luggage racks, including reading lights

(a) A fully functional example of an overhead luggage rack shall be provided mounted at the design height and including the adjacent ceiling panel, built so that the loading and removal of baggage may be performed.

(8) Wall panels, window, window mask and shades

(9) Partitions and windscreens (if applicable)

(10) Convenience outlets with USB ports

(11) Heater grilles and diffusers

(12) Working passenger side doors

(13) Working trap door and folding steps

(14) Working onboard mobility lift

(15) End door, Diaphragms/Gangways and Car-to-Car Connection

(a) The end door and car-to-car connection shall be complete, operable, accurate in all mechanical details, and representative of all the actual components between two of the mock-ups.

(16) All Corridors, end doors, and partition doors

(17) Handrails (where applicable)

(18) Bike Rack/Luggage Shelf Area

(19) Interior doors

(20) Ceiling panels

(21) Floor panels

(22) All lighting

(a) Lighting shall be identical to what is installed in each car type.

(23) Approved decals, placards and signage

(24) Crew arrangements

(25) Working passenger displays

(26) Equipment, electrical and equipment lockers:

(a) All on-board lockers shall be mocked up with all switches, breakers, relay panels, access panels, doors, controls, indicators and components simulated to evaluate access, visibility, maintainability and removal.

(b) All equipment shall be installed to all for the evaluation of maintainability.

(27) Vestibule, side doors, trap door, folding steps, wall, and ceiling panel area for access to door equipment:

(a) Vestibule with working passenger side doors, trap door, folding steps, wall, and ceiling panel area for access to door equipment.

(b) The vestibule side doors, trap door, folding steps, ceiling, and wall area shall be included to simulate access to all side door equipment that requires inspection, adjustment or maintenance.

(c) All wall and ceiling panels shall correctly simulate the means of attachment, removal and operation, to ensure that the ceiling panels are safe and easy to use by maintenance personnel.

(d) High level and low-level station platform boarding areas shall be included.

(28) All safety and emergency equipment.

(29) Exterior

(a) The mock-up exterior shall be complete with respect to details and shall show the location and arrangement of all devices including, but not limited to, car ends, decals, paint finish, lights, indicators, crew steps, and handles.

(b) Exterior Livery should be applied to the exterior of the car.

(30) Each unique Sleeper Module

(31) Each accessible Sleeper Module

ii). The Dining Car shall also include, at a minimum:

(1) All Kitchen and Kitchen equipment

(2) 4 rows of Dining Tables and Seats

(3) Servery and Servery Equipment

(4) Crew storage areas, emergency storage

(5) Accessible spaces with accessible table

(6) Countertops

iii). The Lounge Car shall also include, at a minimum:

(1) 1 module of lounge seating

(2) Accessible lounge seating

iv). The Café Car shall also include, at a minimum:

(1) All food service equipment

(2) Café area

(3) At least two (2) modules of café seating

(4) Accessible café table area

3.18 Virtual Mock-Up

a). The Contractor shall utilize an electronic virtual mockup from the conceptual stages of the project through FDR.

b). The virtual mock-ups shall be delivered as fully 3 dimensional virtual environments running in real-time on stand-alone 6DOF (6 Degree of Freedom) headsets.

i). The headsets will fully track head movements allowing the user to explore the environments fully and naturally.

ii). The virtual mock-up platform should be designed to be collaborative, supporting up to the simultaneous participation of up to ten (10) users.

iii). The design data shall be optimized to run on the proposed platform.

c). 3D modeling and VR shall be used to expedite the presentation and acceptance of concepts.

d). The virtual mock-up shall be a real time tool to evaluate design decision and alternatives analysis through the design review process and shall be presented prior to and in parallel with the required physical mockups.

e). Virtual mock-ups shall also be used to evaluate equipment placement and potential maintainability issues not specifically associated with the Industrial Product Design.

f). The virtual mock-ups shall clearly and accurately show the car arrangement of each different car type including seating conditions (reclined and upright), doors, sidewalls, ceilings, lighting, partitions, accommodations, branding, equipment.

g). The virtual mock-ups shall include all sleeper car corridors for each different sleeper car type, presenting full car length corridors including all junctions with partitions, doors and thresholds with vestibules, etc. Coffee stations and crew cupboards and equipment cupboards should be shown.

h). Color, finish and signage shall be accurately represented to the greatest extent possible.

i). The virtual mockup shall also provide a means for evaluating maintainability as the car design progresses.

j). The virtual mockup shall be presented during IDR and FDR for all systems to ensure no interferences are present.

k). The virtual mockups shall be an integral element of each design review phase.

l). Acceptance of the virtual mockups shall be required as part of the completion of each design review phase prior to progressing to the next design phase:

i). PDR **[CDRL 3-60]**

ii). IDR **[CDRL 3-61]**

iii). FDR **[CDRL 3-62]**

m). The virtual mockups shall present the industrial product design and shall include the up-to-date CMF application and the representation of accurate lighting.

3.19 Renderings

a). General

i). The Contractor shall submit renderings and associated 3D data to facilitate the interior and exterior design efforts at each stage of the design process.

ii). The renderings should be delivered to a high production value and present the design to a photorealistic level, including accurate representation of color, materials, textures, and finishes, lighting and reflections.

iii). The renderings shall convey the design, appearance and functional intent of the proposed product.

iv). The renderings shall show the proposed position, size and appearance of equipment, components, furniture, and appliances in each space.

v). The first set of renderings shall be submitted 30 calendar days prior to the first Interior PDR. **[CDRL 3-63]**

vi). Revised renderings shall be revised and submitted as the design changes through IDR **[CDRL 3-64]** and FDR **[CDRL 3-65]** until the interior and exterior design is frozen.

vii). Renderings shall be provided electronically in both TIFF and JPEG formats with a minimum of 1920 x 1080 resolution.

viii). Format

(1) Renderings shall be provided electronically in both TIFF and JPEG formats with a minimum of 1920 x 1080 resolution.

(2) Additionally, each submittal package of renderings shall include full color print versions at a minimum of 11’ x 17’, printed on glossy paper.

(3) Amtrak accepted final renderings shall be provided in high resolution electronic format as well as 24 (twenty-four) sets of high-quality sets of high-quality D size (24 inches x 35 inches) poster board backed prints for display in public forums.

b). Interior Renderings

i). Interior renderings shall be provided to convey the options for interior layouts.

ii). Renderings shall be submitted for each product type, car class/variant.

iii). Renderings shall be fully detailed and shall present all amenities and features included on-board the cars.

iv). Renderings should accurately represent all the color materials and finishes.

(1) These should be supported by the Color Material and Finish (CMF) sample boards at each stage.

v). Renderings should accurately show the lighting conditions as well as different lighting states (daytime mode and evening mode).

vi). Renderings should depict the various configurations of equipment and accommodations, such as upright and reclined seating arrangements that cater to both seating and sleeping needs.

vii). Renderings included in the PDR package shall include:

(1) Renderings of each proposed seating design concept.

(a) Renderings shall include front, back, side and three-quarter images.

(b) Renderings shall present the full feature set of each proposed concept, as well as the equipment in all seating conditions (reclined upright, table out etc.).

(c) Rendering shall include annotated break out of key features and shall identify key and critical dimensions.

(2) Interior renderings showing all accessible spaces in each car type.

(a) All accessible coach spaces

(b) Schematic 3D data and screen shots/renders showing all elements and break out of parts and annotated to break out of key features and identify key and critical dimensions.

(c) All vestibules and Pathways

(d) Café, Accessible Sleeper, Diner, Diner/Lounge, Premium Accessible Coach, Standard Coach and Standard Sleeper.

(e) All restrooms

viii). Renderings included in the IDR package shall include:

(1) Revised full of renderings for all spaces presenting how the design is evolving and clearly identifying any changes or revisions since the PDR submittal.

(2) Renderings shall incorporate the application of the current Color Material and Finish as well as all states and lighting conditions.

ix). Renderings included in the FDR package shall include:

(1) Final and full suite of all spaces as final renderings for sign off on design. Minimum of 6 renders of each space.

(2) Final full and comprehensive Schematic renders – showing all features sets and key dimensions

(3) Creation of final design book combining renders, drawings, layouts and schedule of finish.

c). Exterior Renderings

i). Throughout the Design Review process, the Contractor shall submit to Amtrak for review and approval exterior renderings of each car type and variant.

(1) Renderings shall show the complete cars, fully equipped and in a ready for service condition, including end masks, doors, windows, and all exterior features.

(2) The Renderings shall include proposed livery color scheme, finish and use of decals (reflective and non-reflective).

(3) To facilitate the review of reflective decals, the Renderings shall include night-time view of front, side and three quarter profile view.

ii). A minimum, six (6) sets of renderings (each with all the necessary views) shall be submitted for Amtrak review and acceptance as the design evolves over the Design Review Process.

(1) Each successive set of renderings will show refined levels of detail and communicate how the contractor will deliver the exterior livery design ambitions set out by Amtrak design vision.

iii). Livery design shall be supported by 2D elevation artworks for all car types – supplied as .PDF. **[CDRL 3-66]**

iv). Final artworks should be supplied as color correct artworks with application guidelines. **[CDRL 3-67]**

3.20 Color Material and Finish (CMF)

a). A robust process will need to be developed by the Contractor to deliver the design vision with a CMF scheme that represents its brand and unique Amtrak brand DNA. For further clarification of expectations, refer to Exhibit F.

b). As part of the process, the Contractor shall provide:

i). Evolving sets of materials boards and samples are required at each stage of the design review process. **[CDRL 3-68] [CDRL 3-69] [CDRL 3-70]**

ii). Samples boards should be produced that include all interior materials and finishes for the Coach cars, Sleeper Cars, Diner, Diner/Lounge, and Café environments.

(1) Sample boards shall be delivered as a collection of all materials that represent all the materials in each area.

(2) Individual samples will not be reviewed or approved without the context of the other materials in the palette for that space.

(3) Samples will not be approved without an accompanying 3D render of the space showing an accurate representation of the color, material, and finish.

iii). Material suppliers and detailed material specifications and data sheets are required for review by Amtrak for each material. **[CDRL 3-71]**

iv). Large samples for flooring and seating should be delivered to coincide with Soft-mock up review.

v). Duplicate sample boards should be produced (3 sets per space).

vi). The Contractor shall support up to three rounds of sampling as materials are color matched, or materials refined.

(1) Material supplier briefs must be submitted to Amtrak for review and approval to ensure that they meet Amtrak's needs and expectations.

(2) Specific refinement will be expected for seating and flooring with rounds of color matching by suppliers expected up to five rounds.

vii). A Schedule of Finish documentation which shall identify the CMF for every part of the interior. **[CDRL 3-72]**

3.21 Requirements for Drawings, Documents and Data

a). Individual drawings shall be prepared for each part incorporated, designed and/or manufactured by or for the Contractor for the construction of the cars.

b). Any and all drawings, shop drawings, plans and specifications produced by the Contractor shall upon presentation to the Authority, become the property of Amtrak consistent with the General Provisions.

c). Assembly, sub-assembly and arrangement drawings shall include a complete Bill of Materials on the field of the drawing or as a subsequent sheet.

i). The Bill of Materials shall describe all items, including the subcontractor's parts and all equipment and details which form part of the assembly.

d). American Welding Society (AWS) standards, references and symbols shall be used at weldments in drawings.

e). All the drawings supplied by the Contractor in accordance with this Specification shall be so delineated that the wiring, piping, or mechanical interference between components shall be readily and clearly identifiable.

f). The Contractor's Safety Engineer shall review all design layouts, assembly, and subassembly drawings of safety related features prior to their submission to

Amtrak and/or their release for production to ensure the safety of operations personnel, maintenance personnel and the riding public.

g). Drawing Sizes and Requirements

i). All drawings shall be prepared in American National Standards Institute (ANSI) standard sizes.

ii). All Contractor drawings shall utilize a standard title block in the lower right corner and application block in the upper-right hand corner

(1) The arrangement for the title block and the application block shall be agreed upon prior to the start of PDR.

iii). The Contractor shall be responsible for the conformity and standardization of all sub-suppliers drawings to be submitted to Amtrak.

h). 3D CAD Data Requirements

i). Contractor shall provide 3D CAD data in the form of well-organized STEP files, with both assemblies and part-level geometry

ii). Files shall be version-controlled and date-stamped to allow for traceability and proper review.

iii). The data shall be reviewable in native 3D environments to support detailed evaluation and integration.

iv). Viewer-only platforms or proprietary viewer formats are prohibited.

i). Bills of Material

i). All drawings shall include Bills of Material with a numbering system for easy identification on the drawing.

ii). Bills of Material shall indicate piece part and assembly weights.

iii). Bills of Material shall include US equivalent units.

iv). Bills of Material shall be carried on the drawings, or on attached sheets of the same size.

v). Bills of Material descriptions shall positively identify the materials used.

vi). For items on the Bills of Material referring to common manufactured materials, the description shall contain the manufacturer name, and manufacturer’s part numbers for the material.

vii). The Bill of Material shall have a separate column for future insertion of Amtrak’s part numbers.

j). Dimensions

i). All dimensions shall be shown in both imperial and metric units.

(1) Metric dimensions, enclosed in parentheses, shall follow imperial dimensions.

ii). Imperial units shall be shown consistently on all drawings as follows:

(1) Inches and fractions, or inches and decimals throughout.

(2) One inch mark (") shall be shown to the right of each dimension.

(3) Decimals shall be shown with maximum of three significant figures to the right of the decimal point as required.

iii). Dimensions up to and including 72" shall be shown in inches.

iv). Dimensions above 72" shall be shown in feet and inches.

k). Metric units shall be shown consistently on all drawings as follows:

i). Metric units shall be shown as millimeters and decimals.

ii). Millimeter units shall be accompanied by one blank space and the letters "mm" to the right of the figures.

iii). Dimensions smaller than one meter shall be shown in millimeters.

iv). Dimensions one meter and larger shall be shown in meters and decimal meters (1.000 m)

v). Decimal units shall be shown with as many significant figures to the right of the decimal point as required.

l). Stationing

i). Numerical station dimensions and lines shall be used on all assembly drawings, and as frequently as possible on detail drawings and views, to locate the individual items in the overall car configuration. All assembly and sub-assembly drawings shall contain station information to accurately locate the item on the car.

ii). Stations shall be shown in three planes:

(1) Longitudinally, commencing with the pulling face of coupler (P.F.C.) at the front end of the car.

(2) Transversely, commencing with the longitudinal centerline of the car and increasing left and right.

(3) Vertically, commencing with the tops of the running rails.

(4) Station figures shall be enclosed in circles.

(5) Transverse dimensions shall have the letters "L" or "R" shown below the figures, to indicate "left" and "right".

(6) Vertical dimensions shall have the letters "ATOR" (above top of rail) shown below the figures.

m). Numbering

i). The Contractor shall confer with Amtrak to develop a numbering system compatible with both the Contractor and Amtrak's standard numbering systems.

ii). All revisions of drawings shall be identified with an alphabetic suffix.

n). Integrated Schematics Package

i). General

(1) The Integrated Schematic Package shall be submitted as a component of the Running Maintenance Manuals.

(2) The Integrated Schematic Package shall be comprised of two parts:

(a) Integrated Schematics

(b) Integrated Wiring Diagrams

(3) The Integrated Schematics shall include all electronic and electrical components on the car.

(a) All minor subsystem components housed in "black boxes" shall also be included in the Record Drawings Schematic Package.

(b) The Integrated Schematic shall provide the physical location of all electrical system components.

ii). Electrical Schematics

(1) The Contractor shall prepare and submit, for acceptance by the Authority, an integrated schematic diagram package relating all electrical systems and including all components and all wiring on the cars.

(2) The schematic diagram shall be one which can be readily followed by technicians with basic electrical knowledge.

(3) Both an alphabetic tabulation and pictorial locator of all electrical components and devices and the physical location of these components shall be included with the integrated schematics.

(a) This tabulation should also identify the circuits where components are used, and the location of each circuit in the schematic package.

(b) Each drawing within the schematics shall include a grid locating system which shall be referenced for continuation to other drawings.

(c) Wire List

(i) The schematics shall be accompanied by a complete Wire List. The list shall include for each wire, as a minimum:

1. Originating equipment

2. Destination equipment

3. Wire size and type

4. Conduits and Raceways through which the wire runs

5. Wire number

(ii) This Wire List shall be provided in an electronic database format (with database software and license provided).

1. The database shall be arranged in logical fields that will allow various sorts of the information (such as by equipment, wire number, conduit, etc.).

2. Both hardcopy and electronic media file shall be provided.

iii). Pneumatic Schematics

(1) In addition to electrical schematics, the integrated schematic package shall contain pneumatic schematics including, at a minimum:

(a) Compressed Air System

(b) Brake System

(c) Secondary Suspension

(d) Any other pneumatic components or systems.

iv). Wiring Diagrams

(1) Complete wiring diagrams shall also be provided for all car wiring.

(2) These diagrams shall be arranged logically and all text shall be clearly legible.

(3) Wiring Diagrams shall:

(a) Identify all conduits and raceways in which wires are run

(b) Identify all wires in each conduit/raceway

(c) Clearly denote all connections at terminal blocks and connectors.

(4) A separate drawing noting the physical locations of all terminal boards and junction boxes shall be provided as part of the wiring diagram package

v). Format

(1) Sample formats for the following shall be submitted to Amtrak for review and approval before submittal as a component of the maintenance manuals:

(a) Electrical Schematics **[CDRL 3-73]**

(b) Pneumatic Schematics **[CDRL 3-74]**

(c) Electrical Component/Device Table **[CDRL 3-75]**

(d) Wiring Diagram **[CDRL 3-76]**

(e) Wire Run List **[CDRL 3-77]**

(2) The schematics shall be provided in B size, 11 inch by 17 inch packages.

(3) All schematics shall be prepared so that all text and other items on the drawings are clearly legible on the 11 inch by 17 inch sheets.

o). All other document control and formatting requirements shall be discussed and agreed upon within 30 days after the project kick-off meeting.

3.22 Rapid Prototype Cars

a). In previous contracts, Amtrak has allowed Contractors to progress with the development of rapid prototype cars (RPC) in parallel with the Design Review process.

b). The advantage of this process was to help prove out manufacturability issues, confirm system integration and conduct pre-qualification testing prior to the construction of the deliverable pilot cars.

c). Should the Contractor desire to propose the incorporation of rapid prototype cars, it should develop and submit to Amtrak a proposal for review and acceptance detailing the following:

i). A detailed schedule showing the progression of the RPC in parallel with the Formal Design Review Process.

ii). Detail of the implementation of gateways in the Design Review Process which will limit and control the progression of the RPC process.

iii). A discussion of how the RPC process will be used to support and optimize the Design Review Process.

iv). Should the Contractor desire to utilize an RPC as a production car, a plan on how it would be remanufactured to comply with the following:

(1) Completion of all FMIs

(2) Replacement of any pre-FAI components with post FAI equipment

(3) Agreement with final design configuration

(4) All quality requirements of this specification, including formal re-inspection of the updated vehicle by Amtrak resident inspectors

(5) Final and complete vehicle testing

d). The following shall be considered constraints for the development of a Rapid Prototype Car process:

i). Process shall not be started until after the carshell design and testing has been completed. The carshell shall be manufactured to the final configuration and using the production process.

ii). The RPCs shall not be considered the pilot cars and shall not be the first cars to be delivered to Amtrak.

iii). The incorporation of an RPC process shall not negatively impact the contractual schedule.

iv). The incorporation of an RPC process shall not result in an increased contract cost to Amtrak.

v). The incorporation of an RPC process shall not negatively impact the material supply for the pilot or production cars.

vi). The complete vehicle FAI shall not be performed on the RPCs.

e). The decision to allow the incorporation of an RPC program shall be solely at Amtrak's discretion.

3.23 CDRLs

CDRL	Description	Due
CDRL 3-01	Project Management Plan (PMP)	NTP + 30 days

CDRL 3-02	System Integration Plan (SIP)	60 days prior to 1st PDR meeting
CDRL 3-03	Interface Control Document (ICD)	60 days prior to 1st PDR meeting
CDRL 3-04	Kickoff Meeting Presentation	At least 5 days before kickoff meeting and within 10 days of NTP
CDRL 3-05	Baseline Project Schedule (Baseline PS) and Narrative	NTP + 30 days
CDRL 3-06	Design Review Plan	NTP + 30 days
CDRL 3-07	Detailed Drawing Tree	30 days prior to 1st PDR meeting
CDRL 3-08	Compliance Matrix	Contract Award and 30 days prior to each design review
CDRL 3-09	Preliminary Design Review (PDR)	90 days after Contract Award
CDRL 3-10	PDR – Compliance Matrix	30 days prior to 1st PDR meeting
CDRL 3-11	PDR – Drawing Tree and Schedule	30 days prior to 1st PDR meeting
CDRL 3-12	PDR – System Functional Description	30 days prior to 1st PDR meeting
CDRL 3-13	PDR – Arrangement Drawings and Related Documents	30 days prior to 1st PDR meeting
CDRL 3-14	PDR – Detailed Technical Specification	30 days prior to 1st PDR meeting
CDRL 3-15	PDR – Detailed Technical Specification covering methods, materials and arrangements for pilot car construction.	30 days prior to 1st PDR meeting
CDRL 3-16	PDR – Table of suppliers and products	30 days prior to 1st PDR meeting
CDRL 3-17	PDR – Weight Analysis	30 days prior to 1st PDR meeting
CDRL 3-18	Intermediate Design Review (IDR)	60 days after the closure of PDR
CDRL 3-19	IDR – All Drawings in the Drawing Tree	30 days prior to IDR meeting
CDRL 3-20	IDR – Drawing Tree: 2 Additional Levels	30 days prior to IDR meeting
CDRL 3-21	IDR – Draft Single Line Control Schematic	30 days prior to IDR meeting
CDRL 3-22	IDR – Functional Block Diagrams	30 days prior to IDR meeting
CDRL 3-23	IDR – Electrical Wiring Diagrams & Schematics	30 days prior to IDR meeting
CDRL 3-24	IDR – Clearance Drawings	30 days prior to IDR meeting

CDRL 3-25	IDR – Piping Diagrams	30 days prior to IDR meeting
CDRL 3-26	IDR – Manufacturer's Data and Spec Sheets for all Control items	30 days prior to IDR meeting
CDRL 3-27	IDR – Updated Compliance Matrix	30 days prior to IDR meeting
CDRL 3-28	IDR – Updated Interior Renderings	30 days prior to IDR meeting
CDRL 3-29	IDR – Updated Exterior Renderings	30 days prior to IDR meeting
CDRL 3-30	IDR – CMF Palette	30 days prior to IDR meeting
CDRL 3-31	IDR – Interior Material Samples	30 days prior to IDR meeting
CDRL 3-32	IDR – Layout of Product Accommodations	30 days prior to IDR meeting
CDRL 3-33	IDR – Draft Maintenance Requirements and Procedures	30 days prior to IDR meeting
CDRL 3-34	Final Design Review (FDR)	90 days after the close of IDR
CDRL 3-35	FDR – Weight Analysis	30 days prior to FDR meeting
CDRL 3-36	FDR – Detailed Technical Specification	30 days prior to FDR meeting
CDRL 3-37	FDR – Functional Analysis	30 days prior to FDR meeting
CDRL 3-38	FDR – Drawing Schedule	30 days prior to FDR meeting
CDRL 3-39	FDR – Arrangement Drawings	30 days prior to FDR meeting
CDRL 3-40	FDR – Supplier Identification	30 days prior to FDR meeting
CDRL 3-41	FDR – All Drawings in the Drawing Tree	30 days prior to FDR meeting
CDRL 3-42	FDR – Single Line Control Schematic	30 days prior to FDR meeting
CDRL 3-43	FDR – Functional Block Diagrams	30 days prior to FDR meeting
CDRL 3-44	FDR – Electrical Wiring Diagrams & Schematics	30 days prior to FDR meeting

Amtrak Universal Single Level Fleet Replacement

Technical Specification

---

4. Reliability, Availability and Maintainability

Revision 2

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Table of Contents

4.1 Reliability Overview 4-1
4.2 Reliability Program Plan 4-2
4.3 Reliability Requirements 4-3
4.4 Failure Review Board 4-5
4.5 Reliability Demonstration Testing 4-6
4.6 Design Changes after Pilot Car delivery 4-10
4.7 Maintainability 4-11
4.8 CDRL List 4-17

4.1 Reliability Overview

a). This chapter defines the Reliability, Availability, and Maintainability (RAM) and Warranty requirements for the Amtrak Single Level Fleet Replacement program, including analysis and other submittal requirements.

i). The Contractor shall ensure that the level of reliability, availability, and maintainability provided by the cars supplied under this Contract meet or exceed the minimum requirements defined in this technical specification.

b). The single level fleet will spend much of their operating life hundreds of miles away from the nearest repair point with no onboard mechanical personnel and few if any tools and where alternative transportation for passengers in the event of a mechanical failure will be limited and time consuming to obtain if available at all.

c). Reliability and uptime of systems is of the utmost importance on these cars.

i). Designs must be robust, prioritizing reliability in all mechanical, electrical, and digital aspects.

ii). Where possible, system design should incorporate elements that will allow partial functionality when some components have failed, or lockouts to allow the car to continue to move safely until a repair point can be reached.

d). The Contractor shall incorporate a Design for Reliability (DfR) philosophy throughout the design process.

i). DfR is a process that ensures a product, or system, performs a specified function within a given environment over its expected lifetime.

ii). DfR requires the integration of product design and process planning into a cohesive, interactive activity known as concurrent engineering.

iii). The Contractor shall discuss the implementation of DfR in its Reliability Program Plan.

iv). By employing DfR, Contractor shall consider reliability throughout the design process to minimize the types and impact of component failures, minimize single point failures, and identify and mitigate failures of critical components that affect system operation.

v). DfR would be expected to include:

(1) Utilize mature designs for systems and components.

(2) Select suppliers with effective parts controls programs.

(3) Minimize design complexity and dormant failure possibilities.

(4) Consider parts obsolescence in the design process.

(5) Ensure component duty cycles do not exceed limits.

(6) Ensure heat sources are insulated from critical components.

(7) Ensure components are isolated to minimize shock and vibration.

(8) Use electro-magnetic interference (EMI) protection on all electronic equipment.

(9) Protection from freeze-related damage and mitigation of issues caused by the accumulation of ice and snow during extended cold-weather conditions.

(10) Use best reliability design practices.

(11) Redundancy between components wherever practical.

4.2 Reliability Program Plan

a). The Contractor shall develop and implement a Reliability Program Plan to ensure the vehicle, its systems, and its subsystems meet or exceed the reliability requirements specified in this Chapter.

b). The Contractor shall be responsible for providing all measures required to meet the specified requirements, including design, manufacture, installation, retrofit of the entire fleet, and all changes.

c). No later than 30 days after NTP, the Contractor shall submit a Reliability Program Plan **[CDRL 4-01]** prior to Preliminary Design Review (PDR), and it shall be updated throughout the design process.

d). The Plan shall be submitted for Amtrak's review and approval.

e). The Reliability Program Plan should discuss the following items:

i). Reliability program objectives and requirements.

ii). Reliability program schedule, including activities and delivery dates.

iii). Organization structure, including the name(s) and qualifications of the Reliability Engineer(s).

iv). Methodologies used for analyses to ensure Plan requirements are achieved, including criteria for Line Replaceable Unit (LRU) classification.

v). Process for identifying subcontractors based on history of reliability capabilities and controls for activities of subcontractors and equipment suppliers.

vi). Reliability allocations.

vii). Method for component qualification and parts selection.

viii). Reliability demonstration test plans, including pass-fail criteria.

ix). Failure Review Board (FRB).

x). Reliability database or process to control failure data for FRB.

xi). Corrective action procedures, including procedure for failure analysis, root cause identification and verifying implementation of corrective actions. This should also address Fleet Defects.

xii). Failure Reporting, Analysis and Corrective Action System (FRACAS), including documentation procedures for capturing failure data, to include factory testing.

xiii). Reliability Progress Reporting, which details implementation of the approved program.

(1) Reports shall be submitted to Amtrak on at least a monthly basis to provide updates on critical Reliability KPIs (MDBCF, MDBSF, Availability, Failures and Fleet Defects).

4.3 Reliability Requirements

a). Every complete car, as well as each constituent component, assembly, subsystem and system element shall be designed in such a manner as to perform its function reliably in revenue service for the stated life expectancy of the component.

b). Failure Rates

i). Each car under all system operating conditions shall operate with a failure rate not exceeding that defined in these Technical Specifications.

ii). The car design and implementation of the design shall provide Amtrak with equipment that meets the Mean Distance Between Service Failure (MDBSF) and Mean Distance Between Component Failure (MDBCF) requirements.

iii). Compliance with MDBSF requirements shall include all failure modes for systems, subsystems, and components to meet the following requirements:

(1) All Car Types MDBSF = 120,000 miles

(2) The reliability objectives shall be based on single car operation at an average speed of 65 mph (104.6 kph.) and a utilization of 215,000 miles/yr. (344,000 km/yr.).

c). A Service Failure shall be defined as in Exhibit G – TSSSA Statement of Work.

i). Component Reliability Requirements

(1) The following MDBCF requirements shall be met:

Figure 4-1: MDBCF Requirements

System	MDBCF	
Braking System	300,000	[482,700 km]
Side and End Doors	300,000	[482,700 km]
HVAC System	380,000	[611,420 km]
Couplers	750,000	[1,207,008 km]
Trucks and Suspension	750,000	[1,207,008 km]
Auxiliary Power Systems	360,000	[579,363 km]
Lighting	1,000,000	[1,609,344 km]
Wheels and Axles	300,000	[482,700 km]
Communications Systems	600,000	[965,606 km]
Water and Waste System	750,000	[1,207,008 km]
Food Service (Café, Diner, and Lounge)	750,000	[1,207,008 km]
Toilet room	750,000	[1,207,008 km]

d). Reliability Prediction Analysis

i). The Contractor shall submit a Reliability Prediction Analysis **[CDRL 4-03]** prior to PDR, and approved prior to Final Design Review (FDR), to demonstrate how the system and subsystem reliability requirements can be achieved with their design.

ii). The Reliability Prediction Analysis should utilize historical reliability data wherever possible and minimize the use of handbook practices such as MIL-HDBK-217F or the NPRD.

iii). The Reliability Prediction Analysis shall be updated throughout the design process, no less frequently than bi-monthly.

iv). The Reliability Prediction Analysis shall be performed to the LRU level.

e). Fleet Defects

i). A Fleet Defect is identified when 5% of the quantity of a warranted item fails or where 5% of cars per a fleet type are affected during the warranty period as noted in the Specification.

ii). Amtrak may classify the total of such items as a failure, or fleet defect, including those items for which the warranty period expired before Amtrak recognized the failure.

iii). The Contractor is responsible for failure analysis, corrective action and all costs of labor and material, for defect identification and location, and for removal, repair or replacement of defective parts, and for alterations, repairs, tests and adjustments in connection therewith made to obtain car performance identified in the technical specifications.

iv). Replaced or repaired items due to a fleet defect are warranted and guaranteed for the remainder of the warranty period or for one (1) year, whichever period is greater.

f). Availability Requirements

i). Car reliability and car maintenance requirements shall be such that fleet availability shall exceed 99.99%, where Availability is defined as:

(1) MTBF (Mean Time Between Failures) see Chapter 2.

(2) MTTR (Mean Time To Repair) see Chapter 2.

$$\text{Availability} = \frac{\text{MTBF}}{\text{MTBF} + \text{MTTR}}$$

ii). Availability shall be measured daily and the exact time at which it will be measured must be approved by Amtrak.

4.4 Failure Review Board

a). A Failure Review Board (FRB) shall be jointly established consisting of representatives from Amtrak and from the Contractor.

i). The core members of the FRB shall be the Contractor's Warranty Manager and Reliability Engineers and Amtrak's assigned Reliability Representative/Warranty Officer and COTR.

ii). The core members shall be supplemented by appropriate personnel from Amtrak, the Contractor, and subcontractors/suppliers, as required, to facilitate a thorough and accurate review of all the data.

iii). The Contractor shall ensure the participation of subcontractors/suppliers to provide subject matter expertise of any problems with components/subsystems and to expedite resolution.

b). The FRB shall meet regularly, beginning when the first cars undergo factory acceptance testing and continuing through the Reliability Demonstration Test to the end of the Warranty Period.

i). FRB meetings shall be scheduled weekly with the understanding that Amtrak may, at its sole discretion, require more or less frequent meetings depending on the reliability of the equipment.

c). Responsibilities

i). The FRB shall review the failure report forms and logs to verify failure classifications and assign responsibilities of failures.

ii). The FRB shall review all reliability test data and failure reports, review failure analyses, report progress toward meeting reliability requirements, identify

areas needing improvement, and propose actions to ensure the successful completion of the reliability demonstration.

iii). The FRB shall correct and update failure reporting, analysis and corrective action system (FRACAS) data.

d). In the event the FRB is unable to reach agreement on the categorization of failures (chargeable/non-chargeable) or on the corrective action to be taken for any item, Amtrak's Reliability Representative will forward the issue, with relevant records and documentation, to Amtrak's COTR.

i). The COTR will act as the arbitrator for all project issues.

ii). Where appropriate, Amtrak's COTR will meet with the Contractor's representative to determine the path forward.

iii). Upon agreement, the decision will be formally communicated to the Contractor and the FRB.

4.5 Reliability Demonstration Testing

a). General

i). As a condition precedent to Final Fleet Acceptance, a Reliability Demonstration must be successfully performed, analyzed and reported upon by the Contractor to validate the reliability of the cars, systems, subsystems and components during revenue service.

ii). The Contractor shall closely monitor the failure modes of all systems to ensure that the cars will meet requirements.

iii). If at any time during the Reliability Demonstration the failure rate of any system exceeds the allowable failure rate (i.e., the MDBCF requirements listed in

iv).

v). Figure 4-1), the Contractor shall seek modifications and changes to bring the system into compliance.

vi). Reliability calculations will be performed using a 12-month rolling average.

(1) All equipment failures during car burn-in shall be reported and recorded, but not counted in establishing MDBCF and MDBSF values.

(2) Determination of pass or fail will be assessed only at the end of the reliability demonstration.

b). Grace Period

i). During the first six (6) months of data collection, Amtrak will consider the reliability results as biased by system interface issues, workmanship issues,

and infant mortality failures and will not hold the Contractor responsible for its reliability goals.

ii). The Failure Review Board shall, however, be active during this grace period.

iii). During the grace period, the Contractor must submit a procedure to identify the collection, review and control of the failure data pertinent to the Reliability Demonstration.

c). Reliability Progress Reporting

i). The Contractor shall submit monthly Reliability Progress Reports **[CDRL 4-02]** following the first Failure Review Board (FRB) meeting.

ii). The format for the monthly reports shall be determined by the FRB members, but shall include, at a minimum, the following:

(1) RAM activities within the reporting period, including minutes and actions of the Failure Review Board meetings.

(2) Reliability Test Report.

(3) Reliability achievements and problems.

(4) Reliability requirements, generic formulas and performance summaries for all defined requirements:

(a) Mean Distance Between Service Failures – Car Level

(b) Mean Distance Between Service Failures – Subsystem Level

(c) Mean Distance Between Component Failures – Car Level

(d) Mean Distance Between Component Failures – Subsystem Level

(e) Availability

(f) Fleet Defect items

(5) Reliability critical items.

(6) Expected reliability activities within the next reporting period.

(7) A summary and schedule of corrective actions, including in-progress and planned.

d). Component Failures

i). For all parts or material returned to the Contractor for repair or replacement, the Contractor shall provide a failure analysis report form to Amtrak.

ii). The failure analysis form shall clearly identify the part by description and part number; identify the car and service mileage of that car, the date and nature of the failure.

iii). The Contractor shall, within 60 days, provide Amtrak with the results of a root cause analysis for the failure along with any proposed action in the Reliability Report.

e). Reliability Design Modifications or Changes

i). The Contractor shall make necessary modifications during the reliability demonstration program in order to achieve the MDBCF and MDBSF requirements.

ii). The Contractor shall submit all requests for such design changes within 60 days of the end of the reliability demonstration using the Engineering Change Request (ECR) system and shall gain Amtrak approval prior to the implementation of any change.

iii). All reliability-related modifications defined during the reliability demonstration program shall be implemented on all cars and spare parts within 180 days of the date of approval of the modifications by Amtrak.

f). Reliability Demonstration Duration and Conclusion

i). The Reliability Demonstration will commence with the Approval for Revenue Service of the first car and continue until two (2) years after the Final Acceptance of the last car.

ii). Satisfaction of the reliability demonstration shall only be met when the specified availability and reliability requirements for each complete system within the fleet (that is all cars installed and commissioned) is achieved based on a consecutive 12-month period of test time.

(1) In the event the reliability demonstration is declared failed, the Contractor shall continue testing and extend the test period until the reliability demonstration is successful, unless otherwise directed by Amtrak.

iii). If two (2) years after the Final Acceptance of the last car it cannot be determined that all specified reliability requirements have been met, the Contractor shall re-design and modify or replace all such systems, subsystems, components, parts or equipment as needed to achieve acceptable reliability, at the Contractor's expense, regardless of whether these items have exhibited the defect or failure and regardless of the warranty status.

(1) Cars so modified shall undertake a further reliability demonstration of at least six months duration to prove reliability.

(2) Demonstration periods may be extended, as necessary, to validate season-dependent reliability. Reliability issues related to air conditioning systems shall not be considered satisfactorily demonstrated until performance has been verified through a full summer operating season. Similarly, reliability issues related to freeze protection or other winter weather conditions shall not be considered satisfactorily demonstrated until performance has been verified through a winter operating season, regardless of when corrective actions are implemented.

(3) Modifications shall continue at the Contractor's expense until the specified MDBCF and MDBSF reliability levels are met.

(4) Should such modifications not be completed within this six-month period, Amtrak shall have the right, at its sole discretion, to perform any necessary engineering or studies, and to correct the defect or failure.

(a) All costs incurred by Amtrak for such engineering and corrective work shall be at the Contractor's expense.

(b) Any items replaced by Amtrak during such corrective work will be disposed of by Amtrak in the manner requested by the Contractor and at the Contractor's expense.

(c) If the Contractor fails to furnish disposition instructions, Amtrak will dispose of such items at the Contractor's expense, where applicable.

g). Reliability Demonstration Report

i). Within 30 days after the completion of the Reliability Demonstration Test, the Contractor shall submit the Reliability Demonstration Report **[CDRL 4-04]** verifying that the reliability requirements of this chapter have been met.

h). Reliability Demonstration Plan

i). Prior to the start of Final Design Review, the Contractor shall submit for Amtrak review and approval the Reliability Demonstration Plan (RDP). **[CDRL 4-05]**

ii). The RDP shall define the specific procedures, facilities, staffing, and protocols to be employed by the Contractor during the Reliability Demonstration to monitor, test, adjust, and report progress toward achieving the reliability requirements of this Specification. Specifically, the Contractor shall provide a procedure to be followed in the reliability demonstration that includes, at a minimum:

(1) Method for all equipment failures to be reported during reliability testing, including forms and reliability database.

(2) The reliability program shall utilize failure data collected through the failure tracking process.

(3) Monitoring of overall car reliability on car and component level.

(4) Tracking of all component failures and identification of Fleet Defect.

(5) Details of the burn-in period for each car.

(a) All equipment failures during the burn-in shall be reported and recorded but not counted in establishing MDBCF values.

(6) Procedure for corrective action when necessary to meet reliability requirements.

(a) This shall include proposed reliability demonstration restart procedures, proposed changes, and appropriate supporting data.

(b) The proposed plan shall clearly identify a specific method for verifying the effectiveness of change(s).

(c) Credit may not be taken for time from previous failed tests, and the specified performance and other required characteristics of the equipment shall not be changed to achieve reliability requirements.

(7) Method for recording all relevant data necessary to calculate MDBCF values for the car and major systems and to verify successful demonstration of the MDBCF requirements.

4.6 Design Changes after Pilot Car delivery

a). If during or after Pilot Car testing and commissioning design changes are deemed necessary for any reason, including Fleet Defects, the Contractor shall formally submit such change for Amtrak approval through an Engineering Change Notification (ECN).

b). The ECN shall include all supporting information and shall be subject to Amtrak review and approval, including reason for change, updated drawings, other documentation, modification plan, schedule, impacted production vehicles, detailed Field Modification Instructions (FMI) as appropriate, and any other data required to allow Amtrak to fully evaluate and approve the request.

i). Amtrak reserves the right to request a prototype or mockup of the proposed change to verify the solution solves the problem when implemented, prior to providing approval.

c). The ECN shall also present which vehicle types shall require an FMI and which shall incorporate the modification into the production process. The modification shall apply to all cars in the fleet, a cut-in car will not be allowed unless approved by Amtrak.

d). FMI configuration management should be managed using a sharable database to follow the various steps to get the FMI implemented.

e). To support what is usually an extended FMI period, the Contractor shall develop and submit during the FDR Phase of Design Review an FMI Plan for submittal to Amtrak for review and approval **[CDRL 4-11]**. This plan should include what accommodations the contractor will require such as roof access, pit access, drop table/car jacks, FMI duration, uncouple, and so on.

4.7 Maintainability

a). General

i). The Contractor shall consider maintainability and its effect on the total cost of ownership of these vehicles throughout the vehicle design process.

(1) The general goal shall be to maximize the ease of testability, reparability, and maintenance of equipment and components that affect system operation during the car useful life.

(2) The quantifiable goal of designing for maintainability shall be that the target for Mean Time To Repair (MTTR) for running repairs and troubleshooting target shall be 30 minutes.

ii). Initiatives which may improve the maintainability of the vehicles may include:

(1) The use of modular design.

(2) Inter-changeability of components performing similar functions.

(3) Accessibility of components and fasteners.

(4) Moveability of replaceable components.

(5) Reparability including appropriate Maintenance Manual data.

(6) Appropriate self-test features.

(7) Built-in quick disconnect test points for air and electrical systems.

(8) Design of simplified test equipment for use as troubleshooting aids.

(9) Minimize the use of specialized tools to replace components.

(10) Equipment covers and access panels incorporate rugged, quick-removal fasteners.

(11) Use of consistent fastener types, where applicable.

iii). The car shall be designed and built to minimize maintenance and repair time and overall costs over the car life. The following shall be considered good

practice in designing for maintainability and shall be utilized in the car design:

(1) All systems and components serviced as part of periodic preventive maintenance shall be readily accessible for service and inspection from under the car (from a pit), from ground level or from inside the car. Periodic maintenance shall not require the use of cranes or fall protection.

(2) Removal or physical movement of components unrelated to the specific maintenance and repair tasks involved shall be minimized or eliminated.

(3) Relative accessibility of components, measured in time to gain access, shall be inversely proportional to frequency of maintenance and repair of the components. (Items requiring more frequent maintenance shall be easier to access).

(4) Items which may need to be accessed while operating over the road, including cut-out cocks to keep the train moving or portions of systems operating even when some components have failed, must be readily accessible by the crew. Access from within the car is best. If necessary to place it undercar or in the equipment room, it must be within easy reach of the side of the car and protected from the buildup of ice and snow.

(5) Assemblies and components that are physically interchangeable shall be functionally interchangeable.

(6) Modular or plug-in assemblies and components that are not functionally interchangeable shall not be physically interchangeable.

(7) Systematic fault isolation procedures shall be developed for inclusion in the maintenance manuals.

(8) Local built-in test points and fault/status indicators shall be provided and clearly marked for all major systems including friction braking, Heating, Ventilation and Air Conditioning (HVAC), passenger doors, auxiliary power, battery charger, Public Address (PA), wi-fi, trainline, toilet system and food service equipment (chillers).

(9) All test points, fault indicators, modules, wire terminations, piping, tubes, wires, etc., shall be identified by name plates, color coding, number coding or other means to assist the maintenance personnel.

(10) Component placements in equipment cabinets, enclosures or confined places shall give the most accessible positions to those items requiring the most frequent maintenance or adjustment. For example, the toilet room and kitchen equipment.

(11) Door panels and openings shall be of sufficient quantity, size and placement to permit ready access from normal work areas.

(12) Standard, commercially available components and hardware shall be used wherever possible.

(13) Captive fasteners shall be used on covers and access panels where periodic maintenance and inspection are to be carried out. The use of special tools for removal shall be avoided.

(14) Cabinets and access panels will prioritize the use of quarter-turn hardware, pencil latches, and coach keys. Special keys are only allowed with express permission from Amtrak Access shall be provided, to the greatest extent possible, to structural components to allow inspection for cracks and corrosion.

(15) Major components shall be designed for ease of removal. Handles and lifting eyes shall be provided as applicable, on heavy equipment and components not readily accessible.

(16) Means shall be provided to verify the operability of redundant hardware components, and their switching devices, during maintenance, troubleshooting and testing.

(17) Requirements for special tools and fixtures shall be minimized.

(18) Any component that may need to be removed from inside the car needs to easily be able to fit through window openings, end doors, access door/hatch or lower body doors after the car is fully fitted-out and in service.

(19) Required list of tools for each task shall be provided.

b). Maintainability Plan

i). The Contractor shall prepare and submit for review at PDR, a Maintainability Program Plan **[CDRL 4-06]** utilizing design standards that minimize Mean Time To Repair (MTTR), cleaning and maintenance costs throughout the car's intended useful life.

ii). The plan shall include the systems and car MTTR goals for the proposed car.

iii). An overall quantitative maintainability requirement goal for the car's corrective maintenance shall be the weighted average of the MTTR (Mean Time To Repair) of the key system elements.

iv). Diagnostic and set-up time shall not be included in the MTTR.

v). Preventive maintenance is defined as the maintenance tasks performed to minimize the possibility of future equipment failure, reduce or minimize wear rates, replace consumable parts, and satisfy warranty requirements.

vi). The elapsed time required to perform preventive maintenance (exclusive of servicing) on the car shall be demonstrated.

vii). The objectives of the maintainability program, including corrective and preventive maintenance, shall provide for:

(1) Maximization of car availability

(2) Minimization of maintenance costs, including cleaning

(3) Minimization of car down time

(4) Minimization of special and high skill levels for maintenance

(5) Minimization of special tools and fixtures

viii). Components and sub-assemblies requiring occasional removal shall be plug-in units, adequately identified and secured and keyed to prevent misapplication.

ix). The need for adjustments shall be avoided wherever possible.

x). Adjustment points shall be readily accessible, adequately identified and self-locking to prevent inadvertent operation and drift.

c). Mean Time to Repair Requirements

i). The Mean Time To Repair (MTTR) a car fault and restore the car to operational readiness shall not average more than 1.5 hours.

ii). MTTR shall be defined as the average time required to fix a failed component or device and return it to production status, including time needed for the maintainer to diagnose, access, remove, replace/repair, close, and test-out the failed component or device.

iii). MTTR shall not include logistics time.

iv). The weighted average of the MTTR values for the following subsystem elements shall be no greater than:

Figure 4-2: MTTR Requirements

System	MTTR or Replace Major Module (hours)
Braking System	1
Side and End Doors	0.5
HVAC System	1
Couplers	2
Trucks and Suspension	1.5
Auxiliary Electrical System	1
Lighting	0.5

Wheels and Axles	1.5
Communications Systems	1
Water and Waste System	1
Food Service (Cafe, Diner and Lounge)	1
Toilet room	1

v). Maintainability Analysis

(1) As part of FDR, the Contractor must submit a Maintainability Analysis **[CDRL 4-07]** per type of cars for Amtrak approval.

(2) The maintainability analysis must:

(a) Demonstrate the MTTR requirement based on all LRU failure rate as well as their replacement times.

(b) Include all scheduled maintenance tasks and their time estimates.

vi). Lifecycle Cost Analysis (LCC)

(1) The Contractor must submit a Life Cycle Cost Analysis (LCC) **[CDRL 4-08]** at IDR and be updated through the design process.

(2) The LCC analysis must estimate all maintenance costs as well as overhaul costs to determine the cost of maintenance during the vehicles service life.

(3) An estimated life cycle shall be provided for all major components and LRU's.

(4) These documents must be approved prior to final approval of FDR.

d). Maintainability Demonstration

i). The Contractor shall perform a formal maintainability demonstration.

ii). The procedures used in the maintainability demonstration shall be the same as those included in the maintenance manuals delivered.

iii). The maintainability demonstration must be held at Contractor's facility or the facility of a sub-supplier.

iv). Maintainability Demonstration Plan **[CDRL 4-09]**

(1) The Contractor shall submit a Maintainability Demonstration Plan based on MIL-HDBK-470 for Amtrak approval prior to qualification testing of the first car.

(2) The Plan shall include a list of tasks to be performed during the demonstration for Amtrak approval.

(3) The Plan shall also include the template that will be used to record the results of the maintainability demonstration of each task, including fields to record the task name, time to access, remove, replace/repair, close, and test-out the component.

(4) The maintainability demonstration shall include:

(a) preventive maintenance

(b) corrective maintenance

(c) train recovery

(d) Accessibility

(e) Troubleshooting guide(s)

v). The preventive maintenance demonstration shall include the periodic inspections and any preventive maintenance tasks identified by the Contractor during the Maintenance Analysis.

vi). The corrective maintenance demonstration shall include change-out of LRUs and LLRUs and use of special tools where special emphasis, instruction, or proficiency is needed.

vii). The LRU and LLRU change-outs shall demonstrate compliance with the MTTR requirements of each system element.

viii). The adequacy of the car design for maintainability shall be evaluated to the satisfaction of Amtrak using product components and equipment, mockups and actual cars during the design, production and acceptance phases.

ix). The maintainability of following systems shall, as a minimum, be demonstrated. However, Amtrak reserves the right to request the demonstration of additional systems.

(1) Braking System

(2) Side and End Doors

(3) HVAC System

(4) Couplers

(5) Trucks and Suspension

(6) Auxiliary Electrical System

(7) Lighting

(8) Wheels and Axles

(9) Communications Systems

(10) Water and Waste System

(11) Food Service (Café and Diner)

(12) Toilet room

(13) Powered Accessible Toilet and Accessible Sleeper Room Doors

(14) Sleeping Accommodations

(15) Non-powered Sleeper Room Doors

(16) Gangway

(17) Diagnostic and digital systems (PIDS, onboard computers, etc.)

(18) Wi-Fi

(19) Digital Trainline

(20) On-Board Mobility Lift

x). This demonstration shall include a shop exercise to troubleshoot, to change out of components, to perform corrective maintenance, and to use the Contractor supplied special tools and equipment.

xi). The demonstration shall also consider train-car lifting and crane access when developing the maintainability demonstration plan and maintenance manuals.

e). Maintainability Demonstration Conclusion

i). If at the end of the demonstration it cannot be determined that all specified maintainability requirements have been met, the Contractor shall re-design and modify or replace elements as needed to achieve acceptable maintainability at the Contractor's expense.

ii). Cars so modified shall undertake a further maintainability demonstration to prove maintainability.

f). Maintainability Demonstration Report

i). Upon completion of the Maintainability Demonstration Test, the Contractor shall submit the Maintainability Demonstration Report **[CDRL 4-10]** verifying that the maintainability requirements of this chapter have been met.

4.8 CDRL List

CDRL	Description	Due
CDRL 4-01	Reliability Program Plan	NTP + 30 days

CDRL 4-02	Reliability Progress Reports	Within 90 days following the 1st FRB, then monthly
CDRL 4-03	Reliability Prediction Analysis	30 days prior to PDR
CDRL 4-04	Reliability Demonstration Report	Reliability Demonstration Test + 30 days
CDRL 4-05	Reliability Demonstration Plan	30 days prior to start of FDR
CDRL 4-06	Maintainability Program Plan	30 days prior to PDR
CDRL 4-07	Maintainability Analysis	30 days prior to FDR
CDRL 4-08	Life Cycle Cost Analysis	30 days prior to IDR
CDRL 4-09	Maintainability Demonstration Plan	180 days prior to qualification testing of 1st car
CDRL 4-10	Maintainability Demonstration Report	Within 30 days after completion of the Maintainability Demonstration Test
CDRL 4-11	FMI Plan	90 days prior to shipment

* End of Chapter 4 *

Amtrak Universal Single Level Fleet Replacement

Technical Specification

---

5. Quality Assurance

Revision 2

Table of Contents

5.1 Overview 5-1
5.2 Regulations, Standards, Specifications and Drawings 5-1
5.3 Quality Assurance (QA) 5-1
5.4 Project Quality Plan 5-2
5.5 Book of Quality 5-4
5.6 Additional Quality Requirements 5-4
5.7 Initiatives that Promote Sustainability in the Manufacturing Process 5-10
5.8 First Article Inspection (FAI) 5-11
5.9 Inspection 5-17
5.10 CDRLs 5-26

5.1 Overview

a). This chapter describes the Contractor quality, manufacturing and inspection requirements for the single level fleet.

b). The Contractor is expected to have an overall Quality Assurance Program that is implemented throughout their organization and a project specific Project Quality Plan, described below.

5.2 Regulations, Standards, Specifications and Drawings

a). Amtrak takes no responsibility for the identification of applicable chapters and paragraphs of regulations and standards with which the Contractor must comply.

b). Nothing in this specification shall relieve the Contractor from ensuring that all applicable regulations, standards, and specifications are followed.

c). The Contractor shall provide proof of compliance with all applicable regulations, standards, and specifications per Section 3.15 b).

d). The Contractor is responsible for ensuring that all applicable regulations, standards, and specifications are followed when complying with the requirements of this document.

e). A summary list of regulations, standards and specifications is listed in Chapter 2 as a guide to the Contractor but shall not be construed as complete.

5.3 Quality Assurance (QA)

a). The Contractor shall develop and implement a Quality Assurance (QA) program that conforms to the latest edition of FTA-PA-27-5194-12.1: *Quality Management System Guidelines*, to assure the delivery of a quality product.

b). The elements of the QA program shall encompass and control the Contractor's entire organization and all other manufacturers, subcontractors and suppliers that perform work relating to this Contract.

c). Should the Contractor's QA program be structured following other Quality System standards such as ISO or IRIS, for example, the Contractor shall include in the Project Quality Plan, described below, a cross-reference matrix of the Standard's requirements versus the FTA-PA-27-5194-12.1.

d). The QA Program shall ensure that all aspects of car design, component manufacture and testing, car assembly and testing, and car commissioning are in full conformance with the design, materials and workmanship requirements provided in these Technical Specifications, and are comprehensively documented.

5.4 Project Quality Plan

a). Overview

i). A Contract-specific Project Quality Plan (PQP) shall be prepared that details when and where in the manufacturing process each element of the Contractor's and major supplier's organizations will perform specific actions required by the associated QA manual using the quality procedures found therein.

ii). The PQP shall also specifically identify an adequate number of qualified staff to carry out the required QA tasks and their roles and responsibilities.

iii). The PQP shall be provided to Amtrak for review and approval sixty (60) days after NTP. **[CDRL 5-01]**

iv). The PQP shall present how the Contractor shall meet the quality assurance requirements of this Technical Specification.

v). Required elements of the PQP include:

(1) Overview of Contractor's QA program.

(2) Contractor's PQP cross-reference matrix of the Contractor's Quality Program elements versus the FTA Quality Management System Guidelines listed above.

(3) Corporate organization chart showing how the unit responsible for QA fits into the overall corporate structure, including how it relates to other functional units such as engineering, purchasing, production and warranty, and how QA communicates with those other functions to ensure quality objectives are met.

(4) Organization chart for the QA unit, including names, duties and responsibilities, and contact information for QA unit personnel.

(5) Specific QA policies, procedures and objectives that are implemented at all stages of the project to ensure that the highest quality is maintained through the life of the project.

(6) References to all project management, administrative, design, production, inspection, testing and warranty procedures relevant to the manufacturing and servicing of the cars.

(7) Role of Amtrak in the QA process, including Amtrak design reviews, inspections and hold points, and Amtrak's authority to require corrective action, additional hold points, and/or inspections to resolve quality problems.

(8) Process for implementing, monitoring, and revising/improving QA policies and procedures, including the means by which QA has the ability to take corrective action to resolve quality problems within

engineering, production or testing, and the authority that gives QA the ability to stop production if problems go uncorrected.

(9) Process for engineering changes, configuration management, production control and other manufacturing tools to ensure that vendors and production are working to current revisions of all drawings, specifications, policies and parts lists.

(10) Process for auditing production to determine if QA policies and procedures are being implemented and maintained, and how problems are corrected.

(11) Process by which vendors and suppliers are verified to be in compliance with the Contractor's QA program, and the process for ensuring that vendors adhere to the PQP, including source inspections, inbound material inspections, resolving vendor quality problems, certification of parts authenticity and anti-counterfeiting efforts, and long-term parts availability in conformance with contractual provisions.

(12) Inspection process for monitoring quality during production, including flow chart and process for resolving defects and closing out non-conformances.

(13) Schedule for inspection and recalibration for all tools and devices used for measurement, testing or inspection.

(14) Comprehensive inspection plan (see Section 5.9)

(15) Process and objectives for defect reduction over the term of production of the cars, including trend analysis, engineering changes if necessary and modifications to inspection and testing processes.

(16) Monitoring of post-delivery performance of delivered cars, including evaluation and analysis of fleetwide failures, engineering changes to production, and field modifications to the delivered equipment if necessary. Refer to the Technical Support, Spares and Supplies Agreement for applicable failure rates.

(17) Process for monitoring the System Safety Program including dedicated resource for managing System Safety.

(18) The PQP shall also contain or refer to a comprehensive collection of standard forms to be utilized for documentation of quality control activities.

(a) These forms shall be designed to assure compliance of materials, processes, personnel and products to the approved design drawings and applicable specifications.

vi). The approved PQP and supplemental manuals, procedures and instructions shall be subject to regular scheduled and/or unscheduled audits by Amtrak.

vii). A quality organization chart included in the PQP shall show the reporting relationships of all QA management staff.

(1) The quality organization chart shall identify that the quality assurance function is fully independent of the production team.

(2) The organization of the Contractor's QA program shall report directly to the General Manager of the Contractor's facility or the Contractor's Project Manager.

(a) In any case, it must be completely independent of the Contractor's manufacturing or purchasing divisions.

viii). QA Authority and Autonomy

(1) The PQP shall clearly describe that the Contractor's QA representatives have the responsibility and sufficient authority to ensure that a nonconforming or discrepant product or service will not be used or delivered to Amtrak.

(2) The QA personnel shall have complete freedom to identify and evaluate problems; to recommend solutions; to verify implementation of solutions; and to control further processing, delivery, or installation of a nonconforming or deficient item until proper and documented disposition has been obtained.

5.5 Book of Quality

a). During the construction of the first car of each car type, the Contractor shall develop a Book of Quality for each car type.

b). The Books of Quality shall be developed and submitted to Amtrak for review and approval prior to the inspection of the first production car of each car type.

c). The Books of Quality shall be organized starting with zones of visibility, with Zone 1 being most visible to passengers and so on down to completely hidden areas.

d). The Books of Quality shall clarify inspection and acceptance criteria for all inspection categories such as gaps, flushness, depth of scratches, diameter of dimples, repairs, etc.

5.6 Additional Quality Requirements

a). QA Organization Responsibility

i). The Contractor shall, for the purposes of this Contract, designate a Project Quality Manager who has sufficiently defined responsibility, authority, resources and organizational freedom of action to be in charge of, and implement on behalf of the Contractor, such QA as is required to ensure a proper control of the production process.

ii). The QA organization must report independently from production and have fully independent authority to reject unsatisfactory material and subassemblies regardless of any effect on the progress of the Work.

b). Personnel Qualifications

i). The Contractor's QA personnel performing inspections and tests shall be certified for such work.

ii). Certification of personnel shall be by the virtue of those skills which are obtained by experience or training and verified by testing.

iii). All manufacturing personnel performing special processes, such as welding, brazing, etc. shall be trained and AWS certified for such work. All certifications shall be maintained and kept up to date throughout the production build.

iv). Welding inspections shall be completed by AWS certified Welding Inspectors. All certifications shall be maintained and kept up to date throughout the production build.

v). Records of personnel certifications shall be maintained and monitored by the Contractor's QA department. These records shall be made available to Amtrak for review.

vi). The Contractor shall, upon request, make measuring and control recordings available to Amtrak for review and provide copies of documentation as requested.

vii). The Contractor shall ensure that inspection and tests are based on the latest approved revision or change to drawings, specifications, and all other applicable design documentation.

c). Revision Control Procedure

i). Prior to the start of PDR, the Contractor shall develop and submit to Amtrak for review and approval a revision management procedure which controls the adequacy, completeness, change and update of drawings and other design documentation. **[CDRL 5-02]**

ii). This procedure shall be in coordination with the change control system as provided in this Specification and Contractor’s configuration management system.

iii). The Contractor shall ensure that requirements for the affectivity point of changes are met and that obsolete drawings and change requirements are promptly removed from all points of issue and use.

(1) Means of recording the effective points shall be employed and made available to Amtrak.

d). Non-Conforming Material

i). Identification and Disposition

(1) The Contractor shall establish and maintain an effective and positive system for controlling nonconforming material and/or workmanship, including procedures for its identification, segregation, and disposition.

(2) Dispositions allowing the use or repair of nonconforming material or workmanship shall require Amtrak's approval.

ii). Segregation of Non-Conforming Materials

(1) All nonconforming material shall be positively identified to prevent unauthorized use, shipment or intermingling with conforming material.

(2) Holding areas and procedures developed by the Contractor and reviewed and accepted by Amtrak shall be established and maintained by the Contractor for the duration of the Contract.

iii). Corrective Action

(1) Corrective action and related information shall be documented and made available to Amtrak upon request.

(2) Corrective action shall extend to the performance of all sub-suppliers and include as a minimum:

(a) Analysis of data and examination of discrepant products to determine extent and causes with corrective action implemented in an expeditious manner prior to the next shipment, order or inspection.

(b) Introduction of required improvements and corrections, initial review of the adequacy of such measures, and monitoring of the effectiveness of corrective action taken.

(c) Analysis of trends in processes or performance of work to prevent nonconforming products.

e). Subcontractor Quality Assurance Requirements

i). The Contractor shall require that each subcontractor or supplier establish and maintain a QA program compliant with that of the contractor and acceptable to the Contractor and Amtrak for the services and items it supplies.

ii). The Contractor is responsible for all subcontractor and supplier quality and performance.

iii). The Contractor shall survey, audit and periodically review each subcontractor and their facilities to assure adequate capabilities to perform subcontracted efforts in compliance with the Contractor’s QA program. These surveys/audits shall be documented and available to Amtrak upon request.

iv). Each major subcontractor or supplier shall have a QA system that is approved by the Contractor and fully implements the PQP of the Contractor as it applies to the subcontractor or supplier's scope of work.

f). Quality Assurance Assessments (Audits)

i). Amtrak Quality Assurance Audits of Contractor, Subcontractors and Suppliers

(1) Amtrak shall, throughout this Contract, have the right to access and visit all facilities of the Contractor, subcontractors and suppliers associated with this contract to conduct initial and on-going assessments (audits).

(a) Amtrak will perform scheduled and unscheduled audits of the Contractor's/Subcontractor's/Supplier's quality assurance activities.

(b) These assessments shall determine if the QA programs are being properly adhered to in compliance with the approved PQP, and that they are producing quality products compliant with the requirements of this Contract.

(c) During these assessments, the Contractor shall provide Amtrak personnel reasonable assistance as they inspect production facilities, examine operations in progress and review documentation.

(2) At a minimum, the following audits of the Contractor will be performed:

(a) During production of the first carshell (will include an audit of both the Contractor and major subcontractors)

(b) During manufacturing, installation of equipment, and testing

(c) Before acceptance of the first car

(3) The Contractor will be notified of other audits to be performed by Amtrak as deemed appropriate.

(4) The Contractor will be provided with an audit report containing audit result information following an Amtrak performed audit.

(a) If any deficiencies are noted, Amtrak shall provide its findings detailing the identified deficiencies.

(b) The Contractor shall implement corrective action and notify Amtrak of the mitigation that was implemented.

ii). Contractor Quality Assurance Self Audits

(1) The Contractor shall perform periodic internal quality assurance audits and inspections throughout the life of the project/during the execution

of the Contract to ensure that all QA program obligations are being fulfilled, that all aspects of Amtrak-approved PQP have been effectively implemented, and that all deliverables meet the requirements of the Technical Provisions and all approved drawings and procedures. These internal self-audits shall be documented and available to Amtrak upon request.

(2) The Contractor shall provide Amtrak with an internal audit schedule **[CDRL 5-03]** at the onset of the project and whenever revisions to the schedule occur.

(3) Deficiencies discovered during the audit process shall be documented and corrected.

(a) Corrective actions shall include measures to preclude recurrence of the deficiency.

(b) Deficient areas shall be re-audited on an accelerated schedule.

(c) These deficiencies shall be documented and available to Amtrak upon request.

(4) Amtrak audits and monitoring will be performed independent of and in addition to the Contractor's quality assurance function, but will in no way replace, negate, override or lessen the Contractor's QA obligations.

iii). Contractor Quality Assurance Audits of Subcontractors/Suppliers

(1) The Contractor shall audit subcontractors to assure compliance with the approved PQP.

(2) As a minimum, the following audits of each subcontractor shall be performed:

(a) Prior to a subcontracted or purchased item being delivered

(b) Within thirty (30) days of the scheduled First Article Inspection (FAI), qualification test or the Contractor's acceptance of any supplied items or services

(3) Amtrak shall be notified in advance of any scheduled audit and may participate as a witness on any Contractor performed audit. These audits shall be documented and available to Amtrak upon request.

g). Quality Assurance Records

i). The Contractor shall maintain adequate records of compliance with its QA program plan for the life of the Contract and through any subsequent warranties.

ii). These records shall be made available to Amtrak on request, and a complete set of records shall be submitted to Amtrak at the end of the warranty period.

h). Audit Reports and Corrective Action

i). The Contractor shall fully plan and document all quality audit activities performed internally and at subcontractor premises.

ii). The Contractor shall develop an audit report within thirty (30) days of each audit detailing any non-compliances found during the audit, corrective action requests and establishing dates by which the corrective actions are required.

iii). The Contractor shall submit a Monthly Quality Report (MQR) that describes the status of key project elements described in the PQP as well as all other quality issues affecting the project.

iv). The Contractor shall submit its first draft MQR to Amtrak for review and acceptance within sixty (60) calendar days of NTP. **[CDRL 5-04]**

v). For the duration of the Contract, the Contractor shall submit a monthly MQR to Amtrak, as part of the Monthly Project Report (MPR).

i). Monthly Quality Report (MQR) Content

i). The MQR shall include, but not be limited to:

(1) Description of the current status of the design and/or production status of the project

(2) Status of PQP open issues

(3) Status of Project Quality Management

(4) Status of Contractor corrective actions

(5) Status of First Article Inspection (FAI) open issues

(6) Status of non-conforming material

(7) Status of field modifications

(8) Contractor’s project audit schedule and results

(9) Subcontractor and supplier audit schedule and results

(10) Project Quality KPIs

(11) Contractor’s internal activities

(12) Vendors and Sub-Contractors activities

(13) Software quality assurance audit results; and

(14) FRB major issues

j). Monthly Project Quality Meetings

i). The Contractor shall hold monthly Project Quality meetings with Amtrak to discuss quality issues and review the MQR. The quality meetings shall include any relevant subcontractors as required.

5.7 Initiatives that Promote Sustainability in the Manufacturing Process

a). The Contractor shall submit to Amtrak for review documentation regarding initiatives it has undertaken to promote sustainability and reduce the amount of material and energy waste produced by the manufacturing process. **[CDRL 5-05]**

b). This documentation shall extend to the strategies employed by the Contractor's suppliers and vendors.

c). These initiatives shall identify how manufacturing waste and energy consumption will be reduced, including tangible and quantifiable goals and the method for monitoring and improving the success of the program.

d). The waste reduction strategies may include (but are not limited to):

i). Creation and utilization of reusable packaging for the transport of materials and components between the facilities of the parts supplier and the Contractor

ii). Use of recyclable materials for packaging

iii). Use of recycled or renewable materials in the production process

iv). Reuse or recycling of excess material created during the manufacturing process

v). Use of energy-efficient or low-emission vehicles and equipment for transportation and production purposes

vi). Capture of reusable or recyclable materials such as office paper, cardboard, copier toner, beverage containers and other post-consumer recyclable material

vii). Use of facilities that meet the standards of the Leadership in Energy and Environmental Design (LEED) program

viii). Employee awareness campaigns that promote reduction of material and energy waste; and

ix). Strategies that promote the reduction of unnecessary use of materials and energy.

e). The Contractor's waste reduction program shall provide to Amtrak quarterly reports **[CDRL 5-06]** that document the status of the program and the level of success that the program is achieving.

5.8 First Article Inspection (FAI)

a). General

i). The Contractor shall perform a First Article Inspection (FAI) of all major components, subassemblies and fully assembled cars of each type.

ii). Amtrak or its representatives shall be present to witness all FAIs.

iii). The Contractor shall perform a satisfactory preliminary FAI on each article prior to notification of Amtrak of an FAI.

iv). The Contractor shall lead, document and report on all FAIs.

v). FAIs shall be conducted at the manufacturing facility of the material of interest, be it the Contractor, a subcontractor or a supplier.

b). FAI Plan and Process

i). Within ninety (90) days of NTP the Contractor shall develop an FAI Plan and submit to Amtrak for review and approval. **[CDRL 5-07]**

ii). The FAI plan shall include the following requirements at a minimum:

(1) A list of assemblies, subassemblies and components subject to FAI along with their projected schedule.

(2) A tracking system to identify each FAI subject and accurately reflect the present status of each inspection. The tracking system shall be maintained through the completion of all scheduled FAIs.

(3) The sample for each FAI shall be considered to be complete by the manufacturer and shall reflect the approved baseline drawings.

(4) The FAI sample shall have been produced using the production methodology and tooling.

(5) Successful completion of engineering tests for the subsystem is a prerequisite for conducting the FAI.

(6) The FAI shall be performed using the approved baseline drawings in conjunction with the Technical Specification reflecting specific requirements of the subject along with any special tools and/or equipment needed to verify the design requirements, configuration, and operation (if applicable) of the item being inspected.

(7) All technical data required for the maintenance manual and/or parts catalogs shall be submitted as initial drafts prior to the full acceptance of the FAI. **[CDRL 5-08]**

(a) The initial drafts shall contain enough information to adequately maintain the equipment during the pilot program and initial production car delivery.

(8) Amtrak shall be given notice of an upcoming FAI at least thirty (30) days before its schedule date for domestic FAIs and forty-five (45) days before its scheduled date for international FAIs.

iii). The FAI Plan shall be updated monthly and presented as an attachment to the program meeting minutes.

iv). None of the material and/or parts listed in this Chapter of the Technical Specification shall be installed on the equipment unless the FAI has been performed and approved by Amtrak.

c). Amtrak Participation

i). For equipment that requires an FAI, the equipment shall not have passed the FAI unless Amtrak or its representative participates in the inspection to its satisfaction.

ii). An inspection that requires Amtrak participation but is conducted without a qualified Amtrak representative shall not be considered as having passed.

iii). Amtrak reserves the right to waive their own participation of FAIs given that the Contractor has provided the requisite amount of notification of the scheduled FAI.

iv). Should Amtrak arrive for an FAI and find the Contractor and/or supplier unprepared, the FAI shall be considered failed.

v). Should the equipment fail inspection, the problem(s) shall be corrected and re-inspected to Amtrak's satisfaction before the FAI is considered passed and production released.

(1) FAI findings shall be closed in person upon resolution of the issue. Closure is to be conducted at the car builders' facility unless alternative arrangements are agreed upon.

d). Systems Requiring FAI Approval

i). The FAI Plan shall include a listing of all items proposed to be subject to an FAI. It is noted that this list may be expanded as the design review progresses and additional critical components are identified.

ii). At a minimum, the FAI program shall include the following components:

(1) Carshell

(2) Floor panels

(3) Door leaves

(4) Gangway and/or Diaphragms

(5) Door hardware, latches

(6) Manual doors (if provided)

(7) Power doors, operators and controls (if provided)

(8) Onboard mobility device lift (if provided)

(9) Windows, including emergency windows or emergency egress hatches

(10) Truck-frame

(11) Truck-fully assembled

(12) Wheel and axle assemblies

(13) Couplers and draft gear

(14) Air brake system

(15) Seats including booths

(16) Digital signage and displays

(17) Tables (workstation and food service area)

(18) HVAC system, controls and temperature controls

(19) All external and internal lighting systems

(20) Communication system, including Central Diagnostics Unit, and Digital Trainline systems

(21) Food service galley, and equipment including refrigeration system

(22) Restrooms (modules)

(23) Water supply system

(24) Waste collection and retention system

(25) Sidewall Panels

(26) Ceiling Panels

(27) Beds

(28) Major fiberglass interior components and hardware

(29) Complete sleeping modules

(30) On-Board Mobility Lift

(31) First completed production car for each car type

iii). The final approval of all colors and finishes shall also be subject to FAI and acceptance by Amtrak. See Chapter 11 of the technical specification for more information.

iv). Equipment shall be shipped from the point of manufacture only after the FAI has been approved.

v). FAI's will not be performed unless the design drawings, production processes, production tooling and any other relevant documentation required for the item to be inspected have been approved.

(1) The inspection area, as well as any components to be inspected, must be cleaned to a new condition before commencing the inspection.

e). Approved FAI Items / FAI Sample / Golden Unit

i). Approved FAI items shall establish the quality of workmanship for the remainder of the same items being produced.

(1) That quality shall be well documented.

(2) Samples of welds, fit-ups, finishes, and colors, photographs, FAI documentation, etc., shall be retained for the duration of the production phase in a secure area at the Contractor's facilities for reference by the Contractor's and Amtrak's representatives.

(3) Changes, modifications or adjustments to this baseline must be approved by Amtrak and will be cause for initiating another FAI by Amtrak.

ii). The FAI sample (Golden Unit) shall be retained by the equipment manufacturer and may be installed on the last applicable model of the production cars.

(1) Either Amtrak or the Contractor may deny usage of the FAI unit in production if just cause is provided such as configuration control.

(2) The FAI sample must be stored at the Contractor's facility and must be updated with any modifications throughout the duration of the Contract.

(a) This requirement does not apply to any completed car FAI.

f). FAI Preparation

i). Availability of the information in a timely manner is essential to ensure that the appropriate level of Amtrak's technical expertise is available for each FAI and that the individuals have sufficient prior information to inspect the equipment.

ii). The Contractor shall provide the following information to Amtrak at least thirty (30) business days before a scheduled FAI **[CDRL 5-09]**:

(1) A complete list of the equipment and its bill of materials to be inspected.

(2) Identify each completed assembly along with the configuration in which it is to be presented.

(3) A copy of the technical Specification for the equipment and the subcontractor's scope of supply.

(4) A complete drawing package with current drawing approvals.

(a) The drawing package should be in sufficient detail to inspect, at a minimum, the fit and finish of the assembly and subassemblies, wire and pipe routing, clearances between components, ergonomic considerations, and any other details that are required to ensure that the equipment is acceptable for the intended purpose.

(5) System schematics, electrical, fluid, pneumatic and piping, with current approvals.

(a) The schematics shall be sufficient to determine that the equipment will operate as intended.

(6) Routine test report(s).

(7) All instruction manuals, operating manuals, maintenance procedures and heavy repair shall be presented at the FAI for review.

(8) A report by a recognized independent testing laboratory certifying that all materials used in the equipment comply with the 49 CFR Part 238 Appendix B requirements and NFPA 130, as applicable.

(9) All material certifications.

(10) Calibration certificates for all routine test equipment and inspection tools.

(11) An Amtrak-approved FAI and acceptance test procedure and an Amtrak approved qualification test procedure to which the equipment will be inspected. A functional test shall be required as part of the FAI.

iii). Should any of the above documents be incomplete or otherwise unacceptable to Amtrak, this shall be grounds to delay the FAI until they are made right.

(1) The burden of any delay shall be with the Contractor.

iv). In addition, during the FAI the Contractor shall provide the following, as applicable:

(1) The Contractor shall make available all previously submitted and accepted pertinent calculations or analyses that show that the design is adequate for the purpose intended.

(2) The Contractor's complete stress analysis and summary, submitted under shall be available during the carshell FAI.

(3) All manufacturing variations of specified materials that vary in color, texture, pattern, etc., shall be presented, for approval by Amtrak, at FAI.

(a) Samples of acceptable variation extremes will be retained for reference in future inspections.

v). The FAI shall include a maintainability demonstration for repairs, the removal/reinstallation of consumables, and routine inspections.

vi). FAIs are considered closed when all FAI open items are closed.

vii). All the information listed above shall be included in a FAI Binder, that after the FAI is concluded, is submitted to Amtrak for review and acceptance. **[CDRL 5-10]**

g). FAI Findings

i). The Contractor shall provide, within ten (10) business days of each FAI, an FAI report which shall include a copy of all the documents presented and/or discussed at the meeting. **[CDRL 5-11]**

ii). The Contractor shall be required to mitigate any unsatisfactory findings at an FAI, up to and including revisiting the design of affected components or subcomponents regardless of FDR status.

(1) Instances of an unsatisfactory demonstration encompass, but are not restricted to:

(a) The operation of components is impeded or compromised due to conflicts within the system.

(b) Improper design or omission of components resulting in a failure of functionality or unsatisfactory operational efficiency.

(c) Tolerance issues which result in interferences between components.

(d) Identification of potential safety issues that pose a risk for injury during operation or maintenance activities.

iii). The Contractor shall include an action plan to correct all deficiencies discovered during the FAI.

iv). The FAI will remain open until all action items are completed to Amtrak's satisfaction.

v). Depending on the severity of the deficiency, follow-up FAI may be required.

h). FAI Photographs

i). Within thirty (30) days following each FAI the Contractor shall provide color photographs of each item on which an inspection was performed.

(1) The photographs shall be provided on 8.5 in. by 11 in. size paper and also in a digital format.

ii). A second set of these photos shall be compiled into an album for Amtrak's reference for future car inspections and will be supplied to Amtrak with the delivery of the first shipment of cars. **[CDRL 5-12]**

5.9 Inspection

a). General

i). As part of the Project Quality Plan, the Contractor shall include a comprehensive inspection plan covering the processes and procedures proposed to ensure the overall quality and compliance of the equipment under this Contract.

(1) The inspection area, as well as any components to be inspected, must be cleaned to a new condition before commencing the inspection.

ii). Amtrak shall, at all times, have the right to inspect any and all work being performed for this Contract.

iii). The Contractor shall grant Amtrak access to the facilities of the Contractor, subcontractors and suppliers to conduct initial and on-going inspections and assessments of the work to determine if it is being performed in accordance with both the requirements of the Contract as well as all approved design documents.

iv). During these assessments, the Contractor, subcontractors and suppliers shall make every reasonable effort to assist Amtrak personnel, including the supply of any necessary equipment to access areas of the assembly and all equipment necessary to perform inspections.

v). Inspection or lack of inspection, approval, or acceptance of any portion of the work by Amtrak shall not relieve or release the Contractor from its obligations to fully comply with all requirements of the Contract documents.

vi). For hold point inspections, the Contractor shall not progress to the next station or commence any testing without approval or a waiver from Amtrak. A comprehensive review of open inspection items, modifications, engineering issues, and material shortages must be conducted to assess their impact to the build before a decision can be made to proceed to the next activity.

vii). The Contractor shall correct any portion of the work not meeting the requirements of the Contract documents at the Contractor's expense to the satisfaction of Amtrak.

viii). Amtrak at any time before issuance of final acceptance for any car may order re-inspection of any portion of the work.

b). Inspections and Tests

i). Inspection of components to be used by the Contractor in performance of the work under this Contract shall be the responsibility of the Contractor

ii). It is preferable for inspections to be performed at the plant where the respective processes are taking place to give the Contractor and/or supplier every opportunity to correct, under factory conditions, any inadequacies found.

iii). Inspection of supplier components shall also be performed at the Contractor's plant to identify any damage in transit.

iv). Amtrak, its representatives and its designees, including the FRA, shall also have the right to:

(1) inspect selected items at any time, whether or not accompanied by the Contractor's representative.

(a) This shall in no way lessen or eliminate the Contractor's responsibility to make proper inspection.

(2) inspect at subcontractor manufacturing facilities any materials, processes, assembly and testing of equipment it deems necessary to validate compliance with the Contract, technical specifications and accepted design documents.

(3) Have access at all times to those parts of the Contractor's and/or subcontractor's plants in which any portion of the work is performed for the purposes of:

(a) inspecting materials and workmanship, and

(b) determining conformity to the Specification during the progress of construction and assembly of the equipment.

v). If any portion of the car shall become hidden by subsequent work contrary to the specific request of Amtrak, that portion of the car shall be made visible for Amtrak inspection by the Contractor at the Contractor's expense (Section 5.8f)).

vi). Amtrak shall be allowed to participate in all Contractor and/or subcontractor tests and inspections of all components of the equipment, at the Contractor's and subcontractor's plants, for the purpose of QA.

(1) Such right to participate shall include Amtrak's right to supplement its on-site inspector with additional experts as necessary according to the particular nature of the test or inspection involved.

vii). The presence of Amtrak in the plant of either the Contractor or subcontractor shall not, in any way, supplant or relieve the Contractor's responsibility for making proper inspections or meeting the requirements of the Specification.

viii). Amtrak shall have the right to reject all materials and workmanship that do not conform to the Specification.

(1) When 3 or more rejections occur for the same item or component, the Contractor shall prepare a written report for Amtrak detailing the problem(s) discovered during inspection and the efforts to be taken to remedy the problem(s).

(2) No further acceptance or production shall take place until the Contractor notifies Amtrak in writing that the problems have completely resolved.

ix). The Contractor shall document the results of both inbound material inspection, outbound inspection, and testing for each car.

(1) A "traveler" shall be attached to each car to track QA functions as the work progresses through the shop.

(2) A copy of the report must be attached to each car through conditional acceptance.

x). If Amtrak has reason to believe that defective work has been performed or permitted by Contractor, or that defective materials were used, Amtrak may examine any partially or fully completed work.

(1) If Amtrak makes such an examination, Contractor shall at its own expense furnish the appliances and labor required by Amtrak to make such investigation and inspection.

(2) Any defective or nonconforming work so disclosed shall be promptly corrected by Contractor at Contractor's expense.

xi). Except as otherwise provided herein, costs incurred by Amtrak in performing or participating in inspections under this Contract shall be borne by Amtrak.

(1) However, Contractor shall reimburse Amtrak for Amtrak's costs incurred as a result of any re-inspection resulting from a failed inspection or Contractor's failure to meet a scheduled inspection or where a scheduled inspection was postponed and rescheduled upon less than three (3) days' notice to Amtrak.

xii). Inspection and Test Log

(1) An Inspection and Test Log (Log) shall be maintained by the Contractor during equipment assembly.

(2) The Log shall be submitted to Amtrak for review before each car will be released for shipment to the delivery site. **[CDRL 5-13]**

(3) All Contractor and Amtrak in-process inspection sheets and test data records for that car shall be contained in this Log, which will be provided in the vehicle history book.

xiii). For those routine inspections and tests of components that are typically performed solely by Amtrak, the Contractor shall give at least 72 hours' notice of such inspections or tests to Amtrak.

(1) Amtrak shall be allowed to participate in such Contractor or subcontractor inspections or tests at the Contractor's or subcontractor's plants for the purposes of QA.

xiv). The Contractor must maintain office copies of all records, and they must be accessible to Amtrak, not more than five (5) days after such notice is given.

c). Contractor Provisions for Amtrak Inspectors

i). From NTP continuously through production, the Contractor shall provide office facilities for Amtrak representatives at no additional cost to Amtrak.

ii). Office facilities will be required at the car construction plants, including the final assembly site and the carshell fabrication site (if a separate facility), as well as similar facilities at any car or equipment qualification testing sites for the duration of the tests.

iii). These office facilities shall enable convenient inspection of materials, work and equipment under this contract.

iv). The office facilities shall be secure, heated, cooled, and adequately lighted private office for a minimum of five people, with access to toilets and a private conference area, and shall be furnished with desks, chairs and lockable locker facilities.

v). Desks and file cabinets shall be lockable, and all keys submitted to Amtrak.

vi). A minimum of five dedicated telephones with an outside line, high speed Internet connection, access to a photocopy machine capable of high-quality copies shall be provided within Amtrak's office.

vii). Reserved parking places shall also be provided for all Amtrak representatives assigned to the Contractor's facility.

viii). Amtrak requires that the Amtrak designated office facility be prepared for up to 15 Amtrak individuals working at the facility at one time.

ix). All resident inspectors, test engineers and the dedicated Amtrak program team require Contract or badges for access to the plant as well as our office facility.

x). Electronic copies of all drawings, manufacturing procedures, test procedures, test reports, test equipment calibration certificates, welder certifications, diagrams, schedules, changes, deviations, revisions and data shall be made available to Amtrak at the same time these are made available to the Contractor's QA department.

(1) Data shall be sufficient to verify design, construction, assembly, installation, workmanship, clearance, tolerance and functioning of the cars.

d). Scheduling of Inspections and Tests

i). Inspection and testing activities by Amtrak staff will normally be conducted during normal daytime shifts and will not be conducted on Saturdays, Sundays or any holidays observed by Amtrak.

(1) Amtrak staff may be made available in extenuating circumstances outside normal hours, provided a fully substantiated request is made at least forty-eight (48 hours) in advance in writing and is approved by Amtrak.

(2) This request will include compensation by the Contractor to Amtrak for this additional expense, as defined in the General Provisions.

ii). The Contractor shall provide Amtrak a one-week inspection/test look ahead **[CDRL 5-14]** to plan and make resources available.

iii). In preparation for an upcoming inspection or test, the Contractor shall provide Amtrak with the proposed activity schedule, location and associated processes, procedures and documentation. This information shall be provided to Amtrak per the following schedule:

(1) For inspections and testing activities in the Contractor's facilities, the Contractor shall present a written schedule of activities to Amtrak's inspectors at least 24 hours before the activities are to take place.

(2) In case an inspection or test proposed for performance outside that standard work schedule of Amtrak's resident inspector, the Contractor shall notify Amtrak at least 72 hours before the scheduled test or inspection.

(3) For inspections and testing activities at subcontractor's facilities in the US, after written notice is submitted to Amtrak ten (10) business days prior to the activities, Amtrak will advise within five (5) calendar days whether a representative will attend the inspection or test.

(4) For inspections and testing activities at subcontractor's facilities outside of the US, after written notice is submitted to Amtrak forty-five (45) business days prior to the activities, Amtrak will advise within five (5) calendar days whether a representative will attend the inspection or test.

e). Receiving Inspection

i). The Contractor shall provide for the inspection of all incoming systems, subsystems, components, parts, equipment and materials to ensure their conformance with procurement documents and condition.

ii). All material certifications and test reports used as the basis for acceptance shall be reviewed for compliance with specifications, retained by the Contractor and kept readily available for inspection by Amtrak personnel.

f). Manufacturing/Assembly Inspection Hold Points

i). The Contractor shall establish inspection hold points in the manufacturing process to provide for critical inspections by the Contractor's quality staff and Amtrak's representative of completed operations/installations or to inspect items that are about to be covered by succeeding assembly operations.

ii). As part of the PQP, the Contractor shall submit a list of hold point inspections per car type **[CDRL 5-15]** for review and approval, which shall include as a minimum the following:

(1) Each carshell section before painting

(2) Each carshell section after painting

(3) Each truck frame

(4) Each assembled truck, prior to installation under a car

(5) Each car underfloor area prior to receiving trucks

(6) Each carshell water tightness test prior to installation of insulation and interior finishings

(7) Each car final water tightness test

(8) Each car interior wiring and components before being covered by panels

(9) Each car underfloor area and connections prior to concealment

(10) Each finished car interior

(11) Each finished car exterior

(12) Each finished car underfloor

iii). The Hold Point Inspection Plan shall include a pre-inspection performed internally by the Contractor prior to the inspection witnessed by Amtrak.

iv). Prior to submitting an invitation to Amtrak inspectors/engineers, the Contractor shall complete its own internal inspection and work off all identified findings.

(1) Amtrak may request the results of the pre-inspection prior to performing the requested inspection.

v). The Contractor shall provide Amtrak at least 24 hours advance notice of each such inspection or 72-hours for off-site inspectors/engineers.

vi). If during manufacturing or testing, a component is replaced after it has gone through a hold point inspection, a subsequent hold point inspection shall be scheduled after the replacement.

vii). Amtrak reserves the right to add hold point inspections based on inspection findings or changes to the design or production process even after the initial plan had been accepted.

viii). The Contractor and Amtrak representatives shall use inspection forms to record any discrepancies noted during inspection. The contractor shall write the findings and provide a physical and electronic copy to Amtrak.

(1) Nonconforming products shall not be released from a hold point area until all discrepancies have been corrected.

(2) The inspection forms shall be posted at or near the point of inspection for each car and included in the vehicle history book when all discrepancies have been eliminated.

(3) The procedure for addressing the findings will be detailed in the PQP and must be approved by Amtrak.

g). Production Completion Inspection

i). After all work, including factory static and dynamic testing as per Chapter 20 of the technical specification is completed, the Contractor shall perform the Production Completion Inspection, including final function testing of each system, according to an Amtrak approved procedure.

ii). All manufacturing or testing non-conformance reports shall be closed out and no configuration upgrades or applicable FMIs will be pending before pre-shipment inspection begins.

iii). The vehicle history book as specified in Chapter 23 shall be complete and ready for review and approval signature by Amtrak.

iv). The Contractor shall provide a qualified supervisor to accompany Amtrak during inspection to assure that proper corrective action is taken and to record the findings.

v). The Contractor shall provide Amtrak with labor and appropriate tools to remove or open and reapply covers and doors.

vi). During inspection, all systems shall be operational without the use of special equipment or power supplies.

vii). Should the Contractor plan to store the car for any longer than 14 calendar days, the Production Completion Inspection shall validate that the car is properly prepared and protected for such storage.

viii). The Contractor shall provide Amtrak 72 hours advance notice of each such inspection.

ix). The Production Completion Inspection shall be documented using an Amtrak approved inspection form.

x). The Production Completion Inspection Form shall be signed off by both the Contractor and Amtrak.

xi). Any damage to the cars and/or any parts or components thereof which become damaged from any cause whatsoever, subsequent to the performance of the Production Completion Inspection and prior to the Pre-Shipment Inspection, shall be made good at the expense of Contractor with no extension of the Contract Time or increase in the Contract Amount.

xii). Subsequent to the performance of the Production Completion Inspection, no components or material may be removed from the inspected vehicle to facilitate the inspection or testing of another vehicle.

(1) Removal of any components or material shall nullify the Production Completion Inspection.

(2) Amtrak may seek the return of any milestone payments made against such a nullified Production Completion inspection until the respective car has been returned to its completed state and the inspection has been successfully reperformed.

xiii). Minor open items shall be documented on the form and be approved by Amtrak.

xiv). Closure of Production Completion Inspection open items shall be documented and included in the Vehicle History Book for the affected car.

h). Pre-Shipment Inspection

i). Should the planned shipment date be more than 14 calendar days after the completion of the Production Completion Inspection, a Pre-Shipment Inspection including function testing of each system, according to an Amtrak approved procedure shall be performed.

ii). The Pre-Shipment Inspection shall validate the completion of all production work, including factory static and dynamic testing as per Chapter 20 of the technical specification.

iii). All manufacturing or testing non-conformance reports shall be closed out and no configuration upgrades or applicable FMIs will be pending before pre-shipment inspection begins.

iv). The Pre-Shipment Inspection shall validate that the vehicle history book as specified in Chapter 23 is complete and has been approved and signed by Amtrak.

v). The Contractor shall provide a qualified supervisor to accompany Amtrak during inspection to assure that proper corrective action is taken and to record the findings.

vi). The Contractor shall provide Amtrak with labor and appropriate tools to remove or open and reapply covers and doors.

vii). During inspection, all systems shall be operational without the use of special equipment or power supplies.

viii). The Contractor shall provide Amtrak 72 hours advance notice of each such inspection.

ix). Pre-Shipment inspections shall be documented using an Amtrak approved inspection form.

(1) Prior to shipment, the Pre-Shipment Inspection Form shall be signed off by both the Contractor and Amtrak.

(2) Minor open items shall be documented on the form and be approved by Amtrak.

(3) Closure of these Pre-Shipment open items shall be documented and included in the Vehicle History Book for the affected car.

x). Any damage to the cars and/or any parts or components thereof which become damaged from any cause whatsoever, during the progress of production or shipping or otherwise before risk of loss has passed to Amtrak, shall be made good at the expense of Contractor or the Subcontractor in whose plant the damage occurs, and with no extension of the Contract Time or increase in the Contract Amount.

i). Shipping Inspection

i). Following pre-shipment inspection, the Contractor shall ensure the car is properly prepared, protected and loaded for shipment in accordance with approved procedures.

ii). For shipments by sea, this shall include all necessary preparations for shipment below decks.

iii). Amtrak representative(s) will then perform a cursory walk-through inspection to confirm that the car has been adequately prepared for shipment before issuing a Release for Shipment document to the Contractor.

(1) The Contractor shall provide Amtrak 72 hours advance notice of each such inspection.

iv). See Chapter 22 for additional shipping requirements.

v). Should a car need to be stored for longer than thirty (30) days, the Contractor shall submit a Long-Term Storage Plan to Amtrak for review and approval.

j). Modification Inspection

i). The Contractor shall provide written procedures for Amtrak review and approval, for the inspection of any modifications or retrofits arising from engineering changes implemented either at the Contractor's facility or on Amtrak property.

ii). Upon completion of the change, the Contractor shall verify satisfactory completion and modify any quality assurance documentation affected by the change, including the Vehicle history book.

iii). The Contractor shall provide Amtrak 72 hours advance notice of each such inspection.

5.10 CDRLs

CDRL	Description	Due
CDRL 5-01	Project Quality Plan (PQP)	NTP + 60 days
CDRL 5-02	Revision Management Procedure	30 days prior to PDR
CDRL 5-03	Internal Audit Schedule	NTP + 30 days
CDRL 5-04	Monthly Quality Report (MQR)	NTP + 60 days, then monthly
CDRL 5-05	Documentation of Initiatives to Promote Sustainability	NTP + 30 days
CDRL 5-06	Waste Reduction Program Quarterly Reports	NTP + 90 days
CDRL 5-07	FAI Plan	NTP + 90 days
CDRL 5-08	FAI – Technical data for maintenance manuals and parts catalogs	Prior to full acceptance of FAI
CDRL 5-09	FAI Documentation	30 business days before FAI
CDRL 5-10	FAI Binder	After conclusion of FAI
CDRL 5-11	FAI Report	Within 10 business days of FAI
CDRL 5-12	Complete set of FAI photographs	With 1st shipment of cars delivered
CDRL 5-13	Inspection and Test Log for each car	Before release for shipment
CDRL 5-14	Inspection and Test 1-Week Look Ahead	14 days prior to initiation of any manufacturing activities then, every weekly
CDRL 5-15	PQP – List of Hold Point Inspections for each car type	NTP + 60 days

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

6.1 Overview

a). This chapter defines the structural performance characteristics of the individual carbody shells. It also lists analysis and other submittal requirements.

b). The structure of the cars shall be independent from each other and capable of meeting all structural requirements on a stand-alone basis.

c). The car structures shall comply with the latest applicable APTA recommended practices and FRA passenger equipment requirements and shall minimize weight to the greatest extent possible.

d). All required standards shall utilize the most recent revisions available at the date of NTP.

e). If contradictions arise between this Technical Specification, APTA recommended practices, and/or FRA requirements, the more stringent shall be used unless otherwise approved by Amtrak.

f). All materials and workmanship shall comply with the requirements of Chapter 19.

6.2 General Requirements

a). The design of each carbody shall be compliant with the Tier I requirements of the FRA contained in the 49 CFR Part 238. Specifically, the carbody shall comply with 238.203 through 238.219 without utilizing alternative compliance.

b). Each carbody's design shall conform to the applicable sections of the most recent edition of the APTA-PR-CS-S-034 standard, "Design and Construction of Passenger Railroad Rolling Stock," as of the time of the Notice to Proceed (NTP).

c). In the selection of the type and thickness of steel and stainless-steel materials to be used, the Contractor shall be guided by the desire to obtain the maximum strength and reliability with the minimum weight and minimum number of different material grades which is obtainable at reasonable cost.

d). The Contractor shall base its structural design on the specific loads, deflections and properties of structural sections called for in this Specification.

e). For structures not specifically covered, the Contractor shall base its design on its experience, subject to successful stress analysis and structural testing.

f). The structure and equipment supplied shall resist these loads, including fatigue loads, with factors of safety consistent with those which have previously been shown to be successful for existing North American Intercity passenger equipment for service at maximum design speed.

6.3 General Design Details

a). General

i). The structure of the individual carbody shell shall be designed and manufactured to provide for the mounting and functioning of all the elements/features defined in this Specification, including:

(1) Passenger seating and related convenience features

(2) Doors, passageways, windows, and emergency exits

(3) Mechanical elements such as trucks, brakes and HVAC

(4) Electrical elements such as lighting, communications, and control trainlines

(5) Accessibility equipment as required by ADA requirements

(6) All ancillary equipment

(7) Diaphragms and/or Gangways

ii). The general arrangement of carbody shells, layout/mounting of the subcomponents, and equipment access setups shall be approved by Amtrak during the mockup and design review process described in Chapter 3.

b). Dimensions, Weights and Under Car Clearance

i). The individual cars shall meet the dimensional and clearance drawing requirements stated in Chapter 1.

ii). Each completed car shall comply with the minimum allowable clearance above top of rail for the carbody and all associated components under the worst combination of conditions, including fully worn wheels, solidly compressed or broken springs, AW3 passenger load, carbody deflection to zero camber and environmental conditions including wind, snow and ice.

c). Physical Requirements

i). The carbody structure shall be designed to prevent water, snow, debris or dust ingress when operating at any permissible speed up to maximum design speed under all weather conditions consistent with the worst case climatic data as specified in Amtrak Specification 963.

ii). The carbody shall be designed to be watertight for a service life of at least 40 years, without maintenance.

iii). Housings for externally mounted equipment shall be completely watertight when covers are in place, excluding battery boxes and the HVAC unit, which shall be designed to prevent water intrusion while allowing adequate ventilation and air flow.

iv). Pneumatic equipment that can tolerate environmental exposure may be mounted in an unsealed container per manufacturer’s recommendations.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

v). Drain holes shall be provided to prevent the accumulation of water.

vi). Exterior surfaces shall not contain pockets that may accumulate or retain water or debris such as leaves.

vii). Exterior structural pockets with flat bottom surfaces shall, at a minimum, include drain holes.

viii). The carbody shall be designed for ease of accident repair, including replacement of any CEM components, CEM structural zones skin panels, and any undercar components or covers.

ix). Frequently damaged parts such as corner posts, edges of side doors, side sill steps, and the ends of undercar shrouds, shall be designed to be simple to remove and replace with readily available or readily fabricated components. Lead time must be minimal for parts that will be frequently damaged and in need of replacement.

x). The Contractor shall review these and other aspects of the carbody design with Amtrak during the design review process.

xi). The Contractor shall include accident repair procedures as part of the deliverables, which will cover a range of scenarios identified by Amtrak, including sideswipes, dragged rolled-over equipment, strike damage to the lead end of the end car and sides of all cars, and automotive grade crossing collision damage to the underframe components of all cars.

xii). Some recommended design techniques consist of use of spot welds, and not seam welds, for attachment of the visible exterior side sheathing, and the routing of underfloor car piping and electrical cables as far inward from the end sheeting and as close to the center sill as possible.

d). Carbody Materials

i). Materials used in carbody construction shall be in accordance with APTA Standards PR-CS-S-034, PR-CS-S-004-98, PR-CS-S-015 and the requirements of Chapter 19.

ii). The carbody shall be constructed of American Iron and Steel Institute (AISI) type 301LN or approved equivalent.

iii). Components such as bolsters, end draft sills, end sills/anticlimbers, structural shelves, corner posts and collision post stubs may be fabricated from High-Strength Low-Alloy (HSLA) steel per American Society for Testing and Materials (ASTM) A588, or approved equal.

iv). Selected steel shall have inherent corrosion resistance equal to or greater then A588 when evaluated per ASTM G101, paragraph 6.3.1.1.

v). All welding and fastening shall conform to the requirements of Chapter 19.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

vi). Other alternate materials and fabrication techniques providing equivalent strength, fatigue resistance and performance goals may be proposed by the Contractor for Amtrak approval. Aluminum will not be accepted for use in carbody structures.

vii). The method used by the Contractor to prevent corrosion from the inside surfaces of closed structural sections (i.e. inside of tubular sections) shall be identified at the design review. **[CDRL 6-01]** At a minimum, each such element shall include a drain hole.

viii). There shall be no corrosion that reduces the load carrying ability below the design strength requirements for the design life of the vehicle.

ix). This can be met by material selection, coating or corrosion allowance and shall be submitted for review and approval at the design review.

x). Cross sectional views shall be provided on carshell drawings and must be submitted for approval at the design review.

xi). Drawings must be submitted not only of individual structural members, but all sub-assemblies and assemblies in order to have a clear record of the carshell assembly construction and process.

xii). Carshell drawings shall be submitted for Amtrak review and approval 30 days before starting the fabrication of any components for the carbody structure. **[CDRL 6-02]**

xiii). The drawings shall show the location of all principal framing members, their cross sectional area, material, metal thickness along with detailed type and method of joining and applicable references to Welding Procedure Specifications.

xiv). Bill of materials shall be provided to link the drawing number and location each part in its assembly level drawing.

xv). Thickness of all sheathing materials shall be provided.

xvi). This information shall be of sufficient detail to permit manufacture of any structural parts necessary to repair damage to a car.

e). Carbody Exterior Finish

i). Specifications and samples for all external surfaces meeting the grit requirement of TS19.5.6 shall be submitted for review and approval. Three samples of all exterior finishes shall be submitted to Amtrak for approval. **[CDRL 6-03]**

ii). These approved samples shall then be used throughout the program as references to maintain quality.

iii). All exterior surfaces shall be free of ripples and buckling.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

iv). Dents, gashes or other surface imperfections shall not be permitted. Maximum allowable variation from a straight line or the designed curved line shall be as follows:

(1) All exterior side and roof surfaces not hidden by covers or shrouds shall have a maximum 0.09375 in. variation (peak to valley) in 3 ft measured in any direction or 1/300 of the span between adjacent members or areas questioned as ripples.

(2) Areas within 8 in. of the side doors and vehicle ends may have a gradual slope towards the doors and ends with a maximum deviation of 0.1875 in. from the side sheet contour.

(3) Exterior surfaces hidden by covers and shrouds shall have a maximum 0.3125 in. variation (peak to valley) in 3 ft measured in any direction.

(4) All other sheet metal exposed to view, inside or outside the assembled vehicle, shall have a maximum variation from a straight line on flat surfaces measured in any direction of 0.1875 in. and 0.125 in. over a distance of 36 in. and 12 in.

f). Fabrication

i). The carbody shall be fabricated so that the shells are identical to the maximum extent practical.

ii). The level of tolerance in different dimensions of carshell build shall be identified in the design process.

iii). Undercar and interior components shall be designed to accommodate those tolerances while remaining interchangeable between cars.

iv). Unless otherwise approved by Amtrak, the carbody shall be assembled using fusion welding or resistance welding.

v). Connections consisting of primary structural members shall be designed so that the ultimate strength of the connection exceeds the ultimate strength of the weakest member joined.

vi). Mechanically fastened connections used in the construction of the carbody structure should be avoided, however, rare exceptions can be submitted for Amtrak approval with fatigue analysis and a factor of safety of 2.0 based upon the proof load for limited connections.

vii). Clamping force friction shall be ignored in the design and analysis of mechanically-fastened connections.

viii). Self-tapping screws are prohibited from being used in the construction of the car.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

ix). Fabrication practices shall ensure that the life of the vehicle is not shortened because of fatigue, corrosion, including galvanic corrosion, breakage or wear.

x). Maintenance practices shall be considered so that parts are not easily lost and cannot be installed in the incorrect orientation.

xi). Fasteners shall be captive wherever practical. Captive fasteners shall be replaceable without drilling or cutting.

xii). A sufficient number of jigs, fixtures and templates shall be used to assure interchangeability of components and uniformity of structure throughout the fleet.

xiii). Parts of the bodies, such as underframes, side frames, end frames and roofs shall be built on jigs.

xiv). All weld and bolt patterns shall be identical on all cars.

xv). Visible weld and bolt patterns shall be uniform and symmetrical and shall be submitted for review and approval by Amtrak.

xvi). All equipment hangers shall be interchangeable on all cars without the use of shims or elongated holes.

g). Equipment Access

i). Apparatus and truck equipment requiring frequent inspection or attention, including any element of a CEM system that requires periodic inspection to confirm serviceable condition, shall be readily accessible and replaceable.

ii). The frequency of required service shall govern the degree of accessibility. Apparatus requiring attention more frequently than every 120 days, or in emergencies, shall be accessible from the side of the car or from the inside of the car unless specifically approved by Amtrak.

iii). All undercar shrouds shall be spaced a minimum of 3 ft. from the adjacent truck to permit ease of truck access at outlying maintenance points not having a maintenance pit. Shrouds shall be designed to be identical for ease of replacement in the future. If different sizes are needed, Contractor shall be required to obtain specific approval from Amtrak.

iv). All other underfloor apparatus shall be arranged to provide ready access from the side of the car.

v). Large apparatus shall be capable of ready replacement by forklift truck from the side of the car, or by overhead crane through appropriately sized roof access panels and lifting eyes.

(1) All mounted equipment weighing 50 lbs or more must be designed for removal by a lifting device. Special processes for equipment removal

are not permitted. The removal and replacement process shall be included in the design review.

vi). All protective devices on the car shall be accessible to maintenance personnel from the side of the car.

vii). For purposes of this paragraph, protective devices shall include devices requiring replacement or resetting to move the car or cause auxiliaries to function, such as air brake cut outs, circuit breakers, fuses, latching protective relays, etc.

viii). Locations for all protective devices shall be identified on arrangement and installation design drawings and approved by Amtrak.

ix). Apparatus supports, and housings shall be mounted interchangeably.

6.4 Structural Design Details

a). Level

i). The difference in height Above Top of Rail (ATOR) of the four corners of each finished car shall not exceed (1/2750) of the carbody length, measured at the car ends.

ii). The measurement shall be made on the completely assembled and equipped car mounted on its completed trucks at AW0.

iii). The measurement may be made from any suitable structural member of the underframe and shall be documented in each vehicle history book.

b). Camber

i). Carbody camber shall be defined as its vertical curved shape as viewed in side elevation and shall have a smooth curvature from end-to-end of the carbody.

ii). Each completed car shall have a positive camber not to exceed (1/2000) of the carbody length under AW1 conditions.

iii). It must be designed so that under full AW3 load, and for the life of the car, a negative camber does not occur.

iv). The maximum difference between the cambers of each side sill, measured at the location of maximum deflection, shall not exceed 0.125 in.

v). The Contractor shall evaluate and submit camber values at AW0, AW1 and AW3 load for approval at the design review.

vi). Camber requirements shall be validated during the AW3 vertical load test.

c). End Doors

i). The end of each car shall be equipped with a weathertight lockable sliding pocket powered door with manually operated override unless otherwise approved by Amtrak.

ii). Door must be airtight to prevent the entrance of diesel fumes.

iii). The use of a fixed end cover is strictly prohibited.

d). Strength, Stiffness and Fatigue Requirements

i). The strength of the carbody, and all carbody components, shall meet the Tier I requirements of 49 CFR Parts 229 and 238.

ii). All safety critical structural connections that are in an impact load path shall be designed so that, in case of excessive impact, failure shall be by buckling or crushing of structural elements rather than by shearing of structural elements or by failure of connections between elements.

iii). The cars shall also be designed, at the minimum, for the worst loading case arising out of the possible simultaneous combinations of the following operational loads acting on the car:

(1) Car tare weight (AW0)

(2) Crush passenger load (AW3)

(3) Vertical, lateral and torsional dynamic load due to wheel/rail interaction

(4) Loads due to vehicle pitching caused by braking

(5) Snow or ice loads

(6) Aerodynamic loads

(7) Train passing wind loads: Compressive and lateral loads caused by another train passing in the opposite direction on an adjacent track with relative speeds of 285 mph

(8) Buff/draft loads

(9) Racking or torsional loads

iv). The carbody strength shall be sufficient to permit operation under the above defined loads for the design life of the car (40 years) without structural damage, including fatigue cracks.

v). For the operational cases defined above, the stresses in the carbody shall not exceed the lesser of 50% of the guaranteed minimum material yield or the buckling strength.

vi). The buckling strength of all structural members with a compressive stress equal to, or greater than 35% of its material's yield strength shall be calculated.

(1) Any variations in the material compression moduli with stress shall be addressed in the buckling strength calculations.

(2) These calculations shall also address the inelastic buckling strength of structural members subjected to any combination of compression and shear.

e). Natural Frequency

i). The FEA model shall be used to calculate natural frequency of the carbody under AW0 and AW3 load and supported at the bolsters.

ii). The natural frequency of the carbody under AW3 load, and rigidly supported at the bolsters, shall be no less than 2.5 times the natural frequency of the car's secondary suspension system.

f). Fatigue

i). The carbody shall be designed to permit operation under nominally expected operational loads in the three orthogonal directions and about the torsional axis, for the design life of the car (40 years) without fatigue cracks/issues.

ii). Fatigue critical joints and members shall be identified using an appropriate analytical method such as finite element analysis (or alternate method as approved by Amtrak). The key load cases from a fatigue consideration are:

(1) Vertical loads from car weight and passenger loads (from AW2 loading)

(2) Load input at the carbody/truck interface due to vehicle-track interaction

(3) Load input at the coupler interface due to traction and braking

iii). Compliance with the design life requirements shall be demonstrated through cumulative damage analyses on all potential fatigue critical locations.

iv). The methodology for the cumulative damage analysis shall be approved by Amtrak.

v). Load spectra for the cumulative damage analyses may be obtained from the following:

(1) Actual test data from existing equipment that is substantially similar, running on similar North American track and having similar braking/acceleration profiles.

(a) Details on any dissimilarities shall be provided and suitably accounted for.

(2) Dynamic analysis of vehicle performance under the appropriate modes, the results of which must be verified by test on the first vehicles.

(3) For the vertical direction, the number of cycles in the life of the vehicle calculated from the first free-free vertical bending mode natural frequency of the car. This will give a constant amplitude loading, the dynamic factor for which shall not be less than ±20%.

vi). Alternatively, an endurance limit analysis may be used for materials that have an established endurance limit, such as materials covered by AWS Standard D1.1.

(1) All stress range cycles shall be below the endurance limit or 10 million cycles, which ever is more stringent.

(2) The dynamic load factor shall be determined by the Contractor and shall not be less than ±20 %.

(3) An endurance limit extrapolated from test results shall not be acceptable.

(4) An endurance limit calculated using a survival percentage is not acceptable unless explicitly approved by Amtrak, but in no case shall the percent survival be below 97.5%.

vii). A detailed fatigue analysis clearly identifying the endurance limits, allowable fatigue stresses, fatigue stress ranges and load cycle information shall be submitted for review and approval. **[CDRL 6-04]**

viii). Fatigue design data such as allowable fatigue stress levels, endurance limits, S-N curve data, MGD characteristics, etc. shall be derived from current versions of nationally accepted standards such as the AAR Manual of Recommended Practices, AWS Standards, or the Aluminum Association Aluminum Design Manual, Specifications and Guidelines for Aluminum Structures, American Association of State Highway and Transportation Officials, or other publication that is acceptable to Amtrak.

ix). For joint designs not covered by the above (IE spot and laser weld joints), the Contractor shall conduct the fatigue tests necessary to develop the needed design data.

g). Underframe Structure

i). Coupler carrier

(1) The coupler carrier, and those portions of the carbody to which it is attached, shall be designed to withstand the loads caused by supporting one end of the car on the coupler carrier, with the truck

attached, such as might occur during emergency jacking or lifting with a crane in the event of a derailment.

(2) Under this coupler carrier load, the allowable design stress of the coupler carrier, or any part of the carbody structure to which it is attached, shall be 80% of whichever is lowest of the yield strength, the critical buckling stress or ultimate tensile strength.

(3) The coupler carrier and its pocket on all car types shall be capable of having an APTA Type H knuckle coupler applied.

(4) Alternate designs may be proposed to Amtrak for approval.

ii). Body Bolster or Equivalent Structure

(1) The design shall provide clearance for the truck in all positions and accessibility for truck maintenance and de-trucking.

(2) Positive stops and safety hangers shall be provided between the carbody and the truck to limit the vertical and transverse movement of suspended trucks when the carbody is lifted with trucks attached.

iii). Cross bearers, floor beams and floor pans

(1) No moisture, dirt, dust or debris shall be able to enter into the subfloor for the life of the vehicle.

(2) The floor pan, or equivalent structure, shall be designed to facilitate replacement or repair of damaged portions and yet provide the attachment and seal welds required to meet the structural, car pressurization and fire safety requirements.

(3) Adhesives shall not be utilized to seal the floor pan or equivalent structure.

(4) The cross bearers and floor pans, if used, shall be constructed of stainless materials.

(5) The floor pan shall contain the underfloor thermal and acoustic insulation.

(6) The pans shall be suitably reinforced for structural rigidity and to prevent resonant noise and vibration and “oil canning” under any operating condition.

iv). Subfloor and Floor System

(1) Floors shall be designed and manufactured so that no permanent deformation or soft spots shall occur during the required service life of the vehicle.

(2) Floors shall be watertight and resistant to spills, washing solutions and moisture. Standing water is prohibited from entering and collecting in any cavities inside of the carbody. Material choices shall be reviewed and approved by Amtrak to ensure that any retained moisture does not adversely affect the life of the carbody.

(3) The floor panel system shall be waterproof and resistant to degradation.

(4) Floor system panels shall be fully sealed composite panels, as large as practical to minimize joints in walkways and shall have no joints in the doorways.

(5) Plymetal and aluminum honeycomb floor panels are not permitted.

(6) If the floor system is designed to be primary structure, it shall be represented in all tests and analyses.

(7) The maintenance manual shall specify the strength and attachment requirements for replaceable elements of the floor system, subject to Amtrak review and approval.

(8) The number of unique floor panels shall be minimized throughout the vehicle and between vehicles.

(9) Under a dead load and a maximum passenger loading of AW3, the floor panels shall deflect by no more than 1/250 of the short span between crossmembers, up to a maximum of 0.0625 in., without permanent deformation.

(10) The sub-floor and its attachments to adjacent structural members shall be capable of resisting the shear resulting from the specified compression loading without permanent deformation.

(11) The flooring system shall meet 49 CFR 238.103 Fire Safety requirements, utilizing ASTM E119 testing as detailed in Appendix B of the CFR with a minimum fire-endurance rating of 30 minutes at AW3.

(12) The representative section of each unique floor assembly configuration shall be reviewed and approved by Amtrak but shall be no less than the entire width by 10 feet.

(13) All joints shall lie on supporting structure.

(14) The floor shall not squeak for the life of the vehicle.

(15) Tapping plates for above-floor equipment shall be suitably attached capable of supporting at least 150% of the equipment load. Plate thickness and dimensions shall be reviewed and approved by Amtrak during design review.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(16) Carpeting or composite floor covering, where specified, shall be installed per manufacturer's recommendation and shall be approved by Amtrak.

h). Collision Posts

i). If CFR 238.211.d will be followed in leu of other collision post standards and regulations, a documented engineering analysis shall be submitted for review and approval by Amtrak within 30 days of NTP verifying the coupling system and supporting structure is capable of preventing disengagement and telescoping. **[CDRL 6-05]**

ii). Analysis and test plan information applicable to the collision post and coupler shall be included.

iii). Car ends utilizing collision posts to meet telescoping regulations shall meet the following requirements:

(1) A continuous cross section shall be fully welded to the bottom and top of the underframe and continue up to at least 18 in. and then taper to a point at 30 in. or continue to the roof.

(2) Longitudinal overload of collision post at 30 in. above the underframe resulting in failure along the post shall not cause deformation in the connections to the under/frame and its supporting structure. Overload capabilities shall be validated through analysis and testing.

i). Roof

i). General

(1) The design loads for equipment and apparatus attached or mounted to the roof, including HVAC units, gutters, air scoops, antennae, lights, equipment supports and supporting roof framing shall meet the carbody strength and fatigue requirements in this Specification.

(2) All parts of the roof structure, sheets, equipment covers, roof walkway, screens and other guards shall have sufficient strength to withstand, without exceeding 80% of the yield strength and critical buckling stress under the following conditions:

(a) Three concentrated loads of 250 lbs spaced 30 in. apart, each applied over a 3 in. by 3 in. area, such as might be applied by maintenance personnel working on the roof.

(b) The placement of the loads shall be such as to produce the worst-case condition for the roof structure without exceeding the yield strength, 80% of ultimate strength and critical buckling meet the rollover strength requirement defined in 49CFR Section 238.215.

(c) loads imposed by a mechanical car washer consisting of a pressure of 60 lbs./ft^2 over a 12 in. wide band extending transversely across the carbody.

ii). Emergency Roof Access

(1) Roof emergency access shall be in accordance with FRA 49 CFR Part 238.123. Perimeter of the cut-zone shall have a retro-reflective sign demarcating the opening, and clearly indicating the purpose, instructions and other emergency signage per APTA Standard PR-PS-S-006-23 and PR-PS-S-002-98.

(2) Cross sections of the fully assembled vehicle shall be provided at the emergency roof access locations to validate the entire cut-zone has uniform cutting thickness and the space below is free from all obstructions and secondary structure.

(3) Configuration of the emergency roof access zone with the roof window layout shall be included. **[CDRL 6-06] [CDRL 6-07] [CDRL 6-08] [CDRL 6-09]**

(4) An emergency egress plan shall also be supplied for each vehicle configuration and shall include a dedicated document with vehicle wide ingress procedure options for emergency responders. **[CDRL 6-10]**

iii). Gutters and deflecting plates

(1) Water deflecting gutters shall be installed on the roofline above all door openings on both sides of the car, to 12 in. inward from the end of the door opening or the end of the car as appropriate.

(2) They shall prevent water from dripping into or in front of the side door opening, any exterior indicator lights or key switches when the car is stopped.

(3) Deflecting plates shall be installed at the ends of the roof of each car to direct water between cars and away from any gangways or diaphragm.

(4) The design arrangement and installation of roof equipment shall not permit accumulation of water.

(5) If used, drains shall be fabricated from stainless steel or aluminum tubing and be designed to be inherently protected from clogging (large diameter size, large radii bends, no fittings, large slope, etc.) as a result of debris, leaves, dust, sand or dirt. Drainage provisions must be submitted for approval at the design review.

(6) Gutters and deflecting plates shall withstand regular passage through a car wash.

(7) Gutters shall be made from the same material as the carbody shell, roof and side sheets.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(8) Alternative gutter designs that meet the Specification requirements shall require approval of Amtrak.

j). Jacking Pads and Lifting Eyes

i). Jacking pads, with anti-skid plates, shall be provided in approved locations on the side sills to lift the car, with trucks attached, for maintenance and for re-railing.

ii). The car shall be designed to permit jacking or lifting one end of the car for truck removal or re-railing with the other end of the car resting on its truck, without damage to the truck attachments, underframes or any of the underfloor equipment.

iii). The Contractor shall coordinate the jacking pad locations with Amtrak so as to permit the use of existing shop permanent jacking systems to the greatest extent possible. **[CDRL 6-11]** Jacking shall not require any special attachment or removal of components from the carbody.

iv). Lifting eyes shall also be provided in approved end-of-car locations to lift the car.

v). If any lifting fittings or adapters are required for connection to the car, 10 sets shall be provided to Amtrak at the time of delivery of the first car.

vi). It shall be possible to lift up a complete car, or either end of a car, utilizing portable jacking devices or a crane and to subsequently support the car with portable stands with truck(s) remaining on the rails and remove the lifting device.

vii). The truck(s) shall be removable without interference, while the car is supported on jacking pads. All such conditions shall be considered at AW0 without exceeding 80% of yield.

viii). The localized strength around each of the jacking pads and lifting eyes shall be designed for a vertical load of one half the weight of the car at AW0 (including trucks) with a horizontal load of 10% of the vertical load.

ix). The horizontal load shall be applied simultaneously with the vertical load in any direction to produce the worst stress condition.

x). The allowable design stress shall be yield or 80% of ultimate, whichever is lower or the critical buckling stress of any part of the lifting location or the structure to which it is attached.

xi). The empty carbody, with trucks attached (AW0), shall be capable of being lifted on any symmetric lifting eyes or jacking pads without exceeding 80% yield.

xii). The empty carbody, with trucks attached (AW0), shall be capable of being lifted on the outboard most diagonally opposite jack pads or lifting eyes without exceeding 80% of yield.

xiii). Analysis of the carbody structure under torsional loading of all diagonal jacking and diagonal lifting cases, and all symmetric lifting and jacking cases, shall be included in the stress analysis.

6.5 Truck to Carbody Interface

a). The carbody stress analysis must assess the carbody's compliance with the truck-to-carbody connection criteria detailed in Chapter 7.

b). This assessment shall use the reaction loads derived from the truck-to-carbody connection evaluation presented in Chapter 7.

6.6 Doorways, Trapdoors and Passageways

a). All car types shall be fully compliant, at the time of manufacture, with all the latest rules and regulations of the Americans with Disabilities Act, as follows:

i). For wheeled mobility devices entraining and detraining, vestibules shall be designed for the use of an on-board mobility lift that meets all requirements per Part 1192, Subpart F – ADA, Accessibility Guidelines for Intercity Rail Cars and Systems.

ii). A minimum 36-inch wide clear passage shall be provided through the B-End powered side entrance doors, center doors on the diner car, as well as the A-End for High Capacity Option Coach car, collision post doors, and diaphragm passage, and a path from the B-end vestibule to accessible location within the car interior. A 60-inch turning circle in the vestibule shall be provided.

iii). A minimum 36-inch wide clear passage shall be provided through the gangway and body-end door, and a 32” path to accessible locations.

iv). Trap Door and Folding Steps: Each side of the vestibule on each car shall be equipped with a modular electrically powered trap door and folding step assembly for safe boarding and discharging of passengers at both low- and high-level platform stations. The module shall be Form-Fit-Functionally interchangeable with other cars in this procurement, with the additional requirement of meeting the clearance requirements per D-05-1355 Rev E-Clearance Diagram. Exception, the diner car shall only have a powered door for loading/unloading food and beverage products.

(1) The trap door and folding steps shall be compliant with all aspects of ADA requirements.

(2) The trap door and folding steps must be designed in a robust manner to operate even with up to 1” of ice coating the outside, or with built in heaters that will prevent the build-up of ice in environmental conditions as described in Amtrak Specification 963.

b). Refer to Chapter 12 for additional details.

6.7 Diaphragm

a). A modular diaphragm, compliant with Amtrak drawing D-00-2031, shall be provided to enclose the walkway on the identified procured cars. The diaphragm shall be compliant with Amtrak specification # 332. It shall provide a safe, enclosed passage for passengers/ crew passing between cars. The diaphragm shall provide a tight seal, with the diaphragm from the adjacent car, under all conditions encountered during normal train operation. The car-to-car path shall meet ADA requirements. A minimum clear opening of a minimum of 32 inches through the diaphragm shall be provided when the car is at rest on level tangent track. Joint between diaphragm and carbody shall be waterproof, so that no water enters the carbody.

i). The faceplate shall be approximately 2 inches beyond the coupler pulling face to provide compressive pre-load when the cars are coupled. The foot plate shall be nominal 53±0.5 inches above Top of Rail.

ii). The design shall provide a weathertight seal when coupled with legacy equipment. Furthermore, access to legacy equipment to and from the new single level vehicles shall be accessible between cars without any tripping hazards, pinch points, etc. while traversing all track geometries on the long-distance service.

b). Diaphragm Curtain

i). Retractable curtains with restraining devices shall be provided on either side in the diaphragm passage. The curtains shall be directly interchangeable, without adapters, with existing curtains, and shall include "automatic retraction or break away" feature. The diaphragm hook to retain and secure the diaphragm curtain shall be located at identically the same height above top of rail as Viewliner I & II for inter-car compatibility. This dimension may be taken from a convenient carbody reference.

ii). A safety gate shall be provided to prevent passage through the collision post opening when is open at the end of the train. A mechanism to secure the gate in the extended and retracted position without rattling shall be provided. In either retracted or extended position, the gate shall not interfere with operation of the handbrake, nor infringe on the FRA required clearance.

c). Diaphragm to Gangway Conversion

i). Both ends of the standard coach, standard sleeper, and utility cars; the non-vestibule end of the premium coach and accessible sleeper shall be designed to accommodate both a traditional type 1 diaphragm or an enclosed gangway to the best extent possible. Amtrak’s vision is that this fleet will operate with legacy cars during the initial years of operation which shall require the use of the traditional diaphragm; however, utilizing the same mounting locations, an enclosed gangway will be installed when the legacy fleet is phased out with procured cars now making up the consist. If the option for the utility car is not exercised one baggage car will be used in all consists.

ii). Amtrak requires flexibility to change the car types listed to gangway or diaphragm configurations to meet operational requirements.

iii). The contractor is responsible for making sure that either configuration will meet all clearance and curve testing with procured and legacy equipment to ensure compatibility without interference.

6.8 Gangway

a). At car ends, a weathertight bellows shall be provided completely enclosing the doorway between cars, including the space below the doorway.

b). It shall provide a safe, stable, weather resistant passageway between two coupled cars which meets or exceeds all ADA requirements for wheelchair passage and target a 40” wide opening as much as practical.

c). The gangway shall be designed to quick-disconnect and shall be separated by one person within 2 minutes without the use of any tools to facilitate car removal and/or adding cars.

d). The design shall also permit trainset wheeled catering carts, as well as wheeled passenger baggage, to easily pass through the cars.

e). The maximum variation in walking surface height when passing between cars, from vestibule to vestibule, shall comply with ADA requirements.

i). Changes in level up to ¼ inch (6.4 mm) shall be permitted.

ii). Changes between ¼ inch (6.4 mm) and ½ inch (13 mm) shall be beveled with a slope not steeper than 1:2.

iii). Changes greater than ½ inch (13 mm) shall not be permitted under any operating condition.

f). Tripping hazards and pinch points shall be eliminated by design.

g). Passenger vertical handrails shall be provided on both sides of the passageway.

h). The passageway shall exclude water ingress within the clearway of gangway system, shall exclude drafts under all normal operating conditions, and shall have a minimum design life of 16 years.

i). Any wear surfaces shall have a design life of no less than 8 years.

j). The design shall have no metal-to-metal contact between moving parts, in order to prevent noise, minimize wear between all parts, and require no lubrication.

k). The walkway plates, buffer and side stems shall be designed to permit coupled cars to negotiate minimum radius curves and crossovers, without any binding of the mechanism.

l). The passageway arrangement and installation shall be identical at all car ends, to

easily allow changes in trainset consist configuration, and is subject to approval by Amtrak during design review.

m). The inter-car bellows shall be mounted so as to easily allow its disconnection from the end of the car(s) to allow access to lifting eyes in Section 6.4.j). for lifting derailed cars in an emergency.

n). The end of each car shall be equipped with a weathertight lockable sliding pocket powered door with a manually operated override. Doors must be airtight to prevent entrance of diesel fumes.

o). All exposed metal components shall be stainless steel including all mounting hardware.

p). The gangway shall be capable of self-supporting when disconnected from either end so that when coupling, a jack is not required to recouple.

q). To the largest extent practicable, car to car trainlines shall be protected within the gangway to protect against the elements and debris strikes.

r). The gangway must remain securely attached to the car at either end of the train, whether the consist is set out or the cars are stored in the yard. It should be designed to prevent snow accumulation, water pooling, and withstand turbulent air. Additionally, the gangway should be designed to stay clean and functional, minimizing the need for extra maintenance when cars are added. Complete removal of the gangway for revenue service is not acceptable.

s). The gangway shall be removable for heavy maintenance and replacement.

t). Mounting locations and hardware shall be standard across all car types.

6.9 On Board Mobility Lifts

a). Overview

i). Contractor shall provide an on-board mobility lift for use by passengers at all side loading doors. At a minimum, a provision shall be installed so that an On-Board Mobility Lift can be added in the future.

ii). This section describes the design and functionality of the lift necessary to support this operation.

(1) Lift utilized to facilitate boarding of accessible passengers between platform heights and cars.

iii). Refer to Chapter 11 and 16 for the passenger interface details of these features.

iv). Structural connections for lifts shall be evaluated in parallel with the carbody stress analysis and at a minimum include conclusions within the carbody stress analysis report.

v). On Board Mobility Lift must be designed free of any recessed pocket to prevent any pinch point injuries. Contractor is responsible for working with Amtrak's safety and operations departments to ensure lifts will operate as intended when in service.

b). As an option, the On-Board Mobility Lift shall be provided in the Utility Car. If the option to install lifts is not exercised on the Utility car, the car shall have the structural provisions installed to facilitate mounting, should Amtrak decide to pursue this option. These provisions shall be integrated into the car design without compromising structural integrity or functionality.

c). General Requirements

i). All Lifts and associated equipment shall be suitable for sustained operation under all ambient conditions through which these cars are expected to operate (see Chapter 3).

ii). Controls for each Lift shall be adjacent to the Lift they control. The Accessibility Lift controls must enable one (1) train crewmember to effectively oversee all aspects of lift operation and the occupant's movements to and from the lift, without impeding or restricting the occupant's mobility. The crewmember shall be capable of assisting the occupant either within the car or on the platform, without the need to access the occupant through an alternative exterior door.

iii). Lifts shall be included on each premium accessible coach, standard coach, accessible sleeper, diner/lounge, café cars, and as an option on the utility car and provisioned in all car types.

iv). Lifts on single-level cars shall be sized for moving passengers from the lowest height low-level platforms to the boarding door.

v). Lifts shall be interlocked with the vehicle braking system so that train movement is inhibited with the lift deployed.

vi). When not in operation the Lifts shall be stowed in such manner to not inhibit passenger movements.

vii). Lifts shall be capable of lifting 800 lbs (363 kg).

d). Structural Requirements

i). All lifts shall be secured to the car structure in a manner such that twist, roll or flexing of the shell shall not affect lift operation.

ii). Lift tracks or guide rails shall not be distorted by carbody or vehicle movement to prevent operation. Clearance between car structure and lift tracks can be developed as needed for design however any bridging between lift platform and car floor shall be automatic.

e). Lift Requirements

i). The lifting device must be engineered with sufficient robustness to prevent twisting, rolling, or flexing during operation. It is essential that the lift provides a secure and stable experience for passengers who rely on its use.

ii). Two Lifts shall be provided on the cars, mounted on opposite sides of the same vestibule space.

iii). Lift operation may be a combination of manual and automatic features. Manual actions to deploy or stow the lift shall be accomplishable by a 5th percentile female; however, shall be designed to be operated by one (1) crew member without any assistance

iv). Lift controls shall be in the vestibule space and shall require an Amtrak standard coach key to enable.

f). Power Requirements

i). Lift shall be powered by car 480VAC bus.

ii). Controls, indicators, and interlocks shall be powered by cars 72VDC bus.

iii). Lift shall meet the requirements of 49 CFR Part 38 Subpart E Paragraph 38.95.

g). Emergency operation

i). In the event of a loss of power, the Lift shall include manual operation provisions to allow passengers to be moved between the car floor and platform. Manual operation shall allow for continuous operation to move multiple passengers as needed.

ii). Manual deployment, lift and lower operations shall be limited to a maximum of 50 lbs. for any individual task.

iii). The lowest station platform height for the purposes of the lift's upper and lower reach shall be assumed be 16" below top of rail. The lift design shall also allow for operation when the car is on a curve with up to 7 in. of lean, due to super-elevation.

(1) When the lift is lowered to the platform, the lift shall sit flush with the platform surface and shall not exhibit any skew, tilt or misalignment.

iv). The lift shall be of modular, compact design to facilitate removal and replacement for servicing/repair.

v). Under power operation, the complete cycle of deploying the platform, lowering the lift to platform height, raising the lift to car floor height and stowing the lift platform shall require no more than 60 seconds.

vi). The lift shall comply with the most recent RVAAC recommendations and any applicable ADA standards.

6.10 Safety Appliances

a). Exterior

i). Railroad safety appliances shall be provided to each car in accordance with 49 CFR Parts 229, 231 and 238, and APTA Standard PR-M-S-016-06.

ii). An ergonomic evaluation shall be performed by the Contractor and approved by the Engineer regarding the size, placement, and positioning of all safety appliances, especially loop step arrangement and necessary handholds. **[CDRL 6-12]**

iii). The Contractor is requested to recommend improvements which facilitate train crew and maintenance personnel boarding and detraining.

iv). Handholds shall be 0.625 inch diameter one piece forged stainless steel and attached with stainless steel bolts or rivets.

v). The Contractor shall arrange for an FRA sample car inspection of the safety appliance applications and shall provide Amtrak with a copy of the FRA “no exceptions taken” letter prior to release of the first equipment of each type. **[CDRL 6-13]**

b). Interior Passenger Grab Handles

i). ADA compliant passenger grab handles shall be provided throughout the cars for safety, and in particular as follows:

(1) Grab handles must be capable of withstanding 400 lbf. without failure.

(2) At each side entrance doorway to allow crew to stand safely in the open doorway; and

(3) At each side entrance doorway to allow use during the entire boarding and alighting process; and

(4) On both sides of the passageway adjacent to the diaphragm or gangway; and

(5) Additional handholds shall be provided in the passenger compartment for standing passengers and in the Food service areas. The quantity and location of handholds will be reviewed during design review. See Chapters 9 and 14 for additional details.

6.11 Equipment, Equipment Boxes, Equipment Rooms and Access Doors

a). General

i). The high-speed nature of service intended for the cars will require a high degree of protection from foreign object damage, and from the effects of winter weather conditions.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

ii). All undercar equipment, other than the trucks, shall be housed in an undercar equipment enclosure fitted with lightweight hinged panels meeting the materials and workmanship requirements of Chapter 19.

iii). Each compartment of the equipment bay shall be completely enclosed by one (1) hinged access door, one (1) drop-down panel, and one (1) bottom panel on each side of the car longitudinal centerline or another proposed lightweight designed by the Contractor for review and approval by Amtrak. Mounting of equipment on any of the doors and panels is prohibited.

iv). The enclosure shall be aerodynamically designed for low drag, and to inhibit the collection of water, debris and snow. The sides of the vehicle below the side sills shall incorporate a continuous aerodynamic contour from front to back that shall include the equipment boxes. The outboard ends of the enclosure facing the trucks, and/or the ends of the car shall be reinforced, spaced at least 3 ft. from the trucks for maintenance access, and protected to the greatest extent possible from foreign objects run over by the car.

v). The enclosures shall quickly allow damaged components to be unbolted and replacement components installed during servicing and allow ease of repair of damaged enclosures at the Amtrak shops. No enclosures shall be directly welded to the carbody.

vi). The enclosure parts shall be standardized as much as possible and shall be assembled with welding and/or mechanical fasteners. Use of adhesives for enclosure assembly is prohibited.

vii). A small, separate set of hinged covers shall be provided on each side of the car for the water tank fill points, and the waste tank drain hose/control valve access points, so as to not require the full side access covers to be opened for their servicing.

viii). Panels shall be designed to be standardized lengths across the entire car, to the best extent possible, and across car types. Any deviation of this requirement will need review and approval by Amtrak.

ix). Panels shall be designed so that undercar components or systems requiring daily or routine maintenance are readily and easily accessible.

x). All equipment boxes, which are required to be watertight, shall be given a water test. Junction boxes are required to be watertight.

xi). The interior of all electrical equipment boxes and terminal boxes shall be primed and shall be given one coat of white insulating coating.

xii). A single coat of insulating varnish, enamel or white (or approved color) epoxy powder coating may also be used. Insulating coatings are not required on fiberglass surfaces.

xiii). Final dimensions, arrangement of all equipment compartment access points and attachments to the carbody shall be subject to approval by Amtrak. **[CDRL 6-14]**

b). Carbody Attachment

i). Brackets and other means of support for the equipment shall be designed and installed to facilitate access for maintenance and servicing and for removal and re-application.

ii). The interfaces of the brackets and major structural components shall be designed to allow Amtrak to alter, remove, or add undercar equipment without modification to the structural members of the carbody.

iii). Fasteners shall be conveniently accessible.

iv). The attachment of all apparatus over 150 pounds to the carbody shall be in accordance with APTA Standard PR-CS-S-034 Section 2.7.

v). Interior fittings shall be in accordance with 49 CFR 238.233 and APTA Standard PR-CS-S-006.

vi). In no case shall the strength of a fastener or the shearing of the fastener through the base material be the limit of the carrying capacity of a member with no bolts in tension.

vii). The analysis of the connection of each fastener shall include considerations for shear, pull out, and tension.

viii). Equipment supported on resilient mounts shall always be designed to have the resilient mount in compression and have safety straps or other devices that will support it in case of a failure of the resilient mounts.

ix). The design of the safety straps shall include the effect of the equipment dropping from its mounts.

x). Under no circumstances shall equipment be supported by bolts in holes that are tapped into the primary structure of the end underframe.

xi). The following shall apply to apparatus over 25 pounds:

(1) Vertically oriented bolts shall not be the primary vertical load-bearing mechanism.

(2) Bolted connections shall be designed with a factor of safety of 1.5 using bolts of not less than 0.375 of an inch diameter when analyzed for in-service loads.

(3) All bolted connections in equipment supports shall be supplied with minimum SAE J429 Grade 5 bolts or equivalent, plated for corrosion resistance in accordance with Chapter 18. Alternatively, metric fasteners of at least property class 8.8 or A4-80 may be used.

c). Floor and Roof Penetrations

i). The Contractor shall ensure that all floor and roof penetrations shall be sealed against fire, pressure differential and entry of vermin and provide for a watertight and dust tight carbody.

ii). Floor penetrations shall be sealed with an appropriate material to prevent flame propagation from underfloor flame sources; and shall be designed to last the life of the car.

iii). Considerations shall be made for compliance to ASTM E119 for representative floor penetrations.

iv). Full interior to exterior floor penetrations shall be made through sealed tubes to prevent moisture from entering pan to floor area.

d). Battery Box

i). See Chapter 15.

e). Electrical Connections

i). Enclosures which, because of internal layout and/or limited external access, require removal from the car for mid-life overhaul shall have electrical connections made by the use of connectors meeting the requirements outlined in this Specification.

ii). The connectors shall lie within the enclosure, and the cables shall enter the enclosure through watertight fittings.

iii). Fully enclosed cable ducts or conduits shall not connect directly to such enclosures but shall incorporate a flexible or rigid, detachable transition piece that will facilitate breaking the connection.

iv). Other enclosures shall have cables and wires entering the box through watertight fittings and shall terminate on devices, bus bars, terminal blocks, etc.

f). Under Car Covers

i). Outboard covers shall rise upward to a minimum of 110 degrees for quick examination of the interior without removing the covers.

ii). Inboard covers shall open to the maximum extent possible, but in no case less than 90 degrees.

iii). All hinged covers shall also be readily removable.

iv). Openings provided upon removal of covers shall be of sufficient size to permit removal and replacement of any component in the box and easy access to equipment in the box for inspection and maintenance.

v). All covers shall have a permanently attached "hold open" feature.

vi). The “hold open” feature shall in no way interfere with or impede the easy removal or replacement of the cover.

vii). These covers shall be provided between the trucks and trucks to end wall as required to complement the overall aerodynamic and aesthetic design and shall not violate any of the clearance requirements of the car.

(1) Trucks to end wall may use removable shields in place of covers this will be determined at design review. Clearance between the end of the covers/shields and trucks shall not inhibit truck maintenance, especially that of brake pads and calipers.

viii). They shall be designed to be lightweight and readily repairable at Amtrak facilities in the event of debris strikes.

ix). Skirt panels shall be operable by a single person, including securing the hold-open feature while holding it up and requiring no more than 25 lbs. of force to open, lift, secure open, or close.

x). Panels shall be designed to be standardized across the entire car, to the extent possible, and across car types.

xi). Panels shall be designed so that undercar components or systems requiring daily or routine maintenance are readily and easily accessible.

xii). All latches that must be manipulated to gain entrance to the enclosures shall be quick-release, spring loaded latches which operate with a toggling-type action.

xiii). Latches must be recessed or have a safety lock which will prevent accidental activation.

xiv). All latches shall be of the highest quality, designed for heavy-duty railroad service and applied in sufficient number to ensure adequate gasket compression needed for long term watertight quality sealing.

xv). A spring-loaded safety catch shall be provided at each enclosure cover.

xvi). The safety catch shall be designed to retain the cover at all operating speeds without the cover latches engaged.

xvii). The safety catch design shall preclude damage from cover misalignment, slamming covers and attempts to open covers with the catch engaged.

xviii). An approved cover nameplate shall identify the location of the safety catch.

xix). All covers more than 3 ft in width shall have two or more handholds arranged about the center of gravity of the cover, and recessed flush into the cover surface. The handholds shall not accumulate debris or moisture.

xx). The covers shall be arranged so that only one person is required to easily open, remove, reapply, close and lock any cover, regardless of size.

xxi). Adequate clearances for all handholds, latches, etc., shall be provided so that a person wearing gloves in a winter environment is not hindered.

xxii). All covers shall fit well and be adequately gasketed where necessary to prevent the entrance of water (including both a driving rain and a high-pressure car wash spray), dust and snow.

xxiii). All gaskets shall remain intact for a period of at least 10 years.

xxiv). Only one common type of gasket shall be used on all covers using a positive mechanical means of attachment.

xxv). Flat foam strips or glue-on attachments shall not be permitted. The design shall allow for ease of gasket replacement, without use of adhesives.

xxvi). All removable doors on underfloor enclosures shall be interchangeable between similar enclosures on different cars without need for adjustments to ensure proper seal operation.

xxvii). All hinged covers should have the hinge placed so that the cover cannot swing down and contact the rail or ground or fall open due to failure of the latch.

xxviii). On each side access door, a rudimentary and intuitive indicator shall be provided in a conspicuous location to help visually identify whether doors are locked or unlocked when viewing the side of the car.

6.12 Windows

a). General

i). Frame and glazing rubber of side passenger windows and side door windows shall be designed to securely retain the glazing material under all operating conditions on specified track configurations. The use of sealant for the installation of the glazing material is prohibited.

ii). Glazing assembly (frame, rubber and glazing material) shall not leak during carbody water tests and shall not rely on sealant.

iii). The glazing material shall show no physical damage or degradation of optical qualities when exposed to the environment encountered in rail passenger service.

iv). All glazing assemblies shall meet all applicable requirements of 49 CFR Parts 223 and 238 for FRA Tier I service. They shall meet any applicable APTA requirements.

v). The Contractor may propose as an alternate design the deletion of the restroom side window for Amtrak approval.

vi). Material selection for glazing rubber and all other materials in all locations must take into account the possible interaction between the materials as well as the environment.

vii). The design of all glazing shall be approved by Amtrak. **[CDRL 6-15]**

viii). Windows shall be designed to not compromise cellular attenuation in any capacity.

b). Glazing Materials

i). Glazing material shall be polycarbonate and shall conform to the requirements specified in Chapter 19.

ii). Only flat glazing shall be used.

iii). The passenger area and restroom side windows shall be double glazed units.

iv). All door, sign and interior partition windows shall be single glazed units.

v). Material shall be integrally tinted with no appreciable variation in color over the entire area of each glazing and between panel of like color designation and thickness.

vi). Color measurements shall be taken with a spectrometer.

vii). Markings are to be in accordance with current ANSI Standard Z26.1 and 49 CFR Part 223.

viii). Location of these markings must be visible for identification after installation.

c). Side Windows

i). General

(1) Side windows shall be double glaze and conform to the requirements specified in Chapter 19.

(2) The edges of the unit shall be sealed.

(3) Retention of glazing material shall allow installation and/or removal of the main rubber extrusion from the carbody frame.

(4) The window opening in the carbody shall be as large as practical and reinforced to keep the opening flat.

(5) A leak proof seal shall be provided.

(6) The use of sealants or adhesives is prohibited to achieve a watertight seal.

(7) The construction of window glazing shall not inhibit cellular audio or data signals from freely flowing into and out of the carbody.

d). Emergency Side Windows

i). A two part "Emergency" handle shall be provided at designated "Emergency" windows for removal of the window from inside of the car.

ii). The design of the glazing rubber shall also allow removal of the glazing from the outside of the car by emergency responders as described below.

iii). All windows on the car except those mounted in a side loading door must function as Emergency windows.

iv). Bonding the emergency pull handle to the window is not allowed.

e). Rescue Access Windows

i). All side windows shall be emergency windows designated as an emergency and rescue access – dual-function window.

ii). Rescue access windows shall provide a means of rescue access by emergency personnel such as, police, fire department, etc.

iii). Identification and removal instructions shall be provided in accordance with 49 CFR Part 223, 49 CFR Part 238.114, APTA Standard PR-PS-S-002-98, and ASTM Standard D 4956-07 for Type I material sheeting.

f). Door Windows

i). All door windows (such as the side door, end car collision post door and sliding interior door). The side door window dimensions shall permit a standing train crew member to clearly see out of the window.

ii). The end car collision post door shall be clear and meet the requirements for FRA Type I glazing.

iii). The side door windows shall be tinted and meet the requirements for FRA Type II glazing.

iv). The sliding interior door window shall be clear and meet the requirements for FRA Type II glazing.

g). Exterior Destination Sign Windows

i). Each exterior destination sign shall have a flat piece of FRA Type II non-tinted window glazing, of sufficient size to prevent masking the display.

ii). The glazing shall be resistant to any defrosting heat which may be applied.

h). Skylight Window (Option)

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

i). Skylight windows shall be included in the offering from the Contractor for Amtrak to exercise as an option in the Diner/Lounge car.

ii). Passenger visibility shall be maximized through the use of flat glazing as large as practical considering maintenance practices for weight and support methods for maintenance personnel, this point shall be discussed in design review.

(1) This shall be achieved by incorporating an upper row of windows aligned above the roof rail.

(2) Skylight windows shall be mounted at an angle on the roof of the car.

(3) Alternatively, a window arrangement with a better viewing field can be proposed for Amtrak review and approval.

iii). Skylight windows shall line up with the coach sidewall windows.

iv). The depth that the window extends inward along the roof of the car shall be determined by the Contractor but shall be no less than 26” x 24” so that the skylight window can provide emergency roof access according to 49 CFR 238.123 as a rescue access window according to 49 CFR 238.114.

v). To the extent practical, the gap between the upper and lower window rows should be reduced to the bare minimum and positioned at the highest point.

vi). The viewing field along the length of the vehicle shall be optimized by reducing structural and interior obstructions for the windows, i.e., the thickness/depth of the posts and interior panels should be minimized so the glazing is flush with the structure and interior to the maximum extent practical.

vii). Skylight windows shall be easily replaceable by maintenance staff while providing leak free design. Design shall be focused on providing a controlled drainage path to prevent accumulation of liquids and to not collect in any area which would result in leaks to the interior or corrosion of components.

6.13 Insulation

a). Acoustical Insulation

i). To reduce movement, structurally-borne sound and noise generated by the vibration of the roof, floor and side sheets, panels, air conditioning ducts and other metal surfaces, in particular the doors, damping material shall be applied to the inner side of these surfaces where necessary.

ii). The thickness of the damping material shall be such that the acoustic requirements are fulfilled.

iii). The damping material shall have a vibration decay rate of not less than 35 decibels per second (dB/sec) as measured by the Geiger-Hamme Thick Plate Test Method.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

iv). The damping material shall have a hydrodynamically smooth finish and shall be receptive to painting.

v). It shall be resistant to dilute acids, alkalis, greases, gasoline, aliphatic oils and vermin.

vi). It shall be unaffected by sunlight or ozone and shall not become brittle with age.

vii). The material shall not contain any asbestos and shall meet the flammability and smoke emission requirements of Chapter 19.

viii). Its application shall be according to the supplier's recommendations and shall include an application of a recommended primer.

ix). The sound dampener shall be compatible with the material used at the affected locations in the car structure.

x). The inner surface of the carbody structural shell, except for the end underframe welds, shall be coated, and the inside surfaces of structural members sprayed to the extent necessary.

xi). Structural members under the floor of the carbody shall not be coated.

xii). The outside or inside surfaces of the main air duct, and all ventilation cross ducts shall be treated with acoustic insulation to reduce noise.

xiii). Duct splitters (if used), the underside of the main air duct, top/bottom of floor beams and inside door pockets shall not be coated.

b). Thermal Insulation

i). The heat transfer through the carbody, using only the carbody's own floor heaters, shall not exceed 14 Btu/Hr/°F per foot of car length (derived from 1200 Btu/Hr/°F for an 85 ft car) under the environmental conditions specified in Amtrak Specification 963 while the carbody is stationary. Other values may be proposed to Amtrak for consideration.

ii). Glass wool or fiberglass insulation shall be used.

iii). The use of urethane foam insulation is prohibited.

iv). All insulation used shall not mold, rot, have any odor, corrode any metals, nor shake down in long service under vibrating conditions.

v). The heat transfer capabilities shall not diminish over the life of the vehicle.

vi). The Contractor shall supply a thermal analysis of completed car for approval at the design review.

vii). A vapor barrier shall be provided between all interior linings and the carbody insulation.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

viii). There shall be no all-metal path between interior of the carbody and outside of the carbody skin.

ix). The insulation shall be mechanically fastened to the carbody.

6.14 Exterior Finish

a). General

i). The exterior finish of the vehicle shall maintain its appearance with regular maintenance.

ii). Soon after fabrication, all non-weathering carbon steel portions of the carbody shall be prepared for painting and immediately thereafter painted with the first coat of primer by trained technicians utilizing the paint supplier's written procedures.

iii). Stainless steel shall not be painted, but shall be sufficiently passivated after assembly, and no signs of rusting at welds or along any portion of the exterior shall be allowed.

iv). The surface preparation and graphics applications shall ensure that the car can operate at least eight years between major exterior finish repairs or replacement.

v). All exterior surface treatment plans and specifications shall be submitted to Amtrak for review and approval. **[CDRL 6-16]**

vi). All paint shall include, at a minimum, a primer coat, color coat and clear coat, applied in accordance with manufacturer specifications.

b). Painting – Exterior

i). Care in painting application shall ensure freedom from runs, sags, orange peel and other unsightly paint deficiencies, by trained technicians utilizing the paint supplier's written procedures.

ii). Exterior designs shall be approved by Amtrak during Design Reviews.

iii). Paint system is subject to approval by Amtrak for its corrosion protection and aesthetic durability.

iv). The paint system must allow for at least twelve years of durability.

v). Replacement of decals shall withstand a minimum of eight years and not damage the paint surface during removal.

vi). Paint system shall meet Amtrak Specification 742-1.

6.15 Graphics and Labels

a). Exterior Graphics

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

i). All exterior graphics, lettering and signage, including vehicle numbers and reporting marks, shall be applied to the vehicle in accordance with Amtrak specifications as identified by Amtrak during design review.

ii). The Contractor may request minor modifications to the size, location and placement of decals, striping and paint application in order to accommodate carshell features, equipment, maintenance points or other obstructions that will affect the quality, appearance or longevity of the decals or graphics.

iii). All exterior decals shall be retro-reflective unless specified otherwise.

iv). All decals, graphics and signage shall be specified and designed to function in the operational, environmental and climatic conditions specified in Amtrak specification 963 with no fading, material degradation, delamination, discoloration, shrinkage or expansion, wrinkling or peeling.

v). It is the expectation of Amtrak that the exterior livery would be jointly developed by the Contractor and Amtrak.

vi). It would be expected to be a final design of vinyl material that allows for the wrapping of all exposed stainless-steel surfaces of the carbody including the roof, end sheets and any undercar elements including but not limited to shrouds.

vii). Each mock-up shall have a vinyl wrapped exterior livery for further input on the design direction.

viii). All exterior decals shall have edge seal applied unless otherwise agreed to.

b). Labels

i). Exterior equipment shall be labeled in accordance with Amtrak Specification 696. Emergency-related decals and signage shall conform to all applicable APTA standards and FRA requirements.

c). Interchangeable Exterior Signage

i). The Contractor shall provide an interchangeable, easily replaceable exterior sign on all car types to be utilized by Amtrak to modify class designation for future operation of the single level fleet.

(1) The sign shall be designed to be interchangeable across all cars in the fleet mounted to the carbody within close proximity to the side loading doors using standardized fasteners or approved locking mechanisms allowing for tool-less removal and replacement.

(2) The sign shall be constructed of non-flammable, scratch resistant and UV-stable materials suitable for the exterior environment complying with all CFR and ADA requirements.

(3) Contractor shall work with Amtrak to develop this signage during the design review process but it is Amtrak's intention that the Standard

Coach car can be reclassified as a Business Class car utilizing this interchangeable exterior signage.

6.16 Automatic Equipment Identification (AEI) Tags

a). Each car shall be equipped with an Automatic Equipment Identification (AEI) transponder tag on each side, located in conformance with Universal Machine Language Equipment Register (UMLER) dimensional and securement requirements and programmed with the reporting marks of the owner, road number of the vehicle and all other technical data required by UMLER.

b). The Contractor is responsible for ensuring the following:

i). Tags are properly installed and sealed in accordance with UMLER requirements.

ii). Tags are properly programmed with all data required by UMLER; and

iii). The UMLER/EMIS system is updated with the data for each vehicle as required for shipment.

6.17 Stress Analyses

a). Stress Analyses and Test Plan

i). A stress analysis and test plan for the carbody structure shall be submitted for approval no later than 120 days after NTP. **[CDRL 6-17]**

ii). Separate plans shall be prepared for each car type as required.

iii). The Plan shall address the requirements of this specification, any applicable CFR, and the latest APTA Standard PR-CS-S-034-99.

iv). The Stress Analysis and Test Plan shall be discussed during the first design review meeting.

v). Each Plan shall be a working document and updated as the design develops.

vi). When the plan for the analyses and testing is revised, it shall be updated and resubmitted no more frequently than monthly.

vii). Each revision shall include revision level indications.

viii). The stress analyses and tests plan shall be approved prior to submittal of the stress analysis report required by this Specification.

ix). The Plan shall be made a volume of the stress analysis report.

x). The Plan shall follow the general requirements of the report as identified herein.

xi). A master table of all different carbody types and their applicable car types for the entire project shall be provided in each plan.

xii). Carbody types utilizing an analysis or test from a different carbody type for validation shall clearly reference it in the plan.

xiii). Carbodies which utilize different drawing or part numbers because of small differences that utilize the same validation analysis or test shall include thorough design differences comparisons in the design review package.

xiv). The Stress Analyses and Test Plan shall detail the methods and approach that will be used to analyze and test the carbody and truck.

xv). It shall also include the following, with references to standards and publications as appropriate:

(1) A comprehensive table of material properties detailing the engineering properties of each grade and temper used in the carbody.

(a) This table shall include the FEA material property inputs and literature references or testing reports supporting these selections.

(2) Detailed and high-resolution illustrations of each material's respective locations.

(3) A numbered listing of each load condition for analysis and test, including load magnitudes and points of application, with CFR, APTA, and Specification references.

(4) Acceptance criteria for each load condition.

(5) Diagrams displaying loads applied and points of support for each load condition for analysis and for testing.

(6) A description of the software settings, model setup, and meshing quality assurance.

(7) Description and examples of methods for analyzing and evaluating the critical structural connections for static and fatigue (all major joint types shall be included; IE resistant and laser welding). Examples should include partial penetration welds if used (IE resistant and laser welding).

(8) Fatigue joint testing plan for joint designs not covered by AAR, AWS, Aluminum Association Aluminum Design Manual.

(9) Descriptions and examples of methods used in past projects to evaluate and justify stress singularities and stress concentrations in the FEA results.

(10) Table of all interior fittings to be analyzed and vehicle equipment over 150 lbs shall be provided with their respective mass and locations.

(11) Description of structural manufacturing work done outside the Contractors main manufacturing facility.

(12) If applicable, description of design process for dissimilar metal connections to isolate and prevent any galvanic reactions.

b). Finite Element Models

i). The Contractor shall submit electronic copies of the preliminary and final Finite Element (FE) models for review by Amtrak. **[CDRL 6-18] [CDRL 6-19] [CDRL 6-20]**

(1) The formats and which major loading results shall be agreed upon between the Contractor and Amtrak.

ii). As part of the carbody FAI, the carbuilder shall provide reports, models, illustrations, and drawings for the Authority to audit and verify the final FEA model represents the final condition of the carbody structure.

iii). If the FEA model does not represent the final condition of the carbody structure such as welds or holes to accommodate interfacing sub-systems, these differences shall be summarized and justified.

iv). Car types claiming to use the same carbody structure shall be similarly validated.

v). The FEA model shall include the major structural components of the HVAC if not resiliently mounted.

vi). Other major equipment which adds considerable stiffness to the carshell may be required at the Authority's discretion.

c). Carbody Stress Analyses

i). The stress analysis shall show the calculated and allowable stresses and margins of safety for all elements, for all specified load conditions, and shall include calculations of stresses in joints, joint elements, and other important elements.

(1) It shall include FEA results, connection, buckling, natural frequency and fatigue analyses.

ii). Preliminary stress analysis results shall be prepared and submitted for review and approval not later than 60 calendar days after approval of the analysis and test plan. **[CDRL 6-21]**

(1) Preliminary results of all load cases shall be included.

(2) The formats shall be agreed upon between the Contractor and Amtrak. **[CDRL 6-22]**

iii). The stress analysis report shall be prepared and submitted for review and shall be fully approved prior to commencing manufacture of any carbody structural parts. **[CDRL 6-23]**

(1) The Contractor shall submit the required stress analysis report in compliance with the format and content specified herein.

(2) If a cited reference in the report is not readily available to Amtrak, the Contractor shall provide the reference or copies of the pertinent pages.

(3) All references shall be in English.

(a) If an English language reference is not available, an English translation shall be provided, and both the original and the translation shall be included in the report.

(4) The report shall demonstrate that all structural members satisfy the requirements of the FRA, APTA and this Specification for compliance with each design load and condition and represent good design practice in the North American railroad industry.

(5) The report shall be organized and in sufficient detail so that Amtrak can readily follow the theory and its application to the car.

(6) The Contractor shall certify that the analysis and calculations have been reviewed and validated before the report is submitted to Amtrak.

(7) If tests are conducted to provide the necessary data, the entire test report shall be submitted.

(8) This report shall show the test procedure, raw data as well as reduced data, and summary, with detailed discussion of the results.

(9) The report shall include analyses of all critical connections and summarize the connections in a critical weld list.

iv). Critical connections which cannot be adequately analyzed shall be prototyped and tested to demonstrate compliance with the requirements of the design and the Specification.

v). The FEA shall be supplemented as necessary by manual or computer calculations of stresses at joints.

d). Validation of Stress Analyses

i). Validation of the finite element model shall be accomplished by comparing the carbody structural test results for each test required by Chapter 19 with the corresponding stress analysis results.

(1) This information shall be tabulated and submitted with the carbody structural test reports for each test. **[CDRL 6-24]**

ii). In the test procedure for each test to be used for validation, there shall be a pre-selected list of strain gauges to be used for the comparison, which shall not be less than half of the total number of strain gauges used during the test.

(1) This table shall include gauge number, type, element number, general location, stress analysis strain value in the active direction of the gauge, active direction of gauge on carbody, a column for the strain gauge value, and a column for notes.

(2) For rosette strain gauges, the information above must be supplied for each leg as well as the combined result.

iii). The test report shall include tables that compare stresses calculated from the test strain gauge readings with analytical stresses from the FEA and shall include the test stress value, the analytical stress value, the percent difference between the two values, and a space for annotation.

(1) The report shall include a graph plotted using commercially available spreadsheet software comparing the stresses calculated from test strain gauge readings with analytical stresses from FEA.

iv). For gauges applicable to the individual tests, the percent difference between the two values shall be within ±15% for 80% of the compared values of the test results and analytical results for each gauge type, with none beyond ±30%.

(1) This shall not include load cells.

v). It is assumed all gauges of interest will target areas of stress over 35% of the allowable stress.

vi). Additional strain gauges can be used for experimental or reference only purposes but shall not help satisfy the gauge count requirements and shall be clearly identified as such in all documentation.

(1) Such experimental gauges may be applied on or extremely close to weld joints with no penalty to the correlation requirements but are not exempt from the yielding requirements and thus must measure and record data the same as the required gauges.

vii). If the analyses results do not agree with the test results within the above-specified tolerance, the Contractor shall revise the stress analyses, update the FEM, and re-run all FEA.

(1) All manual analyses using data from the FEA shall be recalculated using the corrected values.

(2) This process shall be repeated until agreement of results is within the specified tolerance.

(3) The stress analysis report shall be revised and re-submitted.

(4) All results from re-analysis shall meet specification requirements.

(5) The design shall be corrected if such requirements are not met.

viii). Analytical values which disagree with the test value by more than 15%shall include an individualized and detailed explanation of the reasons for the variance in the carbody test report for individual review and approval by the Authority.

(1) This explanation may include supporting manual calculations.

ix). Approval of the carbody test report shall depend, in part, on the adequacy of the justification for excessive variance between analytical and test stress values.

7.17 Maintainability 7-21
7.18 CDRLs 7-21

7.1 Overview

a). This chapter covers the truck design for Amtrak's Universal Single Level Fleet.

b). The cars shall be equipped with trucks designed for safe and reliable operation at all speeds and cant deficiencies up to their maximum, on all FRA Classes of track up to and including Class 7.

c). Maximum operating speed of 125 mph and 5" cant deficiency.

d). Truck frames may be either cast or fabricated. The trucks shall incorporate braking via disc and tread brakes. At a minimum one (1) manual mechanical handbrake per car shall be provided. The handbrake shall not require power or air to apply or release the mechanism. The trucks must be designed to accommodate the maximum static axle load as specified in Chapter 1.

7.2 General Requirements

a). The truck assembly shall be designed for operations specified in Chapter 1, under the environmental and operating conditions identified in Amtrak Specification 963, including track configurations across the entire Amtrak network.

b). Truck designs must have a proven service history in intercity or commuter rail service with a minimum of 2 million miles and must be demonstrated as being compliant with all Specification requirements through finite element analysis, truck dynamic behavior through computer simulation (validated as defined by Amtrak) and instrumented testing at an approved test track facility.

c). All truck frames and bolsters (if used) shall be directly interchangeable between all locations of a given car type.

d). All materials and workmanship shall meet the requirements of Chapter 19.

e). The truck shall be equipped with the brake equipment specified in Chapter 9.

i). The disc brake arrangement shall be sufficient for the thermal load produced by the specified braking performance.

ii). Brake equipment shall provide braking rates as identified in Chapter 9.

f). The Contractor shall provide instructions in the appropriate Maintenance Manuals for allowable field repair welding procedures for the truck.

g). Provisions shall be made for use of a wheel truing machine for re-profiling wheels while mounted on a car without requiring any degree of truck disassembly.

i). Access to the ends of the axle for wheel truing shall be available without the removal of any additional parts, including roller bearing end caps (with the exception of plugs or axle tachometer generators).

h). Components, such as air valves and linkages, wheel slide sensors, speed sensors and wiring shall be located as best as possible to protect them from debris strikes or have shields added.

i). Wheel slide sensors shall be a fixed depth as to be visible for use of a Go-No Go gauge or alternative as approved by Amtrak.

7.3 Vehicle/Track System Qualification

a). Each car type must meet the requirements of 49 CFR Part 213.57, Part 213.329 (d), and the requirements of 49 CFR Part 213.345 for service operation up to the maximum speed and cant deficiency specified in Chapter 7.1.

b). The truck dynamic characteristics shall be suitable for the train application and must demonstrate appropriate response for all speeds, curves, spirals and turnouts, and for all typical track perturbations found within defined safety limits of FRA track geometry standards and as described in this Specification.

i). The truck design must meet this level of suitable performance without use of a tilt system.

c). Vehicle Dynamic Performance Qualification Plan

i). The Contractor shall submit a vehicle dynamic performance qualification plan for Amtrak review and acceptance. **[CDRL 7-01]**

(1) The purpose of this plan is to outline the documentation, process and steps which will be followed to ensure all vehicle dynamic performance requirements are met and ensure timely FRA approval of the planned operation.

(2) The plan shall outline the approach for each project phase through concept development, design, simulation, testing and model validation.

(3) At a minimum this plan must include:

(a) Overview of proposed qualification process, key milestones and planned documentation.

(b) Outline of planned simulation cases and pass/fail criteria.

(c) Preliminary listing of track geometry inputs and rail profiles.

(d) Listing of planned tests and test locations for all component and pilot car tests.

(e) Outline of FRA submittals required in each project phase for vehicle qualification per 49 CFR Part 213.345. Please reference 49 CFR 238.111 for guidance on documentation specific to the acceptance testing project phase.

(f) Outline of simulation model validation plan (i.e. plan for correlation of simulation predicted results with physical test results to ensure validity of the simulation model).

ii). After the vehicle dynamic performance qualification plan is approved by Amtrak, each of the subsequent documents listed below shall be submitted for review and approval.

iii). Periodic vehicle dynamic simulation review meetings between the Contractor and Amtrak will be required as the project progresses through each phase.

iv). It is Amtrak's intent to work collaboratively with the Contractor to ensure that the vehicle dynamic model properly represents the vehicle design and that track inputs represent the actual operational environment.

v). During these vehicle dynamic simulation meetings, Amtrak must be able to review the fully detailed simulation model, track inputs and results in the native simulation software environment.

d). Vehicle Dynamic Simulation Plan

i). The Contractor shall submit a detailed vehicle dynamic simulation plan for Amtrak review and approval. **[CDRL 7-02]**

(1) Details of all planned simulation cases and pass/fail criteria.

(2) Preliminary listing of key simulation model parameters (mass, suspension type, key dimensions, wheel profile).

(3) Description of vehicle model and planned simulation software.

(4) Definition of speed and track geometry inputs.

(5) Vehicle dynamic simulations must be performed using an industry recognized software (NUCARS, VAMPIRE, SIMPACK, etc.).

e). Vehicle Dynamic Simulation Report

i). A vehicle dynamic simulation report must be submitted during the vehicle design process for Amtrak review and approval **[CDRL 7-03]**. At a minimum this report must include:

(1) Tabulation of results for all simulation cases.

(2) Model parameters fully defining all dimensions, masses, wheelsets, suspension components and friction elements along with an indication of the source of the data (manufacturer specification, Contractor specification, measured data, calculation, etc.).

(3) Wheel profile(s), rail profile(s) and resulting wheel-rail contact plots.

(4) Detailed plots of simulation results as requested by Amtrak.

f). Vehicle Dynamic Model Validation Plan

i). A validated vehicle model is required by 49 CFR 213 Appendix D(2)(a). A vehicle dynamic model validation plan must be submitted to Amtrak for review and approval **[CDRL 7-04]**. At a minimum this plan must include:

(1) List of planned quasi-static vehicle characterization tests (static lean, wheel equalization, modal vibration test, truck rotational stiffness, etc.).

(2) List of vehicle dynamic on-track tests (curving, lateral track perturbation, vertical track perturbation).

(3) List of planned suspension component tests (springs, dampers, bumpers, traction rods, friction elements, etc.).

(4) Proposed methods for comparing simulation and test data, including variables to be compared (force, acceleration, modal frequencies, etc.) and acceptance criteria which demonstrated the model has been validated.

(5) Reference APTA-PR-M-S-031-22 Low-Speed Curving Performance, Chapter 2.7, Validations, for additional guidance.

(6) Dynamic simulation model shall be delivered for running internal dynamic simulations after completion of the qualification process with the model being fully editable.

g). Vehicle Dynamic Model Validation Report

i). A vehicle dynamic model validation report must be submitted to Amtrak for review and approval. **[CDRL 7-05]**

ii). The purpose of this report is to demonstrate that the simulation model has been validated by correlating the simulation predicted results with the physical testing results.

iii). This report must include correlation of suspension component and vehicle level test results with model inputs and results.

iv). If this validation effort requires updates to the model, a revision of the vehicle dynamic simulation report must also be submitted.

7.4 Vehicle Dynamic Performance Requirements

a). Wheel Load Equalization

i). The trucks shall conform to the latest revision of APTA PR-M-S-014-06, Wheel Load Equalization of Passenger Railroad Rolling Stock, for Class G equipment.

ii). Per FRA Safety Advisory 2013-02, the suspension system shall control static wheel-load distribution when the equipment is stationary on level track such that the lightest wheel load deviates by no more than 5% from the nominal wheel load for a given truck.

b). Static Lean

i). Maximum Cant Deficiency – Each car type shall meet the requirements of 49 CFR Part 213.329 (d) for wheel unloading and carbody roll angle.

ii). Maximum Cant Excess – No wheel shall experience more than 50% wheel unloading when the train is stopped on a 7-inch superelevation.

c). Wind Loading

i). A side-wind loading analysis shall be performed per APTA PR-M-RP-009-98 Rev 2, Section 3.9 using the environmental conditions specified by Amtrak Specification 963.

d). Low Speed Curving

i). Simulations shall be performed according to the requirements of APTA-PR-M-S-031-22 Low-Speed Curving Performance Standard.

e). Minimally Compliant Analytical Track (MCAT)

i). Each car type shall demonstrate acceptable performance for MCAT simulations as defined by 49 CFR 213 Appendix D.

ii). For the purposes of 49 CFR 213.345 qualification with the FRA, MCAT simulations shall be run with AW0 car loading and all truck components in the new condition.

iii). A select sub-set of additional MCAT simulations for Amtrak information, to be proposed by the Contractor and approved by Amtrak, shall be run with AW3 car loading and all truck components in the new condition.

f). Representative Service Route

i). Each car type shall demonstrate acceptable performance for simulations on track segments of each track Class which are representative of the planned operation as defined by 49 CFR 213.345(c)(2)(ii).

(1) Measured track geometry for these simulations will be provided by Amtrak.

ii). Simulations on representative track segments shall be run with:

(1) AW0 car loading and

(2) AW3 car loading with all truck components in the new condition.

iii). Additional simulations shall be run to ensure safety with truck components in the worn or failed condition: broken coil spring, inoperative damper, high friction at sliding interfaces, stiffening of elastomeric elements due to low temperature and aging, worn wheels, running in emergency-spring-engaged condition.

g). High Speed Stability

i). Each car type must not exhibit truck hunting or sustained vehicle body lateral oscillation up to a maximum service speed of 125 mph, up to a maximum speed of 130 mph (125+5 mph) during qualification testing and up to a maximum speed of 140 mph (125+15 mph) by vehicle dynamic simulation.

ii). Limits for sustained truck lateral and vehicle body lateral accelerations are defined by 49 CFR 213.333.

iii). Linear Modeling

(1) Stability simulations must be performed by linear Eigenvalue analysis with creep factor range of 0.67-1.00 and equivalent wheel conicity range of 0.025-0.400.

iv). Non-Linear Modeling

(1) Stability simulations must be performed in both new and worn conditions using the full non-linear model running through a lateral track perturbation at sufficient speed to cause hunting.

(2) A “top-down speed sweep” must then be used to determine the critical hunting speed.

(3) Simulations must use friction coefficient of 0.5 along with combinations of new/worn wheel profiles and new/worn truck components (dampers, friction elements, elastomer elements, etc.) as well as a friction coefficient of 0.05 for low adhesion scenarios, i.e. wet rails and pectin formation on TOR.

(4) Amtrak will provide representative worn NRCC6 wheel profiles for simulations.

h). Ride Quality

i). A comfortable ride (as defined in this chapter) shall be provided at all permissible speeds under normal operating conditions for each FRA track class, up to maximum vehicle service speed.

ii). Ride quality for all proposed truck designs shall be demonstrated analytically and through actual track testing per the requirements of Chapter 20.

iii). A comfortable ride is defined as weighted root mean square (rms) acceleration in the vertical, lateral and longitudinal directions of less than 0.032g (0.315 m/s^2) and a crest factor less than 9.

iv). The vibration total value (root sum of squares summation) for each measurement point must not exceed 0.051g (0.50 m/s^2).

v). Both values must be based on data in the frequency range of 0.5 to 80 Hz using a 3-minute sliding window.

vi). Weighted rms acceleration and crest factors shall be calculated according to ISO Standards 2631-1 and 2631-4.

vii). Simulations shall be performed in the AW1 load condition.

viii). Monitoring locations for ride quality shall be chosen at representative floor and seat locations of each car type.

i). Ride Quality Measurement System

i). All trucks on all cars shall be equipped with an rMetrix ride quality measurement system (RQMS), manufactured by dFuzion, Inc.

ii). The system shall include at least one truck-mounted triaxial accelerometer on each truck, one carbody-mounted triaxial accelerometer and one GPS receiver.

iii). All diagnostics shall be reported out to the CDU and be able to be viewed remotely.

iv). The RQMS system must meet the following minimum functional requirements:

v). Continuously record, analyze, and report V/TI data including acceleration, vehicle location, heading and speed.

vi). Storage of all V/TI data for a period one year.

vii). Calculate all V/TI exceptions based on the FRA safety requirements per 49 CFR Part 213.333.

viii). Capability to perform fleet wide reporting and analytics.

ix). Extraction of raw data for advanced analysis in third-party applications such as LabView, Matlab, or Microsoft Excel.

j). Natural Frequencies and Damping Rates

i). Eigenvalue analysis must be performed to determine the characteristic damped natural frequencies of the vehicle body and trucks (pitch, bounce, yaw, upper center roll and lower center roll).

ii). Truck hunting modes (free wheelset kinematic) and truck oscillation modes (parallel wheelset kinematic) must be determined over the full range of speed and expected equivalent wheel conicity range of 0.025-0.400.

iii). Characteristic frequencies and damping rates as a percentage of critical damping must be provided.

k). P2 Forces

i). A calculation must be made to show that the vertical track dynamic (P_2) forces do not exceed 68,000 lbs. for a 0.5 degree dip angle and all speeds

up to the operating speed limit. The calculation is to consider nominally stiff concrete tie track and to use the British Rail Equation (as defined in British Railways Board Group Standard GM/TT0088 Issue 1).

ii). The specific equation to be used is as follows:

$$P_2 = P_0 + 2\alpha v \sqrt{\frac{m_u}{m_u + m_t}} \left(1 - \frac{\pi c_t}{4\sqrt{k_t(m_u + m_t)}}\right) \sqrt{k_t m_u}$$

Where:

P_0 Static wheel load in pounds

α Dip angle in radians

v Vehicle speed in inches/second

m_u Unsprung mass per wheel in lbf/in/sec2

m_t Track mass per wheel in lbf/in/sec2

c_t Track damping per wheel in lbf/in/sec

k_t Track stiffness per wheel in lbf/in

Track parameter values are as follows:

α 0.0085 Total dip angle in radians based on ½ degree on both sides of the dip

m_t 1.1335 Track mass per wheel in lbf/in/sec2 for nominally stiff concrete tie track

c_t 671 Track damping per wheel in lbf/in/sec for nominal track conditions (from literature)

k_t 392,900 Track stiffness per wheel in lbf/in for nominally stiff concrete tie track (corresponds to track modulus of 5,100 lb/in/in, assuming a track deflection of 0.084 inches under a 33,000 pound wheel load)

iii). Calculation of P_2 forces using Contractor proposed alternative values in the British Rail Equation and resulting change in the value of P_2 forces may be considered by Amtrak upon approval of justification for such changes by Amtrak and that such calculations are also approved by the owner of the track or its designated representative.

7.5 Truck-to-Carbody Connection

a). The truck frames and all components shall be retained to the carbody in accordance with the requirements of 49 CFR Part 238.219 and APTA Standard PR-CS-S-034-99.

b). The ultimate strength of the truck and the truck-to-carbody connection shall be

sufficient to secure the entire truck to the carbody in a manner which will prevent truck separation during derailments, collisions, or other adverse events in which a horizontal load of 250,000 lbs. is applied to the truck frame.

i). This load may be transmitted from the truck frame through structural members, positive stops, or other rigid, mechanical safety devices and/or combinations thereof to the carbody bolster.

ii). Bolster anchors/traction links (if used) shall not be used to provide any part of this strength.

c). Vertical safety hangers shall be provided to secure the truck to the carbody.

d). Depending on truck design, a locking center pin may satisfy this requirement.

7.6 Truck Clearance

a). All truck-mounted equipment shall conform to the clearance requirements of Amtrak Clearance Drawing D-05-1355 Rev E.

b). A clearance of at least 2.50 inches shall be provided between truck parts (including wiring, hoses, cables, and chains) and the carbody under AW1 load and the most unfavorable dynamic combination of vertical and horizontal track curvature, wheel wear, lateral and vertical motion, roll, and broken coil springs.

7.7 Truck Structural Design

a). Structural Validation Plan

i). The Contractor shall submit a structural validation plan as outlined by APTA PR-M-RP-009-98 Rev 2, Section 3.1.5, for Amtrak review and approval. **[CDRL 7-06]**

ii). The purpose of the validation plan is to describe in detail the list of the steps planned to demonstrate structural safety and compliance with the requirements defined in the technical specification.

iii). The validation plan shall act as a guide for the design and testing process.

iv). After the structural validation plan is accepted by Amtrak, each of the subsequent truck structural analysis and test documents listed below shall be submitted for review and approval.

b). Truck Structural Analysis and Test

i). The Contractor shall submit each document outlined below, detailing each step of the structural validation plan, for Amtrak review and approval.

(1) Truck Stress Analysis Plan **[CDRL 7-07]**

(2) Truck Stress Analysis Report **[CDRL 7-08]**

(3) Truck Stress Test – Laboratory, Plan **[CDRL 7-09]** (see requirements in Chapter 20 – Truck Frame and Bolster Load Tests)

(4) Truck Stress Test – Laboratory, Report **[CDRL 7-10]**

(5) Truck FEA Structural Model Validation Plan **[CDRL 7-11]** (can be combined with CDRL 7-09)

(6) Truck FEA Structural Model Validation Report **[CDRL 7-12]** (can be combined with CDRL 7-10)

(7) Truck Stress Test – On-Track, Plan **[CDRL 7-13]**

(8) Truck Stress Test – On-Track, Report **[CDRL 7-14]**

(9) Fatigue Assessment Validation Report **[CDRL 7-15]**

(10) Manufacturing Validation Report **[CDRL 7-16]**

c). Allowable Stress

i). Fatigue

(1) Contractor and/or the truck designer shall determine the maximum allowable stresses for the truck frame, bolster and truck components in order to perform without degradation over the 40-year useful life.

(2) The allowable stresses shall be determined using industry standard practice and shall be submitted to Amtrak for review and approval as part of the truck stress analysis plan.

ii). Static

(1) Maximum allowable stress shall be 55% of the yield strength of the material.

iii). Overload

(1) Maximum allowable stress shall be the yield strength of the material. No permanent deformation allowed in structural elements.

d). Truck Design Loads

i). The loads specified herein are minimum values.

ii). The Contractor shall be responsible for selecting loads that will develop a high level of confidence in the adequacy of the truck design for the intended purpose and application.

iii). The highest vertical load of all car types, as seen at the truck, shall be used for the loadings.

iv). Loads marked by double asterisk (**) shall be included in the stress analysis but will not be applied during the laboratory truck stress test.

(1) Fatigue

(a) Vertical – 1.0g +/-0.2g x AW1 loaded carbody weight per truck.

(b) Lateral – +/-0.15g x AW1 loaded carbody weight per truck applied at the carbody center of gravity.

(c) Longitudinal – +/-0.15g x AW1 loaded carbody weight per truck applied at the carbody center of gravity.

(d) Braking – Full-service braking, split between tread and disc mounting locations according to Chapter 9.

(e) Twist – One wheel lifted/lowered length equal to 1% of wheelbase.

**Dampers – +/-100% of maximum dynamic condition.

**Truck-Mounted Equipment Mass Inertia Loads

v). Vertical, lateral, longitudinal and braking loads shall be applied simultaneously with phasing and directions which represent the operating environment.

vi). Damper and truck-mounted equipment loads are for localized analysis of brackets and mounts.

vii). Twist load shall be applied in combination with vertical load only.

(1) Static

(a) Vertical – 110% of AW3 loaded carbody weight per truck.

(b) Lateral – 25% of the vertical load, applied at the carbody center of gravity.

(c) Longitudinal – 15% of the vertical load, applied at the carbody center of gravity.

(d) Vertical, lateral, and longitudinal loads shall be applied simultaneously.

(2) Overload

(a) Vertical – 1.5g x AW3 loaded carbody weight per truck.

(b) Lateral – 0.3g x AW3 loaded carbody weight per truck applied at the carbody center of gravity.

(c) Longitudinal – 1.0g x truck weight.

(d) Braking – Maximum specified deceleration, split between tread and disc mounting locations according to Chapter 9.

(e) Twist – Complete wheel unloading at one wheel with Vertical – 1.0g x AW3 loaded carbody weight per truck.

**Dampers – 2 x damper force at reference speed.

**Truck-Mounted Equipment Mass Inertia Loads.

viii). Vertical, lateral, longitudinal and braking loads shall be applied simultaneously. **Damper and truck-mounted equipment loads are for localized analysis of brackets and mounts. Twist load shall be applied in combination with vertical load as listed.

e). Truck-Mounted Equipment Mass Inertia Loads

i). Truck Frame Mounted Equipment

Direction	Fatigue Acceleration	Overload Acceleration
Vertical	+/- 12 g	+/- 40 g
Lateral	+/- 10 g	+/- 20 g
Longitudinal	+/- 5 g	+/- 10 g

ii). Axle and Axlebox Mounted Equipment

Direction	Fatigue Acceleration	Overload Acceleration
Vertical	+/- 50 g	+/- 140 g
Lateral	+/- 10 g	+/- 20 g
Longitudinal	+/- 10 g	+/- 20 g

7.8 Truck Component Design

a). Detailed drawings of all truck components shall be provided to Amtrak. **[CDRL 7-17]**

b). Truck Frame and Bolster

i). Truck frames and truck bolsters (if used) shall be of cast or fabricated steel construction.

(1) They shall be heat stress-relieved after all primary welding is completed, unless otherwise approved by Amtrak.

(2) Critical areas of all welds and castings shall be magnetic-particle inspected per ASTM Standard E709 on all production units.

(3) Radiographic inspection per ASTM Standards E94, E446 and E186 and ultrasonic inspection per AWS D.1.1 shall be used to qualify fabrication and casting techniques and for periodic inspection of production lots, see Chapter 19.

ii). All truck frame and bolster (if used) openings or voids shall be sealed with plastic plugs or similar arrangements, to prevent the accumulation of wayside debris such as leaves therein.

iii). All wearing parts or surfaces shall be provided with renewable liners or bushings.

(1) Truck frame pedestals, if used, shall be lined with low-friction components to minimize wear.

(2) If possible, the truck design shall permit replacement of pedestal liners without requiring the removal of the wheelset.

iv). Retainers shall be provided to prevent an axle from leaving the truck, and to also prevent any primary suspension element from leaving its proper position, when the car is lifted with the trucks attached, or in the event of a derailment.

(1) It shall be possible to change a wheelset expediently (by removing the axle retainer and lifting the car above the wheelset, after intra-car couplings are disconnected), to facilitate changing wheels in locations without a drop table, including changing wheelsets in the field after a derailment.

v). The truck frame shall include attachment points for lifting by a shop crane.

c). Bolster Anchor

i). Longitudinal forces shall be transmitted between the truck and the carbody through bolster anchors or similar method.

ii). The bolster anchors, if used, shall be designed to accommodate longitudinal, swiveling and vertical forces encountered during operation on all classes and conditions of track identified in Amtrak Specification 963.

iii). See Chapter 6 for other requirements for the bolster anchor and related carbody mounting points.

d). Suspension

i). Coil springs and/or rubber element suspension components may be used for primary suspension.

ii). Elastomeric suspension components shall be designed for a minimum functional service life (95% survival) of ten years. To the greatest extent possible, elastomeric components which may require replacement between truck overhauls, shall be designed for replacement without truck removal

iii). Dampers shall have a minimum functional life (95% survival) of five years.

iv). The Contractor shall provide analyses to demonstrate the effect of asymmetric forces from braking on primary suspension deflection, wheelset angle of attack and body yaw accelerations. **[CDRL 7-18]**

v). The carbody secondary suspension shall be provided by coil springs or an alternative may be proposed for Amtrak's approval.

vi). The secondary suspension shall include internal resilient stops to limit vertical travel and act as an "backup spring" should the main spring element fail.

vii). All metal springs shall be mounted using resilient mounting pads to prevent metal-to-metal contact and provide sound and vibration deadening.

viii). All mounted equipment shall be designed for ease of inspection, tramming, access, replacement and maintenance, including allowances for witness point or reference marks to assist in automated visual inspection machines.

ix). Tram marks shall be located on the top and bottom of the truck frame, allowing tramming without flipping the frame.

x). Elastomeric primary springs shall be secured to the truck frame when axle assemblies are removed.

xi). Elastomeric primary springs shall be color-coded for spring rate and shall be installed in matching sets, with only one color-code per truck.

xii). All coil springs shall meet the latest revision of Amtrak Specification 563 and follow the recommended practices of APTA PR-M-RP-009-98, Section 3.5, Helical Coil Spring Design Guidance.

xiii). The Contractor shall submit coil spring design stress calculations for Amtrak review and approval. **[CDRL 7-19]**

xiv). Coil springs shall be grouped by height under AW0 load after manufacturing, then marked to clearly identify group for each spring (banding, color-coded, etc.).

xv). All springs must be in the same group for a given truck.

xvi). In case of a coil spring failure, the system should ensure that the train speed is not compromised, the ride quality remains smooth, and the gangway passageway for customers remains even and safe.

xvii). Elastomeric components shall be fatigue tested to validate service life.

e). Stops

i). Rubber stops limiting vertical and lateral motion shall be designed with a progressive compression rate and shall not exceed 90% of their design compression under any condition that can be developed in the truck.

ii). Lateral stops shall limit the motion of the carbody to stay within the clearance in either direction.

iii). Stops that limit truck over-rotation shall be designed to prevent metal-to-metal contact.

f). Adjustments

i). Provisions shall be made for adjusting the carbody height to compensate for wheel wear or other variations and shall have provisions for being captive.

ii). Adjustments to carbody height shall not impact ride quality.

iii). Suspension design shall permit adjustments to be made without disconnecting the truck from the carbody.

7.9 Wheel and Axle Assembly

a). General

i). Amtrak intends to use existing wheelset designs which are already in service on Amtrak cars.

ii). A conventional wheel and axle assembly shall consist of an axle, two wheels, two journal bearings, two brake discs, speed sensor gear at one bearing per axle, bearing temperature sensors which communicate with car diagnostics, and associated materials.

iii). Mounting graphs and inspection records shall be included in each vehicle history book for all components.

iv). If existing Amtrak wheelsets are deemed incompatible with the new car designs, alternate wheelsets may be proposed by the Contractor and approved by Amtrak.

v). Wheel and axle assemblies shall utilize materials made to the same specifications as above and insofar as deemed practical by the Contractor, components in common with the conventional wheel and axle assembly shall be used. All wheel and axle assemblies shall be sourced domestically.

vi). All wheelset components shall be manufactured and assembled by a supplier currently certified under the AAR Standard M-1003.

vii). It shall be possible to change a wheelset out by removing the axle retainer with hand tools and lifting the car above the wheelset.

b). Axles

i). The axle shall be designed according to APTA PR-M-RP-008-98, Rev.2, Passenger Rolling Stock Axle Design.

ii). The axle shall be solid, forged, Grade “F”, carbon steel meeting the chemical composition and mechanical property requirements of AAR Standard M-101, arranged for outboard journal bearings.

iii). Axle design and application shall be confirmed with theoretical stress calculations. **[CDRL 7-20]**

iv). Axles shall be designed to meet or exceed performance and applicable safety standards.

v). Material and heat treatment certification shall be provided with vehicle history final reports.

vi). Each axle shall be inspected by both the wet fluorescent magnetic particle and ultrasonic methods.

vii). A record of all certification and heat numbers shall be supplied to Amtrak.

viii). If possible, the axle shall have an oversize wheel seat to provide longer service life.

c). Wheels

i). The wheels shall be 36 in. diameter (nominal) Class B, wrought steel multiple-wear type, of a low stress (S-plate) design, conforming to AAR Standard M-107 and M-208, APTA Standard PR-M-S-012-99 Rev.2, and Amtrak Specification 771, latest issue.

ii). The wheels shall be inspected by both the wet fluorescent magnetic particle and ultrasonic methods.

iii). Wheel tread profile shall be in accordance with Amtrak wheel profile NRCC6 per drawing 62-00106, Revision D or later, unless otherwise approved by Amtrak.

iv). A record of all certification and heat numbers shall be supplied to Amtrak.

v). Analytical evaluation of the wheel design for combined mechanical and thermal overload conditions shall be performed according to AAR S-660, with thermal input load adjusted to represent the selected tread/disc braking configuration and Amtrak service.

(1) Analytical evaluation of the wheel design for fatigue loading shall be performed according to AAR S-669.

(2) The results of these analyses shall be submitted to Amtrak for review and approval. **[CDRL 7-21]**

d). Brake Discs

i). For brake disc requirements, see Chapter 9.

e). Axle Journal Bearings

i). The journal roller bearings on conventional axles must outboard located, fully enclosed, rotating end cap, grease lubricated, AAR roller bearings manufactured in compliance with AAR Manual of Standards and Recommended Practices, Section H. If an existing Amtrak wheels set design is not selected, the bearings of the new design must be AAR class “K”.

ii). Roller bearings shall be configured for No Field Lubrication (NFL), with Hydrodynamic Labyrinth (HDL) seals (or equivalent).

iii). The L10 design life of the journal bearing shall be at least 1 million miles under AW3 loading.

iv). The Contractor shall provide design analysis to verify the roller bearing estimated L10 life. **[CDRL 7-22]**

v). The journal bearing end cap shall incorporate a hole allowing access to the axle's centers to allow truing of wheel sets. If the wheel set design has end caps exposed to the weather, the end cap shall be equipped with a plastic plug designed to keep water from penetrating the center hole when in service.

vi). One journal bearing end cap on each axle must accommodate a speed sensor.

vii). The speed sensor design must continue to function under the worst conditions of manufacturing tolerances and wear thresholds for the journal bearing housing, bearing, sensor, etc.

viii). Journal roller bearings shall be new and meet the requirements of Amtrak Specification 900, *Purchase of New or Reconditioned Roller Bearings.*

ix). Bearing temperature monitoring shall be integrated into the car diagnostics system, allowing for real-time recording and trending. This functionality will enable proactive maintenance by identifying irregularities and predicting potential failures. Standalone system may be proposed as an alternative to be reviewed and evaluated by Amtrak.

f). Axle Bearing Housings

i). Removable axle bearing housings shall be provided.

ii). Pressing shall not be required to remove the housing from the bearing.

iii). Axle bearing housings shall be common for all locations, including a provision for mounting a speed sensor.

iv). Each axle bearing housing shall include a hot bearing sensor, such as Amtrak Drawing D-00-7075 Hot Bearing Detector Probe or approved equivalent.

v). Bearing housing must be designed to allow access to axle centers for truing wheels without removing the wheel set from the car.

g). Wheelsets

i). Each wheelset shall be assembled in compliance with the requirements of:

(1) Amtrak specification 907, APTA-PR-M-S-019-17, *Passenger Wheel Set Assembly*, latest issue, and

(2) AAR Manual of Standards and Recommended Practices, Section G, Parts I and II, *Wheel and Axle Manual*, using an AAR certified facility.

ii). A wheelset inspection record shall be completed for each wheelset, which shall include component press tonnage charts, all component serial numbers and inspection measurements.

iii). Torque seal shall be applied to the head of all fasteners after torquing.

7.10 Shock Absorbers (Dampers) and Shock Mounts

a). Lateral, yaw and vertical motion of the trucks and carbody shall be damped through the use of shock absorbers (hydraulic dampers).

b). Shock absorbers, if used, shall terminate in elastomeric bushed connections to eliminate metal to metal contact.

c). All shock absorbers shall be accessible for replacement without requiring the removal of the trucks from the carbody. Shock absorbers shall be protected from debris strikes from under the vehicle.

d). Shock absorber mounting brackets on the trucks and carbody shall be designed to last the life of the carbody without wearing, deforming, loosening or otherwise requiring repair, excluding bushing replacement.

e). Threaded mounting brackets are prohibited.

f). Durability of the shock absorbers, their mounting brackets and bushings shall be demonstrated analytically and through accelerated life cycle testing simulating actual shock absorber functional service life.

g). Test plan for the shock absorbers and shock mounts shall be submitted to Amtrak for approval as part of the Contractor's proof of design testing (see Chapter 20).

h). The shock absorbers shall be appropriately rated for a service life (95% survival rate) of no less than five years.

7.11 Shock and Vibration

a). All pneumatic, electrical and electronic equipment/components mounted to the truck shall be tested for shock and vibration in accordance with IEC 61373 (1999) – *Railway Application, Rolling Stock Equipment, Shock and Vibration Tests*.

7.12 Electrical Wiring

a). All electrical wiring shall be protected from damage during service.

b). Watertight connections shall be provided for connecting electrical devices. At a minimum these connections shall meet IP68.

c). Speed Sensor

i). A speed sensor cable shall be provided on each truck to transmit a signal from the speed sensor on each axle to the wheel slip control system (see Chapter 9).

ii). The speed sensor cables shall be attached to the truck frame using elastomer-coated steel clamps on dedicated mounting pads that provide secure attachment while not abrading or pinching the cable.

iii). Clamps shall be securely fastened to the truck frame.

iv). Appropriate slack shall be incorporated into the cable length to allow free movement of trucks and truck components while providing adequate securement for the cable. Cables shall be protected against debris strikes.

v). Cables shall be routed to prevent damage from pinching, stretching or catching on adjacent equipment. Cable routing shall be designed to minimize potential debris strikes.

vi). Speed sensor and cables shall be per Amtrak Drawing D-00-1359, *Speed Sensor and Cable Assembly*.

d). Grounding

i). An electrical ground path using highly flexible copper cables or straps and ground brushes/rings shall be provided from the carbody to the rail.

ii). Grounding paths shall be run from the truck frame to the truck bolster (if used) and from the truck bolster to the carbody.

iii). Grounding cables or straps shall not restrict the movement of truck components and shall remain slack under all operating and maintenance conditions. Grounding straps must be visible in normal operating conditions to allow for regular inspection.

iv). At least two grounding brush/ring assemblies per truck shall be installed providing a grounding path between the truck frame and axle to bypass current flowing through the journal bearings.

e). Shunting

i). The trucks and its wheelsets shall be designed such that the maximum rail-to-rail resistance through the train shall be no greater than 0.010 Ohms in any combination of vehicles.

ii). It is preferred that the standard truck and wheelset design be capable of achieving the required shunting performance.

iii). Any such supplemental equipment shall be designed in accordance with Amtrak Specification 1118.

7.13 Painting

a). The truck manufacturer shall apply at least one coat of a metal primer on all

exposed surfaces of the trucks immediately after final assembly cleaning, repairs, and inspection.

b). A final coat of an ASTM B-117 1,000-hour paint shall be applied using an Amtrak-approved color.

7.14 Handbrake Linkage

a). Truck mounted hand brake linkage shall be lever type unless otherwise approved by Amtrak.

b). Chains are preferred; however, cables may be used on the truck itself to interconnect the components.

c). All trucks shall be equipped with necessary attachment points for hand brake linkage and shall accommodate the full range or car height adjustment.

d). Refer to Chapter 9 Brakes for operator details.

7.15 Height Adjustment and Shimming

a). Approved provisions shall be made for adjusting the carbody height up to 2.50 inches to compensate for wheel wear or other variations.

b). The design and method of height adjustment shall allow for quick and easy adjustment without disassembly of the truck or removal of the truck from the car.

c). Height adjustment may be by shimming, component adjustment or component exchange, to be proposed by the Contractor and approved by Amtrak.

d). All coil springs and shims shall be positively captured at both top and bottom surfaces.

e). Visual indication of shimming limits (maximum shim height) shall be provided at each respective shim location.

7.16 Truck Classification Plate

a). Amtrak standard truck classification plate shall be mechanically applied to both sides of each truck. The truck classification plate shall contain the following information:

i). Amtrak name and symbol

ii). Bearing size

iii). Center-plate loading

iv). Wheel size and type

v). Truck serial number (to be permanently stamped into the plates)

vi). Manufacturer

vii). Manufacturer's part number

viii). Date of manufacture

7.17 Maintainability

a). The trucks, and associated components (shocks, etc.), attachment fasteners to the carbody shall be accessible with standard pneumatic or hydraulic tools. All fasteners should be readily available and not of a special design.

b). All major components shall be easily accessible and replaceable during repair or overhaul.

c). The overhaul manual shall include all details of disassembling, tramming, and reassembling the truck frame for routine overhauls.

d). The contractor shall provide a heat map of high-stress zones under various dynamic conditions. The intent is to ensure that any welded area in a high-stress zone is visible during daily inspections in normal operation.

e). Rebuild instructions with parts lists shall be provided for all assemblies and subcomponents.

f). Documentation requirements are described in Chapter 22.

8. Couplers and Draft Gear

Revision 2

Table of Contents

8.1 Overview....8-1
8.2 General Requirements....8-1
8.3 Performance Requirements....8-1
8.4 Coupler and Yoke....8-2
8.5 Draft Gear....8-2
8.6 Coupler Carrier....8-2
8.7 Coupler Uncoupling Mechanism....8-3
8.8 Mounting Arrangement....8-4
8.9 Crash Energy Management....8-4
8.10 CDRLs....8-4

8.1 Overview

a). The universal single level cars shall be equipped with an APTA standard Type H Tightlock coupler and associated draft gear.

i). Energy absorbing couplers and draft gears shall be used for each car type as required by the Contractor's car design to achieve compliance with FRA carbody strength requirements in 49 CFR Part 238.

b). AAR approved tightlock couplers, coupler parts, radial connections, yokes and attachments for passenger equipment cars shall be provided.

8.2 General Requirements

a). The Type H Tightlock coupler and draft gear assembly shall be compliant with the requirements of APTA Recommended Practice PR-M-RP-003-98.

b). All couplers, draft gear, and associated components shall conform to the strength requirements specified in all applicable APTA and FRA standards and recommended practices.

c). Coupler carriers shall be capable of withstanding the vertical forces identified in 49 CFR 238.207.

d). All components shall be designed to operate properly under the operational and environmental conditions defined in Amtrak Specification 963.

e). It shall be possible to remove or install a coupler and draft gear assembly without requiring lifting of the carbody or removal of the truck.

f). The coupler pocket shall be designed to prevent any possibility of moisture being trapped.

g). The coupler pocket, coupler carrier, draft gear and associated components shall have a modular design for Amtrak’s future use. This includes the possibility of changing to drawbars with gangways. The contractor shall demonstrate how this will be possible.

h). As an option, Contractor shall design coupler assembly to be interchangeable with a semi-permanent coupler shank. Contractor shall outline any technical complications with this option.

8.3 Performance Requirements

a). Under normal operating conditions, all couplers, articulations and associated apparatus, including coupler carriers and centering devices, shall be capable of withstanding for any horizontal position of the coupler a vertical load of 100,000 lbs. applied in either direction to the coupler as near to the pulling face as practical, without deformation to the coupler carrier, supporting carbody structure and intermediate connections.

b). The car shall be capable of operating normally while coupled to any other car or

locomotive used in passenger service under the operational and environmental conditions defined in Amtrak Specification 963, including legacy equipment. The car shall be equipped with a centering device to ensure proper alignment during coupling.

c). Coupler swing shall be such that a car shall be able to negotiate a 250-foot radius (23 degree) curve while coupled to other cars and/or locomotives as specified without damage to trucks, draft gear, carbody, diaphragms, gangways, air hoses or car-to-car connections.

d). End stops or equivalent mechanism shall be installed to prevent damage to car due to a deflected coupler caused by mis-coupling.

i). 250-foot radius curve requirement shall be achievable with end stops or equivalent installed.

e). The coupler air connections shall be designed in conformance with APTA Recommended Practice PR-M-RP-001-97.

f). Coupler centering devices shall be provided for all H-type couplers to maintain the coupler head in a centered position.

g). Amtrak shall be able to lift one end of the car using the coupler without causing damage to the car.

i). See Chapter 9 for details regarding car-to-car air connections.

8.4 Coupler and Yoke

a). Material for couplers and yokes shall conform to AAR M-201 for grade E high tensile steel.

b). The bottom of the end coupler shank shall have a replaceable steel wear plate installed where it contacts the coupler carrier.

c). Intermediate couplings shall achieve similar performance.

8.5 Draft Gear

a). The car coupler draft gear characteristics shall be equal or better to twin-cushion WM-6-DP draft gear packs.

b). The draft gear pockets shall allow for the implementation of push-back couplers if required by the design.

c). Draft gears shall be designed to take into account the overall car ride quality and compliance with any CEM performance requirements, if utilized.

d). If regular inspection is required, inspection of draft gears and rubber elements shall be possible without removal of other major components.

8.6 Coupler Carrier

a). The coupler carrier shall be designed to support adequately and consistently the coupler through its full range of vertical and horizontal movement.

b). The coupler shall be supported at a nominal 34.5 in. height Above Top of Rail (ATOR), with an adjustment range of plus/minus 1 in., as measured at the center of the coupler when uncoupled.

c). The coupler carrier shall be designed to accommodate the complete push-back motion of the coupler without interference if an energy absorption function is used.

i). During coupler push-back, contact between the coupler head and the coupler carrier shall not result in unintentional activation of the coupler uncoupling mechanism and therefore cause car separation.

d). A means shall be provided to allow removal and replacement of wear plates, carrier springs and carrier stops.

i). The top surface of the coupler carrier shall be equipped with a replaceable nylon (or other low friction material) wear plate.

ii). The coupler shall not rest on a metal surface.

iii). Alternate service proven methods appropriate for rail vehicle service and as approved during design review process will be considered.

8.7 Coupler Uncoupling Mechanism

a). All coupler uncoupling levers and hardware shall meet the safety requirements of 49 CFR Part 238.

b). Each knuckle coupler shall be equipped with an AAR number 6 uncoupling operating mechanism, in conformance with section 5.10 of APTA Standard PR-M-S-016-06.

i). It shall be located on the left side when facing the end of the car.

c). Minimum clearance of 2 in. shall be maintained between uncoupling mechanism and all other components on the end of the car (including jumper cables, receptacles and carbody structural elements such as collision posts) when car is either coupled or uncoupled.

d). The uncoupling levers shall seat firmly when locked in place, shall not bind when being used, and shall not rattle or vibrate.

e). The uncoupling levers shall be designed with a locking mechanism to prevent unintentional unlocking of the coupler due to vibration or debris strikes.

f). Alternative uncoupling lever designs may be proposed.

g). The uncoupling mechanism shall be designed to accommodate any push-back motion of the coupler without unintentional activation of the coupler lock mechanism causing car separation.

h). The coupler should have a failsafe mechanism to prevent car separations if components become worn.

8.8 Mounting Arrangement

a). The proposed mounting arrangement of the coupler assemblies shall be submitted for Amtrak approval during design review. **[CDRL 8-01]**

8.9 Crash Energy Management

a). If a push-back coupler system is required by design, it shall be coordinated with the carbody Crash Energy Management (CEM) design, if utilized.

i). To ensure operational compatibility, any push-back energy absorbing coupler assemblies at the ends shall have a minimum initiation load of 600,000 lbs.

ii). The slope of the force during push-back shall be greater than or equal to zero for all CEM elements.

iii). The coupling system must be capable of transferring a 150,000 pounds draft load at any time during the push-back sequence to ensure that cars remain coupled during and after an impact.

b). Indicators shall be provided that shall be visible from outside the car to indicate full or partial activation of the energy absorption unit and the need for its replacement.

i). The activation of the energy absorption unit shall be readily apparent when performing periodic inspections.

9. Brakes

Revision 2

Table of Contents

9.1 Overview 9-1
9.2 General Requirements 9-1
9.3 Performance....9-2
9.4 Design Review 9-3
9.5 Car Body Components 9-4
9.6 Truck Components 9-10
9.7 Wheel Slide Control System 9-15
9.8 Brake Indication Devices 9-20
9.9 Hand Brake 9-21
9.10 CDRLs....9-22

9.1 Overview

a). This chapter describes the design and functionality of the electro-pneumatic and mechanical braking systems that shall be provided on the rolling stock equipment.

b). The braking systems shall include an electro-pneumatic system for service and emergency brake applications, a wheel slide control system and a handbrake.

c). All materials and workmanship shall comply with Chapter 19.

9.2 General Requirements

a). Electronic Brake System

i). All cars shall be equipped with a Passenger Electronic 26C Emulation Braking system meeting the requirements of APTA PR-M-S-020-17.

ii). The brake system on the cars shall also comply with the requirements of Electronically Controlled Pneumatic (ECP) brake system configured per APTA PR-M-S-021-17.

iii). This shall include the installation of trainlines, an electrical terminal box at each end of the car (for installation of the inter-car cabling), a terminal box at the brake manifold, conduit connecting them, as well as armored cable wiring.

iv). The ends of all cars shall include the ECP inter-car cable and junction connections. Design, arrangement and installation shall be subject to Amtrak approval during design review. **[CDRL 9-01]**

v). At a minimum the brake system shall:

(1) Be powered by the ECP trainline (when available), by a low voltage source from the car (when available) and/or a back-up battery when car battery is not available. Amtrak understands that interoperability with ECP braking will not be able to be utilized until legacy cars are assembled with ECP equipment.

(2) Have a discrete means to configure the brake controller for ECP or brake pipe operation.

(3) Incorporate fully pneumatic backup control of emergency brake application, if a malfunction of the electronic brake system occurs, if the car battery is depleted or if no electrical power is present on the car.

(4) Accommodate mounting of pneumatics and electronics within a single module or manifold inside of the car.

(a) If mounting inside the car is not possible, undercar mounting enclosure shall be sealed from dust, moisture and snow.

(b) The enclosure shall be shielded from debris damage and its location and arrangement provide easy access for maintenance.

(5) Incorporate component standardization in accordance with current APTA requirements.

(6) Use brake control valves meeting the approval of APTA PR-M-S-025-018.

vi). The air brake equipment shall be arranged to be compatible with Type 26C/26L air brake equipment and trainlines as per APTA PR-M-RP-001-97 currently in use in Amtrak intercity rail passenger service. This is in addition to having complete ECP brake trainline connections, for operation with an ECP-equipped locomotive.

(1) As described in Chapter 1, the intention is for the equipment to be delivered to be interoperable with Amtrak's legacy fleet initially which will require the use of a traditional braking system; however, the goal is for the entire new fleet to be equipped with ECP when completely assembled.

vii). Nominal air pressures in the air brake system shall be:

(1) Main Reservoir: 140 psig

(2) Brake Pipe: 110 psig

(3) Brake Cylinder: 100 psig maximum

viii). Each car shall be equipped with a brake pipe for emergency braking to provide break-in-two protection, and a main reservoir pipe.

ix). All components shall be equipped with an identification plate or tag which includes:

(1) Vendor

(2) Vendor part number

(3) Date of manufacture

(4) Serial number

9.3 Performance

a). The system shall be designed for normal and dead-in-tow operation at all speeds up to 125 mph in train consists of up to 1,530 ft in total length [excluding locomotive(s)] with propulsion provided by the rail passenger locomotives.

b). The air brake system shall be designed for normal and dead-in-tow operation in conformance with all applicable Amtrak air brake rules, specifically AMT-3.

c). Braking performance shall be in conformance with the braking performance curve

as identified for Average Performance Distance (no safety factor) for Amfleet equipment operating at 125 mph in Amtrak Drawing S-603.

d). A car built to this specification in a train of up to 1800 ft in total length and one Amtrak ALC-42 or equivalent locomotive shall have a minimum full service braking rate of 1.35 miles per hour per second (mphps) at 125 mph increasing to and maintaining an average of 2.00 mphps at speeds of 70 mph or less.

e). The cars shall be loaded to AW2 condition.

i). The instantaneous full-service deceleration rate shall not exceed 2.75 mphps nor be less than 1.25 mphps.

ii). The emergency brake rate shall not be less than 2.50 mphps at speeds below 70 mph.

f). The Contractor shall verify that the brakes are fully functional under all operating and environmental conditions found in Amtrak Specification 963.

g). Locomotive dynamic braking shall not be used to determine compliance with specified brake rates.

h). The maximum jerk rate (the change in the rate of deceleration) during initial service brake application shall be limited to 1.5 miles per hour per second per second (mphpsps) under all normal conditions.

i). There shall be no jerk limit for emergency brake applications.

j). The Contractor shall determine the brake system delay/dead time, build-up time, response time and equivalent deceleration rates for all speeds from maximum speed to full stop.

i). This information shall be provided to Amtrak during the brake system design review. **[CDRL 9-02]**

ii). The Contractor shall use *Mass Transit Brake System - Performance Requirements* per DIN EN Standard 13452-1 as the method to measure dead time response time and deceleration rate where applicable.

9.4 Design Review

a). Preliminary design review shall address the following subjects, describing Engineer actions and indications and also providing detailed technical design and performance analysis for the following subjects:

i). Concept:

(1) Concept and operation of friction brake system

(2) Thermal capacity of brake system

(3) Calculations showing that the system’s performance requirements will be met

(4) Graduated release setting of control valve

(5) Graduated release mode of automatic brake valve operation

(6) Wheel slide control

(7) Handbrake interface with brake system, as per APTA PR-M-S-006-98.

(8) Pneumatic supply to accommodate auxiliary systems

(9) Brake Cylinder Pressure Sensors and Settings

ii). Operating:

(1) Push-pull operation with locomotive in either leading or trailing position

(2) Push-pull operation with a non-powered control unit

(3) Stopping on a grade

(4) Starting on a grade

(5) Conductor- or passenger-initiated emergency brake application

(6) Train separation (break-in-two)

(7) Operation of short trains [consists of up to 300 ft in total length excluding the locomotive(s)]

(8) Operation of long trains [consists of up to 1800 ft in length excluding the locomotive(s)]

(9) Dead engine movement

iii). Design and performance analysis will be evaluated during design review, First Article Inspection (FAI) and proof of design testing. **[CDRL 9-03]**

9.5 Car Body Components

a). Piping and Fittings

i). The inside diameter of the trainline Main Reservoir (MR) pipe shall be 1.00 in. Iron Pipe Size (IPS), or equivalent.

ii). The Brake Pipe (BP) shall be 1.25 in. IPS, or equivalent.

iii). All pipes and fittings in both lines that are located on the exterior of the car shall be 304 stainless steel pipes in accordance with ASTM Standard A-53 or equivalent.

iv). Type K copper pipe may be used if located in the car interior.

v). Brake pipe trainline must pass Brake Pipe Restriction Test per AAR Standard S-471.

vi). Brake Equipment Installation and Design shall conform to AAR Standards S-400, and S-401.

vii). AAR type branch pipe tees, or approved equivalent, shall be provided and shall be orientated at a 45 degree slope upwards or higher to prevent moisture from being drawn into the branch pipes.

viii). The trainline MR branch pipe shall be routed to the main reservoir tanks before being routed to the brake manifold.

ix). Piping shall be routed to avoid traps and avoid draining moisture toward brake valves or brake manifold. Traps and low spots in the piping are prohibited.

x). The low point of the MR pipe shall be equipped with a heated automatic drain valve, to rid the pipe of moisture buildup; moisture drain shall be in response to either brake release cycle or timed cycle.

xi). The air supply system shall conform to APTA Standard SS-M-011-99 for compressed air quality for passenger locomotive and car equipment.

xii). All pneumatic piping shall conform to APTA Standard APTA PR-M-S-029-21.

xiii). A coalescing filtration system shall be utilized to remove moisture in any portion of the MR pipe before being supplied to the brake system.

xiv). Inter-car hoses shall be designed to allow for coupling between legacy and new equipment at a length that will not pull apart or drag on the right of way.

xv). Approved test gauge fittings shall be installed in the brake system piping to facilitate testing and troubleshooting the brake system.

(1) They shall include all fittings needed for conducting single car brake tests, including the brake cylinder lines to each truck downstream of all cutout cocks.

(2) Protective caps shall be provided as necessary.

b). Angle and Cut-out Cocks

i). Locking handle, ball type, cut-out cocks shall be provided in the MR Pipe and the BP at each end of every car, in a location for ease of access when coupling in restrictive tunnel locations.

(1) The BP angle cocks shall not be vented and must include a spring-loaded locking handle.

(2) The MR pipe cutout cock shall be vented toward the hose end, oriented below horizontal.

(3) The MR pipe cutout must include a spring-loaded locking handle.

ii). Each brake manifold shall be provided with a brake pipe cutout cock located for ease of access and simultaneous protection.

iii). A locking vented ball-type cut-out cock shall be provided in the brake cylinder line to each axle or truck as appropriate for venting brake cylinder pressure.

(1) The cutout cock shall be a 3-way type, vented down-stream.

(2) The vent port of the cut-out cock shall be tapped for 0.25 in. National Pipe Thread (NPT).

iv). A single Amtrak-approved brake cylinder cutout shall be provided inside the body of each car, requiring use of the standard coach key to access, to be able to vent the brake cylinder pressure on all axles or trucks in emergency or rescue situations.

v). All cut-out cock handles, except end of car BP end angle cocks, shall be arranged so that the handles are parallel to the air pipe in the closed position.

(1) Closed end of car BP cut-out angle cock handle shall be perpendicular to the air pipe.

vi). Labels

(1) All valves and cocks shall be labeled including the cut-in and cut-out positions.

(2) A flow bar cast or stamped into cock handles shall be acceptable for cut-in/cut-out position labeling.

(3) All air brake angle cocks and cutout cocks are to be clearly labeled using engraved and color-coded stainless steel or aluminum tags.

c). Hoses and Couplings

i). All connecting hoses, except BP and MR trainline hoses, shall be AAR Standard M-618 double wire braid reinforced hose.

(1) BP and MR car and trainline hoses shall be AAR Standard M-601 or M-618 hose.

ii). All hose material, when installed on the car, shall be less than one year old from date of manufacture unless approved by Amtrak.

iii). MR and BP end hoses shall be supported near the glad hand end from the coupler using rubber hose supports.

iv). End hose locations shall be in conformance with APTA Recommended Practice PR-M-RP-001-97 or alternate approaches can be proposed by the Contractor for Amtrak’s approval.

v). Two dummy couplings, one "F" type and one "E&L" non-vented type, shall be provided at each end of the car along with one ECP dummy coupling.

(1) The dummy coupling shall be secured to the car with chains in a manner which will prevent the trainline hoses and cables at the ends of the car from dragging when the couplings are connected to the hoses and cables.

vi). Inter-car jumpers and hoses shall be designed to allow for coupling between legacy and new equipment at a length that will not pull apart or drag on the right of way.

d). Emergency (Conductor) Brake Application Valves and Vent Valves

i). Manually operated conductor's valves shall be provided as follows:

(1) On both ends of the passenger compartment of each car just inside the body end door, right side of the door facing outward.

(2) At least two conductor's valves shall be provided per the equivalent length of the single-level passenger car.

(a) These valves shall be monitored by the car diagnostics system.

(3) Ensure no fouling condition in both application and resetting function of conductor valves.

(4) The valves shall be located in a conspicuous location for ease of operation.

(5) Valves shall not be blocked by any doors or access panels when they are opened.

(6) The operating handles shall be red and shall be clearly labeled, in accordance with Amtrak Specification 697, and shall not rattle when in service.

ii). These emergency brake valves, when used in conjunction with an appropriate brake application valve, shall cause an emergency brake application when activated.

iii). Vent valves shall be provided along the BP in accordance with air brake system design requirements based on brake pipe length and control manifold locations.

iv). Ready access shall be provided to all valves to facilitate inspection, replacement and maintenance.

v). The valves shall meet the requirements of APTA Standard PR-M-S-007-98.

e). Air Reservoirs

i). Reservoirs of sufficient capacity shall be provided to enable a minimum of three full-service brake applications and releases followed by an emergency brake without recharging.

ii). The Contractor shall define necessary service inspection and change-out intervals for filters.

iii). Check valve isolation requirements must be demonstrated for dedicated reservoirs.

iv). ASME-certified main and auxiliary (brake cylinder) supply reservoirs shall be drilled with telltale holes as described in 49 CFR Part 229 to eliminate the need for hammer and hydrostatic testing.

v). When installed, they shall include a manual purge valve with locking handle to drain accumulated moisture.

vi). The reservoir shall not have volume accessible to fluid below the plane of the purge valve inlet.

vii). All valves shall be easily accessible from the side of the car.

viii). Main reservoirs and air supply reservoirs used for water raising or other auxiliary functions shall be protected to prevent corrosion. If a coating is applied, the coating must last the life of the tank with no failures impacting any system.

ix). All reservoirs shall be welded and shall comply with the ASME *Boiler and Pressure Vessel Code* as applicable.

x). Air reservoirs shall be sloped if drain valves are located at end of the tank.

f). Control Manifold and Valves

i). The Electronic 26C Service portion shall provide the functionality equivalent to a Type 26C service portion and shall be manifold mounted.

ii). The air brake control manifold valve may be mounted underfloor.

iii). Branches will leave the brake pipe at a 45-degree slope upwards or higher and shall utilize an AAR "branch pipe tee", or approved equivalent.

iv). The air brake control manifold shall include test fittings for main reservoir, brake pipe, brake cylinder and #16 air pipes.

v). In addition, the relay valve exhaust shall have a threaded exhaust outlet to permit mounting a gauge.

vi). Full-face gaskets or O-ring gaskets shall be used for valve portion interface sealing.

vii). All stud mounted components shall be designed to allow installation or removal with standard socket wrenches by a single person.

viii). Electronic modules, pneumatic modules, cutouts, test points and electrical connections shall be front-plate mounted on the manifold.

ix). Front-plate mounting is not required if the manifold is oriented so that access is provided to both sides.

x). All power, input and output connections, external to the manifold, shall be provided with multiple pin connectors or a screw-type terminal block.

xi). Individual spade-type or threaded connectors are not permitted.

xii). Ring terminals shall be used if connected to a screw-type terminal block.

xiii). All valves on the manifold, as well as the manifold itself, shall be easily removable for servicing.

xiv). All valves shall be individually replaceable with the manifold installed on the car without removing any additional valves or components.

xv). All air brake system components which are subject to scheduled, regulated maintenance shall be serialized.

xvi). Valves shall be acoustically isolated from the passenger car interior areas to minimize exposure of passengers and crew to noise generated by the air brake components.

xvii). Exhausted air shall be piped to the underside (exterior) of the car.

xviii). All valves that have an exhaust port shall be equipped with a wasp excluder.

xix). Brake cylinder pressure shall be supplied and maintained by a relay valve with a 1:1 ratio, or approved equivalent.

xx). All devices shall be clearly and permanently labeled on the manifold body, including cut-in and cut-out positions of all valves and cocks.

xxi). Etching or silk screen printing during the machining process is acceptable for labeling manifold items.

xxii). Stamped aluminum tags may be used on valve handles.

xxiii). Full-service brake and emergency brake cylinder pressure shall be sufficient to achieve the required brake rates.

g). Auxiliary Air Equipment

i). MR air will be used for air-operated auxiliary devices.

ii). BP air shall not be used, except for air suspension (if applied).

iii). Auxiliary functions shall be isolated from air brake functions and shall be disabled when MR pressure falls below 80 psig.

iv). Adjustable-setting auxiliary valves with governors shall regulate air pressure for MR-supplied functions such as water raising and toilets.

v). Cutout cocks and pressure test ports shall be provided.

vi). All water raising, or waste system air valves shall be mounted above the water level of the storage tank to prevent backflow of water into the air system during normal operation or when the air system is depressurized.

(1) Appropriate check valves will also be used to ensure this functionality.

(2) The valves shall be readily accessible for maintenance and replacement.

9.6 Truck Components

a). General

i). All cars shall be equipped with disc and tread brake equipment.

ii). The contractor shall preferably use an existing Amtrak wheel set design including the existing disc design, count, diameter, and spacing.

iii). The actuators for both the disc brakes and the tread brakes shall operate at the same air pressure from the same air source.

iv). Brake effort contributions from disc and tread brakes shall be specified to avoid wheel thermal cracking and brake disc damage.

v). Under all circumstances the brake rates defined in this Chapter and in this Specification shall be achieved.

vi). The truck-mounted components as specified have been identified for the purposes of interchangeability with other single level passenger cars.

vii). The Contractor may propose alternate components for Amtrak approval if the components as specified cannot achieve the specified braking rates or if superior braking performance can be achieved through the use of other brake system components or based on the car design constraints.

viii). The truck brake equipment and general car arrangement shall facilitate ease of access for disc brake pad and tread brake shoe replacement at remote yard locations, without the need for a servicing pit.

b). Disc Brake Actuator

i). Caliper Assembly

(1) An air actuated caliper mounted on the truck frame shall be used in conjunction with each disc to develop braking effort.

(2) Suspension of caliper assembly shall be a 3-point position type or a compact caliper that permits caliper to follow lateral movement of the wheel assembly without restriction.

ii). Slack Adjusters

(1) Automatic slack adjusters shall have sufficient capacity to maintain nominal pad clearance and piston travel through the full range of new to worn discs and brake pads.

(2) The slack adjuster shall have sufficient capacity to maintain nominal shoe clearance and piston travel through the full range of new to worn discs and brake pads.

iii). Brake Pads

(1) The disc brake system shall use pads compliant with Amtrak Specification 973 and approved during Design Review.

(2) The disc brake units shall be capable of using 35mm thick brake pads if possible.

(3) Performance of brake disc friction material shall be suitable for the speeds, route brake duty cycle and overall train braking performance and shall not induce temperatures that may result in long- or short-term thermal damage to the disc friction ring as defined by brake disc manufacturer. This requirement shall be validated by a brake pad wear study to ensure that the expected mileage wear rate is met or exceeded.

(4) Pad holders and disc pads shall have an approved locking device.

iv). The disc actuator shall be capable of handling pressure up to 150 psig without damaging the actuator, disc, brake rigging or any other system or component on the vehicle.

c). Brake Discs

i). The number of brake discs per axle and the type of brake disc (axle or wheel mounted disc) shall be sufficient to meet the brake rates specified herein and not exceed the thermal rating of the disc or pads.

ii). Brake disc supplier shall provide an analysis of the thermal capacity of the discs based on the planned train operational pattern including frequency of braking for various braking initial speeds and station stopping patterns as provided by Amtrak. **[CDRL 9-04]**

iii). In the design of axle mounted discs, the fatigue life of the connection between the hub and friction ring must take into account cyclic loading from thermal and shock environments that are separately considered and are encountered in normal service.

(1) The shock environment due to wheel/rail interaction at normal revenue speeds is known to result in disc response in the form of a “bending out of plane” vibrational mode.

(2) The natural resonance frequency of the disc, for this bending mode, shall be demonstrated (by analysis or test) to be greater than 350 Hz. **[CDRL9-05]**

(3) The frequency analysis is to be performed under the assumption that the disc is fixed to the axle or wheel.

(4) The fatigue life at the most highly stressed location in the connection between the hub and spoke, due to combined strains from thermal and shock load, shall be equal to or greater than the projected service life of the friction ring or 1,000,000 miles, whichever is greater.

iv). All brake discs shall be manufactured by an Amtrak-approved facility with a history of successfully supplying railway brake discs.

v). Disc characteristics compliant with the requirements of this Chapter shall be demonstrated during design review.

vi). The brake disc supplier shall use the brake disc specifications currently used by Amtrak for a G-size axle unless it can be demonstrated that this design is unsuitable for the application.

vii). Design Criteria

(1) The brake discs (including friction ring and spokes) shall have adequate mechanical and thermal capacity for service on and off the Amtrak Northeast Corridor (NEC), under the environmental and operating conditions identified in Amtrak Specification 963.

(a) The discs shall be designed to withstand the mechanical loads arising from track-generated accelerations and thermal loading from friction braking from initial installation through the projected service life of the disc friction ring.

(b) This shall be verified by Finite Element Analysis (FEA) per Section 9.6c).vii) and a fatigue life estimate **[CDRL 9-06]** based on the results of the analysis performed by the brake disc supplier and shall be submitted to Amtrak for review and acceptance.

(2) An analysis shall be conducted to predict the fatigue performance of the proposed brake disc from the thermal loading measured from the dynamometer testing performed pursuant to the requirements of Chapter 20 and submitted to Amtrak for approval.

(3) For mechanical loading, each shock event shall translate into a minimum of two full bending stress reversals when evaluating the

fatigue life of the disc, to account for the damping of the excitation in the disc.

(4) A moment arm shall be taken into account for the distance from the axle box to the center of the disc for vertical shock loads, based on the worst case condition.

(5) The fatigue analysis of the disc shall take into account fatigue damage from in-service thermal and mechanical loading combined.

(6) The fatigue limit shall be selected based on at least a 50% probability of survival and shall account for manufacturing technique, surface finish, metallurgical properties, etc. as specified in recognized industry standards.

(a) The factor of safety shall be at least 1.50.

(b) The factor of safety shall be applied to the stresses obtained from the FEA which are incorporated in the fatigue estimate to reduce the predicted fatigue life.

viii). Brake Disc FEA report

(1) The brake disc supplier shall submit a brake disc FEA report, for approval by Amtrak. **[CDRL 9-07]**

(2) The maximum stress from the FEA at the specified loads, with a factor of safety of at least 1.50, shall be less than the allowable fatigue limit.

(3) The Contractor may elect to simplify the load cases into stepped increments, provided the methodology and the data utilized to establish equivalency is found acceptable to Amtrak.

(4) The FEA report must include an analysis for fatigue life and must include a Miner's rule calculation showing the damage factors due to loads imposed by vertical and lateral axle box acceleration and thermal loads resulting from friction between the disc and brake pads.

(a) The Miner's sum must not exceed 0.3 for the service life of the disc for the hub-friction ring connection.

(5) The FEA report shall include, but not be limited to, the following:

(a) Introduction

(b) Table of Contents

(c) Summary

(d) Physical properties of each material used for the disc.

(i) This table shall include, but not be limited to:

1. Yield strength
2. Ultimate strength
3. Elongation
4. Tension modulus
5. Compression modulus
6. Shear modulus

(ii) Minimum values shall be used and shall be selected from ASTM (or equal) material specifications, as approved by Amtrak.

(iii) The brake disc supplier may propose alternate material specifications for Amtrak approval.

(e) Views of key structural areas (spokes, hub-friction ring connections, etc.) showing member locations and geometry, and indicating the material and thickness of each.

(i) Other FEA views may be required where critical stress areas are identified.

(f) A tabulation or fatigue curve justifying the Contractor's selection of allowable fatigue stresses for the disc material for each transition or joint, and the fatigue-critical stress ranges.

(i) The FEA report shall include a description of how this process is carried out.

(g) The complete test report must be submitted including procedure, raw and reduced data, and summary of results, including:

(i) Structural sketches and/or layouts of the critically stressed locations showing locations and shapes depicted in scale, thickness, section properties and material. Methods of joining (if appropriate) shall be defined.

(ii) Diagrams displaying externally applied loads and boundary conditions.

(iii) Color plots of the stress under each load condition for critically stressed areas.

(iv) Natural Frequencies of the disc.

d). Tread Brake Units

i). Tread brake units shall be added to the car to supplement disc braking.

ii). A truck mounted air actuated tread brake unit, with integral single acting slack adjuster shall be applied at each wheel.

iii). The tread brake unit shall operate in conjunction with the adjacent disc brake caliper from the same air source.

iv). Composition brake shoes 2.5 inch thick, of a size and type in general use by Amtrak and conforming to Amtrak Specification 80-276 shall be provided.

v). Performance of brake shoe friction material shall be suitable for the speeds, route brake duty cycle and overall train braking performance and shall not induce temperatures at the wheel tread that may result in long- or short-term thermal damage, as defined in 49 CFR Part 238. This requirement shall be validated by a brake pad wear study to ensure that the expected mileage wear rate is met or exceeded.

vi). A brake key shall secure the brake shoe to the brake heads and shall not require the use of specific tools for installation or removal.

vii). The design of the tread brake shall accommodate the maximum allowable size wheel with sufficient clearance for operation and maintenance.

viii). The slack adjuster shall have sufficient capacity to maintain nominal shoe clearance and piston travel through the full range of new to worn wheels and brake shoes and shall provide sufficient clearance to install a 2.5 in. brake shoe against a new wheel.

9.7 Wheel Slide Control System

a). General

i). The wheel slide control system shall modulate the application of the pneumatic brakes to prevent sliding of the wheels through the use of a microprocessor design. The system for each wheel location shall include:

(1) System unit/controller with pre-wired connector plugs

(2) Modulation type dump valves as required

(3) Molded T-harness cable, or equivalent protected cable type as required

(4) Active speed sensors (one per axle or wheel location)

(5) The ability to perform wheelslide system diagnostics with a laptop Portable Test Unit (PTU) (test unit itself is not required) and by the car CDU.

(a) Additionally, the system shall be capable of logging historical data and events by way of the system diagnostics and the car diagnostics unit.

(6) Adapter cable to connect a PTU to the wheelslide control unit

(7) Wheel Slide Control may be incorporated into the ECP controller with the approval of Amtrak

ii). The system shall continuously measure the speed of each axle/wheel and take corrective action should a sliding wheel be detected.

iii). The wheel slide system shall operate under all braking conditions and shall not permit the jerk limit to be exceeded on reapplication of brakes following a slide correction.

iv). The system shall be designed to prevent permanent thermal damage to the wheel tread as evidenced by spalling, under all adhesion conditions.

b). Control Unit

i). The control unit shall not be mounted under the car unless approved by Amtrak.

ii). The wheelslide control equipment is subject to the following conditions:

(1) The wheel slide function shall be automatically self-calibrating to continuously adjust for the difference in wheel circumference from nominal new wheel to fully worn wheel rim thickness.

(2) The system software shall be designed to account for the rotational inertia properties of the wheel set assembly.

(3) Wheel slide corrections shall not occur at normal deceleration rates on dry, level tangent track.

(4) System logic and criteria for detection and correction of wheel slide and instantaneous deceleration rate shall be submitted for review and approval. **[CDRL 9-08]**

(5) The system software/control electronics shall possess features to prevent inappropriate wheel slide correction function from transient signals arising from one damaged or missing gear tooth.

(a) This requirement includes provisions for intelligent interpretation of transient changes in signal amplitude at all speeds due to axle gear run-out, vibration of sensor mounting bracket or sensor/gear clearance settings.

(b) Wheel slide protection shall be retained on all remaining axles should the control unit fail to receive one or more axle speed signals.

(c) It is recognized that the system performance for the axle with the defective sensor is compromised under these conditions.

(6) A safety timing function meeting the requirements of EN Standard 50126 SIL 3 shall be provided to cancel wheel slide corrections

exceeding a specified duration to be determined based on final system design.

(a) Protection shall be locked out on the affected axle/truck until car is at zero speed.

(7) The system shall utilize software that is at the current revision at the time of installation. All software revision levels shall be checked at commissioning to verify compliance.

iii). Auxiliary Functions

(1) The system shall supply at least two auxiliary zero speed signals, provided for door control, as described in Chapter 12, as follows:

(a) A zero-speed switching device shall close below 3 mph, and shall open above 3 mph.

(b) A 20-mph speed switching device shall close below 20 mph and shall open above 20 mph.

(2) Logic shall be fail-safe, such that zero-speed and 20 mph relay drop out in the event of any component failure or loss of power.

(3) Speed signal logic shall meet the requirements of EN 50126 SIL 2.

(a) The speed signal shall incorporate separate relays that break both the positive and negative components of the zero and 20 mph signals.

(b) Both the normally open and normally closed contacts shall be made external to the unit.

(c) Contact rating shall be 0.25A at 80VDC.

(d) Contacts shall be high reliability to reduce the probability of welding.

iv). Diagnostics

(1) The wheelslide control unit shall include integral diagnostic indications (at a minimum) of the following system states with the vehicle moving:

(a) Open, shorted or grounded speed sensor circuit

(b) Open, shorted or grounded dump valve circuit

(c) Electronics fault identified at component level

(d) Power loss/low supply voltage

(e) Software logic fatal error or program lockup

(f) Time out of safety timer

(g) Weak/missing speed sensor signal

(h) Logging capability for running total of slide corrections

(i) Locked axle

(2) When the car is stationary with adequate power and air, it shall be possible to conduct a self-test that shall verify the following functions in addition to those above:

(a) Ability of magnet valves to release and apply brake cylinder pressure

(b) Ability to test magnet valve time-out

(c) Ability to exercise zero-speed relays

(d) Power loss/low supply voltage

(3) The diagnostic information listed in Diagnostics and Faults shall interface with the car CDU, and shall be accessible remotely.

(4) Diagnostics and faults shall be capable of remaining in stored memory for no less than 3 months and shall continuously overwrite the oldest data with the newest with the capability of remote access.

(5) Refer to Chapter 24 for additional details.

v). Faults

(1) Faults detected shall be retained in the fault memory and displayed on the front of the controller using a numerical display that indicates proper system operation, or a fault code. The readout shall:

(a) Be able to identify defects down to printed circuit board, individual speed sensor or dump valve level.

(b) Include transient faults detected while the car is in motion.

(c) Provide sufficient information to enable maintenance personnel to determine if the unit is working properly, and if not, whether the system can be repaired while on the car or must be removed for repairs.

(2) A permanent label shall be fixed to or near the wheel slide control unit that identifies the codes for faults represented by the display.

(a) It shall also provide instructions for initiation of self-test program and the clearing of faults from memory.

(b) The chart shall be positioned so that it can be easily referenced in seated or standing position (as appropriate) while reading the display or manipulating button.

vi). Components

(1) All components shall be identified with:

(a) Vendor name

(b) Vendor part number

(c) Date of manufacture

(d) Revision level

(e) Serial number

vii). Test Equipment and Software

(1) The Contractor shall provide wheelslide system diagnostic software to be used on a PTU. **[CDRL 9-09]**

(a) Amtrak shall be licensed and permitted to install and use this software on an unlimited number of laptop computers for the maintenance of the cars or via remote access.

(b) Operating and installation instructions for this software shall be included in the vehicle maintenance manuals.

(2) The Contractor shall provide a common method for each car for connecting locally to a PTU to the wheelslide control unit and remotely to allow on-car troubleshooting. **[CDRL 9-10]**

c). Dump Valves

i). When a slide condition is detected by the wheel slide control unit, it shall be relieved on a per truck/per axle basis, by controlled reduction of brake cylinder pressure by an electro-pneumatic modulating type dump valve.

ii). Braking shall be reapplied after correction is made at a rate designed to take maximum advantage of prevailing adhesion without exceeding the jerk rate.

iii). Air consumption shall be minimized during slide correction.

iv). The dump valve porting and internal capacity shall be optimized for car dead and displacement brake cylinder volumes.

v). The manufacturer must provide a pre-wired mating plug connector for each dump valve.

vi). The wire pigtail must be molded construction and sealed at the plug.

d). Speed Sensors and Wiring

i). Axle/wheel speed shall be determined from an active speed sensor mounted on a journal bearing adapter and a toothed gear mounted on the axle.

(1) The sensor shall detect all speeds down to 0 mph at 0.01 mph increments.

ii). The speed sensors shall connect to the wheelslide control unit through a T-harness, or equivalent protected cable system.

iii). The T-harness or equivalent protected cable system shall connect to the carbody wiring through a MIL standard circular connector, mounted to an electrical box on the carbody.

iv). Terminal and junction boxes shall not be mounted on the trucks.

v). The speed sensor cables and T-harness, or equivalent protected cable system, shall be attached to the truck frame, or equivalent, using coated clamps that provide secure attachment while not abrading or pinching the cable.

(1) Each clamp shall secure no more than one cable.

vi). Clamps shall be attached to the truck frame, or equivalent, using fasteners and lock washers.

vii). There shall be sufficient slack in the speed sensor wiring to allow the bearing adapter to move to the bottom of the pedestal opening without stressing the cable (such as when the truck is lifted with axles installed).

viii). Cables and harnesses shall be accessible for replacement while the car is at a normal service and inspection facility.

ix). Mounting and wire routing of all truck components shall be arranged to minimize the exposure to wayside debris damage.

9.8 Brake Indication Devices

a). Indicators

i). Indicators, one on each side of the car at each truck or axle, shall be connected to the brake cylinder supply line between the brake cylinder cut-out cock and the brake cylinder.

ii). These indicators shall provide a positive visual status of the brake system to crew members.

iii). The indicators shall be readily visible from station platforms as well as track level, and from both ends of each side of the car.

b). Pressure Switches and Brake Status Lights

i). A pressure switch shall be provided for each truck or axle, monitoring the brake cylinder pressure downstream of the truck or axle cutout cock.

ii). A test fitting shall be provided in each brake cylinder line to the trucks/axles, downstream from cutout cock and dump valve.

iii). In addition, a test fitting shall be provided for each pressure switch to check calibration. These pressure switches operate the brake applied/released indicator lights.

iv). Trainline function is as follows:

(1) Brake released: continuity when air brake pressure on both trucks “zero” and handbrake is released.

(2) Brake applied: continuity when brake cylinder pressure on both trucks is applied at “Min” or more.

v). The exterior of each car adjacent to the air brake control manifold shall be equipped with two 3-lamp LED indicator assemblies, as specified in Chapter 13.

vi). Indicators shall display the following aspects, top to bottom:

(1)	Solid Green:	All service brakes released
(2)	Solid Yellow:	Service brakes applied
(3)	Flashing Yellow:	Handbrake applied (with air brakes applied or released)

vii). For handbrake applications, a weatherproof micro-switch or pressure switch shall be provided to indicate handbrake status to the car’s exterior brake status lights, and to the locomotive via the 27-point communication trainline and the digital trainline.

(1) The switch shall be weatherproof to prevent damage from environmental conditions.

viii). Alternatively, an integrated car diagnosis could be implemented. An electronic monitoring computer in certain areas of the car could allow a full diagnosis of all the car axles brake status from only one point.

ix). A pressure transducer or pressure switch monitors the brake cylinder pressure downstream of each truck or axle cutout cock. Output from those pressure measuring devices will be routed to car electronics, and from there to the monitoring centers in the car via communication car buses including historical data storage. In parallel, brake pressure indicators will be maintained on the exterior of the car. Communication trainlines will provide the same functionality.

9.9 Hand Brake

a). A sufficient number of wheels shall be equipped with handbrakes, such that compliance with APTA Standard PR-M-S-006-98 is achieved.

b). The handbrake shall be capable of holding AW3 loaded car, on a 5% grade, with an applied force of 125 lbs, 3 inches from the end of the handle under all normal truck wear (tread, wheel and brake shoe) conditions.

c). The system shall be able to be applied and released infinite times without air or power.

i). The handbrake shall be provided with a lever type handle at the B-end of each car in the diaphragm area.

d). Operating instruction labels shall be provided for the train crew regarding manual operation and rescue operation when normal air or electrical supplies are disrupted. These shall be provided at the control location and also at the ends of the cars.

9.10 CDRLs

CDRL	Description	Due
CDRL 9-01	Design of ECP brake system inter-car cable and junction connection	30 days prior to Brake System PDR meeting
CDRL 9-02	Brake system delay/dead time, build-up time, response time and equivalent deceleration rates for all speeds from maximum speed to full stop.	30 days prior to Brake System IDR meeting
CDRL 9-03	Brake System design and performance analysis	30 days prior to Brake System IDR meeting.

10.10 Thermal Response Analysis 10-25
10.11 CDRLs 10-26

10.1 Overview

a). General

i). Each car in any configuration shall be equipped with two independent HVAC units to provide heating, ventilation and air conditioning to the car, along with the overhead and convection heaters evenly distributed in the vehicle interior.

(1) The cars shall have roof mounted HVAC units that must be removable without opening covers and hatches.

(2) The covers and hatches shall be coordinated with the appearance and contour of the main structural roof.

(3) There shall be no handles, flanges or other drag or noise inducing features on the hatch covers which project above the basic contour of the unit.

ii). The HVAC units shall be identical, self-contained, independent, easily removable, interchangeable among like cars and have seamless integration with the car shell design and contained within a stainless steel or aluminum housing and shall be mounted in a watertight recess on the main carbody or structural roof with an IP rating of 66 or better. If dissimilar metals are used, there shall be sufficient dielectric isolation from the carbody.

iii). The HVAC units shall utilize scroll compressors using an US EPA approved refrigerant and choose a unit capable of handling refrigerant regulation updates by the EPA for cooling and shall supply a ceiling-mounted main air distribution duct capable of supplying all air diffusers along the length of the car.

iv). Each HVAC unit shall consist of one or more compressor/condenser sections and one or more evaporator sections with electric heating units.

v). In the event of a failure of one of the HVAC units, the ducting shall be capable of providing limited air supply throughout the entire car whether through automated dampers or split ductwork.

b). Design Requirements

i). The HVAC system shall provide a comfortable temperature-controlled environment of the interior areas of all areas of the cars.

ii). The cars shall be designed to operate in all environmental and climatic conditions identified in Amtrak Specification 963.

iii). The HVAC system components shall be service proven and supported by design and test information to demonstrate compliance with the Contract requirements.

iv). The HVAC units shall be controlled depending on car type. Likewise, the floor heat shall be independently controlled, with different approaches for open-body and compartmented car types.

v). Single-level car passenger loads shall be assumed to be AW1 for cooling load calculations.

vi). ASHRAE standards for passenger and solar heat load will be used.

vii). Heating and cooling requirements shall simulate loading and unloading as follows in all outside ambient temperatures identified in Amtrak Specification 963.

(1) This shall include the opening of vestibule doors, end doors, and all sets of side doors on alternating sides of the vehicle every 15 minutes, with the doors held open for 2 minutes each time.

viii). Ambient conditions as specified and heat losses due to car motion shall be included in HVAC system performance evaluation.

ix). Air losses due to door and carbody leakage shall be included in the HVAC system performance evaluation, including the temperature gradient end to end of the Car (one end hot and one end cold).

x). Supply air flow shall be balanced in all occupied areas of the car as well as food service area.

xi). Dampers on the fresh air intake vents shall control the amount of outside air taken in by the HVAC system.

xii). Freeze protection shall be provided and turned on when the ambient outside temperatures drop below 45°F, and shall shut off when the outside temperatures rise to 50°F.

xiii). The Contractor shall prepare, and submit for Amtrak's approval during design review, a detailed heating and cooling load analysis along with recommended heating, cooling and ventilation capacities of all car types. **[CDRL 10-01]**

xiv). The HVAC unit manufacturer shall conduct qualification testing to verify the heating and cooling capacity of the unit per ASHRAE Standard 37-2009 and to verify the design approved by Amtrak.

xv). Power

(1) Power to the HVAC system and controls shall be from the following supplies:

(a) HVAC system:

(i) 480VAC, 3-phase, 60 Hz supply

(b) Temperature controls:

(i) 120VAC, 1-phase, 60 Hz suppl. Alternatively, carbuilder may propose a DC powered controller as an alternative supply voltage.

(c) Freeze protection circuits:

(i) 120VAC, 1-phase, 60 Hz supply.

(2) Alternate supply voltages may be proposed to Amtrak for approval.

(3) The HVAC system shall be designed to perform at the nominal voltages and operate within the voltage and frequency tolerance ranges specified in Amtrak Specification 963.

(4) To minimize the effects of motor inrush currents on the head end power system, the controls on each car shall incorporate a soft start or a method to provide randomly staggered starting of the refrigerant compressor motors in the car.

(a) Control scheme shall be submitted for review and approval. **[CDRL 10-02]**

(5) HVAC system circuit breakers, temperature display, fault detection and protection, PTE/diagnostic port, and status indicator screen shall be located in the electrical locker and shall be accessible only to the operating and maintenance crews. Roof-top or under-car access shall not be required.

(6) Circuit breakers, controls and relays shall be inaccessible to the passengers.

xvi). Temperature controls shall be reliable and maintain car temperature at desired values.

xvii). The control system(s) shall not shut down by themselves and require manual reset. All connectors shall be rated to an IP rating of 68 or better.

xviii). The HVAC unit shall utilize a scroll compressor using an US EPA approved refrigerant for cooling, hermetically sealed, without threaded components, or other non-brazed fittings, except for service ports (high and low pressure and, if required, charging port).

xix). Pressure transducers shall be provided to allow the microprocessor to monitor both the discharge and suction line pressures.

(1) This information shall be available to technical personnel for troubleshooting purposes.

xx). The performance of the entire assembled HVAC system as installed in a completed car shall be verified at the climate room test.

10.2 Design Parameters

a). The following parameters are to be assumed in the design of the cooling system:

Figure 10-1: Cooling System Design Parameters

Ambient Temperature	110°F Dry Bulb/76°F Wet Bulb, with 120°F air entering the condenser
Solar Load	Based upon worst case conditions in Phoenix, AZ
Passenger Heat Load	440 BTU/hr/person at a heat ratio of 0.60
Number of Passengers	Full coach car seating per AW1
Carbody Heat Transmission	In accordance with the Contractor's carbody insulation design to meet the requirements of this Specification, but not greater than 1200 BTU/hr-F° for standard car length of 85 ft
Minimum Fresh Air	12 Cubic Feet per Minute (cfm)/seated passenger, with 9cfm/seated passenger permitted at outside temperatures above 100°F.
Other Heat Loads	Normal vehicle lighting, electrical equipment and appliance loads

b). The following parameters are to be assumed in design of the heating system:

Figure 10-2: Heating System Design Parameters

Ambient Temperature	-30°F Dry Bulb
Carbody Heat Transmission	In accordance with the Contractor's carbody insulation design to meet the requirements of this Specification, but not greater than 800 BTU/hr-°F for stainless steel, or 1600 BTU/hr-F° for aluminum.
Minimum Fresh Air	12 Cubic Feet per Minute (cfm)/seated passenger, with 9cfm/seated passenger permitted at outside temperatures below 0°F.
Solar Load	None
Passenger Load	None
Other Heat Loads	"Quiet car" lighting only (see Chapter 13)

c). The city of Minot, ND should be considered for worst case heating load requirements and the city of Phoenix, AZ should be used for cooling load

calculations.

10.3 Comfort Requirements

a). Interior

i). The following temperatures shall be maintained within the car, including toilet rooms when the associated ambient outside temperatures are present:

Figure 10-3: Required Interior Vehicle Temperatures

Outside Ambient	Interior Vehicle Temperature
Below -30ºF	As system will provide
-30ºF to +60ºF	70°F ± 2°F (±4°F for toilet room)
60ºF to 110ºF	72°F ± 2°F (±4°F for toilet room)
Above 110ºF	As system will provide, but no less than 25ºF below outside temperatures up to 130ºF.
Layover Heat Mode	50ºF ± 5°F

ii). During all modes of air conditioning, the interior relative humidity shall not exceed 55%.

iii). Except within the area of the side doors and vestibules, the HVAC system shall maintain a temperature variation of the following:

(1) Vertical variation:

(a) On any vertical line, 4 in. above floor to 43 in. above floor, not closer than 12 in. from walls, and not closer than 20 in. from doors.

(b) 3°F maximum difference between end points of the vertical line.

(2) Horizontal variation:

(a) On horizontal planes measured 4 in., 43 in. and 67 in. from floor, not closer than 12 in. from walls and not closer than 20 in. from doors.

(b) The temperature at any point within each plane should not exceed ± 3°F from the average temperature in that plane.

iv). The average car temperature shall recover within 2°F of the required interior vehicle temperature within three minutes maximum following a two-minute door opening of vestibule doors, end doors and all doors on one side of the car.

(1) It shall be demonstrated that this requirement can be met during two hours of continuous door cycling on alternate sides of the vehicles of two minutes open and 15 minutes closed at the design conditions in both heating and cooling modes.

v). When the car interior temperatures are within the ranges specified, the air temperature differential between the car interior and the air leaving the diffuser at the slot outlets shall not be greater than 25ºF.

vi). An exhaust duct system and fan shall be used to collect air from public restrooms and galleys exhausting it into the undercar equipment bay, both to provide pressurization and also ventilation with some heating/cooling value.

vii). The Supply Air Diffusers made of stainless steel or satin finish to be approved during design review shall be provided in the lower row of windowsills to distribute conditioned air. Alternate solutions may be submitted for review and approval.

b). Sleeper Cars

i). Each HVAC unit shall have its own temperature controls, monitoring the car temperatures of the respective zone independent of the other HVAC unit/controller.

ii). Separate car air temperature sensors shall be used to provide independent floor heat control in open-body areas as well as hallways.

iii). In the sleeper compartments, each passenger/crew room supply air diffuser shall be integrated into the room's thermostat to allow the room occupant to modulate the volume of conditioned air entering the room.

iv). Likewise, floor heat modulation for each room shall be integrated into the room's thermostat.

v). The temperature differential between the upper and lower berth of each configuration of sleeper car room shall be less than 4°F; (room air circulation fans may be used if required)

vi). An exhaust duct system and fan shall be used to collect air from each toilet/shower, public restroom and shower, exhausting it to the undercar. Sleeper compartments shall utilize static exhaust ventilation.

vii). The sleeper cars shall employ a duct running down the center of the roof, with inlets from each sleeping room, all toilet/showers as well as the public restrooms and showers.

(1) The exhaust fan will be located in the HVAC plenum, with the outlet venting it outside of the car.

viii). The Supply Air Diffusers made of stainless steel or satin finish shall be provided in the lower row of windowsills to distribute conditioned air to the following car areas:

(1) Accessible bedrooms, bedrooms, roomettes, attendant rooms, passenger seating areas, hallway, lounge, hallways, dining room, galley.

(2) Vents shall be designed to prevent debris from falling into the diffusers, screens may be used if necessary.

ix). Controls in passenger/crew rooms shall be integrated into the room to allow the room occupant to adjust air flow volume. Adjustments to the air flow shall not create any noise such as whistling and when fully closed, all air shall be blocked for passenger comfort.

x). In the sleepers, the two HVAC units both receive identical control instructions from the temperature controls but have independent internal controls.

(1) In this way, the A and B-end HVAC units may be controlled separately but supply of the conditioned air is provided to the entire car, at a reduced level if one unit fails.

(2) Details of the by-pass mode shall be developed during design review.

xi). The duct heat primarily is used to temper car fresh air, whereas floor heat is used to overcome carbody losses and adjust room temperature.

xii). In general, floor heat and duct heat will be independently controlled.

xiii). All car ventilation and humidity control shall be provided by the HVAC unit.

c). Noise and Vibration

i). The overall HVAC system shall be designed to minimize noise in the passenger and crew areas of the cars.

ii). The noise level from the HVAC system shall not exceed the values in Figure 10-4.

Figure 10-4: Maximum Noise Levels

Interior noise level: Coach seating areas, toilet rooms and galley	As specified in Chapter 11
Exterior noise level	75 Decibels (Acoustic) (dBA) max (15 ft from centerline of vehicle)

iii). Particular care shall be required at the return air grilles, and galley ceiling air diffusers.

iv). The main parts of the HVAC system should minimize the transmission of noise and vibration into the car interior.

v). Vibration eliminators shall be incorporated in the base of compressors or motors, if necessary, and in the refrigerant lines between resiliently mounted compressor(s) and rigidly mounted piping.

vi). The evaporator blower and condenser fan assemblies shall be balanced according to IEEE Standard 11-2000 “IEEE Standard for Rotating Electric Machinery for Rail and Road Vehicles” with no more than 0.001-inch peak-to-peak displacements in any direction.

10.4 Air Conditioning

a). General

i). The vehicles shall be cooled using electromechanical equipment that has been proven in rail service. Self-contained, hermetically sealed, roof-mounted HVAC units shall be provided on the cars.

ii). The HVAC units shall all be identical. The units shall be designed for an approved refrigerant at the time of delivery of the first vehicles, conforming to 40 CFR Part 82. All components within the unit, such as seals, shall be compatible with the refrigerant and its associated lubricants.

iii). Each occupied area of each car shall be supplied by two HVAC units arranged so that conditioned air will be evenly distributed to all areas in the event of a failure of one of the HVAC units.

iv). The air conditioning system shall be designed and adequately sized to maintain interior car temperature as specified at the normal ambient conditions.

v). For ambient temperatures at or above 110°F Dry Bulb/76°F Wet Bulb, with air entering the condenser above 120°F, the air conditioning system shall be capable of maintaining cooling at a reduced capacity, but in no case shall the average interior temperature be less than 25°F below the outside temperature.

vi). Application and integration of the system are to be in accordance with the recommendation of the air conditioning manufacturer who shall also specify air flow requirements.

b). Refrigerant

i). The units shall be designed for an approved refrigerant at the time of delivery of the first cars, conforming to 40 CFR Part 82.

ii). All production units must comply with any new regulations regarding refrigerant phase out enacted at the time of manufacture, and any new refrigerant or component changes associated with new regulations must be backward compatible with earlier production units.

iii). All components within the unit, such as seals, shall be compatible with the refrigerant and its associated lubricants.

c). Components

i). The refrigeration system shall include, at a minimum, the following components and features or alternative design as approved by Amtrak:

(1) Drain Pan

(a) A condensate drain pan shall be provided beneath the evaporator coil, headers, thermal expansion valves and coil U bends to collect moisture from the evaporator components subject to sweating.

(b) The condensate drain pan shall be made of stainless steel, with stainless steel or copper alloy fittings and shall discharge into the rooftop drain pan.

(c) The HVAC unit shall be mounted above rooftop drip pans and shall be sealed against moisture entering the carbody.

(d) The drain pans shall catch the evaporator condensate as well as any water entering the compressor/condenser section. The pan shall be designed to prevent clogging, freezing and not drain on top of any underframe equipment including trucks. The drain pan shall be visible for inspection without any disassembly.

(e) All collected moisture shall be directed to the roadbed through the car sidewall, without leaking into the car structure and shall not be discharged on undercar structure, wheels, brakes, trucks, or electrical equipment.

(f) Elastomeric silicone rubber flapper type check valves must be provided at the ends of the condensate drains.

(g) The exits of the drain pan lines to the undercar shall be arranged in an approved manner that shall be readily accessible for maintenance and shall be protected against clogging and rodent/wasp entry.

(h) Drain pan design and maintenance shall be presented for review and approval during design review.

(2) Compressors

(a) A service proven and efficient variable speed single scroll or two scroll type refrigerant compressors operating seamlessly between 30% and 100% capacity.

(b) If tandem scrolls are employed, means shall be provided to alternate use of compressors during single stage cooling so as to equally distribute use and wear.

(c) The Contractor may propose an alternative capacity regulation method for review by Amtrak.

(d) Pump-Down

(i) Refrigerant compressor shutdown control shall be by means of a pump down cycle that senses suction line pressure. The system shall automatically reset without faults of the input power to the compressors was interrupted.

(ii) Refrigerant system controls must include a bump start process that prevents liquid build up in a loss of power condition when pump down was not initiated or at start up if pump down routine has not occurred in the previous 90 minutes.

(iii) Pump-down or similar system must not be initiated if the system shut down is initiated by a protective safety device such as excessive pressure, temperature, or current protective devices.

(iv) A refrigerant control box, readily accessible within the return air opening, shall be provided containing transducers, service switches, etc.

(3) Condenser Fans

(a) Direct drive condenser fan and motor assemblies.

(b) Condenser fan motors must be rated IP56 per IEC 60529 or higher.

(4) Condenser Coil Assemblies

(a) Condenser coil assemblies with 0.008 in. thick copper or an approved coated aluminum fins on copper tubing at a spacing of 8 fins per in.

(b) Fins and tubes evaluated for minimum 600 hours in AASS per EN ISO 9227.

(5) A charging port and an evacuation port equipped with high quality Schrader valves and sealing metal caps.

(6) Filter Drier

(7) Discharge line check valves

(8) Sight glass/moisture indicators

(9) Direct drive supply air blower and motor assemblies

(10) Liquid line solenoid valves (2 per unit)

(11) Thermal expansion valves (2 per unit)

(12) Evaporator Coil Assemblies

(a) Evaporator coil assemblies with two interlaced cooling circuits for modulated and full cooling.

(b) The assembly shall have 0.008 in. thick copper or an approved coated aluminum fins on copper tubing at a spacing of 10 fins per inch.

(c) Fins and tubes evaluated for minimum 480 hours in AASS per EN ISO 9227.

(13) High- and low-pressure switches

(14) High- and low-pressure transducers

d). Leak, Evacuation, and Charging Procedure

i). Leak, Evacuation, and Charging procedure for Refrigeration System in accordance with ASHRAE GPC-23 or approved alternate shall be submitted to Amtrak for review and approval. **[CDRL 10-03]**

10.5 Heating

a). General

i). Each zone of the car shall be electrically heated using forced air overhead heaters in the HVAC unit and by convection heaters evenly distributed in the vehicle interior to provide maximum possible comfort for all passenger areas of the car.

ii). The heating system shall compensate for carbody losses and fresh air heating loads.

iii). The heating system components including floor level and compartment/module heating elements, fan motors, protective devices, heating resistor, and thermostats are considered an LLRU.

iv). The heating system shall be designed, controlled and be adequately sized to maintain interior temperatures as specified, throughout the car at normal outside ambient conditions.

v). Main heat shall be divided into stages to allow control of overhead heat output.

vi). The size of each heating stage shall be chosen and controlled so that cycling of the heating contactors is minimized.

vii). The maximum allowable heater grill and enclosure surface temperature accessible to passengers or train crew shall not exceed 125°F.

viii). Antifreeze protection, activated at an outside temperature of 45°F, shall be provided for the water tank and water drain valves, doors and thresholds, and elsewhere as required.

ix). The protective heater circuits shall be protected by an independent circuit breaker.

b). Layover Mode

i). Layover heat shall be provided by the HVAC system, the toilet room auxiliary heater and floor heat shall maintain an interior temperature of 50°F ± 5°F.

ii). During layover heating, the fresh air damper shall be closed, and the evaporator fan (if needed) shall only operate below 50°F ± 5°F.

iii). In layover mode, the dampers shall be fully closed and the temperature at the coldest place in the car cannot be less than 40°F.

c). Freeze Protection

i). Freeze protection system shall be provided to the side doors, thresholds, water tanks, water drain valves and all water and waste system components that may be exposed to freezing conditions.

ii). Freeze protection heaters shall have an LED indicator to indicate activation and facilitate troubleshooting, easily accessible by the maintainers. This applies to external mechanical components such as steps, waste valves, and similar systems exposed to freezing conditions.

iii). The system shall be controlled and monitored through the HVAC controller and shall allow unrestricted vehicle operation of systems down to -30ºF ambient temperature under all weather and car operating conditions, including at full operating speeds

d). Overhead Heaters

i). Overhead heaters shall be supplied within the evaporator compartment to provide tempering for fresh air intake and for reheat to maintain humidity control under partial cooling operation of the air-conditioning apparatus.

ii). The total heat capacity in shall be divided into stages of approximately 1/3 and 2/3 of total capacity, allowing for HIGH, MEDIUM, and LOW power operation.

iii). The heater elements shall be of low thermal inertia, open coil, resistance wire type with terminations, and insulated supports as approved by Amtrak.

iv). Alternative configurations shall be submitted to Amtrak for review and approval.

v). The heaters shall be powered from the nominal 480 VAC supply and shall be staged to provide variable power operation.

e). Overhead Heater Protection

i). The overhead heaters shall be protected against over-temperature.

ii). Over-temperature protection utilizing airflow detection, resettable and manual reset devices and other control means shall be evaluated during design review prior to approval by Amtrak.

iii). An automatically resettable overheat protection thermostat (OHPT1) shall be installed in a location to sense the temperature reliably and accurately in the area of the heater coils.

iv). The thermostat shall be wired directly in series with the coil of the overhead heat contactor and shall also provide feedback to the control logic.

v). The set point shall be selected such that the overhead heaters may cycle indefinitely on overhead thermostat control with no damage caused to any HVAC system components.

vi). The set point shall also prevent nuisance trips from any condition that may be expected to arise during normal operation, including operation over the allowed range of input voltage and air filter maximum recommended pressure drop.

vii). A backup overheat protection thermostat (OHPT2) shall be provided to positively remove power to the overhead heater elements in the event of a control failure or failure of the overheat thermostat.

viii). The backup protection may be a thermostatic sensor wired to a shunt-trip circuit in the overhead heat circuit breaker.

ix). The set point shall be selected such that no damage shall occur to any HVAC component by temperatures reached before or after the back-up protection device actuates.

x). The setting of the back-up device shall be coordinated such that it will not actuate under any conditions which may be achieved with normally operating controls and functional overheat thermostat.

f). Heated Floor Panels

i). All passenger loading entrance areas shall be equipped with service-proven heated floor panels or alternative solution to ensure no ice or water accumulation at the passenger entrance.

ii). The heated floor panels shall not be covered and any replacement of a heated floor panel shall not require the disassembly of other assemblies unless otherwise approved by Amtrak.

iii). The total floor heat capacity in each zone shall have uniform temperature distribution throughout the whole vehicle for passenger comfort.

iv). Each floor panel must be protected with two levels of over-temperature protection as specified under UL 1995, Section 30, Electric Heaters.

v). Fault detection and diagnostic features of heated floor panels shall be submitted for review and approval. **[CDRL 10-04]**

(1) These features shall be available to be accessed remotely.

vi). Alternate methods of heating and temperature regulation, ground fault detection and protection may be submitted for consideration by Amtrak.

g). Floor Heaters

i). Floor heating shall be provided throughout the passenger areas using convection type heaters.

ii). The Contractor shall take appropriate steps in the design of the floor heat system to minimize overall power demand while complying with all technical requirements of this specification.

iii). The floor heating system shall be controlled via a PulseWidth Modulation (PWM) circuit to regulate thermal output. This control strategy shall enable the use of a single high-capacity heating circuit while minimizing the risk of temperature overshoot and reducing excessive on/off cycling of the system.

iv). Alternative capacity regulation method may be provided for approval by Amtrak.

v). Floor heating shall be provided using electric strip heaters, powered from the 480 VAC HEP supply, mounted behind stainless steel heater guards along the side walls at the floor.

vi). The electric floor heater elements shall be of the strip-heater type consisting of a nickel-chromium resistance wire embedded in a baked, compressed, refractory material sealed within a rust proof, high heat transfer metal sheath.

vii). The heater elements shall be mounted on ceramic standoffs, or equivalent, to provide a high resistance to arcing or grounding under wet conditions.

viii). The floor heat shall have sufficient capacity to heat the car interior from 12º F to 70º F with the ventilating fans and overhead heat inoperative and without benefit of solar or passenger loads.

ix). The heaters shall be uniformly distributed.

h). Heater Fault Detection and Protection

i). Each heated floor and floor heater circuit shall have its own circuit breaker, fault detection and protection.

ii). The heater fault detection circuit shall be able to indicate if any of the heaters in the circuit is either open, shorted, or grounded.

iii). Each heater circuit shall have current input to and output from the floor heaters monitored by the differential relay which energizes for a predetermined difference between the two.

iv). When this relay energizes, both the positive and negative feeds to the affected floor heater circuit shall be interrupted.

v). The ground fault type circuit shall remain latched in the disconnected mode until manually reset by means of a momentary reset button located in the HVAC control box.

vi). The fault trip must not be affected by control power loss or fluctuation.

vii). A tripped ground fault circuit shall be annunciated by means of an LED indicator on the ground fault detection device in the HVAC control box.

viii). The sensor device shall be designed such that it is not necessary to disconnect heater power leads to remove and replace the ground fault detection unit.

ix). A separable sensing coil or other approved method shall be provided to accomplish this requirement.

x). Alternate methods of ground fault detection and protection may be submitted for consideration by Amtrak.

10.6 Ventilation

a). General

i). The ventilation system for each car shall include, at a minimum, the following components and features:

(1) Exterior fresh air intakes with water eliminators and filter with a minimum of MERV 13, if it is deemed that air flow is compromised by using a MERV 13 filter, an alternative filter may be proposed.

(2) Electrically motorized automatic fresh air dampers.

(3) Disposable pleated-type fresh and return air filters with a minimum of MERV 13.

(4) Air distribution ducts

(5) Air diffusers and grilles

(6) Exhaust ducts

(7) Exhaust fans

(8) Emergency fan shutoff switches

ii). The ventilation system shall provide a minimum positive carbody pressurization of 0.1 in. water gage (with full fresh air flow) above ambient exterior pressure with all exterior doors and windows closed and the toilet room and electric locker exhaust fans running.

b). Fresh Air Mixing

i). Intake of filtered fresh air shall be regulated according to demand and shall be adequate to maintain positive interior pressurization under all operating conditions and a minimum of 0.1” w.g. while at standstill.

ii). Fresh air shall enter the car through fresh air intakes and air filters and shall pass through ducts which include drains for condensation and water to be diverted to the outside of the car.

iii). In addition, the fresh air exterior intakes shall be fitted with louvers or grilles that prevent ingress of water and snow.

iv). Re-circulated air shall pass through grilles into a plenum chamber where it shall mix with the fresh air and pass to the HVAC unit blower.

v). Fresh and re-circulated air shall be filtered at the HVAC units by disposable pleated-type filters.

vi). The filters shall be located for ease of replacement from inside the vehicle via the return air grill and shall meet the requirements specified in Amtrak Specification 685 and be commercially available.

c). Return Air Temperature Sensors

i). The Return Air Temperature Sensors should be installed in such way that they only measure the temperature of the re-circulated air, and not when later mixed with the fresh air.

d). Evaporator Blower Fans

i). Ventilation of each car shall be provided by blower fans supplied as part of the HVAC units.

ii). The blower fans shall move the mixed air through the cooling and heating coils and force the conditioned air into the supply air ducts.

iii). The evaporator blower fans shall be sized to overcome the high external static pressure as determined by the Contractor.

iv). The blower shall be centrifugal type, directly driven from the motor shaft.

v). The motor shall be TEFC, class H insulation, resiliently mounted, and equipped with permanently lubricated sealed bearings.

vi). Use of variable speed motor controls for the blower and exhaust fans is permitted if it will lead to a more efficient and energy saving system.

e). Air Ducts

i). The air ducts shall be sized to minimize noise from air velocity.

ii). The air ducting shall be free of any obstructions such as electrical wiring or piping.

iii). Ducts should be able to be cleaned using rotating brushes with vacuum system.

iv). Mounting of the air ducts to the carbody structure shall minimize noise and heat transfer across the joints.

f). Insulation

i). Use of polyolefin insulation is prohibited including the use of any type of insulation inside the air ducts.

ii). Insulation shall be adequate to prevent condensation from occurring in or outside the duct under any operating conditions.

iii). Insulation shall comply with Amtrak Flame, Smoke and Toxicity Requirements, # 352.

g). Air Discharge

i). The air diffusers shall be designed to deliver equalized airflow throughout the car and meet the temperature variation requirements specified.

ii). The velocity of discharge air shall not exceed 100 feet per minute (fpm) measured 6 in. below the face of the diffusers.

iii). Air delivery performance shall be verified during HVAC system proof-of-design testing. Refer to Chapter 20.

iv). The diffusers shall be fixed on all vehicles, except for the car(s) designated for proof-of-design testing, where adjustable diffusers may be used and then permanently set following successful test.

v). The total air flow from the evaporator blower fans on the HVAC units shall be determined by the Contractor to meet the interior requirements at the specified ambient temperatures but shall not be less than 70 cfm per foot of occupied car length.

vi). The supply air shall be adequate to maintain positive interior pressurization under all operating conditions and a minimum of 0.1” w.g. while at standstill.

h). Baffle Plates

i). Baffle plates shall be used to set the volumes of fresh and re-circulated air.

ii). The baffle plates shall be fixed on all cars, except for the car(s) designated for testing, where adjustable baffle plates may be used and then permanently set following successful test.

iii). Adjustment and balancing procedures shall be included in the final deliverables with the first batch of cars and identified in the maintenance manuals.

i). Toilet Room Exhaust Fans

i). A forced exhaust fan vented to the exterior of the car shell shall be provided in each toilet room, exhausting away from any fresh air intake for a minimum 0.5 cfm/ft2 to maximum 1 cfm/ft2.

ii). Toilet room exhaust shall, at all operating speeds, maintain a negative pressure in the toilet room at all times when activated, as compared to the rest of the car interior.

iii). Another method of preventing toilet odors in the car may be proposed and approved by Amtrak.

j). Electric Locker Ventilation

i). A forced exhaust flow shall be provided in the electric locker to assist in cooling the electrical equipment in the electrical locker.

ii). The electric locker fans shall draw air from the car interior and exhaust it to the exterior.

k). Controls

i). The temperature controls shall provide for ventilation with no heating or cooling when temperature conditions fall in the ventilation range shown for comfort requirements in Section 10.3.

ii). Ventilation detection and interlocking devices shall be provided and installed such that there shall be no overhead heat and/or cooling when absence of ventilation is detected.

10.7 Fresh Air Dampers

a). The fresh air intakes shall be equipped with electrically power operated fresh air dampers that shall at a minimum provide two positions:

i). fully open

ii). fully closed

iii). adjustable stop for restricting.

b). The dampers shall be controlled by the vehicle temperature control panel; the dampers shall be used to provide full fresh air into the vehicle under normal operating conditions.

c). With temperatures outside the normal range, the dampers shall operate variably between open and closed to optimize fresh air quantity for the purpose of maintaining the required interior temperature while providing the maximum possible percentage of full fresh air.

d). During layover and warm up/cool down, the dampers shall be fully closed.

e). Alternate arrangements may be proposed to Amtrak for approval.

f). The damper frame, blades and hardware shall be constructed of corrosion resistant material so they will last the life of the car with no attention other than inspection and cleaning at 8-year intervals.

g). The drive motor shall be robust and readily available.

h). The dampers shall incorporate a spring close feature so that they self-close upon loss of power.

i). They shall also incorporate a position sensor to provide a feedback signal to the temperature control panel.

j). Design of the damper unit shall keep the number of adjustments required to a minimum.

k). Once settings are made, they shall be locked so they remain fixed for the life of the damper.

10.8 Controls

a). General

i). A microprocessor-based, integrated HVAC temperature control system shall be provided to monitor the inside and outside temperatures, and adjusts the system's cooling, and heating functions to maintain a comfortable inside temperature and humidity level throughout the range of environmental and climatic conditions of the car.

ii). Activation of the HVAC system on each car shall be under the control of the train crew.

iii). The system shall be designed to maintain the specified interior passenger area temperature and humidity and to also assure adequate interior ventilation.

iv). The output of the microprocessor shall be short circuit protected and shall drive solid state and electromechanical relays and contactors which shall, in turn, control electrical power to the heater elements, motors and various control devices.

v). The changeover between heating and cooling shall be automatic and, except for the reheat stage of overhead heat, shall preclude the simultaneous operation of heating and air conditioning.

vi). The microprocessor application software shall permit Engineering Level maintenance personnel using on board touch screen display to modify temperature and pressure set points as well as various other parameters, such as timers and fault management.

vii). Measures shall be taken to prevent control algorithms that might cause contactor hunting.

viii). Provisions shall be made to control, download, and monitor HVAC status information from a single point of access through intercar connections.

ix). All HVAC sensor inputs, faults, and monitoring shall be available to the car's vehicle diagnostic system and shall be available to be accessed remotely.

x). Heating and cooling shall be sufficiently capable of maintaining desired interior temperature near the lockout temperatures for the compressors or condenser fans with maximum solar loads.

b). Sensors

i). A sufficient number of temperature and humidity sensors shall be provided to regulate heating and cooling in response to temperature changes inside and outside the vehicle.

ii). Temperature sensors in the car body shall be located such that they reflect temperature without being influenced by external heat sources or solar radiation.

iii). All sensor information shall be recorded by the controller and available to the vehicle monitoring system.

iv). At a minimum, the following temperature sensors shall be required:

(1) Minimum of one interior temperature sensor located throughout the passenger seating area for layover heat.

(2) Return air sensor at each HVAC unit return air grille.

(3) Fresh air sensor at each HVAC unit fresh air inlet.

(4) Supply air sensor where each HVAC unit supplies the main duct.

(5) Freeze protection thermostat located in a position that accurately measures outside temperature. (May utilize a signal from the fresh air sensor).

(6) Evaporator coil sensors to detect ice build-up on the evaporator coils.

(7) Humidity sensor at each HVAC Unit (location TBD)

c). Use of Controls

i). The temperature control system for each car shall be under the command of a rotary mode selector switch located in the switch locker and operated by the train crew.

ii). This switch shall determine the operating mode of each of the two HVAC systems and the heating system.

iii). The mode selector shall switch from AUTO/NORMAL to LAYOVER without cycling the HVAC through OFF.

iv). In the event an air conditioning compressor is in operation when it is commanded to shut down, the pump down cycle shall be initiated before the compressor(s) are shut down.

v). Positions and functions are as follows:

Figure 10-5: Temperature Control Positions

Name	Function
AUTO/NORMAL	Car HVAC and heating set up and provides the normal occupied car environment. All systems including freeze protection operate automatically.
LAYOVER	Used for car storage in winter to minimize energy consumption, yet still maintain interior temperature of 50°F. Only floor heat and freeze protection shall be available.
OFF	Used to shut off all car heating and cooling when car is being serviced or in storage. Does **not** disable the freeze protection system.

d). Status Display

i). Each HVAC control panel shall include an indicator and monitor display which shall show the control logic state, unless other display options are reviewed and approved by Amtrak.

ii). Indications shall be by means of suitably labeled Light Emitting Diodes (LEDs) and by an LCD screen, which shall display all microprocessor requests for heating or cooling from the zones controlled from that panel.

iii). Fresh air temperature, supply air temperature, return air temperature, suction line pressure and discharge pressure shall be displayed for each HVAC unit.

iv). Overload indicators and resets shall be available for use by the train crew without exposing the crew to hazardous voltages.

v). The control system shall include the ability to download data using a laptop computer or a flash memory card that is loaded with the Contractor's HVAC diagnostic software.

vi). The requirement to remotely monitor the system status, faults, etc. for the HVAC system is required as part of the base scope of work. The HVAC diagnostic software shall provide the following functionality:

(1) A controller that provides HVAC system status at a glance through remote viewing and has strong diagnostic features.

(2) This includes remote viewing of all sensor status, alerts, errors and relevant data.

(3) Monitor the HVAC system and provide the following:

(a) Have the capability to test the HVAC system and temporarily override the control system.

(b) Log performance, all faults and download history.

(c) Have several levels of security to limit the access and controls of the system (crew, technician, programmer).

(d) Display HVAC system pressure and temperatures

(e) Display HVAC System current mode

(f) Display suction and discharge line temperatures

(g) Display ambient air, fresh air, supply and return air temperatures

(h) Display motor status and current of blower motor and condenser motor

(i) Display heater status and current

(j) Display humidity level

(k) Display fresh air damper position and status

(l) Forecast air filter replacement and condenser and evaporator coil cleaning through the use of differential pressure sensors

(m) Ability to record and indicate system faults

(n) Automatically calculate system superheat and subcooling

(4) HVAC High Pressure and Low Pressure fault Condition

(5) Have the capability to test the HVAC system and temporarily override the control system.

(6) Log performance, all faults and download history.

(7) Have several levels of security to limit the access and controls of the system (crew, technician, programmer).

(8) Provide capability to diagnose failures down to the failed component. Details to be discussed during design review.

vii). The control system shall include, at a minimum, the following components and features:

(1) Temperature sensors

(2) Motor starters

(3) Motor protective devices

(4) The control method shall rely on a combination of the return air and fresh air temperature measurements.

(5) Diagnostics and test capabilities

(6) Heater switching devices

(7) Pressure transducers

viii). The Contractor shall submit a temperature control schedule and a detailed description of operation for approval by Amtrak at the HVAC system design review. **[CDRL 10-05]**

(1) The temperature schedule shall be approved by Amtrak.

(2) In the temperature control schedule, control switch points shall be separated by at least one degree differential for rising and falling temperatures to prevent oscillation of operating modes.

(3) A Ventilation Mode should be present between the heating and cooling modes.

e). Emergency Ventilation Cut-Out Temperature Measurements

i). The following control device functions shall be reviewed and approved by Amtrak and their functions will be monitored by the controller and their activation displayed, including any lockout criteria that is met:

(1) High Pressure Switch

(2) Low Pressure Switch

(3) Freeze Protection Temperature Sensor

(4) HVAC Emergency / Load Shed Operation

(5) Overheat Protection Devices

f). Emergency Ventilation Cut-Out

i). A ventilation system isolation cut-out switches shall be provided on each car for use of the train crew.

ii). The emergency ventilation cut-out shall immediately shut down the HVAC system ventilation blowers and disable heating or cooling on all HVAC units to prevent the circulation of smoke or fumes throughout the car in the event of an emergency.

iii). Operation of the ventilation cut-out shall also fully close the fresh air dampers.

iv). The switch arrangement and labeling shall be identical as that used on existing Amtrak cars and shall be approved by Amtrak during design review.

g). HVAC Emergency / Load Shed Operation

i). In the event of a load shed operation or loss of HEP power supply, HVAC shall provide ventilation in high ambient temperature conditions for a minimum of 6 hours.

ii). Ventilation rate may be reduced if necessary but shall be subject to Amtrak review and approval and in no case shall be below 8 CFM per passenger for AW2 loading.

iii). Alternative solutions may be submitted to enable heating or cooling at extreme ambient temperatures after extended periods of time after 480V power loss. Contractor to include overall impact to vehicle design and battery capacity/size.

10.9 Accessibility and Maintainability

a). Each HVAC unit shall be designed to provide full accessibility where all the basic troubleshooting and running maintenance can be performed from inside the car without removing the equipment and without interference from other systems.

b). All filter replacement shall be performed from inside of the car.

c). Where necessary, the Contractor shall provide custom lifting eyes, slings, jigs or handles that allow safe removal and replacement of major components using Amtrak's existing maintenance facility and material handling equipment.

d). Tapered guide pins or a suitable method shall be provided to guide the HVAC unit into its position.

e). Quick connections shall be provided to the car air ducts and electrical connections.

i). The design should avoid using a special lifting fixture to remove HVAC units. If a fixture is required Amtrak approval is required.

f). The installation and removal process, including removing and installing all

mounting hardware, and electrical connections, shall not exceed one hour and shall be demonstrated for Amtrak approval before final approval of the final design review.

g). At a minimum, the following components shall be a part of the unit and shall be easily accessible for servicing and replacement either through a hinged grille, which provides access to the return air plenum from the inside of the vehicle, or inside the electric locker making access easy for the onboard crew:

i). Air filters

ii). Diagnostic test plug/connector for the PTE

iii). System fault and status LED's

iv). Return air sensors

v). Dampers

vi). Test switch, if provided

vii). All electric transducers and pressure controls

viii). Circuit breakers, relays, and contactors

ix). Refrigerant gauge ports

x). Liquid line sight glass

xi). Crankcase oil sight glass, if applicable.

h). It is anticipated that the air filters and return air sensors shall be accessible via the return air plenum and the other components through interior access doors in the intermediate level ceiling or alternate location.

i). All other components shall be easily accessible for servicing and replacement from within the equipment bay.

10.10 Thermal Response Analysis

a). The Contractor shall perform and submit a comprehensive thermal response analysis for each car type to support the development of Amtrak's Standard Operating Procedures (SOPs) for emergency power-loss scenarios. **[CDRL 10-06]**

b). The Contractor shall analyze no fewer than ten (10) distinct power-loss conditions that may reasonably occur during operations, including but not limited to variations in:

i). Ambient outdoor temperature (hot and cold extremes)

ii). Car occupancy levels

iii). HVAC operating state at time of power loss

iv). Train speed and ventilation state (static vs. moving)

v). Door and vestibule leakage conditions

vi). Emergency ventilation modes

vii). Battery-only or degraded-power modes

viii). Duration of power outage

ix). Seasonal environmental differences

x). Any additional conditions identified by the Contractor through hazard analysis

c). For each scenario, the Contractor shall quantify:

i). Rate of internal temperature change (increase or decrease) over time following loss of normal power.

ii). Time required for interior temperatures to reach thresholds relevant to passenger health and safety (e.g., heat stress, cold-stress, ADA considerations).

iii). Effects of residual thermal mass, insulation performance, and solar loading.

iv). Influence of passive ventilation, infiltration, and natural convection paths.

v). Impact on critical passenger systems, including emergency lighting, communication systems, and safety equipment.

d). The Contractor shall provide a final report identifying worst-case heating and cooling scenarios for each car type and recommended operational considerations for Amtrak personnel during emergency conditions based on observed thermal behavior.

10.11 CDRLs

CDRL	Description	Due
CDRL 10-01	Detailed heating and cooling load analysis	30 days prior to PDR, on-going updates for each DR
CDRL 10-02	In-rush mitigation control scheme	30 days before IDR
CDRL 10-03	Leak and Charging procedure for Refrigeration System	30 days before IDR
CDRL 10-04	Fault detection and diagnostic features of heated floor panels	30 days before IDR
CDRL 10-05	Temperature Control Schedule	30 days before IDR
CDRL 10-06	Thermal Response Analysis	30 days before IDR

Part I: General Requirements

11.1 Overview

a). This Chapter defines the interior design and configuration for each car type.

b). All car types are single level with:

i). Entry/exit to the car from train side is from the single vestibule located at the B-end of the car. It is equipped with powered side doors, powered trap doors, powered folding steps, and on-board mobility lifts on defined cars.

ii). A powered collision post door is provided to seal the vestibule from weather when it is oriented at the end of the consist.

iii). Power operated body end doors at both the vestibule and blind ends of the car provide access to the car interior.

iv). Ceiling lighting in the vestibule illuminates not only the vestibule, but also the station platform outside the car, meeting ADA requirements.

v). Ceiling lighting is provided along the passageway, as well as low-location exit path marking.

c). Accessibility

i). The accessibility areas of the cars will conform to ADA requirements as listed in 49 CFR 38, Americans with Disabilities Act (ADA) Accessibility Specification for Transportation Vehicles and 2010 ADA Standard as applicable.

ii). In addition to compliance with the requirements of the ADA and other accessibility requirements in this specification, the Contractor shall comply with the terms of the Application for Equivalent Facilitation (EF) submitted by Amtrak and approved by the USDOT. (Exhibits R-1 and R-2). If the design concept is modified and a new Equivalent Facilitation (EF) is necessary, the Contractor is responsible for working with Amtrak, FRA and disability community to obtain an accessibility solution that is accepted by all parties involved.

d). Compliance with preliminary design concepts included in the specification and attachments does not relieve the Contractor of all the other requirements within the specification.

e). All car types shall be easily reconfigurable to another car type to meet Amtrak's evolving business needs over the life of the equipment. All components shall be modular in design to be easily replaced with a different configuration if needed.

11.2 General Requirements

a). This Chapter describes the basic requirements for the interior configuration of all coach and café cars.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

b). Each car type shall meet or exceed all requirements for ADA accessibility and general seating arrangements that provide comfort and amenities such as electrical outlets, task lighting, and individual work trays or tables.

c). The interior of the car shall be designed and constructed for maximum safety, comfort, convenience, and service to the passenger, and shall be fully ADA compliant along the accessible path.

d). The Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

e). All mechanisms described below should be durable, free from jamming, and racking.

f). All operable features intended for passengers use, unless otherwise specified or approved by Amtrak, shall comply with ADA requirements, including a maximum force of 5 lbf to operate. Operable controls shall be usable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. Forward or side reach operable controls shall be mounted between 34 inches and 48 inches above the finished floor.

g). The design should meet abuse, load, and crash criteria as described in CFR.

h). Dimensions, position, configuration, comfort, and usability of all items and features will be subject to Amtrak approval during the mockup review.

i). Walls, ceiling panels, and window masks shall be easily cleanable and designed and constructed to form a safe and attractive environment.

j). Visible fasteners shall be minimized.

k). All systems requiring maintenance shall be easily accessible and removable for cleaning and repair.

l). Interior layouts shall be developed by the Contractor and submitted to Amtrak for review and approval during design review per the Design Review processes outlined in Chapter 3.

m). Whenever possible, common components shall be used in all car types.

n). Strength of all interior fittings and their attachment to the carbody shall meet APTA Standard SS-C&S-006-98 and 49 CFR Section 238.233.

o). All interior or occupied areas shall have Emergency Lighting and LLEPM that leads to the primary exits.

    i). These areas include non-seated areas restricted to crew members including the kitchen, café, and baggage areas. See Chapter 13 for additional information.

p). The interior clear height from the top of the floor to the ceiling shall be no less than 84” unless otherwise approved by Amtrak.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

q). The use of self tapping screws is forbidden in the construction of all equipment.

r). Protection shall be provided to prevent damage along the accessible path especially with respect to seats, armrests, walls, etc. Arm rests shall be designed to absorb wear and tear over the life of the assembly. Details to be reviewed and approved by Amtrak during Design Review.

11.3 Human Factors Study

a). As part of PDR, the Contractor shall submit for Amtrak review and acceptance a Human Factors Study Report. **[CDRL 11-01]**

b). The report shall also address specific human factors for restrooms, including but not limited:

i). to accessible paths,

ii). aisle and door clearances accessible reach zones,

iii). wheeled mobility device accessible features,

iv). wheeled mobility device and leg clearances,

v). handrail heights and sizes,

vi). transfer positions to seats and toilets.

c). The report shall also address all seating human factors for each seated position including but not limited to:

i). Recline

ii). Leg room

d). The Human Factors Study Report shall validate the use of all features of the cars by a 95% US male and a 5% US female.

e). Wheeled mobility device animations shall be included to validate accessible paths.

11.4 Accessibility and Universal Design

a). Each car shall be fully compliant at the time of manufacture, with all rules and regulations of 49 CFR 38, Americans with Disabilities Act (ADA) Accessibility Specification for Transportation Vehicles and 2010 ADA Standard as applicable.

i). No part of this specification alters or changes those requirements.

b). Review of the car’s accessible features (including all drawings, calculations, and supplier information required to define the proposed installation) shall be conducted with Amtrak as part of the mockup review.

c). Each car with accessible positions shall include accessible wheeled mobility device locations, which shall allow passengers using wheeled mobility devices to

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

remain in their wheeled mobility devices while on board the car.

i). The number of dedicated accessible areas for wheeled mobility devices is determined by the car configuration, as described in Chapter 1.

ii). A storage area for an unoccupied, folded wheeled mobility device, 48 in. long by 20 in. wide and 40 in. high, in close proximity to the dedicated accessible area and to accessible seating, shall be provided on each car for each accessible space.

d). Each coach which includes revenue seating with an accessible area for a wheeled mobility device shall also include an accessible toilet room with direct access via a 32” path from the accessible area to the accessible toilet room.

i). The toilet room door shall operate automatically and may operate manually in emergency situations and shall be of the sliding type.

ii). Requirements for the toilet and associated equipment are detailed in this Chapter.

e). ADA-compliant car-to-car access is required along the accessible path.

i). The accessible coach car shall include end doors and bulkhead doors that have a clear, unobstructed opening of no less than 32 in. wide.

ii). Overlapping gap closer or bridge plates shall be provided between coupled cars to allow wheeled mobility devices to pass from car-to-car without trapping the wheels in gaps.

f). The accessible toilet room and standard toilet room should be in the vestibule area, separated from the coach seating area by the vestibule door.

11.5 Arrangement Flexibility and Modularity

a). The basic car interior shall be standardized to the greatest extent possible and shall be capable of reconfiguration, upgrade, or replacement without disrupting adjacent interior elements of the car. Contractor shall utilize a seat track or C-channel integrated into the carbody design for attachment of all assemblies.

b). All like components and all associated assemblies (e.g. floor panels, bulkheads, side wall & ceiling panels, etc.) and their spare parts shall be designed and manufactured to be identical/ interchangeable, both as individual parts and as sub-assemblies, throughout the entire car order production.

c). All parts shall mount without modification. Replacement parts shall also be interchangeable.

d). Easy accessibility shall be provided for all items that require periodic maintenance and/or may require replacement.

i). Access doors or panels shall be secured using approved captive fasteners or locks.

ii). It shall be possible to remove these parts without damage to the individual pieces or adjoining components.

11.6 Signage and Labels

a). The Contractor shall equip each car with adequate signage to provide passengers and crew information about the amenities and safety-related features of the cars.

b). The signage to be provided shall include, but is not limited to, the following:

i). Location of safety equipment

ii). Hazards such as high voltage or heat sources

iii). Operation of emergency exit equipment

iv). Operation of on-board equipment such as doors and door latches/locks

v). Amenities such as trash and recycling containers, potable drinking water, 120VAC outlet, etc.

vi). Toilet room amenities

vii). Seat numbers

viii). Capacities for storage locations such as luggage racks and overhead luggage bins

ix). Service-related signs for maintenance and inspection

x). Vehicle road number on both ends of the car

xi). Exterior signage for service points

c). The interior and exterior signage shall conform to the latest revision of Amtrak Specification #697, National On-Board Signage Manual.

i). The artwork, material, location, and specifications for each sign shall be submitted to Amtrak for approval at the design review.

d). Provisions shall be made for all seating locations to have a dedicated safety card holder at each location.

e). A metallic American flag sign shall be installed in each entrance area of each car. The sign shall be light weight and corrosion free.

f). Existing Amtrak signs, in accordance with Amtrak Specification #697, shall be used where possible.

i). Where new sign designs are required, the Contractor shall develop artwork per the Amtrak Onboard Signage Guidelines and submit to Amtrak for review and approval as part of IDR.

ii). The Contractor will provide a signage application drawing for Customer approval identifying all signs and labels used on each car type, including text, as well as the mounting location.

g). Emergency Signage and LLEPM shall be installed in accordance with APTA Standards APTA-PR-PS-S-006-23 Emergency Egress/Access Signage and LLEPM for Passenger Rail Equipment while in compliance with the CFR.

i). All HPPL signage shall be passive and shall not utilize electric components to reach required illumination levels.

ii). HPPL shall utilize LED backlighting to ensure charging under all lighting conditions except Emergency. Locations incapable of utilizing backlighting can use overhead lighting with the approval of Amtrak.

iii). The HPPL material shall be charged and shall maintain charge under all lighting conditions except Emergency.

iv). All HPPL shall have drawings for placement with specific part numbers.

h). Additional signage guidance will be supplied at NTP.

11.7 Interior Noise Levels (Passenger Areas)

a). Under all specific vehicle and operating conditions listed below, the interior noise levels on any car shall not exceed the sound levels below:

i). Vehicle Condition:

(1) Completely assembled car

(2) No passenger load

ii). Operating Conditions:

(1) Operating in any specified mode of acceleration, deceleration, or coasting at any speed up to 125 mph.

(2) On tangent, at-grade, ballast-and-tie track with clean, smooth continuous welded rail.

(3) All auxiliaries operating simultaneously at normal conditions.

iii). Measurement Location:

(1) Any and all points at least one foot from the ceiling, floor, end walls, or side walls.

iv). Maximum Sound Levels which include transient noise, i.e. locomotive horn:

(1) 70 Decibels (Acoustic) (dBA) in seating areas.

(2) 75 dBA in entrance areas (referred to 0.0002 microbar).

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

b). Compliance with this requirement shall be demonstrated using a Type 2 sound level meter as defined by ANSI Standard S1.4: American National Standard Specification for Sound Level Meters, using the slow meter scale.

11.8 Vibration

a). All car equipment shall be designed to operate without damage or degradation of performance when subjected to vibration and shocks encountered during normal service.

b). All newly designed equipment and auxiliaries mounted anywhere on any car, car body, or trucks shall not cause vertical or horizontal vibrations anywhere on the car floor, walls, ceiling panels, and seat frames in excess of:

i). 0.10 in. peak-to-peak amplitude,

ii). 0.01 acceleration due to gravity (g) peak acceleration for the frequency range from 5 Hertz (Hz) to 14 Hz, and

iii). 0.045 in. per second peak vibration velocity for the frequency range above 14 Hz.

c). Carbody-mounted components shall be designed to withstand vibrations of not less than 0.2 g at frequencies up to 100 Hz and randomly oriented shock loads of 8 g longitudinal, 4 g vertical and 4 g lateral.

d). Shock and vibration tests shall be conducted in accordance with IEC 61373 (1999) – Railway Application, Rolling Stock Equipment, Shock and Vibration Tests.

11.9 Sanitary Design

a). Cleanability

i). The car interior and all materials shall be designed so that they do not soil, stain, or show dirt easily.

ii). Interior materials shall be easy to clean using few tools and little specialized equipment.

iii). Items such as HVAC grilles shall only require opening to access the ductwork during extensive periodic cleaning.

iv). The number of items that require removal for cleaning shall be kept to a minimum.

(1) Equipment seen by the passenger and crew shall be cleanable in daily service without removal.

(2) Those items that must be removable shall be easy to remove and replace, preferably without tools, with all like units being interchangeable.

(3) Removable items shall employ captive fasteners of a type that will not deteriorate or degrade in effectiveness with use over the life of the car.

(4) If screws are used, they shall be easy to line up with the mating hole on the fixed part.

b). Protection from Fluids

i). All floors and pipe connections, etc., shall be sealed internally to prevent liquids from leaking into the car sub-floor and insulation.

(1) This is to avoid sanitation and odor problems and minimize potential for sub-floor corrosion.

(2) Sealing design is subject to Amtrak approval.

c). FDA Requirements

i). Interior design and installation shall meet all applicable requirements of FDA for water, waste, and general sanitation issues.

ii). All areas inside a food service car must meet all FDA requirements of sanitary construction.

11.10 Maintenance and Material Performance Expectations

a). Attachment Methods

i). Strength of all interior fittings and their attachment to the carbody shall meet APTA Standard PR-CS-S-006-98 and 49 CFR Part 238.233.

ii). Secondary structure shall be provided to securely anchor car interior items that are subject to significant loads, such as handrails, light fixtures, etc.

iii). In instances where FRP components are used, they shall be stiffened and reinforced appropriately with stainless steel, balsa panels or other materials as approved.

(1) Stiffening and reinforcing will be subject to approval by Amtrak for each application.

iv). All components shall be secured to the car auxiliary structure with machine screws, which engage stainless-steel tapping plates.

v). Floating nut assemblies may be used if they are part of a tapping plate assembly.

vi). Nut-inserts (Riv-nuts, Nut-serts, etc.) are not an acceptable alternative to tapping plates. Likewise, spring type mountings are not acceptable.

vii). Where components attach to car interior materials, such as FRP, mounting shall be coordinated so the appropriate provisions are incorporated into the design of those materials.

(1) When the component is mounted on FRP, the tapping plate shall be embedded deeply into the FRP behind the primary FRP wall and completely glassed in using woven glass fabric and resin, so it never loosens for the life of the car.

(2) Mounting holes can be incorporated into the panels to which the components are mounted or drilled in place using a template.

(3) Match drilling using the component as a template is not acceptable.

(4) Components should be mounted from the exposed side of the mounting surface so that the component can be removed for repair or replacement from the front.

(5) Provisions are required to prevent squeaking between the component and mounting.

b). Access Panels

i). Easy access shall be provided for all items that require periodic maintenance, defect repair or replacement.

ii). Panels/ doors covering this equipment shall be hinged, where possible and fastened with approved captive fasteners in a manner that permits these activities.

iii). Safety catches shall be provided for access panels/doors to prevent sudden or accidental deployment.

iv). Window masks shall allow for easy window replacement.

c). Junction Boxes

i). Junction boxes shall be located within electric lockers or hidden behind access panels. See Chapter 15 for additional information.

d). Time to Repair/ Replace

i). All lowest replaceable units (LRUs) shall be replaceable in less than 30 minutes by a single maintenance worker unless otherwise approved by Amtrak. See Chapter 4 for additional information.

11.11 Safety

a). Fire Safety

i). The builder shall provide a Fire Safety Analysis for Amtrak review and approval, in accordance with APTA RP-PS-005-00. See Chapters 19 and 25.

ii). All interior materials shall meet the flammability and smoke emissions requirements of Amtrak Specification # 352 (which incorporates references to 49 CFR 238.103).

iii). Test reports from an independent lab showing compliance with Amtrak Specification # 352 shall be provided in advance of related FAI's.

b). Injury Prevention

i). The car interior shall be designed to provide a safe, comfortable, and convenient functional environment to the passengers, crew, and maintenance staff.

ii). Interior design shall integrate the car sidewall, transverse wall, window mask, ceiling, and other interior surfaces into a harmonious unit.

iii). Generously rounded edges and corners to guard against personnel injury by passengers, crew, and maintenance staff shall be provided.

iv). The use of visible fasteners shall be kept to a minimum, and where used, be inconspicuous.

c). Pinch Points

i). Gaps smaller than 1.5 inches, and larger than 0.5 inches shall be considered potential pinch points that shall be avoided to the maximum extent possible.

(1) Exceptions can be presented to Amtrak if the gap surface depth is less than 0.5 inches.

ii). The Contractor shall develop and submit a Pinch Point Gap Analysis **[CDRL 11-02]** document that identifies all potential pinch points and justifications.

(1) The analysis shall be submitted for Final Design Review FDR approval.

Part II: Interior Components

11.12 Doors and Latches

a). Relevant information for doors and latches as they pertain to interiors is generally described below.

i). Further information for doors and latches can be found in Chapter 12.

b). All interior doors shall be built of robust materials to withstand repeated use without deforming or losing adjustment.

c). Doors, unless otherwise indicated as sliding doors, shall have a continuous piano hinge and shall open outward into the interior of the car unless specified otherwise.

d). All latches and hinges shall be stainless steel piano hinges unless approved by Amtrak during the design review process.

e). Access panel doors shall have stainless-steel piano hinges.

f). Cabinet doors shall be supplied with lanyard or equivalent door limiting mechanism to ensure that no collisions occur between cabinet doors and other components of the train.

i). Doors with lanyards shall be limited to 130 degree opening as a default setting with minimal adjustment. Lanyards shall be removable without the use of special tools.

g). Doors shall close securely without requiring the use of a key and shall remain closed without rattling or becoming loose during operation.

h). As necessary for proper airflow in each car according to the HVAC design, doors shall have a grille located in the lower half of the door panel for air circulation.

i). Electrical locker and utility locker doors shall have a release lever on the inside of the latch.

j). Doors that have passenger safety equipment behind them shall use paddle latches with no locking mechanism. Please refer to Chapter 18 for more information regarding emergency equipment.

k). Doors that cover PA handsets shall be equipped with a single, positive-locking latch or lock. The locking mechanism shall automatically re-engage upon door closure, without requiring the operator to turn a key or manually actuate the latch.

11.13 Cleaning Supply Cabinet

a). General

i). Cleaning supplies shall be stored in a full height cabinet that is at least 2.5 ft wide and 2 ft deep.

ii). One cleaning supply cabinet shall be provided per car.

iii). This cabinet shall have adjustable shelving and retaining devices to hold equipment in place and/or on the shelf.

iv). Provisions shall be made for retention of one cordless vacuum with a dedicated outlet, one broom, one dustpan, one mop, and one mop bucket in all car types.

v). The cabinet shall have a light that turns on when the door is opened and light switch inside.

vi). The cabinet shall have a duplex service outlet.

b). Material and Construction:

i). Cleaning Supply Cabinet door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). Adjustable shelves with retaining bars shall be provided in these cleaning supply cabinets.

iii). A minimum of 3 shelves per cabinet shall be the default for the cleaning supply closet design and the final number of shelves and installed spacing arrangement shall be determined at the mockup review.

c). Cleanability:

i). The inside of the cleaning supply cabinet shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

11.14 Windows

a). Window size should be maximized with an equal pitch where possible.

b). All seating positions and accessible spaces should have a view out of the window.

c). See requirements of Chapter 6 and Chapter 19.

11.15 Window Masks

a). The window masks shall be either Fiberglass Reinforced Plastic (FRP) or thermoformed plastic.

b). The window edge should incorporate openings for heating vents at the window and shall not interfere with minimum accessible clearance requirements.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

c). Sidewall heat vents may be separate powder coated aluminum (as appropriate for the mask to window interface), or integral to the window mask.

d). The window masks must not readily collect dust/dirt and shall be easy to clean without removal or special tools.

e). Window masks shall be wrapped in a protective film in accordance with Chapter 19. Paint is prohibited.

f). Panel construction shall allow for removal and recovering of the surface covering at overhaul without damage to the base material.

g). Window masks shall allow for easy window replacement.

11.16 Window Blinds

a). Window blinds shall be provided for all side windows and skylight windows if the option is exercised.

b). Blinds should cover the entirety of the window.

c). Blinds shall be replaceable within a 30 min timespan.

d). A single pull-down blind system shall be provided per window, common across all car types, capable of delivering both daytime solar/glare control and full blackout performance, as follows:

i). In daytime mode, the blind shall provide effective sun shading and glare control without creating an overly dark or opaque interior.

ii). In night-time mode, the blind shall achieve full blackout and privacy suitable for sleeper accommodations.

iii). The blind system may utilize engineered fabric solutions (e.g. graduated density, variable weave, perforation, or equivalent) to enable both modes of performance within a single blind system.

e). Side window blinds shall be provided with a handle on the lower edge that is easy to use and accessible. It shall move the blind with no racking or jamming and without exceeding 5 lbf. during operation.

f). Blinds shall be stored in a valance so that they can easily be accessed for maintenance.

i). Where luggage racks are provided, the blinds may instead be stored behind the luggage rack.

g). Operation

i). Coach side window blinds shall be operated manually by a passenger.

ii). If the skylight window option is exercised, then the skylight window blinds shall be automated so that the conductor can deploy or retract the blinds at

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

the push of a button. Alternatives may be proposed for Amtrak's review and approval.

Part III: Storage Areas

11.17 Storage in Coach Areas

a). Each storage location below shall integrate into the coach area in an inconspicuous manner and shall flow seamlessly with the aesthetic of the rest of the coach car.

b). Each storage location shall be clearly labeled according to Amtrak Specification #697.

c). Each storage location shall be easily opened and accessed by any passenger and the use of paddle latches or push-button latches is desired.

d). Folded Wheeled Mobility Device storage spaces shall be dedicated for at least two devices per car along the accessible path for passengers wishing to transfer to another seat.

e). Storage space for an evacuation chair shall be included. Please refer to Chapter 29.

f). Emergency Equipment listed below shall have appropriate storage locations within the coach car. Please refer to Chapter 18 for more information regarding emergency equipment.

i). Trauma Kit and Stretcher

ii). AED

iii). First Aid Kits

11.18 Trash and Recycling Storage

a). General:

i). Trash and Recycling Receptacles shall be provided on each car type in conspicuous locations to encourage passenger/crew use.

ii). Recycling and trash receptacles shall be provided on both ends of each car type as close as practical to restroom areas.

iii). The recycling and trash receptacles shall be either side-by-side in a row or directly across the aisle from one another.

iv). The recycling and trash receptacles shall meet all FDA and NSF requirements for trash containers and their materials.

v). To the extent possible, these receptacles will be designed to maximize trash capacity or at a minimum accommodate the Amtrak standard trash container, per Amtrak Drawing C-96-7591.

vi). The receptacles shall be boldly labeled with an intuitive icon for type of trash, in accordance with Amtrak Specification # 697.

vii). The inside of each trash receptacle door shall be permanently labeled with the Amtrak AMMPS number of the container required for that space.

viii). Each set of receptacles shall include two separate openings and respective bins:

(1) one for trash

(2) one for recyclables (cans, bottles, and newspapers)

b). Material and Construction:

i). Trash and recycling locker door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). The trash locker container access door shall be secured closed with a square lock.

iii). The trash locker door shall include a recessed grab handle to be used to pull the door open when unlatched.

iv). Visible hardware and fasteners shall be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

v). Recycling and trash receptacle lockers shall be of panel construction with substructure as appropriate to support components.

vi). The locker shall include appropriate brackets and/or guides, etc. to properly index the trash containers with the openings, and as required, to keep them upright.

(1) These devices shall be rounded, etc. to protect staff handling the containers or servicing the end door from injury.

vii). The locker enclosure with walls & door material will be fireproof or be lined with fire-resistant material.

viii). The locker shall use as few joints as possible in fabrication; they shall be permanently sealed against moisture and vermin.

ix). The locker shall be structurally sound and conform to requirements set out in 49 CFR 238.233.

c). Cleanability:

i). The inside of the trash locker shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

iii). Easy to clean trash guides shall be provided on the sides and back of the locker and on the inside of the locker door. The trash guides shall prevent trash and liquids from getting between the container and locker wall.

iv). Horizontally accessed recycling and trash receptacles shall include a hinged self-closing door flap of a touch-free design that is as large as practical.

(1) This flap shall be as wide as possible.

(2) It shall be possible to open the trash flap by pushing against the vertical surface and further provide for opening without touching the vertical surface.

(3) If possible, the flap should be attached to the locker top surface rather than a door-within-a-door concept.

(4) Spring tension of a stainless-steel spring should prevent the door from swinging/ banging as a result of train motion.

(5) These flaps shall avoid trapping any hands or fingers.

v). Vertically accessed recycling and trash receptacles shall have clear openings without flappers.

(1) Enclosure shall be constructed so as to not ignite, produce lingering char, or allow fire to spread to adjacent interior elements.

d). Required Trash and Recycling Volumes

i). Figure 11-1 defines required trash and recycling capacity volumes in each section of the car:

Figure 11-1: Trash and Recycling Quantities

Section	Location	Type	Volume
Coaches	Entrance Area	Trash and Recycling	7.5 cu ft
	General	Trash and Recycling	20 cu ft
	Accessible Toilet Room	Trash Only	2.25 cu ft
	Standard Toilet Room	Trash Only	2 cu ft
Café	General	Trash and Recycling	20 cu ft
	Café	Trash and Recycling	20 cu ft

11.19 Emergency Equipment

a). General

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

i). Emergency Equipment boxes shall be mounted on each end of the car.

ii). These boxes shall contain, at a minimum:

(1) a fire extinguisher

(2) crowbar

(3) hammer

(4) snap lights

(5) first aid kit

iii). Emergency equipment boxes shall not be locked and be mounted in an area easily accessible to all passengers in the event of an emergency.

iv). The labels and gages for the fire extinguisher shall be visible and readable from either a seated or standing passenger in an aisle.

v). Further information on these emergency equipment boxes can be found in Chapter 18.

b). Material and Construction

i). Emergency equipment locker door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

c). Cleanability

i). The inside of the emergency equipment locker shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

11.20 Luggage Storage – General

a). General

i). Luggage racks shall conform to 49 CFR 238.737.

ii). The Contractor shall factor in:

(1) Safety

(2) Crashworthiness, abuse, load, and crash criteria

(3) Materials and Workmanship

(4) FDA cleaning clearances

(5) FDA cleaning radii

(6) Sanitary design

iii). All mechanisms should be durable, free from jamming, and racking.

iv). Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

b). Cleanability

i). The inside of the luggage storage locations shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

c). Required Luggage Storage Volumes and Baggage Analysis

i). Baggage storage volumes shall comply with the requirements of this Specification.

ii). Luggage Tower

(1) Each coach car shall have luggage towers located at one end of the car closest to the side loading door with sufficient capacity for all potential passengers' suitcases to the best extent possible.

(2) Luggage towers shall have a minimum width of 48" and shelf spacing shall maximize the storage of large and medium suitcases.

(3) Each passenger's suitcase shall be stored on the car they are travelling in.

(4) For calculation purposes, assume 50% of the suitcases are large and 50% are medium sized.

(5) Sizes

(a) Large suitcases measure 30" x 20" x 12"

(b) Medium suitcases measure 26" x 18" x 11"

iii). Overhead Luggage Rack Volume

(1) Each car shall have capacity for one carry on case per passenger to be stored widthwise in the overhead rack.

(2) Each passenger's carry-on shall be stored on the car they are travelling in.

(3) Carry-on cases measure 22” x 14” x 9”

iv). As part of PDR, the Contractor shall develop and provide an analysis of how the proposed car arrangements shall comply with the requirements of this specification. **[CDRL 11-03]**

d). Key Features

i). Expected features for Luggage Storage areas are summarized in Figure 11-2 and detailed below.

Figure 11-2: Luggage Storage Key Features

Feature	Short Description	Qty
Trim Panels	Wall panel with provisions for mounting signage, etc.	TBD during design review
Roll Stop	Retaining bar for luggage	1 per shelf level
Glass Side Panel	Safety Glass on side of stack to allow passengers to view bags	On side facing passengers
Kick Strips	Stainless steel strips	each exposed side
Solid Panel	HPL panel	TBD during design review
Upper Shelf	Shorter depth shelf	1
Protective Back Panel	Replaceable wear panel	1 per shelf
Shelves	Full depth shelf	TBD during design review
Bottom Shelf	Floor luggage storage for large bags	1

ii). Trim Panels

(1) Trim panels shall interface with side wall and ceiling with no gaps or dirt traps.

(2) Trim panels are made from HPL composite sandwiches.

iii). Roll Stop

(1) Retaining bars or similar detail shall be provided on large shelving edges that prevent luggage from falling or rolling out.

iv). Kick Strips

(1) Stainless steel kick strips at 9” high should be used on all exposed edges.

v). -Side Panels

(1) A solid panel with HPL skin and no safety glass should be used when stacks are placed up against bulkheads.

(2) In all locations where luggage stacks permit passenger views of stored baggage, safety glass side panels shall be provided.

vi). Upper Shelf

(1) Upper shelf can be shallower for smaller bags and aid in passenger reach of luggage.

vii). Protective Back Panel

(1) Replaceable trim panel that protects wall from scuffing shall be provided. Panel should be easy to replace.

viii). Shelves

(1) Shelving with hard wearing finish shall be provided. Shelf should be easily replaceable, easy to clean, with no dirt traps.

ix). Bottom Shelf

(1) The bottom shelf shall be deep enough for large suitcases. It shall have an easy clean surface, no dirt traps, and a soft back corner.

11.21 Overhead Luggage Storage

a). General

i). Overhead luggage storage racks shall be provided above all coach seating.

ii). Overhead luggage storage shall incorporate dividers to prevent excessive shifting/movement of luggage.

iii). The luggage racks shall consist of modular units bolted to the sidewall and roof structure and extend the entire length of the passenger seating compartment.

iv). The racks shall accommodate carry-on luggage of up to 14 in. x 9 in. x 22 in. in size and smaller personal items.

v). Length of the racks shall match the window pitch so that the bin dividers are centered on the pillar between windows.

vi). Design of the racks shall include as few obstructions as possible for manipulating luggage into and out of the rack.

vii). The luggage bearing surface shall be durable and not require replacement or refurbishment for the life of the car.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

viii). The lower edge of the rack at the aisle shall incorporate a smooth convex radius to mitigate passengers bumping their heads against the underside of the luggage bin.

ix). An easily reached continuous passenger handhold shall be provided facing the aisle way.

b). Strength and Attachment

i). The rack structure and attachment to carbody structure shall have sufficient strength to support a load of 250 lbs., applied over a 10 in. by 10 in. area, midway between adjacent supports with a deflection not to exceed 0.25 in. (including rack itself and its attachment to carbody) and without fracture or permanent deformation.

ii). The load-bearing surface shall be inclined upward from the horizontal toward the center of the car at an angle of approximately three degrees.

iii). The complete and fully loaded luggage rack and its attachment to the carbody shall be designed to resist loads, without failure, due to accelerations of 8g longitudinally 4g laterally and 4g vertically, acting on the mass of the luggage.

iv). The contractor shall demonstrate the strength and luggage retention capability of the luggage racks during the design review.

c). Reading Lights

i). Track-mounted reading light assemblies, as described in Chapter 13 may be mounted on the underside of the racks, for accessible seating locations.

ii). The design shall allow the light fixture units to be moved in small increments longitudinally to be centered above each accessible passenger seating area.

iii). The luggage rack shall be equipped with a wiring chase or equivalent that provides the flexibility in wiring to achieve this.

(1) Alternate arrangements may be proposed for Amtrak review.

11.22 Luggage Towers

a). General

i). Quantity and location of luggage towers shall be guided by the information presented in Chapter 1 as well as the compliance with the Baggage Analysis required in Section 11.20.

b). Materials and Construction

i). A luggage tower shall be of robust stainless-steel construction and include shelves.

ii). Bumper guards shall be mechanically attached to the wall panels within the luggage tower to prevent damage to walls or luggage.

iii). The towers shall have sufficient strength to support a load of 250 lbs. midway between adjacent supports with a deflection not to exceed 0.25 in. and without permanent deformation.

iv). The load-bearing surface shall not be less than 24 in. wide and shall be inclined upward from the horizontal toward the center of the car at an angle of approximately three degrees.

c). Aesthetics

i). The towers shall have decorative graphics and patterns.

ii). Exact graphics, decals, opacity, etc. shall be determined with Amtrak during the design review process.

d). Luggage Tower

i). Luggage towers should be built as a modular set of parts.

ii). Various lengths of luggage tower shall be allowed for within the same modular construction.

iii). Luggage towers should be integrated with the side wall and ceiling with no gaps or dirt traps between it and the adjoining body side panels.

iv). Bumper guards shall be mechanically attached to the wall panels within the luggage rack/tower to prevent damage to walls or luggage.

Part IV: Integrated Electronics and Technology

11.23 Digital Displays

a). General

i). Digital displays shall be provided.

ii). Displays shall be capable of both displaying uniform content across multiple screens and displaying unique information.

(1) This should be adjustable by Amtrak employees who have access to software passwords for such activities.

iii). See Chapters 14 and 26 for additional information and requirements for displays.

iv). Please refer to Exhibit F for further guidance on screen placement.

b). Materials and Construction

i). All display screens shall be rail rated and/or service proven.

ii). Displays shall be integrated into an access panel for ease of maintenance and replaceability.

iii). Behind each access panel should be provisions for electrical, diagnostics, and communications connections even if the display screen is only powered by the Contractor.

iv). Displays shall be flush mounted unless otherwise agreed with Amtrak during IDR and Mockup Review.

c). Required Screen Quantities

i). The required type and quantity of display screens in each section of the car is summarized.

d). Screen Placement

i). General

(1) Screens shall be located to ensure high visibility and legibility for passengers throughout the train.

(2) The intent is to provide consistent access to passenger information without prescribing exact screen sizes, orientations, or positions.

(3) Screen placement shall support dynamic wayfinding, real-time travel updates, and service information including advertising.

(4) Please refer to CMF and suggested layout attachments for further information on screen placement and examples.

ii). Visibility Guidelines by Area

(1) Entrance Areas

(a) Screens should be clearly visible upon entering and exiting the car.

(b) Screens should be positioned to be readable from multiple angles.

(2) All Coach Cars

(a) Screens should be positioned so that at least 75% of passengers have a clear line of sight from their seated position to at least one screen.

(b) Where full visibility is restricted by luggage racks or partitions, multiple screens should be used to maintain coverage.

(c) Content should remain legible from a seated position without obstruction from fittings or furniture.

(d) Available bulkheads and high-level positions shall be used to maximize screen visibility across the car.

(e) Screens shall be positioned to maintain adequate head clearance in walkways- avoiding any obstruction to passenger movement in low ceiling areas.

(f) Seat reservation screens (Option) shall have a resolution comparable to a mobile phone in order to provide a clear display void of any pixilation which would result in screens appearing dated and pixelated. Details of the screen resolution and aspect ratio shall be discussed during design reviews.

(3) Food Service Areas

(a) Screens used for digital menus, Food and Beverage Promotions, or service information must be readable from multiple positions including:

(i) While queuing (even when two or more people are in line)

(ii) Directly at the point of purchase

(iii) From seated dining positions

(4) Screen Format

(a) Aspect ratio, orientation, and mounting should be selected to support clear visibility in each context.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(b) All screens shall feature anti-glare treatments and meet accessibility standards for legibility, contrast, and resolution.

(5) Screen Selection and Placement

(a) Amtrak reserves the right to modify screen placement or suggest screen selection changes during the design review process and mock up stages of the design.

11.24 Electrical Locker and Panels

a). The car electric/ switch locker shall be located within the car interior.

b). The car PA unit is located in the electric/switch locker, recessed into the wall.

c). The locker shall have separate doors for crew operated equipment, and maintenance operated equipment. See Chapter 15.

d). Locker walls shall be of melamine faced aluminum panel construction with substructure as appropriate to support components.

e). Longitudinal walls facing into the entrance area shall be decorated with melamine or other factory-manufactured laminate material.

f). The locker wall & door material shall be fireproof or be lined with fire-blocking material.

g). The substructure shall be robust to support the numerous heavy electrical panels, etc. located within the locker.

h). The door and frame shall be robust due to frequent use and rough treatment.

i). The door lock shall be a coach key style lock with interior release latch.

j). The electrical locker shall be positively pressurized by conditioned air as part of the HVAC system to prevent dust from entering and accumulating in the electrical locker.

k). Air shall only be allowed to vent from the electrical locker through gaps and voids where dust may enter.

l). There shall not be a vent or grille in the door to the electrical locker.

m). The locker shall include a metal pocket or rack to hold the car defect report book, which is approximately 8.5 in. wide by 11 in. tall by 1 in. thick.

n). The inside face of the electrical locker door shall have an identification sign listing the car number, car weight and freshwater capacity, and an 8.5 in. wide by 11 in. tall metal surface for an FDA inspection form and stickers.

o). The surface must be smooth to allow pasting up maintenance forms i.e. extermination.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

p). A train-level Central Diagnostic Unit control and display shall be included in the locker.

q). The electric locker door shall be labeled in compliance with Amtrak Specifications # 696 & # 697.

r). When the door is opened, the locker service lights shall be illuminated by service-proven, automatic switches.

s). The locker doors shall be hinged to open to not block aisleways/passageways when open.

t). The passage side of the electric locker with the door shall contain all crew and emergency controls in one location to facilitate emergency preparedness and response.

u). At a minimum the following components shall be located on the passage side of the electric locker:

i). B-end emergency fan switch

ii). B-end body end door cutout switch

iii). B-end conductors emergency brake valve (Note: exhaust of valve must not direct onto electrical equipment in the locker, so as to avoid blowing water onto it when valve is activated)

iv). Fire extinguisher enclosure (see Chapter 18)

v). Smoke Detector main display panel and controls, behind a transparent door, accessed with a coach key (see Chapter 25)

vi). Waste system status (see Chapter 17)

vii). System status indicator panel (See Chapter 10)

viii). All other crew operated emergency controls

v). The electrical equipment and switch locker shall be located as appropriate near the end the car.

w). A small switch locker shall be incorporated into the electrical locker, containing just the essential lighting and other control switches needed by the train crew for car setup for consist operation.

11.25 Outlets

a). General

i). Convenience outlets utilizing duplex receptacles as described in Chapter 15 shall be located throughout the interior.

ii). A “120 Volts” label, in accordance with Amtrak Spec. # 697, shall be installed at each outlet location, 0.5 inch from the outlet.

b). Passenger Convenience Outlets

i). Seat Outlets

(1) A duplex receptacle shall be provided for each seat, including those at tables, and all accessible locations in all car types. See the following sections for additional information:

(a) 11.32: Standard Coach Seats and Café

ii). Table Outlets

(1) A duplex receptacle shall be installed on each side of each table, located such that the table or seat does not interfere with access to the outlet.

iii). Mirror Outlets

(1) A duplex receptacle shall be installed adjacent to each mirror. See the following sections for additional information:

(a) 11.37: Standard Toilet Room (STR)

(b) 11.38: Accessible Toilet Room (ATR)

Part V: Interior Structures

11.26 Bulkhead Walls

a). General

i). Bulkhead walls at the end of each passenger seating area shall be constructed of melamine or HPL- faced aluminum panels for durability and to be pleasing to the passenger.

ii). Any fiberglass material shall be covered with a high gloss gel coat. All seams will be sealed, using appropriate sealing materials.

iii). Fasteners shall not protrude from the wall panels but countersunk to be flush with the wall panels.

iv). Bulkheads dividing the car shall be constructed for durability. All joints shall be sealed, using appropriate sealing materials.

v). Fasteners shall not extend from the wall panels but instead countersunk to be flush with the wall panels.

vi). The bulkhead shall meet the structural strength required in APTA PR-CS-S-006-98.

vii). Panels shall be machined smooth and free of sharp edges and burrs. Like panels shall be identical.

viii). Edges and corners shall have generous radii. Finished surfaces shall be decorative laminate, Schneller G20002T or high-pressure laminate.

ix). Amtrak shall reserve the right to choose material it deems appropriate for the application.

x). Provision for textile wainscot panels or sections shall be included.

xi). Panels shall include stainless-steel kick panels equal in height to the sidewall heater grills.

xii). Kick panels shall wrap the edges of the passage/ aisle side edge of the panel.

xiii). Bulkheads shall be designed so that decorative surfaces can be changed at overhaul without damaging the substrate.

xiv). Alternate panel construction will be considered where appropriate.

xv). To keep the number of fasteners low, service panels shall be kept as small as possible while still allowing access to the necessary items requiring access.

xvi). The gaskets shall be protected from crushing through the use of metal-to-metal stops incorporated around the mounting fastener holes.

xvii). There shall be one type of bulkhead wall on the car: bulkheads that include doors.

(1) Bulkheads with Doors

(a) Doors should be made from safety glass, have a minimal frame and an I/R sensor with a backup accessible touch button to open the door.

b). Interchangeable Bulkhead Signage

i). Contractor to provide a modular, easily replaceable/reconfigurable signage solution mounted on the bulkhead wall for the Standard Coach Car to be utilized as a Business Class Car enabling clear, consistent passenger information and flexible reconfiguration of car class designation.

(1) The signage shall be mounted on all bulkhead walls in the Standard Coach Car and shall be visible from the aisle clearly indicated the class of service while complying with Amtrak's branding and accessibility standards.

(2) The signage assembly shall be designed as a modular component that is interchangeable across all cars in the fleet using standardized captive fasteners or approved locking mechanisms, allowing for tool-less conversion from a Standard Coach Car to a Business Class Car designation.

(3) The sign panel shall be constructed of non-flammable, scratch-resistant and UV-stable materials suitable for high-traffic interior environments with permanently bonded or etched graphics to prevent peeling or fading over time.

(4) Signage shall comply with ADA requirements, including tactile lettering and Braille where applicable with placement and contrast meeting visibility standards for passengers with visual impairments.

(5) The sign shall be removable without damage to the bulkhead wall or adjacent components.

11.27 Ceilings

a). Ceiling panels shall be designed and constructed and installed to allow easy individual removal for maintenance and repair of any components included in the ceiling design, such as air ducts.

b). Ceiling panels shall be constructed of material that meets flame, smoke, toxicity, and structural standards, subject to Amtrak's approval.

c). The ceilings shall be made of a wear resistant and easy to clean material, preferably coated metal sheets or HPL panels.

d). Panels shall have a dense phenolic composite edge machined smooth and free of

sharp edges and burrs or may employ imbedded aluminum trim.

e). Alternatively, as appropriate, honeycomb aluminum panels may be used. Finished surfaces shall be decorative laminate, Schneller G20002T or Amtrak approved equivalent.

f). Corners and edges shall be rounded.

g). Panels should be self- trimming.

h). Where trim extrusions are necessary between panels, their size should be minimized.

i). The number of visible fasteners should be minimized.

j). Piano hinged ceiling panels shall be designed, constructed, and installed to allow easy individual opening and closing to provide access for maintenance and repair of any components located above the ceiling, such as:

i). body end door operators and tracks,

ii). HVAC air ducts,

iii). lighting fixtures,

iv). PA speakers,

v). water piping,

vi). wiring, etc.

k). These panels shall be hinged along one edge in such a way that they may be hung open or easily removed from the hinge.

l). Ceiling panel size shall allow a single person to open/ close the panels safely, unaided.

m). The panels shall be secured closed with a quarter turn Southco or equal quarter turn draw-tight vice-action latches with indicators for the locked position. When in the locked/closed position the latch arm shall not move freely. The latch will be determined during the design review process. Self-adjusting compression latches are prohibited.

n). The driver required for the latch will be determined during the design phase.

o). Each panel shall include a passive self-engaging safety catch to prevent accidental panel openings.

p). These safety devices shall be stainless steel and be configured so as not to rattle in service. The safety latch shall be self-engaging when opening and closing the panel.

q). Panels shall be sealed against air leaks around their entire perimeter, with the seal

on the stationary side of the joint.

r). Any components that penetrate the ceiling shall form an air-tight joint to the ceiling to avoid dirt streaking.

s). The seal on these items shall be on the component, rather than the ceiling panel.

t). The method of securing the ceiling panel to the car structure shall ensure that panels cannot drop at all due to any car motion from coupling/ uncoupling as well as under all operating conditions at all authorized speeds on any FRA class of track.

u). Hinged panels, which provide access of overhead equipment such as door operators, water heater, etc., shall be equipped with a limit switch so that when the panel is opened, the associated service lights shall be illuminated.

v). Where the car ceiling panels form the bottom of the HVAC duct, they shall be hinged along one side to allow them to be easily opened for periodic duct cleaning.

11.28 Flooring

a). Floor Covering

i). The car floor shall be equipped with a combination of carpeting and anti-slip flooring to provide an aesthetically pleasing and safe environment for the passenger.

ii). Safety and installation shall be foremost in the design.

iii). Carpeting is used not only for aesthetics, but also as a sound absorbent.

iv). All floor coverings shall be new.

v). The integration of the base floor material, carpeting, and restroom inserts shall be the subject of design review.

vi). Care shall be taken to ensure smooth transitions between flooring, carpeting, and transitions in doorways, restroom entrances, seat tracks, etc., to avoid tripping hazards.

vii). Generally, clamping thresholds should be used at these joints and longitudinal carpet-retaining tracks used to secure carpeting.

viii). Carpet-retaining track locations shall be coordinated with those of LLEPM tracks to ensure a smooth transition.

ix). Joints in the floor beneath the floor covering shall be smooth with no transmit bumps, ridges, and other irregularities through to the finished surface of the covering.

x). The builder shall provide an adhesive system suitable for railcar applications and be unaffected by the inherent flexing of vehicle interior color panels and temperature swings during train operation.

xi). The adhesive shall not degrade the flammability, smoke emissions, and toxicity characteristics of the carpet, composite flooring, or car substrate.

xii). The composite flooring, floor coverings, and their adhesive systems shall be able to withstand a wide variety of periodic and specialized stain removal cleaning typical for a passenger rail vehicle without any stretching, puckering, rippling, fraying, pulling up, or other adverse effect to the surface appearance or function.

xiii). Cleaning may occur daily and at least every 90 days using a carpet cleaning machine, hot water, and caustic or acid chemicals.

xiv). Daily specialized spot cleaning will take place using chemical cleaners, scrubbing with brushes, and application of gum remover.

xv). The base floor and floor coverings shall be installed in accordance with the best practices of the industry and OEM instructions.

xvi). Floor coverings, their trim, and the installation of these materials shall result in a smooth and flat floor covering for the life of the floor covering. Coverings shall be removable at end-of-life with no damage to the underlying floor panels.

xvii). Floor covering seams should be kept to a minimum and the plan for seam location shall be approved by Amtrak during the design review process.

xviii). The carpet vendor shall provide detailed recommended cleaning instructions for the builder to include in the maintenance manual sets.

xix). To the extent possible, floor coverings for each site shall have the same dimensions among all cars, or among like cars at a minimum, so materials can be cut to size outside of the car and be installed with minimal on-car trimming.

xx). Repairing floor coverings is not allowed; instead, the covering must be replaced with new material up to the nearest seam. Any exceptions to this requirement will require approval from Amtrak on a case-by-case basis.

xxi). High-wear carpet locations especially center aisle carpers shall be designed to be fully replaced in under 30 minutes.

xxii). Walk-off carpets shall be installed and secured in all entrance areas to each car to prevent damage to the interior flooring of each car. Walk-off carpets shall be designed for high-traffic environments and must function under all conditions including temperature fluctuations, vibration, continuous passenger loading, and free of any condition that could create a trip hazard.

(1) The walk-off carpet system shall be easily replaceable and shall trap water and soil at the entryway to improve cleanliness and safety while providing a stable, firm and slip-resistant walking surface consistent with all accessibility requirements for floor surfaces.

(2) Walk-off carpets shall be replaceable in 15 minutes or less.

xxiii). Please refer to Figure 11-3 below for general outline of where each flooring type will be utilized:

Figure 11-3: Floor Covering Table

Location		**Flooring Type**
Standard Coach Seating Areas	Aisle	High Traffic Carpet 1
	Under Seats	High Traffic Carpet 1
	Entrance area	Anti-Slip Rubber Flooring 1
Premium Accessible Coach Seating Areas	Aisle	High Traffic Carpet 1
	Under Seats	High Traffic Carpet 1
	Entrance area	Anti-Slip Rubber Flooring 1
Café Areas	Aisle	Anti-Slip Rubber Flooring 1
	Under Seats (Booth)	Anti-Slip Rubber Flooring 1
	Entrance Area	Anti-Slip Rubber Flooring 1
	Café Queuing Area	Anti-Slip Rubber Flooring 2
	Café Crew Area	Anti-Slip Rubber Flooring 2
Restrooms	ATR and STR	Anti-Slip Rubber Flooring 2
High Capacity Coach Areas (Option)	Aisle	High Traffic Carpet 1
	Under Seats	High Traffic Carpet 1
	Entrance Area	Anti-Slip Rubber Flooring 1

b). Carpeting and Securement

i). Carpet

(1) Heavy-duty commercial carpet shall be provided as indicated including seating areas.

(2) Carpet shall be designed for modular replacement.

(3) All areas of common design shall use template cut carpets. Linear carpets such as those used for aisles, shall likewise be of identical sizes within car types.

(4) All carpet shall be designed per Amtrak specification and shall be designed to provide maximum passenger comfort and safety as dictated by ergonomic requirements.

(5) The carpet shall be compliant with all applicable APTA and ADA guidelines.

ii). Carpet Securement

(1) Generally, the aisle and hall carpet shall be mechanically secured to the floor using longitudinal carpet-retaining tracks along both sides of the center aisle and along the outside edges of the car.

(2) A cove shall be provided where the carpet meets the longitudinal wall for ease of cleaning.

(3) Clamping thresholds shall be used at transitions to rubber or composite flooring and metal moldings, as required, such as at bulkheads.

(4) The carpet-retaining tracks along the aisle may be incorporated in the tracks for LLEPM.

(5) The spacing between the carpet-retaining tracks, moldings, etc. shall be identical on all cars so that carpeting does not need to be trimmed to fit a specific car.

(6) If carpet must be glued into place at certain locations, these require Amtrak approval.

c). Anti-Slip, Skid Resistant Flooring

i). Skid-resistant, waterproof composite floor covering, that has been tested and proven to meet ADA requirements, shall be used where indicated including passageways, restrooms, food service areas and other utility areas where carpet is not installed.

ii). The floor design must comply with 36 CFR Part 1192 Appendix I and RVAAC VI Floor Surfaces recommendations.

iii). The floor covering shall have an integral cove of 4 in. radius, where specified, for easy cleaning, and shall extend from 2 in. to 6 in. up the wall, depending upon application.

iv). Transition strips shall be provided between composite flooring and carpeted areas.

v). Transitions between flooring types shall produce level changes in flooring surfaces less than 0.25 in.

vi). The trim strip between the wall lining and the floor covering shall be sealed to prevent harborage, accumulation of debris, or incursion of water and cleaning fluids.

vii). Floors in entrance areas and end passageways shall have a 3 in. wide high-contrast visibility strip directly adjacent to door openings to delineate the door opening for visually impaired passengers.

viii). The high-contrast strip at the side entry doors shall be made of high-performance photo-luminescent material so that it is integrated into the LLEPM system for exit pathway marking.

ix). The LLEPM material and application shall comply with APTA Standard APTA-PR-PS-S-006-23 Emergency Egress/Access Signage and LLEPM for Passenger Rail Equipment and shall be embedded in the floor system.

x). All flooring shall be installed using an adhesive system that is approved by the flooring manufacturer and Amtrak. Self-adhesive style flooring is prohibited (i.e. Nora nTx).

11.29 Entrance Area (Vestibule)

a). General

i). Entrances for the cars shall have entrance doors on both sides of the car.

ii). Entrance areas shall include a 60” turning circle.

iii). All entrance areas shall be designed and constructed to form a safe and attractive environment.

iv). Visible fasteners shall be minimized.

v). Modularity shall be optimized during the design process.

vi). All mounted items in the area shall be secured to the module structure through the use of fully embedded tapping plates when pullout strength or expected weight is greater than 20 lbs.

(1) These are expected to last the life of the car without coming loose.

vii). Consistent features shall be maintained across entrance areas to the extent possible.

viii). Please refer to Exhibit F for further guidance.

b). Integrated Systems

i). HVAC

(1) Supply Air Diffusers

(a) Conditioned air is delivered to the entry area via 2 supply air diffusers with adjustable air flow control.

(2) Exhaust Grille

(a) Exhaust air is removed from the entry area via the exhaust air grille which is located at the upper portion of the module.

(3) Air Circulation Fans

(a) Air circulation fans with controls shall be provided.

(b) The purpose is to stir air and decrease the potential for temperature differential between the vestibule and passenger area.

(c) The air circulation fans shall have manual adjustment of the airflow direction.

ii). Communications

(1) Speaker

(a) PA speaker shall be located on the central ceiling panel.

(b) The PA speaker shall have an associated mute button.

(c) The speaker used in this location shall be identical to PA speakers used in other locations in the car for ease of maintenance and replacement.

(2) Passenger Emergency Intercom

(a) Two (2) PEIs shall be located in every car as called out later in this section.

(b) The intention of this button is to notify the conductor and flag the entire train that there is an onboard emergency.

(3) All communications equipment shall meet the requirements in Chapter 14.

iii). Electrical System

(1) All electrical equipment in the entrance area shall meet the requirements in Chapter 15.

(2) Junction Box

(a) The junction box shall be located where practical and shall be presented during the design phase. It shall be easily accessible by the maintenance group.

iv). Lighting System

(1) Lighting general information is shared in detail for each area. Detailed lighting information can be found in Chapter 13.

(2) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

v). Emergency Equipment

(1) Chapter 25 details emergency equipment requirements.

(2) Smoke Detector

(a) Smoke Detectors shall be mounted on the central ceiling panel.

(b) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the car for ease of maintenance and replacement.

c). Security

i). Many items within the entrance area will need to be secured.

ii). The following items are identified with specific locking preferences:

(1) Crew access panels

(2) Boarding equipment such as ramps, transfer bridges, etc.

iii). Any other locking or security items will be discussed with Amtrak during design reviews.

d). CMF and see CMF exhibit for details

i). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic or melamine resin composite with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb, melamine resin, or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

ii). Ceilings

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

iii). Flooring

(1) Flooring within the entrance area shall be made from high traffic anti-skid flooring. Please refer to Section 11.28 for details on this flooring type.

e). Key Features

i). A comprehensive list of expected features in entrance areas is provided in Figure 11-4 and detailed below.

ii). In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design. All mechanisms described below should be durable, free from jamming, and racking. The design should meet abuse load and crash criteria. Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

Figure 11-4: Key Features - Entrance Areas

Feature	Short Description	Qty
Handholds	49 CFR 38.115 compliant handrails	4
Door Threshold	Anti-slip, color contrast, texturized flooring at door	2
Trash Bin	Trash bin with push flaps and access door	2
Panel Work	HPL panels and Tedlar style sidewall liners split horizontally into two types (See Exhibit F)	All
Passenger Information Screens	Digital display monitor (PIS/OTIS) at each door	2
Control Panel Doors	Access panels with seamless features to panel work	All access panels
Kick Strips	9” stainless steel strips	All exposed panel work
Folding Stairs/Trap Door	Steps connecting low level platforms	1
Storage for Step Stool	Storage location for step stool	1
Wheeled Mobility Device Lift	Wheeled mobility device lift for boarding	1
Crew Door Control Panel	Exposed crew controls and buttons for doors and lifts	1
Electrical Control Panel	Maintenance storage location behind access panel	1

PEI	Emergency Alert system with intercom	1

iii). Handholds

(1) Compliant handholds should be supplied on both sides of each door for low- and high-level loading heights, and at key access point along aisles.

(2) Grab bar positioning will be subject to mockup testing and Amtrak approval.

(3) Grab bar shall meet the requirements in 49 CFR 38.115. Handhold grab bars shall be made from stainless steel.

iv). Door Threshold

(1) Door threshold should have a slip-free surface and a contrasting floor color to the main entrance area flooring to mark the threshold.

v). Trash Bin

(1) Trash bins shall be provided with stainless steel push flaps.

(2) Please refer to Section 11.18 for more information on trash and recycling requirements.

vi). Panel Work

(1) Entrance areas should be designed to have well fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(2) There should be no protruding equipment, snag point, or dirt traps.

(3) Lower side wall panels shall define a material split, with the lower panel in a wood finish.

(4) All equipment storage cabinets should be accessible using a crew key with discreet locks.

vii). Hand Sanitizer Dispenser

(1) An infrared hand sanitizer dispenser shall be installed in each car in the vestibule.

(2) The dispenser shall provide a touchless and hygienic solution for dispensing hand sanitizer in public places.

(3) Infrared Sensor

(a) The dispensers shall utilize advanced infrared sensor technology for touchless operation.

(b) The IR sensor shall have an adjustable sensor range to optimize detection distance.

(4) The dispenser shall accommodate a minimum of 1000 ml of hand sanitizer.

(5) The sanitizer reservoir shall be easily refillable without the use of tools.

(6) The dispensers shall be powered via hardwired connection.

(7) The dispensing volume shall be adjustable between 1.5 ml and 3.5 ml per application.

(8) The dispensers shall be constructed using durable and easy-to-clean materials suitable for high-traffic areas and compliant with all requirements of this specification.

(9) The dispenser shall have an LED indicator for low sanitizer levels.

(10) The dispensers shall be wall-mounted and shall allow for easy removal and replacement.

(11) Dispensers shall come filled with an unscented, hand sanitizer with a minimum alcohol content of 60%.

viii). Passenger Information Screen (PIS/OTIS)

(1) Display screens should be supplied on both sides of the interior vestibule door.

ix). Control Panel Door

(1) All equipment storage cabinets should be accessible using a crew key with discreet locks.

(2) These doors should use the same front panel as the other entrance area wall paneling.

x). Kick Strip

(1) Stainless steel kick strips at 9” high should be used in all entrance areas.

xi). Trap Door and Folding Stairs

(1) Stairs shall comply with ADA standards for riser, tread, nosing and handrails.

(2) The rake of the stairs shall be maximized within these guidelines.

(3) An additional lower handrail should also be included to assist children climbing the stairs, handrails should be free from snags.

(4) See chapter 6 and 12 for details.

xii). Step Stool and Storage

(1) A step stool shall be provided which aids passenger boarding when not at a level platform. The step stool shall work at floor height at all platforms.

(2) A storage location shall be labeled and located behind an access panel with a paddle latch for a step stool.

xiii). Wheeled Mobility Device Lift

(1) A wheeled mobility device lift shall be mounted by doors on both sides of the car, where any passenger with disabilities may board.

(2) The wheeled mobility device lift mounting shall not impede on passenger ingress or egress through the doorway.

(3) Please refer to Chapter 6 and 12 for more information.

(4) Crew door controls shall be exposed for ease of access and located on a panel near the entry and exit doors of the train. Please refer to Chapter 12 for more information.

(5) Electrical control panels shall be located behind access panel doors that are operated using a square lock, or as otherwise approved by Amtrak.

xiv). PEI

(1) Intercom and alert button shall be integrated into the sidewall for emergency notification and communication. Please refer to Chapter 14 for more information.

f). Lighting

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups. Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

ii). Lighting Types and Locations

(1) Locations and sizes will be subject to review, user testing, and Amtrak approval.

(2) LED Panel Spotlights (White Lights)

(a) Small circular LED light panels shall act as spotlights above the doors, along aisles, and in the vestibule.

(b) The frame for the spotlights shall be color matched to the ceiling.

(c) Light should enhance contrast for visibility and safety.

(3) Step Lights

(a) Step lights should illuminate interior threshold during boarding.

Part VI: Coach Areas

11.30 Interior Structures – Coach Specific

a). Key Features

i). A comprehensive list of expected features of the Coach Interior structures is provided in Figure 11-5 and described in detail below.

Figure 11-5: Key Features - Coach Interior Structures

Feature	Short Description	Qty
Windows	Windows in the side wall of the car	TBD
Blinds	Blinds that cover windows	1 per window
Window Pillars	Structural member between windows	between each window
Window Masks	Cover for window installation	1 per window
HVAC Gondola	HVAC air path through the center of the car	all ceilings
Side Ceiling Panels	Lateral side ceiling panels along the curve from sidewall to ceiling panel	all ceilings
Kick Strips	9” high stainless steel strips	All wall panels
Lower Sidewall Panels	HPL sidewall liners with wood finish	All
Coat Hooks	Coat hooks that hold up to 50 lbs	2 per seat row
Luggage Shelf	Overhead luggage rack	Maximize
Reservation Screen	Passenger information screen for each seat assignment (option)	1 per seat row on each side of car

ii). General

(1) The Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

(2) All mechanisms described below should be durable, free from jamming, and racking.

(3) The design should meet abuse, load, and crash criteria outlined in CFR.

(4) Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

iii). Windows

(1) Windows shall be provided that meet the requirements of Section 11.14.

iv). Window Blinds

(1) Side window blinds shall be provided that meet the requirements of Section 11.16.

v). Window Pillars

(1) Window pillar width should be minimized.

vi). Window Mask

(1) Window mask should minimize or mask glass corners to create an architectural aesthetic.

vii). HVAC Gondola

(1) Gondola shall be designed to maximize headroom.

(2) Lighting washes both centrally into gondola and across side ceilings shall be provided.

(3) The gondola should terminate and transition to a separate lower ceiling section if any equipment or junction in the interior architecture prevents the gondola from completing a full uninterrupted run. Contractor shall present the solution at design review for review and approval.

(a) For example – where the ceiling moves around an ATR or STR.

(4) At these junctions, the gondola should terminate in a straight line with architecture that creates a visual ring at the termination point.

(5) The transition between ceiling profiles should be treated with clean and well considered intersections.

(6) These lower ceilings should have their own lighting light wells and HVAC vents.

viii). Side Ceiling Panels

(1) These side ceiling panels shall be curved to create a smooth transition from the ceiling to the back of the overhead luggage racks.

ix). Kick Strips

(1) Stainless steel kick strips at 9” high should be used in all coach areas.

x). Lower Sidewall Panels

(1) Lower side wall panels shall be provided such that the trim panel has minimized thickness to take advantage of full width of the car body.

(2) These should be designed to have well-fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(3) These panels shall define a material split, with the lower panel in a wood finish.

(4) There should be no protruding equipment, snag point, or dirt traps.

xi). Coat Hooks

(1) Coat hooks should be provided for each seated location, integrated with the luggage shelf and valance.

(2) Hooks should be easy to move if seat positions or set pitch are changed in the future.

(3) A solution where integrated coat hooks are provided at the back of the seat will also be considered and is subject to Amtrak approval during the design review process.

xii). Luggage Racks

(1) Overhead Luggage Racks shall meet the requirements of:

(a) Section 11.20: Luggage Storage – General

(b) Section 11.21: Overhead Luggage Storage

(2) The overhead luggage racks should be built in modules that align with window placements.

(3) Split lines and module length should be consistent and to visually match the window module splits.

(4) The overhead luggage racks shall be modular to create different length segments using extruded aluminum.

(5) The following elements shall be included:

(a) Back Barrier – Back of rack should prevent bags from damaging side ceiling panels.

(b) Roll stop Nosing – Nosing of luggage rack should be suitable to secure bags with a 3” restraint bar to the best extent possible.

(c) Glass Panel – Glass panel construction from safety glass to allow passengers to see bag and let light through – frosted finish or laminated with decorative film or etching pattern. The glass panel shall have protective film applied in the event of a failure that will stop shattered glass from falling on passengers.

(d) Module Dividers – Divider brackets to prevent bag slip – discreet design with no sharps, snags, or dirt traps.

(e) Blind Storage – Window blind storage should be easily accessible and discreetly hidden behind rack.

b). Lighting Requirements

i). General

(1) To the best extent possible, all lighting shall be provided via indirect lighting unless otherwise approved by Amtrak.

(2) Lighting general information is shared in the points below.

(3) Standard Coach

(a) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

ii). Lighting Types and Locations

(1) Gondola Ceiling Lighting

(a) Gondola Ceiling Lighting shall wash light from the gondola across both the central ceiling panels and the side ceiling panels.

(2) LED Panel Spotlights (White Lights)

(a) In the case where spotlights are proposed, small circular LED light panels shall act as spotlights along aisles.

(b) The frame for the spotlights shall be color matched to the ceiling.

(3) Standard Coach ONLY

(a) Compartment lighting at a fixed temperature with indirect wash lighting under each seat or seat pair shall be provided as an option.

11.31 Seats – General Ergonomics

a). Through the use of the CAESAR Database for Anthropometric Data, seat frame, cushion, and arm rests shall be designed and optimized to accommodate all passenger sizes from the 5th percentile female through the 95th percentile male in a full range of normal seating positions to the extent possible and as approved by Amtrak.

b). A human factor specialist shall be involved in all stages of the design, testing, and

review process.

i). A coach seat should provide initial comfort when first seated and then comfort over the length of passenger travel (minimum of 2 hours and maximum of 72 hours).

(1) Café Seating shall have a minimum of 2 hours and a maximum of 12 hours of comfort.

ii). It should comfortably accommodate a variety of seating postures and provide comfort when seated posture changes.

iii). Back and seat cushions shall both be custom contoured through pressure mapping analysis to minimize contact pressures through the widest possible range.

iv). Lumbar support shall accommodate all passenger profiles to the extent possible.

v). Sufficient knee space to allow for multiple seated positions for a 95th percentile male with no contact against the next seat backrest.

vi). Test rigs shall be utilized to evaluate both the initial design properties and longevity of materials, including but not limited to deflection, stiffness, thickness, material wear, and appearance.

vii). Deflection, stiffness, and thickness properties shall not decrease by more than 20% over the entire life of the cushion.

viii). Wear and appearance deterioration shall be minimized to accommodate an 8-year design life. Further detail is provided in Chapter 18.

11.32 Standard Coach Seats

a). Standard Coach Seats General

i). A modular system shall be used for seating arrangements, so Amtrak can change seat spacing, add, or delete seats in the future. This shall be accomplished without having to make any changes to the car other than moving the seats. The Contractor will submit their proposal for approval during the design review process.

ii). The standard coach seat is designed to work as pairs with four seats across the width of the train.

iii). The seat should be optimized for both day and nighttime operations.

iv). Features are included that aid in better night’s sleep or support passengers on longer journeys by maximizing comfort and available passenger space.

v). The minimum width of the seat between armrests should be 22” when arranged with a minimum aisle dimension of 22”.

vi). All seats must have a movable armrest.

vii). Braille and raised characters shall be posted at the seat's headrest edge.

viii). A single seat type may be required in smaller numbers to accommodate transfer seats, maximize capacity and fulfil requirements around accessible paths in the accessible coach car.

ix). Contractor is responsible for meeting all technical requirements for all seat types, including any potential single-seat designs.

x). All seat types are expected to be included in the mockups.

xi). Please refer to Chapter 1 for information regarding quantity of this accommodation type desired.

b). Standard Coach Seats Attachment

i). Passenger revenue seats must meet the performance requirements as defined in APTA Standard PR-CS-S-016-99, Standard for Passenger Seats in Passenger Rail Cars.

ii). This APTA Standard shall also be used as a design guideline.

iii). Seats shall be designed to provide maximum passenger comfort and safety.

iv). The seats shall be mounted on a standard adjustable seat-mounting track allowing for pedestal or pedestal wall mounting.

v). Mounting slots shall be included on the underside of the seat frame allowing for lateral adjustability so that the aisleway centerline and dimensions are consistent throughout the car with no misalignment or staggering.

vi). The seat attachment angle to the car floor shall optimize passenger knee room.

vii). HPPL signage shall be located either on the seat pedestal or seat frame.

viii). See Chapter 13 for additional details. HPPL shall not be placed on the floor to the best extent possible.

ix). Approved tamper-resistant means of connections to a subfloor cable duct for electrical supply and future audio/visual data lines shall be provided.

(1) These connections shall provide for ease of future changes in seat spacing.

x). Revenue seats shall be mounted in seat tracks on the floor and/or wall in all car types.

xi). Seat tracks shall be installed with Amtrak approval for all processes and drawings.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

xii). Between seats, the wall and floor seat tracks shall be covered with a trim suitable for the application and as flush to the floor or wall panel as practical.

(1) Alternative floor and wall seat track installation locations shall be allowed as approved by the Customer.

xiii). Seats shall be mounted to the seat tracks in accordance with the strength and crashworthiness requirements of 49 CFR Section 238.233 (a) and APTA standard PR-CS-S-016-99.

c). Standard Coach Seats Key Features

i). A comprehensive list of expected features in this type of coach seat is provided in Figure 11-6 and detailed below.

ii). In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

iii). All mechanisms described below should be durable, free from jamming, and racking.

iv). The design should meet abuse load and crash criteria.

v). Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

vi). Standard seat configuration will be all seats facing forward. The seat design shall be modular, so Amtrak can reconfigure the layout in the future.

Figure 11-6: Key Features - Standard Coach Seats

Feature	Short Description	Qty
Headrest Pillow	Adjustable portion of seat headrest	1
Privacy Wing	Protrusion on headrest to provide privacy	2
Hand Grab	49 CFR 38.115 compliant handrails	1
Reading Light	White light with adjustable lens and toggle switch	1
Seat Recline Mechanism	Sliding mechanism that attaches seat back to seat pan for recline	1
Calf Rest Pad	Cushioned pad for leg support	1
Seat Controls	Manual buttons that adjust seat configuration features	1
Folding Armrests	Arm rests that rotate upwards when stored	2
Flexible Net Pocket	Pocket at the base of the back of a seat for storage	1
On Seat Power	Outlets and USB integrated into the seat	2
Central Foot Pedestal	Support structure for a seat or pair of seats	1
Storage Strap	Small elastic band for retaining items	1

Fold Out Table	Table stored in the back of a seat	1
Cup Holders	Metal cup holder ring that folds flush with seatback	1
Device Holder	Small ledge for propping up a cell phone	1
Fold Out Footrest	Footrest that is stored in the back of a seat	1
Under Seat Lighting	Lighting shall be provided to illuminate the space under each seat	1

vii). Seat Dimensions

(1) The following seat dimensions should be used as the basis for designing the seat.

(2) Note that seat dimensions are subject to Amtrak approval during the design review and mockup review processes.

(a) Seat width between armrests – at least 20”

(b) Seat depth – at least 18”

(c) Highest point on seat pan (at knee bend) 19” from the ground

(d) Natural seat recline angle when in upright position – 105 degrees as measured from passenger facing side of seatback to passenger facing side of seat cushion.

(e) Seat pan recline – 5-7 degrees as measured from parallel to the floor.

(f) Seat pitch shall be a minimum of 42 inches.

viii). Headrest Pillow

(1) Headrest pillow should be adjustable in height to comfortably accommodate the range from 5th percentile female to 95th percentile male seated heights.

(2) It should have adjustable wings that fold outwards to adjust the width of the headrest while also providing lateral support for the head when the passenger is resting or sleeping in an upright seated position.

ix). Privacy Wing

(1) Privacy wing on the seats should provide good separation between passengers at head level and be wide enough and high enough as not to impact shoulder width for taller passengers.

x). Hand Grab

(1) Every aisle seat should have a compliant accessible grab for better access along the aisle.

(2) Grab bar positioning will be subject to mockup testing and Amtrak approval.

(3) Grab bar shall meet the requirements in 49 CFR 38.115.

xi). Reading Light

(1) Seats should include a reading light that is positioned so as not to disturb neighbor during nighttime hours.

(2) Passengers should be able to adjust the lighting angle to cast light over the shoulder and into the lap or at a position suitable to read a book at night.

(3) Light intensity should have three settings.

xii). Seat Recline Mechanism

(1) Seat recline mechanism should allow the seat pan to slide forwards so as not to burden the full recline onto the passenger behind in addition to reclining the seat back.

(2) It should be easy to use by people of all abilities and shall not require more than 3 lbf to adjust or operate.

(3) The mechanism should be durable and rattle free. It should be free from finger traps.

xiii). Calf Rest Pad

(1) Calf-rests tilt up for optimal leg support and comfort. Angle and width to be optimized as part of a detailed human factors study.

(2) The calf rest should be integral to the seat pan to avoid seat pinch.

xiv). Seat Controls

(1) Seat controls for recline and leg rest should be located within easy reach of a customer – for example, on the inner side of the outside armrests.

(2) It should be possible to control the seat back recline and the calf rest independently.

(3) The seat controls should be intuitive, easy to use by people of all abilities, and shall require 3 lbf or less to operate.

xv). Folding Armrests

(1) 2” wide armrest shall include a soft wrap around the top for comfort and a hard-wearing bottom wrap and side cap for durability.

(2) Armrests should be included on both sides of the seat and in between a seat pair.

(3) Armrest should fold flush or sub flush to the front surface of the seat back.

xvi). Flexible Net Pocket

(1) A storage pocket should be provided on the back of the seat.

(2) A semi-rigid frame with a net suitable for passengers to stow personal items or for Amtrak literature.

(3) The net should be durable and allow a clear view of the items placed inside to aid quick and easy cleaning routines.

(4) The design should allow for this element to be quickly and easily replaced on the train.

xvii). On-Seat Power

(1) Two USB ports should be provided on the back of each of the seats.

(2) Two duplex plug sockets should be located on the seat pedestal. Sockets should be shielded from spills from the table or cup holder.

xviii). Central Foot Pedestal

(1) A central seat pedestal should be positioned to maximize foot clearance.

(2) Interface with the floor should allow easy cleaning.

xix). Storage Strap

(1) Behind the fold down table a ledge and elastic restraint band suitable to allow customers to simply store smart phones and other personal items behind table.

(2) The band should be durable and easily replaceable.

xx). Fold Out Table

(1) A fold out table should be provided on each seat back. The fold out tray table in all positions shall be operable with one hand using 5lbf or less.

(2) The table shall have an independent pivot point so that its resting position will not be impacted by the recline of the seat in front.

(3) The latch design should prevent accidental activation, and the table should be free from rattle when either stored or fully deployed.

(4) The table should be able to extend forwards telescopically.

(5) The usable surface should allow people to use a 15” laptop – even when the seat in front of the passenger is fully reclined.

(6) The mechanism should be durable and rattle free.

(7) It should not extend accidentally.

(8) When the table is deployed it shall be able to support a 50 lbf point load on the end of the table without damage.

xxi). Cup Holders

(1) A metal cup holder should be positioned on the back of the seat.

(2) Cup holders should be placed in positions outside of knee and leg clearance and free from the movement of the seat.

(3) The cupholder should be an open clasp design capable of storing and securing cups of various diameters.

(4) It should be designed to prevent passing passengers getting snagged.

xxii). Device Holder

(1) A fold out ledge with clip should allow the secure mounting of passengers’ personal devices.

(2) The clip should be sprung and adjustable so different sizes can be securely kept in place including a typical tablet and/or a smartphone.

(3) The angle should be set so it is usable in both recline and upright positions.

(4) The latch should be designed in such a way to prevent accidental activation.

xxiii). Fold out Footrest

(1) A fold-out adjustable footrest should be provided.

(2) There should be three set positions, and the footrest should have a degree of angle adjustment.

(3) The size and positions should be defined by a detailed human factors study.

xxiv). Under Seat Lighting

(1) Lighting shall be provided to illuminate the space under each seat.

d). Standard Coach Seats Functional Elements

i). Seat Recline of 20 degrees

(1) Recline features

(a) When seats are fully reclined there shall be at least 7” of knee clearance for a 95th percentile male between the back of the seat in front of the passenger and his knees.

(b) The recline features shall be operated manually:

(i) The seatback shall recline

(ii) The seat pan shall slide forward

(iii) The calf rest shall extend forward to raise the legs

(iv) The footrest shall be able to be folded out

ii). Seat Rotation (OPTION)

(1) As an option, Amtrak shall be able to elect to have a manual rotation feature for each of the seats in standard coach.

(2) If option is exercised, the seats shall all be installed facing the same direction on both sides of the aisle.

(3) Seats should have the capability to rotate at the end of the line so that all seats are facing the opposite direction.

(4) This rotation would be manually performed by Amtrak staff.

(5) Each seat bench should be able to be rotated in less than 30 seconds and shall lock in place.

(6) A visual indicator of the seat being properly secured shall be provided.

(7) Any seat not fully locked into place shall send an alert to the conductor for inspection.

(8) The controller shall report alerts and faults to the car diagnostic system. See Chapter 24 for additional information.

e). Standard Coach Seats – Emergency Window Access

i). Seats shall not obstruct emergency windows and, to the extent possible, shall be arranged to optimize passenger access to window views.

f). Standard Coach Seats CMF

i). Please refer to Exhibit F for further information.

ii). All colors, cushions, fabrics, and appearance shall be as directed by Amtrak. All revenue passenger seats shall share the same common design appearance.

iii). Individual components shall be interchangeable wherever possible.

iv). They shall have a profile that is free of sharp corners and edges.

v). All seat coverings shall use synthetic leather.

vi). Arm rests, if upholstered, shall use the same covering as the seats.

vii). Final construction of the cushions including sewing and fire blocking shall be subject to the approval of Amtrak.

11.33 Café Seating

a). Booth Seating

i). Arrangement and Dimensions

(1) A repeatable booth module of back-to-back seating shall be provided in the Café.

(2) Booths should be 2x2 across the aisle.

(3) Seats shall be mounted to the seat tracks in accordance with the strength and crashworthiness requirements of 49 CFR Section 238.233 (a) and APTA standard PR-CS-S-016-99 as applicable.

(4) Seat width shall be maximized with a minimum acceptable dimension of 40” wide for a seat suitable for two passengers.

(5) To achieve a 32” accessible path between Café seats the side wall detail/clearance will need to be minimized and tolerances will need to be tightly controlled.

(6) Seat pan height shall be between 18” and 19” with a seat pan depth of no less than 18”.

(7) Seat back height from finished floor should be a minimum of 38” with a higher divider no lower than 44”.

(8) All seat dimensions, cushion density/ shore hardness will be subject to mock-up review, testing and approval by Amtrak.

(9) Booths shall be located on either side of a table in the Cafe.

(10) The table shall be centered in the window alignment.

(11) The privacy dividers in each booth shall align with the window pillars in a repeating 81” pitch.

ii). Under-Seat Storage

(1) Each booth seat shall be designed such that under the seat cushion there is a storage compartment for crew and cafe emergency storage items.

(2) The access to these seats should not impact the seat comfort or aesthetic.

(3) The actions required to access to the storage location should take the average person under 30 seconds.

iii). Seat Cushions

(1) Booth seat cushions should be contoured to aid seat comfort.

(2) Seat cushions shall provide ergonomic support in the following locations: back support, seat back and seat pan pillowing.

(3) Cushioning, seat trim, and detailing will be evaluated during the design review process.

iv). Pedestals

(1) Booth seats shall be mounted on a pedestal that is seamless with the floor, with no dirt traps, or protruding edges.

(2) Pedestals shall be undercut from the seat base to provide a floating seat aesthetic.

v). Materials

(1) The seat structure should be finished with high-quality, hard-wearing laminates and veneers.

(2) Laminate edges shall be protected with delicate trim details.

vi). Amtrak Approval

(1) Booth seating details shall be presented for Amtrak approval during the PDR.

(2) Final seat configuration and comfort shall be subject to Amtrak approval based on documentation and mockup information presented by the Contractor.

b). Table Module

i). A repeatable ‘workstation’ table module shall be used in the Cafe.

ii). A high-quality table surface should be used and shall have a protective edge trim detail.

iii). Split lines should be managed to a high tolerance and sealed to create a flush finish and prevent any potential dirt build up in edges.

iv). A minimum usable table length of 32” shall be provided.

v). Access in and out of the seat should be evaluated carefully. A tapered leading edge may be required to aid access to the seat.

vi). Top of table surface should be between 27” and 28” while also allowing 3” clearances in height for the legs for a 95th percentile male.

vii). Table leg location shall be positioned as to not provide a knee clash for passengers.

viii). All table dimensions will be subject to mock-up review, testing and approval by Amtrak.

ix). A fixed workstation table shall be provided compliant with APTA Standard PR-CS-S-018-13.

x). Although APTA Standard PR-CS-S-018-13 excludes cafe tables, it shall apply for the purposes of this Contract.

xi). Energy absorption features shall be built into the workstation table and/or its attachments such that human injury criteria for the 50th percentile HIII male ATDs are not exceeded during dynamic sled testing, per the requirements specified in APTA Standard PR-CS-S-018-13, Section 5.2.1, modified for testing with a workstation table installed.

xii). The table must meet the performance requirements specified in Section 5.2.1.3 of APTA Standard PR-CS-S-018-13.

xiii). The table must not become detached from its mountings and the ATDs must remain compartmentalized between the table and the launch seat.

xiv). Workstation tables shall be attached to the carbody via the wall seat track and to the floor seat track.

c). Accessible Table

i). Provisions for integrating a new accessible table or changing the booth table at the accessible space location shall differ from the standard booth table but shall meet the same strength requirements.

ii). In order to utilize the space to its full extent, fold down seats may be incorporated.

iii). In this instance, the accessible space shall also include a fold out seat from the side wall in this location so that if a person using a wheeled mobility device is not occupying the space, another passenger can opt to utilize the area instead.

d). Folded Wheeled Mobility Device Storage

i). A storage space for two folded wheeled mobility devices shall be located next to the transfer seat a for passengers wishing to transfer to another seat.

e). Accessible Space

i). Provisions for two accessible spaces with RVAAC compliant dimensions shall be provided.

ii). The accessible space shall also include a fold out seat from the side wall in this location so that if a person using a wheeled mobility device is not occupying the space, another passenger can opt to utilize the area instead.

f). Café Coach Style Seating (Option)

i). A modular system shall be used for seating arrangements, so Amtrak can change seat spacing, add, or delete seats in the future. This shall be accomplished without having to make any changes to the car other than moving the seats. The Contractor will submit their proposal for approval during the design review process.

ii). Generally, the passenger fixed seats shall be arranged to face the center of the seating area, with a worktable provided at the center facing pair of seats. The minimum distance between the two facing seats bottom cushion faces shall be 20 inches in the non-reclined position.

iii). All passenger revenue seating locations with Standard Coach seating shall use a fixed (non-rotating) reclining passenger seat. The predominant revenue seating arrangement shall be a central aisle with a 2 plus 1 seating configuration with a minimum seat pitch 42 inches.

iv). A comprehensive list of features for the Standard Coach seat is described in this chapter

v). A single seat type may be required in smaller numbers to accommodate transfer seats, maximize capacity and fulfil requirements around accessible paths.

vi). Contractor is responsible for meeting all technical requirements for all seat types, including any potential single-seat designs.

vii). All seat types are expected to be included in the mockups.

viii). Please refer to Chapter 1 for information regarding quantity of this accommodation type desired.

ix). Additional specifics regarding seats, seat pitch, seat fabrics and other details shall be discussed during Design Review. The seat attachment angle to the car floor shall optimize passenger knee room

11.34 Premium Coach Seats

a). General

i). Premium Coach seats shall only be installed in the Premium Accessible Coach.

ii). The Premium Coach seat is designed as an enhanced coach product. The seat shall be arranged 2x1 across a 32” accessible aisle.

iii). The seat should be optimized for both day and nighttime operations.

iv). Features are included that aid a better night’s sleep or support passengers on longer journeys by maximizing comfort and available passenger space.

v). The minimum width of the seat between armrests should be 22” when arranged with a 32” aisle.

vi). The minimum seat pitch shall be 48”.

b). Attachment

i). Passenger revenue seats must meet the performance requirements as defined in APTA Standard PR-CS-S-016-99, Standard for Passenger Seats in Passenger Rail Cars.

ii). This APTA Standard shall also be used as a design guideline.

iii). Seats shall be designed to provide maximum passenger comfort and safety.

iv). The seats shall be mounted in standard adjustable seat-mounting track allowing for pedestal or pedestal wall mounting.

v). Mounting slots shall be included on the underside of the seat frame allowing for lateral adjustability so that the aisleway centerline and dimensions are consistent throughout the car with no misalignment or staggering.

vi). The seat attachment angle to the car floor shall optimize passenger knee room.

vii). HPPL signage shall be located either on the seat pedestal or seat frame.

viii). HPPL charging shall be accomplished by local backlighting and not dependent on other interior light fixtures. See Chapter 13. HPPL shall not be placed on the floor.

ix). Approved tamper-resistant means of connections to a subfloor cable duct for electrical supply and future audio/visual data lines shall be provided.

(1) These connections shall provide for ease of future changes in seat spacing.

x). A provision for restraining two child retention seats per car as detailed by Amtrak during design review shall be provided.

xi). Revenue seats shall be mounted in seat tracks on the floor and/or wall in all car types.

xii). Seat tracks shall be installed with Amtrak approval for all processes and drawings.

xiii). Between seats, the wall and floor seat tracks shall be covered with a trim suitable for the application and as flush to the floor or wall panel as practical.

(1) Alternative floor and wall seat track installation locations shall be allowed as approved by Amtrak.

xiv). Seats shall be mounted to the seat tracks in accordance with the strength and crashworthiness requirements of 49 CFR Section 238.233 (a) and APTA standard PR-CS-S-016-99.

c). Key Features

i). A comprehensive list of expected features of the premium coach seats is provided in **Error! Reference source not found.** and detailed below.

ii). Detailed functional requirements for each feature are listed below.

iii). In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

iv). All mechanisms described below should be durable, free from jamming, and racking. The design should meet abuse load and crash criteria.

v). Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

vi). Seat Dimensions

(1) The following seat dimensions should be used as the basis for designing the seat (see **Error! Reference source not found.**).

(a) Seat Width: at least 22”

(b) Seat Depth: at least 20”

(c) Seat Pitch: at least 48”

(d) Highest Point on Seat Pan (at knee bend): 19” from the ground

(e) Natural Seat Recline Angle when In Upright Position: 105 degrees as measured from passenger facing side of seatback to passenger facing side of seat cushion

(f) Seat Pan Recline: 5-7 degrees in full upright position as measured from parallel to the floor.

(g) Seat dimensions are subject to Amtrak approval during the design review and mock-up review processes.

Figure 11-7: Key Features – Premium Coach Seat

Feature	Short Description	Qty
Headrest Pillow	Adjustable portion of seat headrest	1
Privacy Wing	Protrusion on headrest to provide privacy	2
Hand Grab	49 CFR 38.115 compliant handrails	1
Reading Light	White light with adjustable lens and toggle switch	1
Seat Recline Mechanism	Sliding mechanism that attaches seat back to seat pan for recline	1
Calf Rest Pad	Cushioned pad for leg support	1
Seat Controls	Manual buttons that adjust seat configuration features	1
Sliding Armrests	Arm rests that slide beneath the seat pan when stored	2
Flexible Net Pocket	Pocket at the base of the back of a seat for storage	1
On Seat Power	Outlets and USB integrated into the seat	2
Central Foot Pedestal	Support structure for a seat or pair of seats	1
Fold Out Table	Bifold table attached to seat armrest	1
Cup Holders	Metal cup holder ring that folds flush with seatback	1
Device Holder	Small ledge for propping up a cell phone	1
Fold Out Footrest	Footrest attached to calf rest pad that can be telescopically extended	1

vii). Headrest Pillow

(1) Headrest pillow should be adjustable in height to comfortably accommodate the range from 5th percentile female to 95th percentile male seated heights.

(2) It should have adjustable wings that fold outwards to adjust the width of the headrest while also providing lateral support for the head when the passenger is resting or sleeping in an upright seated position.

viii). Privacy Wing

(1) Privacy wing on the seats should provide good separation between passengers at head level and be wide enough and high enough as not to impact shoulder width for taller passengers.

ix). Hand Grab

(1) Every aisle seat should have a compliant accessible grab for better access along the aisle.

(2) Grab bar positioning will be subject to mockup testing and Amtrak approval. Grab bar shall meet the requirements in 49 CFR 38.115.

(3) With rotating seats (Option) hand grabs will need to be located on both sides of the seat.

x). Reading Light

(1) Seats should include a reading light that is positioned so as not to disturb neighbor during nighttime hours.

(2) Passengers should be able to adjust the lighting angle to cast light over the shoulder and into the lap or at a position suitable to read a book at night.

(3) Light intensity should have three settings.

xi). Seat Recline Mechanism

(1) Seat recline mechanism should allow the seat pan to slide forwards so as not to burden the full recline onto the passenger behind in addition to reclining the seat back.

(2) It should be easy to use by people of all abilities.

(3) The mechanism should be durable and rattle free.

(4) It should be free from finger traps.

xii). Calf Rest Pad

(1) Calf-rests tilt up for optimal leg support and comfort.

(2) Angle and width to be optimized as part of a detailed human factors study.

(3) The calf rest should be able to be operated independently from the seat pan.

xiii). Seat Controls

(1) Seat controls for recline and leg rest should be located within easy reach of a customer - for example on the inner side of the outside armrests.

(2) It should be possible to control the seat back recline and the calf rest independently.

(3) The seat controls should be intuitive to use by people of abilities and shall require 3 lbf or less to operate.

xiv). Armrests

(1) 2” wide armrest shall include a soft wrap around the top for comfort and a hard-wearing bottom wrap and side cap for durability.

(2) Armrests should be included on both sides of the seat and in between a seat pair.

(3) The aisle armrest on transfer seats must slide or fold out of the way to provide an unobstructed approach to the seat pan so a person using a wheeled mobility device can complete a successful side transfer.

(4) It is acceptable that a design that uses a folding armrest is adopted for dedicated transfer seats.

xv). Flexible Net Pocket

(1) A storage pocket should be provided on the back of the seat.

(2) A semi-rigid frame with a net suitable for passengers to store personal items or for Amtrak literature.

(3) The net should be durable and allow a clear view of the items placed inside to aid quick and easy cleaning routines.

(4) The design should allow for this element to be quickly and easily replaced on the car.

xvi). On-Seat Power

(1) Two USB ports should be provided on the back of each of the seats.

(2) Two duplex plug sockets should be located on the seat pedestal. Sockets should be shielded from spills from the table or cup holder.

xvii). Central Foot Pedestal

(1) A central seat pedestal should be positioned to maximize foot clearance.

(2) Interface with the floor should allow easy cleaning.

xviii). Fold Out Table

(1) An airline style bi-fold table should deploy from central console.

(2) The usable surface should allow people to use at least a 15” laptop.

(3) The table should also be able to track forward and back when deployed.

(4) The mechanism should be durable and rattle free.

(5) The size and resting position will be subject to mockup review, testing, and Amtrak approval.

(6) When the table is deployed it shall be able to support a 50lbf point load on the end of the table without damage.

xix). Cup Holders

(1) A fold out metal cup holder on each seat should be deployed from central console.

(2) It should be positioned within easy reach of the passenger.

(3) Cup holders should store in a position free from the movement of the seat and outside of knee and leg room.

(4) The cupholder should be capable of storing and securing cups of various diameters.

(5) It should be designed to prevent passing passengers getting snagged.

xx). Device Holder

(1) A fold out ledge with clip should allow the secure mounting of passengers' personal devices.

(2) The clip should be sprung and adjustable so different sizes can be securely kept in place including a typical tablet and/or a smart phone.

(3) The angle should be set so it is usable in both recline and upright positions.

(4) The latch should be designed in such a way to prevent accidental activation.

xxi). Fold out Footrest

(1) A fold out adjustable footrest should be provided.

(2) There should be three set positions and the footrest should have a degree of angle adjustment.

(3) The footrest should be durable to prevent damage is passengers misuse (e.g. step on accidentally while climbing in to aisle from window).

(4) The size and positions should be defined by a detailed human factors study.

d). Functional Elements

i). Seat Recline to Lazy Z

(1) Recline features- when seats are fully reclined there shall be at least 8" of knee clearance and 2" of foot clearance for a 95th percentile male between the back of the seat in front of the passenger and his knees.

(2) The recline features shall be operated manually:

(a) The seatback shall recline

(b) The seat pan shall recline to raise the knees upwards

(c) The calf rest shall extend forward to raise the legs

(d) The footrest shall be able to be folded out and adjust in length to support the feet

ii). Seat Direction

(1) The seats shall be installed all facing the same direction the right and left sides of the aisle.

(2) As an Option, rotation features shall be included for the premium seats.

(a) Seats should have the capability to rotate at the end of the line so that all seats are facing the opposite direction.

(b) This rotation would be manually performed by Amtrak staff.

(c) Each seat bench should be able to be rotated in less than 30 sec and shall lock in place.

(d) A visual indicator of the seat being properly secured shall be provided.

(e) Any seat not fully locked into place shall send an alert to the conductor for inspection.

(f) The controller shall report alerts and faults to the car diagnostic system. See Chapter 24 for additional information.

e). Emergency Window Access

i). Seats shall not obstruct emergency windows and, to the extent possible, shall be arranged to optimize passenger access to window views.

f). CMF

i). Please refer to the attached CMF document (Exhibit F) for the exact color, material, and finishes desired in this sleeper cabin area. Please also refer to chapter 19.

ii). All colors, cushions, fabrics, and appearance shall be as directed by Amtrak.

iii). All revenue passenger seats shall share the same common design appearance.

iv). Individual components shall be interchangeable wherever possible.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

v). They shall have a profile that is free of sharp corners and edges.

vi). All seat coverings shall use synthetic leather.

vii). Arm rests, if upholstered, shall use the same covering as the seats.

viii). Final construction of the cushions including sewing and fire blocking shall be subject to the approval of Amtrak.

11.35 Accessible Seating Spaces for Wheeled Mobility Users

a). Passengers who wish to transfer from wheeled mobility device

i). Designated transfer seat positions shall be reserved for passengers who wish to transfer from their wheeled mobility devices into a standard coach seat.

ii). Each transfer seat shall be of identical design and appearance to the other passenger seats.

b). Passengers who wish to remain in wheeled mobility device

i). Standard Coach shall have one RVAAC compliant accessible space. The car seating shall be modular with the ability to add one more accessible space.

ii). Premium Accessible Coach shall have three RVAAC compliant accessible spaces. The car seating shall be modular with the ability to add one more accessible space.

iii). Designated spaces shall be reserved for passengers who wish to remain in their wheeled mobility device.

iv). Each designated space shall include the features described for a seated standard coach passenger. This includes the following features:

(1) Reading Light

(a) Seating spaces should include a reading light that is positioned so as not to disturb neighbor during nighttime hours.

(b) Passengers should be able to adjust the lighting angle to cast light over the shoulder and into the lap or at a position suitable to read a book at night.

(c) Light intensity should have three settings.

(2) Flexible Net Pocket

(a) A storage pocket should be provided adjacent to the seating space.

(b) A semi-rigid frame with a net suitable for passengers to store personal items or for Amtrak literature.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(c) The net should be durable and allow a clear view of the items placed inside to aid quick and easy cleaning routines.

(d) The design should allow for this element to be quickly and easily replaced on the train.

(3) Seat Power

(a) Two USB ports should be provided adjacent to each of the seats.

(b) Two duplex plug sockets should be accessible by a seated passenger. Sockets should be shielded from spills from the table or cup holder.

(4) Cup Holders

(a) A fold out metal cup holder at each seating space should be deployed and positioned within easy reach of the passenger.

(b) Cup holders should store in a position free from the movement of the seat and outside of knee and leg room.

(c) The cupholder should be capable of storing and securing cups of various diameters.

(d) It should be designed to prevent passing passengers getting snagged.

(5) Device Holder

(a) A fold out ledge with clip should allow the secure mounting of passengers' personal devices.

(b) The clip should be sprung and adjustable so different sizes can be securely kept in place including a typical tablet and/or a smart phone.

(c) The angle should be set so it is usable in both recline and upright positions.

(d) The latch should be designed in such a way to prevent accidental activation.

(6) Adjustable Workstation Table

(a) ADA compliant and adjustable height workstation table between 27" and 34" shall be provided for all wheeled mobility spaces.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part VII: Restrooms

11.36 Restrooms – General

a). General

i). Restrooms shall comply with water and waste system equipment requirements detailed in Chapter 15.

ii). The highest levels of winterization protection in the design of the toilet room shall be provided.

iii). Accessibility requirements for labeling in the restroom from Chapter 26 shall be followed. Please also reference signage from Section 11.6.

iv). All parts of the toilet room and associated water and waste piping shall have complete maintenance access provided to all components.

v). All toilet room fixtures, dispensers and appliances shall be constructed in accordance with the requirements of the US Public Health Service and 21 CFR Part 1250 requirements and ATR shall meet the ADA requirements of 49 CFR Part 38.123.

vi). Complete details of the toilet room, including maintainability analysis and winterization details, shall be presented for Amtrak approval during design review, and they shall be included in the interior mock-ups.

vii). The accessible toilet room and standard toilet room should be in the vestibule area, separated from the coach seating area by the vestibule door.

b). Floor Pan

i). The floor pan of the toilet room modules shall be FRP with 1.5 in. minimum radii corners to eliminate the accumulation of debris and aid in cleaning.

(1) A stainless-steel overflow pan shall be provided under the toilet and water connections.

(2) A waterproof rubber flooring covering which reduces noise and resists accumulation of odors shall be provided.

(3) The purpose is to prevent fluids from wicking beneath the toilet room flooring, both for hygiene and to prevent degradation of the subflooring materials.

(4) This pan shall be watertight and have raised edges of at least 4 in. in height. The pan’s exposed edges shall be folded for safety and to provide stiffness.

(5) The floor pan shall be installed over the subfloor of the car, and the perimeter of the pan shall be fully sealed to prevent moisture from seeping under the pan.

(6) Attachment points to secure the floor pan to the subfloor shall be in the sides, rather than the bottom surface, and be watertight. The floor pan joint at the door opening shall be waterproof to the subfloor.

(7) Floor penetrations shall be avoided, when possible, but where required, sealed to make the joint waterproof and with an appropriate material to prevent flame propagation from underfloor flame sources.

c). Floor Covering

i). A seam-free, skid-resistant rubber floor covering, solid surface material, or approved coating shall be used in the toilet room floor area.

ii). Color and pattern selection shall be approved by Amtrak.

(1) The floor covering shall be coved a minimum 4 in. up the sidewalls to form the inside scuff/kick plate.

(2) The edges shall be sealed to form a watertight seal.

d). Drainage

i). A provision shall be provided for a floor drain in the toilet room pan that shall be reviewed with Amtrak during Design Review.

(1) The floor shall be properly sloped toward the drain, preferably located near the toilet and an intumescent device shall be utilized to seal the drain in case of a fire, or alternate approved design.

e). Attachment Strength of Fittings

(1) The fittings in toilet rooms shall meet the attachment strength requirements defined in 49 CFR Part 238.233.

f). CMF

i). Please refer to Exhibit F for further information.

ii). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic or thermoset material with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iii). Ceiling

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

iv). Flooring

(1) Flooring within the restroom area shall be made from rubber flooring with a friction, no-slip texture.

(2) Flooring will be durable to withstand spills, leaks, and all methods of cleaning. Flooring shall also not become frequently damaged or worn.

(3) Flooring shall have enough give to prevent fatigue from standing.

11.37 Standard Toilet Room (STR)

a). General

i). The STR shall have the ability to be used in two orientations.

ii). A modular design that allows different door positions should provide flexibility for the layout of the interior architecture.

iii). The orientation should always prioritize seats and passenger accommodation numbers where possible, while providing options for better aisle access in other instances.

iv). To the extent possible equipment, parts, and features in the STR shall be identical to equipment, parts, and features in the ATR.

v). The intent of this clause is to minimize spares and maintenance techniques.

b). Key Features

i). A comprehensive list of expected features in the Standard Toilet room is provided in Figure 11-8 and described in detail below.

ii). Detailed functional requirements for each feature is listed below. In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Figure 11-8: Key Features – Standard Toilet Room

Feature	Short Description	Qty
Restroom Door	Sliding door for entrance into STR	1
Toilet	Assembly including toilet bowl, shroud, and overflow pan	1
Toilet Seat	Assembly including lid and seat for toilet	1
Toilet Flush	Push button flush and automatic flush mechanisms	1
Toilet Paper Dispenser	Protective location for dispensing toilet paper	1
Toilet Seat Cover Dispenser	Protective location for dispensing seat covers	1
Sanitary Waste	Storage location for used feminine hygiene products	1
Sharps Bin	Storage location for used needles and other medical waste	1
Sink	Solid surface sink counter and basin	1
Hand Dryer	Automatic hand dryer and paper towel dispenser	1
Vanity Mirror	Mirror for passenger to look while washing hands	1
Trash	Storage for restroom related trash	1
Grab Handles	49 CFR 38.115 compliant handrails	1
Baby Changing Table	Fold out table for infant diaper care	1
Crew Storage	Locker with square key for dedicated crew storage	1
Coat Hooks	Coat hooks that hold up to 25lbs	2
PEI- Intercom only	Speaker for emergency conversations	1
Emergency Call Button	Buttons in accessible locations that activate PEI	2
Exhaust	Adjustable exhaust grille	1

iii). Restroom Door

(1) The door should be sealed to prevent leaking water escaping into the internal space of the car.

(2) The door should lock from the inside, with an indicator on the outside showing the door lock status.

(3) The clear width door opening shall be a minimum of 24”.

(4) The door shall be of lightweight construction, consistent with durability and be secured with stainless-steel hinges.

(5) The door shall be free from resonance and rattles when in the closed position when the train is in motion at any permissible speed.

(6) The door frame and attachment of the keeper shall be sufficiently rigid so that it does not flex when the door closes, even if it is slammed; the intention is that this interface does not deteriorate over the life of the car.

(7) Likewise, interior door construction shall incorporate interior stiffening in the area where the lock/ latch is attached to the door, so that the fasteners securing it to the leaf have a solid surface on which to clamp.

(8) The door latch, with a handle on both sides of the door, shall engage automatically when the door moves towards a closed position, but the lock requires definite action to engage.

(9) The door shall remain in the fully closed position at any permissible train speed.

(10) The lock shall be operable, in an emergency, from the outside with a standard Amtrak coach key.

(11) An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

iv). Toilet

(1) An elongated toilet, complete with toilet bowel assembly, shroud, and overflow pan shall be provided in the restroom.

(2) Toilet Bowl Assembly

(a) A toilet stand with shroud assembly shall be located in the toilet room. Each restroom shall be equipped with a toilet bowl assembly, encased in the toilet shroud.

(3) Toilet Shroud

(a) The shape of the toilet shroud housing shall locate the toilet seat ergonomically for ease of use and comfort.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(b) Sufficient foot room shall be provided.

(c) When seated, the user's legs shall not contact the shroud.

(d) The toilet shroud shall be constructed of FRP with gel coat color to match the restroom shell or of stainless steel, with brushed finish or approved alternate.

(4) Toilet Overflow Pan

(a) The toilet bowl assembly shall be mounted on a stainless-steel overflow pan, which shall contain flooding should the toilet outlet become blocked or system leak.

(b) The overflow pan shall be watertight with raised edges of ~2 inches height, have the attachment points exterior to the pan, have all exposed edges folded for safety and to provide stiffness, and be equipped with an overflow tube.

v). Toilet Seat

(1) A standard toilet seat and toilet lid shall be provided.

(2) Toilet seat and seat lid should have soft close mechanisms.

(3) A white toilet seat with lid, meeting Amtrak Specification # 352, shall be provided.

(4) The toilet seat and cover shall be constructed of reinforced fiberglass or approved alternate.

(5) The lid and seat shall be stable in the up position regardless of train motion, including braking, to prevent it from slamming down suddenly against the shroud.

vi). Toilet Flush Mechanism

(1) A two-button push flush shall be located on the back wall of the restroom above the toilet.

(2) This shall provide standard and eco-flush features for the passenger.

(3) The flush mechanism shall also incorporate an automatic flushing feature when the passenger is done using the toilet.

vii). Toilet Paper Dispenser

(1) A toilet paper dispenser shall be provided adjacent to the toilet.

(2) This dispenser shall protect the toilet paper from getting wet.

viii). Toilet Seat Cover Dispenser

(1) A dispenser for paper toilet seat covers should be located by the toilet.

ix). Sanitary Waste Disposal

(1) A sanitary waste bin shall be provided to the right of the toilet complete with modesty flap. The minimum volume for this bin shall be 7 gallons.

x). Sharps Bin

(1) Provision for a sharps bin should be provided within the room.

(2) The size, position, and method of removal of sharps should be agreed and instructed by Amtrak.

xi). Sink

(1) General

(a) A solid surface sink with hot and cold water faucet shall be provided for passengers.

(b) The sink countertop shall be made from solid surface material and shall include a marine edge, 6” backsplash, and ¾” radius for cleanability.

(c) Note that all sink countertops shall be sloped toward the basin and drain.

(2) Sink Basin

(a) The sink basin shall have minimum internal dimensions of 18" width x 10" length x 5" depth.

(b) The sink shall have a 1/2 to 1 gallon capacity and be equipped with an overflow.

(c) The sink shall be drained through a nominal 1-1/4” diameter drain.

(3) Faucet

(a) The faucet shall be mounted behind the sink.

(b) The faucet shall use IR sensor to control water dispensing.

(c) Water flow from the faucet shall be aligned directly over the drain to not splash the user and/or countertop.

(d) Faucet shall be hardwired for power with a battery backup.

(4) Soap Dispenser

(a) An automatic liquid soap dispenser which will accept a Celeste Industries liquid soap refill shall be installed and shall be located adjacent to the mirror.

(b) Power for the soap dispenser shall be hardwired with a battery backup.

(5) 120V Outlet

(a) A duplex 120VAC GFCI receptacle shall be located on a panel adjacent the sink, preferably located to keep it dry from splashes from the sink.

xii). Hand Dryer

(1) A high velocity motion-activated hand dryer and a paper towel holder shall be mounted on the wall near the sink in an easily accessible location.

xiii). Vanity Mirror

(1) A large 41.5” x 23” mirror shall be positioned in front of the sink. The mirror can be split into two sections as necessary.

xiv). Trash

(1) A trash bin shall be provided under the sink with push flap cover.

(2) The minimum volume of trash for this receptacle shall be 2 cu ft.

(3) The trash flap for this receptacle shall be a minimum of 10” x 10”.

xv). Grab Handles

(1) Stainless-steel grab bars shall be provided on one side of the restroom to allow passengers to steady themselves against train motion.

(2) Bars shall be directly secured to car secondary structure or module structure.

(3) These bars shall be anti-slip grab bars in accordance with Subpart F of 49 CFR Part 38.123 (a) (3) shall be provided for passengers to utilize while using the facility.

xvi). Baby Changing Table

(1) A baby-changing table should be provided.

(2) The changing table should be easy to deploy and stow with an intuitive handle. The table shall include a strap to ensure passengers with limited reach can operate the table.

(3) The mechanism should be durable, free from jamming and racking.

(4) The design should meet abuse loads.

(5) It should have a soft opening mechanism.

xvii). Crew Storage

(1) A crew storage cabinet shall be provided at high elevations in the restroom for storage of restroom and cleaning supplies.

xviii). Coat Hooks

(1) Two coat hooks shall be provided on the partition wall. Coat hooks shall be capable of supporting up to 25lbs each.

xix). Emergency Call Button

(1) Two waterproof Emergency Call Buttons shall interface with the Passenger Emergency Intercom (PEI) in the toilet room.

(2) The Emergency Call Buttons are providing better access for passengers if they are not able to reach the PEI unit.

(a) The Emergency Call buttons shall have illuminated and audible indications when actuated.

(b) One Emergency Call button shall be located within easy reach while seated on the toilet and not easily confused with the flush button or other controls.

(c) A second button located within 12 inches from the floor or otherwise reachable for someone who has fallen.

(d) Placement of the buttons is subject to approval during design review.

(3) The PEI in the toilet room shall interface with the Emergency Call Buttons.

(a) The PEI and Emergency Call button arrangement, including the interfaces used between them, must maintain the same safety level and a standalone PEI.

(b) The PEI and Emergency Call Buttons must remain functional under any toilet module degraded mode condition.

(c) See Chapter 14 for additional details.

xx). Exhaust

(1) An exhaust grille shall be provided in the ceiling.

(2) Negative pressure in the restroom shall be provided by the HVAC system.

c). Additional Equipment Requirements

i). HVAC

(1) Supply Air Diffusers

(a) Conditioned air is delivered to the room via 2 supply air diffusers.

(2) Exhaust Grille

(a) Exhaust air is removed from the room via the exhaust air grille.

ii). Outlet

(1) Outlet to be provided within crew storage cabinet for maintenance and cleaning access.

iii). Lighting

(1) General

(a) Lighting general information is shared in the points below.

(b) Detailed lighting information can be found in Chapter 13.

(c) All lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(d) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting Types and Locations

(a) Main Ceiling Light (White Light)

(i) A large rectangular LED panel in the ceiling provides the main source of light for the room.

(b) Compartment Light

(i) Floor Lights

1. Lights shall be provided as indirect lighting that spills out across the floor under the sink counter.

(ii) Sink Lights

1. A wash light should be used to light the sink area indirectly.

2. This light shall only be activated when the door to the restroom is locked.

(iii) Mirror Light

1. A LED light shall illuminate the mirror around the boarder.

2. This light shall only be activated when the door to the restroom is locked.

iv). Communications

(1) Speaker

(a) PA speaker shall be located on the central ceiling panel.

(b) The speaker used in this location shall be identical to PA speakers used in other locations in the car for ease of maintenance and replacement.

(2) All communications equipment shall meet the requirements in Chapter 14.

v). Emergency Equipment

(1) Smoke Detector

(a) Smoke Detectors shall be mounted on the central ceiling panel.

(b) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the car for ease of maintenance and replacement.

vi). Security

(1) Many items within the restroom area will need to be secured.

(2) The following items are identified with specific locking preferences:

(a) Restroom Door Locking Mechanism

(3) Any other locking or security items will be discussed with Amtrak during design reviews.

11.38 Accessible Toilet Room (ATR)

a). General

i). All features shall be reached by a person sitting in a wheeled mobility device unless otherwise listed in this section.

ii). Dimensions shall be taken from the Americans with Disabilities Act.

iii). Additionally, the ATR shall conform with 49 CFR 38.123.

iv). To the extent possible equipment, parts, and features in the ATR shall be identical to equipment, parts, and features in the STR.

v). The intent of this clause is to minimize spares and maintenance techniques.

b). Key Features

i). A comprehensive list of expected features in Accessible Toilet Rooms is provided in Figure 11-9 and described in detail below.

ii). In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

Figure 11-9: Key Features – Accessible Toilet Room

Feature	Short Description	Qty
Restroom Door	Curved and automatic door for ATR	1
Toilet	Assembly including toilet bowl, shroud, and overflow pan	1
Toilet Seat	Assembly including lid and seat for toilet	1
Toilet Flush	Push button flush and automatic flush mechanisms	1
Toilet Paper Dispenser	Protective location for dispensing toilet paper	1
Toilet Seat Cover Dispenser	Protective location for dispensing seat covers	1
Sanitary Waste	Storage location for used feminine hygiene products	1
Sharps Bin	Storage location for used needles and other medical waste	1
Sink	Solid surface sink counter and basin	1
Hand Dryer	Automatic hand dryer and paper towel dispenser	1
Vanity Mirror	Mirror for passenger to look while washing hands	1
Trash	Storage for restroom related trash	1
Grab Handles	49 CFR 38.115 compliant handrails	1
Baby Changing Table	Fold out table for infant diaper care	1
Crew Storage	Locker with square key for dedicated crew storage	1
Coat Hooks	Coat hooks that hold up to 25lbs	2
PEI – Intercom only	Speaker for emergency conversations	1
Emergency Call Button	Buttons in accessible locations that activate PEI	2
Exhaust	Adjustable exhaust grille	1

iii). Restroom Door

(1) The door should be a curved automatic sliding door.

(2) The door should be sealed to prevent water escaping into the internal space of the car.

(3) The door should lock from the inside, with an indicator on the outside showing the door lock status.

(4) The restroom door shall also be able to operate in a manual mode in the event of power loss or malfunction so that the restroom is not put out of service due to door operation failure.

(5) The clear width door opening shall be a minimum of 44”.

(6) The door shall be of lightweight construction.

(7) The door shall be free from resonance and rattles when in the closed position when the train is in motion at any permissible speed.

(8) The door frame and attachment of the keeper shall be sufficiently rigid so that it does not flex when the door closes.

(9) The intention is that this interface does not deteriorate over the life of the car.

(10) Likewise, interior door construction shall incorporate interior stiffening in the area where the lock/ latch is attached to the door, so that the fasteners securing it to the leaf have a solid surface on which to clamp.

(11) The door latch, with a handle on both sides of the door, shall engage automatically when the door moves towards a closed position, but the lock requires definite action to engage.

(12) The door shall remain in the fully closed position at any permissible train speed.

(13) The lock shall be operable, in an emergency, from the outside with a standard Amtrak coach key.

(14) An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

iv). Toilet

(1) General

(a) An elongated toilet, complete with toilet bowel assembly, shroud, and overflow pan shall be provided in the restroom.

(2) Toilet Bowl Assembly

(a) A toilet stand with shroud assembly shall be located in the toilet room. Each restroom shall be equipped with a toilet bowl assembly, encased in the toilet shroud.

(3) Toilet Shroud

(a) The shape of the toilet shroud housing shall locate the toilet seat ergonomically for ease of use and comfort.

(b) Sufficient foot room shall be provided.

(c) When seated, the user's legs shall not contact the shroud.

(d) The form of the toilet should be floating or undercut at the bottom to maximize wheeled mobility device clearance.

(e) The toilet shroud shall be constructed of FRP with gel coat color to match the restroom shell or of stainless steel, with brushed finish or approved alternate.

(4) Toilet Overflow Pan

(a) The construction of the toilet in this room prevents a separate toilet overflow pan.

(b) Therefore, the entire ATR will be treated as an overflow pan in terms of preventative measures for water damage.

(c) The floor pan features described above are critical in this module.

v). Toilet Seat

(1) A standard toilet seat and toilet lid shall be provided. Toilet seat and seat lid should have soft close mechanisms.

(2) A white toilet seat with lid, meeting Amtrak Specification # 352, shall be provided.

(3) The toilet seat and cover shall be constructed of reinforced fiberglass or approved alternate.

(4) The lid and seat shall be stable in the up position regardless of train motion, including braking, to prevent it from slamming down suddenly against the shroud.

vi). Toilet Flush Mechanism

(1) A two-button push flush shall be located on the back wall of the restroom above the toilet.

(2) This shall provide standard and eco flush features for the passenger.

(3) The toilet flush buttons shall be mounted no more than 44” from the floor.

(4) The flush mechanism shall also incorporate an automatic flushing feature when the passenger is done using the toilet.

vii). Toilet Paper Dispenser

(1) A toilet paper dispenser shall be provided adjacent to the toilet. This dispenser shall protect the toilet paper from getting wet.

viii). Toilet Seat Cover Dispenser

(1) A dispenser for paper toilet seat covers should be located by the toilet.

ix). Sanitary Waste Disposal

(1) A sanitary waste bin shall be provided to the right of the toilet complete with modesty flap.

(2) The minimum volume for this bin shall be 0.25 cu ft.

x). Sharps Bin

(1) Provision for a sharps bin should be provided within the restroom.

(2) The size, position, and method of removal of sharps should be agreed and instructed by Amtrak.

xi). Sink

(1) General

(a) A solid surface sink with hot and cold water faucet shall be provided for passengers.

(b) The sink countertop shall be made from solid surface material and shall include a marine edge, 6” backsplash, and ¾” radius for cleanability.

(c) The sink countertop shall be approximately 32” from the floor and no more than 34” from the floor.

(d) Note that all sink countertops shall be sloped toward the basin and drain.

(2) Sink Basin

(a) The sink basin shall have minimum internal dimensions of 11" width x 16" length x 5" depth.

(b) The sink shall have a 1/2 to 1 gallon capacity and be equipped with an overflow.

(c) The sink shall be drained through a nominal 1-1/4” diameter drain.

(3) Faucet

(a) The faucet shall be mounted behind the sink. The faucet shall use IR sensor to control water dispensing. Water flow shall be aligned directly over the drain and shall be directed into the sink and not splash the user.

(4) Soap Dispenser

(a) An automatic liquid soap dispenser which will accept a Celeste Industries liquid soap refill shall be installed and shall be located adjacent to the mirror.

(b) Power for the soap dispenser shall be hardwired with a battery backup.

(5) 120V Outlet

(a) A duplex 120VAC GFCI receptacle shall be located on a panel adjacent the sink, preferably located to keep it dry from splashes from the sink.

xii). Hand Dryer

(1) A high velocity motion-activated hand dryer and a paper towel holder shall be mounted on the wall of near the sink in an easily accessible location.

xiii). Vanity Mirror

(1) A large mirror shall be positioned in front of the sink at an angle that allows both standing and sitting passengers to use adequately.

xiv). Trash

(1) A trash bin shall be provided under the sink with push flap cover.

(2) The minimum volume of trash for this receptacle shall be 2.25 cu ft.

(3) The trash flap for this receptacle shall be a minimum of 10” x 10”.

xv). Grab Handles

(1) Stainless-steel grab bars shall be provided on one side of the restroom to allow passengers to steady themselves against train motion.

(2) Bars shall be directly secured to car secondary structure or module structure.

(3) These bars shall be anti-slip grab bars in accordance with Subpart F of 49 CFR Part 38.123 (a) (3) shall be provided for passengers to utilize while using the facility.

xvi). Baby Changing Table

(1) A baby-changing table should be provided.

(2) The changing table should be easy to deploy and stow with an intuitive handle. The table shall include a strap to ensure passengers with limited reach can operate the table.

(3) The mechanism should be durable, free from jamming and racking.

(4) The design should meet abuse loads.

(5) It should have a soft opening mechanism.

xvii). Crew Storage

(1) A crew storage cabinet shall be provided at high elevations in the restroom for storage of restroom and cleaning supplies.

xviii). Coat Hooks

(1) Two coat hooks shall be provided on the partition wall.

(2) Coat hooks shall be capable of supporting up to 25lbs each.

(3) These hooks are identical to the towel hooks provided in the sleeper cabin.

(4) Hooks shall be positioned in accessible reach locations.

xix). Emergency Call Button

(1) Two waterproof Emergency Call Buttons shall interface with the Passenger Emergency Intercom (PEI) in the toilet room.

(2) The Emergency Call Buttons are providing better access for passengers if they are not able to reach the PEI unit.

(a) The Emergency Call buttons shall have illuminated and audible indications when actuated.

(b) One Emergency Call button shall be located within easy reach while seated on the toilet and not easily confused with the flush button or other controls

(c) A second button located within 12 inches from the floor or otherwise reachable for someone who has fallen.

(d) Placement of the buttons is subject to approval during design review.

(3) The PEI in the toilet room shall interface with the Emergency Call Buttons.

(a) The PEI and Emergency Call button arrangement, including the interfaces used between them, must maintain the same safety level and a standalone PEI.

(b) The PEI and Emergency Call Buttons must remain functional under any toilet module degraded mode condition.

(c) See Chapter 14 for additional details.

xx). Exhaust

(1) An exhaust grille shall be provided in the ceiling. Negative pressure in the restroom shall be provided by the HVAC system.

c). Accessibility Features

i). 44” Curved Toilet Door

(1) Access to the room will be subject to review and mockup user testing. Restroom door should be an automatic sliding door.

ii). Handrail Locations

(1) Horizontal Handrails

(a) ADA compliant horizontal handrails positioned to assist transfer through the restroom shall be provided.

(b) The handrail should be positioned to provide maximum access and support for passengers.

(i) Adjacent to sink

(ii) On the wall behind toilet

(iii) Along the stationary curved wall.

(2) Vertical Handrails

(a) ADA compliant vertical handrails positioned to assist transfer through the restroom shall be provided.

(b) The handrail should be positioned to provide maximum access and support for passengers.

(i) Adjacent to the toilet

(ii) On the wall near the door and baby changing table.

iii). Control Buttons

(1) Room Door

(a) The controls for the room door must be ADA compliant in position, size, and configuration.

(i) Door Open/Close

(ii) Door Lock

(b) The buttons should be easy and intuitive to use.

(c) An accessible manual lock should be included with an indicator to show lock condition.

(d) The control buttons shall be located 12” minimum from the inside corner.

(e) The buttons should have visual and haptic feedback. Dimensions, position, and usability will be subject to Amtrak approval during mockup review.

(i) Note this review will include the disability community input.

iv). 60” Turning Circle

(1) Center of room

(a) A clear 60” turning circle should be provided inside the room.

v). Accessible Space for wheeled mobility devices

(1) A clear accessible space of 59’’ x 32’’ shall be provided for use of the sink and associated features.

(2) A clear accessible space of 59’’ x 32’’ shall be provided for use of the baby changing table, side transfer to toilet, and seat covers.

d). Additional Equipment Requirements

i). HVAC

(1) Supply air diffusers

(a) Conditioned air is delivered to the room via 2 supply air diffusers.

(2) Exhaust grille

(a) Exhaust air is removed from the room via the exhaust air grille.

ii). Outlet

(1) Outlet to be provided within crew storage cabinet for maintenance and cleaning access.

iii). Lighting

(1) General

(a) Lighting general information is shared in the points below. Detailed lighting information can be found in Chapter 13.

(b) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(c) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting Types and Locations

(a) Main Ceiling Light (White Light)

(i) A large circular LED panel in the ceiling provides the main source of light for the room.

(b) Compartment Light

(i) Floor Lights

1. Lights shall be provided as indirect lighting that spills out across the floor under the sink counter.

(ii) Sink Light

1. A wash light should be used to light the sink area indirectly.

2. This light shall only be activated when the door to the restroom is locked.

(iii) Mirror Light

1. A rounded LED light shall illuminate the mirror around the boarder.

2. This light shall only be activated when the door to the restroom is locked.

e). Communications

i). Speaker

(1) PA speaker shall be located on the central ceiling panel.

(2) The speaker used in this location shall be identical to PA speakers used in other locations in the car for ease of maintenance and replacement.

(3) All communications equipment shall meet the requirements in Chapter 14.

f). Emergency Equipment

i). Smoke Detector

(1) Smoke Detectors shall be mounted on the central ceiling panel.

(2) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

g). Security

i). Many items within the restroom area will need to be secured.

ii). The following items are identified with specific locking preferences:

(1) Restroom Door Locking Mechanism

iii). Any other locking or security items will be discussed with Amtrak during design reviews.

11.39 Premium Accessible Coach Car

a). General

i). The Premium Accessible Coach car shall include all of the elements listed in this Chapter; however, the arrangement of these elements can be modified by the Contractor to best meet the design requirements for the car as a whole.

ii). The Contractor shall provide the optimal general arrangement to Amtrak for review and approval for the Premium Accessible Coach car.

b). Key Features

i). A comprehensive list of expected features of the Coach Interior structures is provided in Figure 11-5 and described in detail below.

ii). General

(1) The Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

(2) All mechanisms described below should be durable, free from jamming, and racking.

(3) The design should meet abuse, load, and crash criteria outlined in CFR.

(4) Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

(5) There should be a 32” wide accessible path from end to end.

(6) In Premium Coach a linen closet shall be provided to accommodate a pillow and blanket for each premium coach passenger.

(a) See chapter 31 for linen closet requirements.

iii). Windows

(1) Windows shall be provided that meet the requirements of Section 11.14.

iv). Window Blinds

(1) Side window blinds shall be provided that meet the requirements of Section 11.16.

v). Window Pillars

(1) Window pillar width should be minimized.

vi). Window Mask

(1) Window mask should minimize or mask glass corners to create an architectural aesthetic.

vii). HVAC Gondola

(1) Gondola shall be designed to maximize headroom.

(2) Lighting washes both centrally into gondola and across side ceilings shall be provided.

(3) The gondola should terminate and transition to a separate lower ceiling section if any equipment or junction in the interior architecture prevents the gondola from completing a full uninterrupted run.

(a) For example - where the ceiling moves around a restroom.

(4) At these junctions the gondola should terminate in a straight line with architecture that creates a visual ring at the termination point.

(5) The transition between ceiling profiles should be treated with clean and well considered intersections.

(6) These lower ceilings should have their own lighting light wells and HVAC vents.

viii). Side Ceiling Panels

(1) Side ceilings should be washed with light form central gondola.

(2) These side ceiling panels shall be curved to create a smooth transition from the ceiling to the back of the overhead luggage racks.

ix). Kick Strips

(1) Stainless steel kick strips at 9” high should be used in all coach areas.

x). Lower Sidewall Panels

(1) Lower side wall panels shall be provided such that the trim panel has minimized thickness to take advantage of full width of the car body.

(2) These should be designed to have well-fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(3) There should be no protruding equipment, snag point, or dirt traps.

(4) These panels shall have different material/color to create a horizontal tide line with the window mask. See CMF document (Exhibit H)

xi). Coat Hooks

(1) Coat hooks should be provided for each seated location, integrated with the luggage shelf and valance.

(2) Hooks should be easy to move if seat positions or set pitch are changed in the future.

(3) A solution where integrated coat hooks are provided in the back of the seat will also be considered and is subject to Amtrak approval during the design review process.

xii). Luggage Shelf

(1) Overhead Luggage Shelf shall meet the requirements of:

(a) Section 11.2019: Luggage Storage – General

(b) Section 11.2120: Overhead Luggage Storage

(2) The overhead luggage shelf should be built in modules that align with window placements.

(3) Split lines and module length should be consistent and to visually match the window module splits.

(4) The overhead luggage shelf shall be modular to create different length segments using extruded aluminum.

(5) The following elements shall be included:

(a) Back Barrier – Back of rack should prevent bags from damaging side ceiling panels.

(b) Rollstop Nosing – Nosing of luggage shelf should be suitable to secure bags.

(c) Glass Panel – Glass panel construction from safety glass to allow passengers to see bag and let light through - frosted finish or laminated with decorative film or etching pattern.

(d) Module Dividers – Divider brackets to prevent bag slip - discreet design with no sharps, snags, or dirt traps.

(e) Blind Storage – Window blind storage should be easily accessible and discreetly hidden behind rack.

xiii). Reservation Screen

(1) As an option, passenger information displays should be integrated with the rack design.

(2) The position of the seat reservation module should be designed so they can easily be moved in case seat pitch or density is modified in the future. The display function shall indicate either single or double seat assignments, as applicable based on the seat location within the car. A single seat arrangement shall not have two displays.

c). Lighting Requirements

i). General

(1) Lighting general information is shared in the points below

(2) Premium Accessible Coach

(a) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

ii). Lighting Types and Locations

(1) Wash Lights

(a) Ceiling Panel Wash light

(i) Indirect strip lights wash light onto the ceiling from the central gondola fixture inward.

(b) Gondola Ceiling Lighting

(i) Gondola Ceiling Lighting shall wash light from the gondola across the side ceiling panels

(c) Under Luggage Rack

(i) Indirect wash lighting hidden behind the rack shall wash down the side walls.

(2) LED Panel Spotlights (White Lights)

(a) Small circular LED light panels shall act as spotlights along aisles.

(b) The frame for the spotlights shall be color matched to the ceiling.

(3) Compartment Lighting

(a) Under seat lighting. Indirect wash lighting under each seat or seat pair washes pools of light under and around seats.

(b) Spread of light to be approved by Amtrak.

11.40 Café Car

a). General

i). The Café shall include all of the elements listed in this Chapter; however, the arrangement of these elements can be modified by the Contractor to best meet the design requirements for the car as a whole.

ii). The Contractor shall provide the optimal general arrangement to Amtrak for review and approval for the Café car.

b). Key Features

i). A comprehensive list of expected features in the Café is provided in Figure 11-10 and described in detail below.

(1) Detailed functional requirements for each feature are listed below.

(2) In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

(3) All mechanisms described below should be durable, free from jamming, and racking.

(4) The design should meet abuse, load, and crash criteria.

(5) Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

(6) At least one (1) drain shall be provided inside the Café area to eliminate standing water from daily operations and cleaning.

ii). Please refer to Chapter 16 for information regarding the food service modules and appliances to be placed within the Café.

iii). The following features shall be incorporated into the Café:

(1) Digital Menus shall be included. Please refer to Section 11.22 Digital Displays for further information on placement.

(2) Qty 3 shall be provided in addition to PIS screens.

(3) One menu display shall be located near the point of sale.

(4) One menu display shall be located along the aisle side of the Café.

(5) One menu display shall be located perpendicular to the aisle on the wall where the service counter ends.

(6) Recessed Handrail

(7) A recessed handrail shall be incorporated into the wall for the outside of the coach café. This handrail shall meet the requirements in 49 CFR 38.115.

Figure 11-10: Key Features – Café

Feature	Short Description	Qty
Accessibility		
Accessible Path	32” continuous aisle through entire car for ADA regulated aisle	1
RVAAC Accessible Space	Location for a passenger using a wheeled mobility device to dine and remain using device - including 60" diameter turning circle	2
Folded Wheeled mobility device Storage	Open storage location for wheeled mobility devices	2
60” Turning Circle	60” diameter turning circle for accessibility at side of the Café	2
Interior Structures		
Café	Food service Area described in Chapter 16	1

Condiments Station	Convenience station for passengers in the Café	1
Windows	Aligned to booth tables and includes emergency egress features	TBD
Skylights (Option)	Aligned to booth tables and windows	1 per window
Blinds	A single blind system that provides sunshade and blackout performance	1 per window (+ skylight option)
Doors	Vestibule with a passenger door each side	1
Conductors Office	Enclosed seating area with a workstation for one and/or two persons	1
Seating and Tables		
Booth Seating	Repeatable and modular bench seating for 2 passengers each - minimum 40" width	22 booth seats
Table Module	Repeatable dining table for 4 passengers	10
Accessible Table	Modified version of table module with flip up portion	2
Privacy Divider	Safety glass divider between booths with hand grab features	1 between each booth
Lighting (Car Specific)		
Wall Lamps	Light fixtures mounted to each available window pillars in dining area	1 on each window pillar

iv). Fixed worktables shall be provided for each non-accessible seat. For detailed specifications, refer to section 11.32.

v). A repeatable booth module of back-to-back seating shall be provided in the Café. Booths should be 2x2 across the aisle. For detailed specifications refer to 11.32.

vi). Folded Wheeled Mobility Device Storage

(1) A storage space for two folded wheeled mobility device shall be located near the transfer seat in the Café car for passengers wishing to transfer to another seat.

vii). Accessible Path

(1) The Café car should be fully accessible end to end.

(2) There should be a 32” wide accessible path from end to end in the Café.

(3) Where a 90° turn is required across the car, the aisle should be 44” wide.

viii). 60” Turning Circle

(1) There should be a 60” accessible turning space at the vestibule end of the Café, at the accessible seating spaces, and at the counter POS location.

ix). Window

(1) Windows shall be provided that meet the requirements of Section 11.14.

x). Skylight Windows (Option)

(1) As an option, skylight windows shall be included for the cafe, diner and diner/lounge cars where booth tables and lounge seating are present.

(2) Please refer to Section 31.13 for window requirements.

xi). Skylight Blinds (Option)

(1) Skylight blinds shall be provided that meet the requirements of Section 31.15.

xii). Skylight Valance (Option)

(1) Skylight design should incorporate a valance without a luggage shelf, that contains only blinds, and coat hooks.

xiii). Blinds

(1) Side window blinds shall be provided that meet the requirements of this Technical Specification. Alternative solutions may be provided to Amtrak for review and approval.

xiv). Side Rails

(1) Side rails under each window shall include a tideline.

xv). Lower Sidewall Panels

(1) Lower side wall panels shall be provided such that the trim panel has minimized thickness to take advantage of full width of the car body.

(2) These should be designed to have well-fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(3) These panels shall define a material split, with the lower panel in a wood finish.

(4) There should be no protruding equipment, snag point, or dirt traps.

xvi). Kick Strips

(1) Stainless steel kick strips at 9” high should be used in all coach areas.

xvii). Hand Grab

(1) Where possible, a compliant accessible grab for passenger navigation shall be available.

(2) Grab bar positioning will be subject to mockup testing and Amtrak approval. Grab bar shall meet the requirements in 49 CFR 38.115.

xviii). Window Pillar

(1) Window pillar width should be minimized.

xix). HVAC Gondola

(1) Lighting washes both centrally into gondola and across side ceilings shall be provided.

(2) The gondola should terminate and transition to a separate lower ceiling section if any equipment or junction in the interior architecture prevents the gondola from completing a full uninterrupted run.

(3) At these junctions the gondola should terminate in a straight line with architecture that creates a visual ring at the termination point.

(4) The transition between ceiling profiles should be treated with clean and well considered intersections.

(5) These lower ceilings should have their own lighting light wells and HVAC vents.

xx). Outlets

(1) Duplex outlets with two USB sockets shall be provided for each seat or seat pair in the café.

(2) The outlets shall be located in easy reach of people while seated.

xxi). Trash Bin

(1) Trash bins shall be provided with stainless steel push flaps.

(2) Please refer to section 11.18 for more information on trash and recycling requirements.

(3) Condiment Station

(a) A condiment station shall be provided for use by both passengers and crew.

(b) The unit shall be compact and architecturally integrated with the diner interior and booth seating.

(c) The capacity and arrangement of the station shall be appropriate to the number of diners served.

(d) The station shall provide separate, food-safe compartments for cutlery, napkins, stirrers, single-use condiments, salt and pepper pots, and table dressings.

(e) Lower sections of the unit shall be provided for waste, recycling, and supplementary crew storage, as appropriate.

xxii). Conductor Office

(1) Conductor office location shall be located in the café Car.

(2) A conductor's office modular seating area with a workstation for one and/or two person(s) enclosed with full height wall and pocket door with window shall be provided for train crew to use as office space.

(3) The seat(s) shall be identical to the coach seat supplied for passengers unless otherwise approved by Amtrak.

(4) A pair of duplex electrical outlets and USB ports shall be provided for the crew to use for charging of radios, cell phones and other equipment. A dedicated AED charging station shall be provided.

(5) A PA, crew IC and OTIS control station shall be provided in accordance with the requirements of Chapter 14.

(6) An overhead luggage bin may be included, fitted with a standard coach key lock.

(7) The conductor office module shall be reviewed and approved by Amtrak during Design Review.

c). CMF

i). Please refer to Chapter 19 and Exhibit F for further information.

ii). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iii). Ceiling

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

iv). Flooring

(1) Flooring within the Café area shall be anti-slip flooring as listed in Section 11.28.

(2) Flooring shall be durable to withstand spills, leaks, and all methods of cleaning. Flooring shall also not become frequently damaged or worn.

(3) Flooring shall have enough give to prevent fatigue from standing.

v). Lighting

(1) General

(a) Detailed lighting information can be found in Section 13, Lighting System.

(b) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(c) Ceiling lighting shall match the ceiling lighting in the coach cars.

(d) A digital controller shall be provided allowing for crew to adjust the brightness of the lighting in the car.

(2) Featured Lighting

(a) Strip lighting

(b) LED Spotlights

(i) Spotlights cast down light on top of the service counter.

1. Note this is additional from the lighting required by Chapter 16 Food Service.

(c) Wash Light

(i) A wash light for the counter shall be included in the café.

(d) Wall Lamps

(i) On each window pillar, a wall lamp shall be provided that casts indirect light on the pillar.

(ii) The lamp is intended to be a premium design feature that contributes to the overall lighting of the space.

(iii) Lamp design, spread of light, lamp materials, and detail design will be subject to Amtrak's approval.

11.41 Drinking Water Stations

a). A drinking water station shall be included in the café car.

b). The drinking water station shall have the following features:

i). Recessed water dispenser with drain in accordance with the requirements listed in Chapter 17.

ii). An access side panel secured with quarter-turn fasteners for access to the water valves for maintenance

iii). ADA compliant design

iv). Shall operate with IR sensor

c). The dispenser shall be arranged to permit passengers to easily refill a 1-quart water container.

d). The design shall be in compliance with 21 CFR Part 1250 and US Public Health Service (USPHS) requirements, arranged for ease of sanitation, and approved by Amtrak.

e). Alternative designs can be provided for review and approval by Amtrak.

f). An option for a drinking water station shall be provided in each car for Amtrak to exercise during the design reviews.

Part XIII: CDRLs

Amtrak Universal Single Level Fleet Replacement

Technical Specification

12. Door Systems

Revision 2

Table of Contents

12.1 Overview 12-2
12.2 General Requirements 12-3
12.3 Powered Side Entrance Doors 12-5
12.4 Powered Carbody End Doors and Vestibule End Door 12-20
12.5 Powered Gap Filler, Trap Door and Folding Step 12-29
12.6 Onboard Mobility Device Lift 12-34
12.7 Passenger Room Entrance Doors (Sleeping Accommodations) 12-35
12.8 Automatic Sliding Restroom Door 12-39
12.9 Accessible Rooms 12-41
12.10 CDRLs 12-41

12.1 Overview

a). The Amtrak Single Level Fleet shall be equipped with electrically controlled power operated side entrance doors, carbody end doors, vestibule doors, trap doors, folding steps, accessible restroom doors, and accessible sleeping room doors.

i). The Contractor shall provide technical solutions for gap fillers and on-board mobility lifts. The requirements for the lifts are outlined in Chapter 6 while the requirements for the gap filler are outlined in this Chapter.

b). All doors shall use mar-resistant polycarbonate windows meeting FRA type I or II requirements. Window tint percentage will be reviewed/approved during the design review process.

c). The side entrance doors shall be located on the B-end of the car and designed to accommodate a portable ramp, and passenger boarding from high level (48”) and low level (8” and 15” and 0” and -8” ATOR) station platforms.

i). The diner car shall be equipped with centrally located powered doors, specifically designed without trap doors and folding steps, to streamline the loading and stocking of food and beverage products. The precise placement of these doors will be determined during the design review process. These powered doors shall be operable via local controls positioned both inside and outside the car, requiring a crew key for activation. Additionally, they shall be integrated into the door summary circuit and remain independent from trainline control by any other car in the consist, ensuring both operational security and convenience.

ii). If the option is exercised, the utility car side entrance doors will be located at the B-end of the car with powered traps doors and powered folding steps. Exception, the powered doors shall be operable via local controls positioned both inside and outside the car, requiring a crew key for activation. Additionally, they shall be integrated into the door summary circuit and remain independent from trainline control by any other car in the consist, ensuring both operational security and convenience.

d). The Contractor’s design for the entire door system must comply with the latest requirements of 49 CFR Part 37, 49 CFR Part 38, 49 CFR Part 238, EN50155, APTA PR-CS-S-012-02, and APTA Standard PR-M-S-18-10.

e). The door system shall operate over the entire range of operational, climatic, and track conditions identified in the Amtrak Specification 963, including the buildup of ice on unheated exterior surfaces during below-freezing temperatures with snow accumulation. Door control relays and associated panels shall meet Amtrak Specification 528.

i). Low level station platforms may be either below Top of Rail, at Top of Rail, 8 inches above Top of Rail and 61 inches from centerline of track, or 15 inches above Top of Rail and 64 inches from centerline of track.

(1) Mitigations for minimizing the gap between the door threshold and station platform shall be performed to the maximum extent possible.

ii). Many of the at or below TOR platforms are controlled by freight railroads who will protect their clearances. Careful consideration must be provided for these platforms as well.

f). As this equipment will operate throughout the entirety of the Amtrak network, Amtrak envisions this equipment utilizing powered side entrance doors for ease of boarding and alighting, especially at the busiest stations; however, Amtrak also acknowledges that many of the station stops off the Northeast Corridor are greater distances. As an option, Contractor shall propose an alternative solution that utilizes manual side entrance doors for Amtrak to review and evaluate.

i). Each side door window of the manually operated side door shall be designed to permit crew to easily lean out, when standing, and be able to view a station platform or the wayside in either direction. An alternative design hinged side window may be proposed for review and approval.

12.2 General Requirements

a). Design Objectives

i). Door systems have a demonstrated history of complexity and inconsistent performance that can affect the operation of passenger service and hinder maintenance and repairs. In order to maximize safety, system functionality and equipment availability, while minimizing the potential for degraded service or system performance, the side and end door systems shall be specified, designed and manufactured with an emphasis on addressing the following areas of concern:

(1) Unsafe conditions for passengers or crew members;

(2) Train delays from malfunctioning side door equipment;

(3) Poor system reliability in adverse operational and environmental conditions;

(4) Accumulation of dust and dirt that affects system performance and causes failures;

(5) System complexity that increases the time and effort required for troubleshooting and repairs; and

(6) Requirement for frequent adjustment and component replacement.

ii). The door systems shall be designed with great attention to details so that they are safe, very reliable, requires little maintenance, is easy to service, has support parts available and will have a long service life.

(1) All control devices, cutouts, bypass switches, and similar components shall be equipped with labels or decals that clearly describe their function and proper operation, enabling safe and confident, and error free use.

b). Design Requirements

i). The door system shall be designed and constructed so that no single point malfunction of door system components shall create an unsafe condition.

ii). Door system failures shall be detectable through the following means:

(1) Failure to complete the door closed summary circuit and therefore prevent the locomotive from developing traction power (when a door panel is not fully closed and latched, or mechanically locked in the closed position and isolated electronically.

(2) Use of indicator lights on the inside and outside of the car that signal when a door is not confirmed closed and latched; and

(3) An indicator that signals when a door has been locked manually and isolated electrically on the inside and outside of the car for each door.

iii). All controls, locks and latches, as well as door emergency access covers identified in this Chapter shall use the standard Amtrak coach key (coach key), per Amtrak Drawing B-144 (J.L. Howard Part No. 2555).

iv). Environmental Considerations

(1) When closed, the doors shall provide a weatherproof seal under all car operating conditions.

(2) Neither drafts, nor air noises shall be detectable from the closed door over the full range of operating speeds of the vehicle, on all specified classes of track.

(3) The doors shall operate as specified over the entire range of all operational, climatic and track climatic conditions identified in Amtrak Specification 963.

(4) None of the electrical components, such as limit switches, shall be directly exposed to the weather, even with the door open.

(5) Climatic and environmental conditions, such as dust, rain, snow or heat, shall not be a cause of door system failures.

v). The door equipment mounting and internal fasteners shall be such that once adjustments are made and locked, they will not need to be re-adjusted until equipment overhaul or replacement.

vi). Fasteners

(1) Fasteners shall be metric.

(2) Jam nuts, lock washers, nylock nuts or equivalent fasteners shall be used to secure door equipment.

(3) Fastening aids, such as Loctite or equivalent products, shall not be permitted, unless specifically approved by Amtrak.

vii). Maintainability

(1) All door mechanisms, including but not limited to tracks, operators, wiring to door panels, stops, limit switches and controls shall be accessible by opening hinged access panels on the inside of the car.

(2) No special tools will be required to open such panels, nor will any equipment have to be disconnected or removed to gain access.

(3) Access shall be provided from inside the car to all points necessary for inspection, service, installation or removal.

(4) All door system equipment shall be installed in such a manner so as to be:

(a) readily accessible to maintenance personnel with minimal effort

(b) readily available from the exposed side of the door operator

(c) able to be adjusted and maintained by a single person.

viii). Interchangeability

(1) All door equipment of like function and the same hand shall be interchangeable without requiring modification.

(2) All component mounting holes for all door hardware shall be jig-drilled by the manufacturer.

(3) Mounting holes on the car shall also be jig- drilled.

(4) Door operators, door tracks and thresholds shall have their mounting positions controlled through suitable jigs/fixtures so as to ensure the correct physical relationship between carbody, door track, door pocket and operator.

(5) All door operators, tracks, hangers, linkages, brackets, obstruction sensing and electrical fittings shall be manufactured or supplied by one subcontractor.

ix). Door panels shall be fully insulated against thermal and sound transmission and grounded per APTA Standard SS-E-005-98.

x). A Portable Test Unit connection and software will be provided to aid in troubleshooting and provide system diagnostics.

xi). Door controllers shall report alerts and fault information to the car diagnostic system.

12.3 Powered Side Entrance Doors

a). General

i). Trainline-controlled, power operated stainless steel side entrance plug or pocket doors shall be provided for each car type.

ii). Side entrance doors with a gap filler, stepwell and trap door shall be installed at the B-end of the car. Exception, the diner car shall have only doors located in the center of the car.

iii). A door control panel shall be installed adjacent to each exterior side door and shall have both local door and trainline controls. Exception, the diner and utility car (option car) shall only have local door controls.

iv). Side entrance doors shall provide an opening width of at least 36”.

v). Side entrance doors shall provide an opening height of at least 78” when boarding from a level platform.

vi). An exterior weatherproof coach key switch, complete with seal over key opening and detent latch, shall be provided adjacent to the side doors on each side of all cars to allow crew to open or close the adjacent door leaves, trap door, and folding steps to enter or exit the car.

vii). Each car shall be equipped with two (2) side entrance doors.

viii). A minimum number of door panel types shall be used for each car type.

ix). Hand-operated latches and handles shall provide clearance for operation by a gloved hand.

x). All doors shall be solidly mounted, of lightweight construction, vibration free, open or close positively, and not rattle or make noise in service.

xi). It is preferred that the design of the exterior doors of each car type shall be a flat panel, where possible. The panel shall meet the materials and workmanship requirements and shall have fully interchangeable components.

b). Side Door Controls and Operation

i). The side door controls for each car type shall include the following features:

(1) Trainline control at 74 Volts Direct Current (VDC) via 27-point communication trainline cable, in compliance with Amtrak Drawing A-63-7676-1. Exception, the diner and utility car shall have local control only.

(2) The side doors shall be operated from a local door control panel or via trainline OPEN or CLOSE commands from another location or train.

(3) Side doors shall not prohibit egress in an emergency situation or in the event of HEP power loss or air loss.

(4) A local maintenance on/off switch shall be provided per doorway to de-energize the local door circuits and motor during maintenance and/or troubleshooting.

(5) Interchangeability

(a) The DCU shall automatically detect the car type and location in which it is installed.

(b) The door system software shall be unified throughout all DCUs, so no additional manual configuration is needed when it is installed/replaced.

(6) Relay-based logic and discrete trainlines shall be provided for the issuing of control commands to the doors.

(7) Discrete trainlines shall also be used to monitor the door closed and locked status, and provide the required indications to the train crew.

(8) Safety Considerations

(a) The door control system shall incorporate logic that shall meet the requirements of EN 50126 SIL 3 so that no unsafe condition will be created:

(i) through normal operation of the door system, or

(ii) due to a failure of door system equipment or components.

(b) Door control system shall be able to tolerate two separate grounds anywhere in the train in the door circuits and not have an unintended door opening.

(c) Control system design shall be fault tolerant to prevent unintended door openings.

(9) Each door leaf shall be provided with a position sensor to detect that the door is fully closed and that it is mechanically latched.

(10) Zero Speed Protection

(a) The zero-speed protection from wheel slide control unit on each car shall include all of the following:

(i) Door control panel system deactivation if not at zero-speed.

(ii) Removal of power from door operator’s door OPEN function if not at zero speed.

(iii) Door CLOSE command automatically issued in both directions on left and right door close trainlines when car motion is detected.

(b) Zero-speed signal supplied by the wheel slide control unit shall be required in order to issue an OPEN command to the side doors.

(i) Conversely, the absence of a zero speed signal shall prohibit the issuance of an OPEN command to the side doors.

(11) Traction Interlock

(a) Traction interlock shall be provided, with door closed indication, that prevents the locomotive from developing tractive effort if any side door is not fully closed and latched, or mechanically locked and electrically isolated.

(i) There is no interlock between the door closed summary circuit and the brake system.

(12) Obstruction detection with over current and a sensitive edge on each door leaf meeting the requirements of APTA Standard SS-M-18-10.

(13) Emergency Releases

(a) Manual emergency release for each door leaf from inside the car, with frangible cover.

(b) Exterior emergency release for each door leaf, fully enclosed behind a weatherproof cover.

(14) Mechanical lock which can be engaged manually with a coach key from inside the car which allows the on-board crew to secure the door leaf closed and isolate the door operator electrically.

(15) All door control system signal and indicator lights shall use approved long life, high intensity Light Emitting Diode (LED) or LED arrays lamps having a rated life of at least 100,000 hours.

(16) Audible signal, on or near the door header at each side door opening at the same rate as the blue ADA indicator light.

(a) Tone and volume of audible signal to be submitted to Amtrak for approval during design review. **[CDRL 12-01]**

c). Side Door Operator and Linkage

i). General

(1) The side doors shall employ electric, electro-pneumatic or linear-induction operators, one per door leaf.

(2) Doors shall be operated from the nominal 74VDC car battery system but shall operate normally over the full voltage range from normal Head End Power (HEP).

(a) The motor and controls shall reliably be compliant to EN50155 and shall operate without damage and without affecting the reliability and serviceable life of the operator.

(b) The Contractor shall provide an engineering analysis to verify door operators will operate over this voltage range without damage to components. **[CDRL 12-02]**

ii). Locking Mechanism

(1) The operator shall include an over-center or equivalent locking mechanism so that a door which is closed will remain closed and latched upon loss of electrical or pneumatic power, regardless of car vibration.

(2) The door operators shall include a local mechanical cutout which allows the on-board crew to deactivate and isolate a door operator by locking the door.

iii). Opening and Closing Forces

(1) The drive mechanism shall be designed to minimize torque applied to door panels during operation.

(2) The operator and linkage for each panel shall be arranged so the maximum force required to manually move a door panel shall not exceed 30 pounds of force (lbf) at mid-point of travel.

(3) The doors shall open or close successfully with no greater than 60 lbf applied perpendicular to the interior door surface at a height of 56 in. above the floor, throughout the entire opening cycle, and through the closing cycle until 5 in. before the fully closed position.

iv). Dampening and Door Motion

(1) The door motion shall be smooth and free of shock and impact.

(2) The door operator shall decelerate the door leaves at each extremity, to preclude slamming or rebound, and bring them to rest gently at the extremity of door leaf travel.

(3) Damping shall be provided at the ends of travel of the door panel in both the opening and closing directions.

(4) The door operator motion shall be smooth and free of shock and impact and shall be capable of holding the door, without oscillation, in either an open or closed position with the car on all configurations of track as specified in Amtrak Specification 963.

(5) Door leaf travel shall be easily adjustable, with provisions, to set open and close positions.

v). Limit Switches and Proximity Sensors

(1) All limit switches and proximity sensors used in the operator shall be hermetically sealed and shall be easily replaceable.

(2) All limit switches and proximity sensors shall be precision units that are positively and precisely located so they may be replaced without the need for mechanism adjustment.

vi). Opening and Closing Times

(1) Door opening and closing times shall be independently adjustable and shall be initially set at:

(a) Opening: 3 (± 0.5) seconds

(b) Closing: 3 (± 0.5) seconds

(2) If sliding plug doors are used, the operating timing shall be defined as follows:

(a) Opening: 4.0 seconds – Adjustable 4.0 to 8.0 (± 0.5) seconds

(b) Closing: 4.0 seconds – Adjustable 4.0 to 8.0 (± 0.5) seconds

(3) The opening and closing values shall be independently adjustable by the Portable Test Unit.

vii). Protection from Damage

(1) Operator design shall be such that a mechanical or electrical failure shall not result in subsequent damage to other equipment.

(2) The door motor shall be suitably protected from the surrounding environment and be of a sealed design.

viii). Interchangeability

(1) All door operator motors shall be interchangeable from one door position to another, or between all doors of the same hand (right-hand and left-hand).

d). Side Door Panel Construction

i). The side entrance door panel shall be constructed of stainless-steel frame and skin with a honeycomb core.

ii). Doors shall be of an adequate thickness for the intended service, which means they shall be resistant to damage from impacts with roadside debris such as rocks, as well as resist being bent from misuse, attempted operation with the door stuck, or a mechanical malfunction.

iii). In addition, when supported at both ends, the door leaf shall sustain a concentrated load of 250 lbs applied at the center of the front face, over an

area of 4 in^2, at 90° to the plane of the panel, without deflecting more than 0.25 in., nor shall the panel take a permanent set.

iv). All door panel joints and edges shall be sealed against moisture.

v). Stainless steel reinforcements shall be provided at attachment points.

vi). Structure used to secure the door leaf to the door hanger shall last the life of the car, without fatigue cracks or similar failure, even if the door operator malfunctions and slams the door leaf repeatedly.

vii). Epoxy used in door panel construction shall be waterproof.

viii). All internal door leaf wiring and sensitive edge shall be run through internally routed conduit.

ix). The exterior surface of the door panel shall match that of the exterior of the car body.

x). The sensitive edge and door mounted weather seals shall be part of the door panel assembly.

xi). Door panels shall be insulated against thermal and sound transmission.

xii). Door panels shall be welded in accordance with all applicable AWS requirements.

e). Door Panel Windows

i). Each door panel shall have window openings formed to accept FRA Part 223 compliant glazing.

ii). The door window frame shall be an integral part of the door structure and shall be capable of retaining the window in the door opening when subjected to the impact applicable to the window location described in 49 CFR Part 223.

iii). The window and its glazing shall not extend beyond the outer surface of the door.

iv). All door windows shall be retained in the door frame by use of a rubber extrusion and zip strip combination which will allow installation/removal of the glazing from inside of the door.

f). Side Door Obstruction Detection

i). Each door leaf shall be equipped with an obstruction detection system. The system should include over-current detection and a sensitive edge.

ii). Should the door close against an obstruction, the obstruction detection system shall immediately initiate the door opening cycle.

iii). The force required to activate the system shall not exceed 20 lbf.

iv). The sensitivity of the obstruction detection system shall conform to APTA Standard SS-M-18-10.

v). The design of the obstruction detection system shall not allow the door to oscillate if no obstruction is present.

vi). The doors shall not close and latch to permit a closed-door indication if an obstruction is detected.

vii). Deflection of the sensitive edge shall have no effect on the door control system after the door has closed and locked.

viii). Soft elastomer edges shall be designed to permit the withdrawal of an obstruction that could be undetected between a closed side door and its mating edge

ix). The design of the obstruction detection system shall be subject to Amtrak approval during design review.

x). The Contractor shall provide a detailed assessment of the obstruction detection system as proposed, including theory of system operation, proven service history, reliability and maintainability, compliance with applicable regulations and standards, and safety analysis.

g). Overhead Door Track

i). Door leaves shall be suspended from an overhead door track.

ii). The track and door hanger assembly shall have minimum service life of 25 years.

iii). The door track/hanger shall not require lubrication over its life.

iv). The load bearing surface of the door track shall be convex, so as to be self-cleaning from buildup of dust.

v). The door track shall employ rollers with sealed, permanently lubricated bearings or other roller design that does not require lubrication.

vi). The overhead door track and rollers shall not be affected by environmental conditions, including the accumulation of dust.

vii). The door hanger and door track shall be able to resist, without damage or permanent deformation, a force of 200 lbf applied perpendicularly at the center of the door panel, both in inward and outward directions.

viii). The rollers shall be secured to the hanger assembly with a mechanism, both to adjust for level as well as control vertical free-play between the hanger assembly and door track.

ix). Door leaf adjustment shall allow the space between the nosing seal to be made constant from the top to the bottom of the leaf.

x). The amount of track-to-roller free-play shall prevent the trailing edge roller from lifting on the track if the door leaf strikes an obstruction down low while closing.

xi). Adjustment of free-play clearances shall be easily done using standard tools.

xii). The track itself and mounting to carbody (not the door-to-hanger connection) shall be adjustable to accommodate both carbody and door leaf tolerances, including both height and plumb.

xiii). Sliding plug doors with linear bearings may be used, provided that the linear bearings are of a service proven design and do not require lubrication more frequently than annually.

h). Bottom Door Guides and Thresholds

i). A door guide with corresponding threshold shall be provided at the bottom of the door.

ii). Adjustable wear strips, if provided, shall be easily replaceable without removing or readjusting the door panel.

iii). The bottom guide arrangement shall be designed not to collect dirt and debris and to ensure a low friction operation with no binding or rattling.

iv). The thresholds shall be compliant with ADA requirements.

v). The door guide/threshold shall form part of the door weather seal and shall incorporate drain holes to carry off water to the underside of the car.

vi). The threshold and drain and their sealing to the carbody shall ensure that water or other fluids do not seep underneath and cause deterioration of flooring, its substructure or insulation.

vii). Easy access shall be provided to the door guide/threshold for cleaning and maintenance.

viii). The guide shall be adjustable to accommodate both carbody and door leaf tolerances.

ix). Any part of the door guide system subject to wear shall be easily replaceable without removing the door panels.

i). Freeze Protection

i). Freeze protection system shall be provided at each side entrance door and shall be with sufficient capacity to prevent ice formation in the door pockets, bottom door guide, thresholds, gap fillers, vestibule steps, trap door, and boarding/alighting paths. The system shall prevent slippery conditions for passengers.

ii). All heaters shall be 120 VAC and shall be activated by the car freeze protection circuit at ambient temperatures of 40 degrees F or below.

iii). The design of the system shall be included in the door system design review and shall be subject to Amtrak design review and approval.

j). Weather Seal

i). Amtrak will operate the cars at 125 mph throughout the continental United States.

ii). The very high operating speeds of the cars combined with frequent winter exposure to snow, freezing rain and ice, as well as heavy rain conditions, makes it of extreme importance that exceptionally high levels of weather sealing be applied to the door systems.

(1) The leading edge of the door panel shall interlock with the adjacent door panel (if present) to form a weatherproof seal.

(2) The door opening, including the interior and exterior sides and top, shall be equipped with a flexible weather seal.

(3) The rear edge of the leaf shall be equipped with a batten that positively engages the door seal when the door is fully closed, including the radius at the top of the door opening.

(4) This combination shall create a dust and weatherproof seal (see Chapter 20 for test requirements).

iii). The seal shall be attached to the door frame with sufficient clearance so as to prevent chafing against the leaf as it moves, yet ensure every door leaf seals on every car, despite the combination of all manufacturing tolerances.

iv). The top of the opening shall also be equipped with a weather seal.

v). The interface between the bottom of the door and the threshold shall form a weather seal.

vi). Seal design shall also limit the entrance of dust and snow into the door pocket when the door is open.

vii). Adjustments to keep the seal system weather tight shall not be required more often than annually.

k). Emergency Releases

i). Manual interior and exterior emergency releases shall be provided to allow each side door panel to be opened manually in emergency situations.

ii). The emergency release handle shall be red and be simple for individuals to understand and operate.

iii). Activating the emergency release handle shall: remove power from the door motor, release the door mechanical lock (if locked) and disengage the door over-center locking mechanism and separate the door panels by at least one inch so that the door leaf may be manually opened.

iv). Using the emergency release, the force to disengage the door operator and to move the door leaf shall not exceed 30 lbf external per APTA Standard SS-C&S-012-02.

v). The exterior emergency release handle shall be located on the car side, near the door it releases, behind a weatherproof cover.

vi). At least one release shall be provided for each door opening that permits the opening of both door leaves.

vii). The cover shall allow access in an emergency and be able to be sealed and locked for securing car when not occupied.

viii). Operating instructions shall be provided on or near the cover.

ix). An interior emergency release handle shall be located adjacent to each door leaf, behind an easily replaceable, transparent frangible weatherproof cover.

x). To allow crew access to the release emergency release without breaking the frangible material, such as when the car has no power, the cover frame shall be hinged and equipped with a coach key release.

xi). Opening the frame will also allow the frangible material to be easily replaced.

xii). The inside handle, once actuated, shall remain in the actuated position.

xiii). Operating instructions for the emergency door release mechanism shall be installed near the emergency release, per the location and illumination requirements of 49 CFR Part 238.

xiv). It shall be possible for emergency personnel to manually open the side doors from outside the car with the car resting on its side, by using only tools normally carried by such personnel.

xv). This shall be demonstrated with an exterior door and frame assembly in the horizontal position, using actual production components.

xvi). It shall be assumed that no damage exists to the door, door frame or operating mechanism.

xvii). If a cable system is employed between the external release handle and door operator, it shall be run within a conduit to allow it to be replaced easily, without major car disassembly.

xviii). Appropriate labels shall be provided with operating instructions at convenient locations, consistent with APTA Standard SS-PS-002-98.

l). Door Control Panel

i). A stainless steel watertight door control panel shall be provided for the train crew to control all the side doors on its respective side of the train.

ii). The control panel shall be activated with a coach key, with the key removable only in the OFF position.

iii). Indicator lights on the panel shall employ socket-mounted LED technology.

iv). A button shall be provided at the door control panel for the Conductor's signal buzzer.

v). In addition to trainline operation, the side doors shall be equipped with a trainline/local coach key switch panel which allows the crew to select whether an adjacent door will open in response to trainline OPEN commands, or only on a local basis.

vi). Positions shall be labeled TRAINLINE/LOCAL (9 o'clock position) and LOCAL ONLY (6 o'clock position).

(1) The coach key shall be removable from either position.

vii). With the switch in the LOCAL ONLY position, the connection from the door open trainline is interrupted, so that the affected doors only open upon an OPEN command from the door control panel-local or the crew access switch adjacent to those doors and shall not open in response to a trainline OPEN command from another door control panel.

viii). When in the TRAINLINE/LOCAL position, the side doors at this location shall open either upon a trainline OPEN command from another door control panel, or from the adjacent door control panel-local or exterior crew access switch.

ix). In either position, the doors will close upon a CLOSE command from the door control panel-local, or from a trainline CLOSE command.

m). Crew Key Switches

i). The crew switch shall be three-position, spring return to center, with key capture in open and closed positions on the exterior of the car.

(1) A standard Amtrak crew (conductor's) key shall be used to operate the switch.

ii). The crew switches shall not be connected in parallel and shall have separate inputs to the DCU so lower and upper crew switches can be configured independently.

iii). Rotating the key to the left shall open the doors, and to the right shall close the doors.

iv). The crew key switch shall be arranged so that when the key is removed, the door shall remain in the last position commanded.

v). Local commands shall take precedence over trainline commands.

vi). If a door is opened with the local crew key switch, it shall be possible to close it by trainline control.

vii). Switches within the assembly shall be weatherproof.

viii). Switches shall require the use of the standard Amtrak coach key.

n). Door Cutout and Mechanical Lock

i). A positive mechanical lock function shall be provided for each passenger side door leaf, or pair of side door leaves if door operation uses synchronized door panels, to deactivate power from that door operator and to secure the leaf in the fully closed position.

ii). This lock shall be operated from inside the car only, by a coach key. The door closed and lock loop shall only be bypassed when the door leaf is fully closed, and the mechanical lock fully engaged.

iii). The emergency release function shall still be available for a locked-out door, but if the release is used, the door panel locked sensing function shall be reactivated.

iv). If the emergency release has been activated while the mechanical lock was in the locked-out position, the design of the keeper shall allow the lock bolt to re-engage automatically when the door leaf is again closed (so as to not ram the edge of the keeper with the bolt).

v). Engagement of the lock bolt shall be sufficient to provide positive panel locking under all conditions.

vi). It shall not be possible to withdraw the key unless the lock bolt is fully engaged or fully unlocked.

o). Door Status Indicators and Alarms

i). Audible and visual warnings that comply with the requirements of 49 CFR Parts 37 and 38 shall be provided at each doorway and shall be activated prior to door closing.

ii). Activation of the warnings shall precede the initiation of door closing by approximately 3 seconds.

iii). The warnings shall alert passengers inside and outside the car on the side of the car at which the doors are open.

iv). Exterior Door Open Indicators

(1) A red exterior LED type door open indication shall be provided on each side of the car at each entrance doorway (see Chapter 11).

(2) Both lights adjacent to an individual vestibule (one on each side of the car) shall be extinguished when all doors at that entrance vestibule (both sides of car) are closed and locked.

(3) The indicators shall be bright and visible at a distance of 1870 ft, on tangent track, bright enough to be visible in bright direct sunlight and shall be visible to crewmembers in vestibules and in the operating cabs of locomotives when looking down the side of the train from either direction.

v). Exterior Accessibility Indicators

(1) A blue Accessibility LED indicator shall be provided outside each passenger side entrance door that contains an onboard mobility device.

(2) The Accessibility indicators shall be triggered via the door controls to provide a flashing indication at 1 Hz while the doors at that location are open and shall flash at 2 Hz from the time that a CLOSE command is issued to those door until the doors are closed and locked.

vi). Interior ADA Door Closing Indicators and Alarms

(1) To warn hearing impaired passengers that the doors are about to close, red LED interior door closing warning lights shall be provided in the door header at each side entrance door.

(a) These lights shall be triggered via the door controls to provide a flashing indication, upon initiation of the door “close” command, and continue to flash until the door begins to close.

(b) The flashing rate of the indicator shall be approximately 2.0 Hz.

(2) To warn passengers that the doors are about to close, an interior door closing warning audio alarm shall be provided in the door header at each side entrance door.

(a) The door closing warning audio alarms shall be triggered by the door controls.

(b) The door closing warning alarm shall start to sound upon the initiation of the door CLOSE command and continue to sound until the door begins to close.

(c) The audio alarm shall be pulsing audio shall develop a sound level of 88 +/-2 decibels (dB) at 5 ft 6 in. above the center of the door threshold, with a frequency of 3000 Hz.

(3) An interior door closing interlock with Public Address (PA) system to initiate “doors closing” message shall be provided. See Chapter 14.

(4) When the door closed trainline is activated, a 3 second warning of the above visual and audio devices will be given at each entrance area before the doors begin to close.

vii). Interior Door Status Indicators

(1) Each door leaf shall be equipped with a yellow LED indicator light mounted in the ceiling panel over each door leaf. This indicator shall display the status of the door leaf:

(a) On continuously: Door leaf is open or is not confirmed closed and latched.

(b) Flashing (1 Hz): Door leaf is locked manually with the mortise lock and isolated from the door control circuit and the door closed summary circuit.

(c) Off: Door panel is confirmed closed and latched, but not locked with the mortise lock.

p). Design Safety Validation

i). The Contractor shall conduct a hazard analysis and a Failure Mode and Effects Criticality Analysis (FMECA) for hardware and a Fault Tree Analysis (FTA) for the entire side door system as necessary to demonstrate that the safety requirements of the system are met under all operating conditions.

ii). This analysis shall be performed for an individual car of each type and for a train consisting of cars from the same build lot. This shall include:

(1) logic,

(2) interlocks,

(3) mechanical mechanisms,

(4) indicators,

(5) bypasses,

(6) cutouts and

(7) controls.

iii). The analysis shall be submitted to Amtrak for review and acceptance as part of the Design Review process. **[CDRL 12-03]**

q). Door Pocket

i). If pocket doors are provided, the door pocket will accommodate the door leaf while the door is open.

ii). The bottom of the door pocket shall be lined with corrosion resistant material to prevent deterioration of car structure and flooring.

iii). The bottom of the door pocket shall also incorporate a pan designed to drain water out of the pocket area through a tube to the underside of the car.

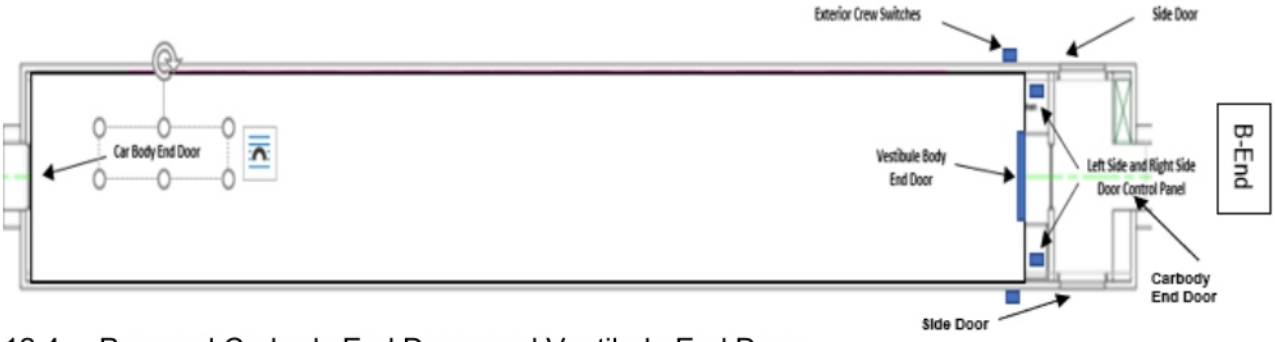
iv). The drain shall be easily accessible for cleaning and shall be equipped with a backflow preventer to keep dust and moisture from blowing into the pocket.

v). It shall be designed to ensure that water does not seep underneath and cause deterioration of flooring, its substructure or insulation.

r). Door Markings

i). Door positions shall be numbered in accordance with Error! Reference s ource not found..

ii). In addition, each door shall be labeled for emergency egress in accordance with APTA Standard SS-PS-002-98, Rev 2.



iii). Signage shall be installed on each door leaf that describes the procedure for opening the doors in the event of an emergency.

iv). This signage shall conform to the requirements of APTA Standard SS-PS-002-98 and 49 CFR Part 238.

v). Signage shall also be provided above each door leaf or pair of door leaves, adjacent to the yellow door status LED indicator, that states that the door leaf is inoperative or out of service when the yellow light is flashing.

vi). The proposed artwork, material, color, size, location and adhesive for these signs shall be submitted for Amtrak approval during the design review process. **[CDRL 12-04]**

Figure 12-1: Door Positions

12.4 Powered Carbody End Doors and Vestibule End Door

a). General

i). Carbody End Door

(1) A weathertight lockable sliding pocket powered doors with a manually operated override shall be provided at the ends of each car.

(2) The end door shall have a minimum footprint within the passenger area, pressure sealed, and mechanically lockable.

(3) A minimum 36 in. "clear passage" shall be provided through the doorway when the end door is fully opened.

(4) If applicable, carbody end doors shall have a removable window and kick panel in compliance with 49 CFR 238.112.

(5) The door shall be constructed from stainless steel with a stainless steel honeycomb core and shall be equipped with an FRA Type 1 window.

(6) The door shall be weatherproof and compliant with the requirements of 49 CFR 238.209.

(7) The door shall be of an adequate thickness for the intended service, which means it shall be resistant to minor wayside impact damage, as well as resist being bent from misuse.

(8) In addition, when supported at both ends, the door shall sustain a concentrated load of 200 lbs applied at the center of the front face over an area of 4 sq.in., at 90° to the plane of the panel without deflecting more than 0.25 in. nor shall the panel take a permanent set.

(9) The door shall be recessed from the front surface of the vehicle, so as to shield it from possible impacts.

(10) A safety end gate shall be provided to prevent passage through the collision post opening when the door is open on the end of the train or single car. A mechanism to secure the gate in the extended and retracted position without rattling shall be provided. In either the retracted or extended position, the gate shall not interfere with the clear path or devices like the handbrake.

ii). Vestibule Door

(1) An electrically powered sliding door shall be located at the vestibule to isolate the car interior.

(2) A minimum 36 in. "clear passage" shall be provided through the doorway when the door is fully opened.

(3) If applicable, the vestibule doors shall have a removable window and kick panel in compliance with 49CFR238.112.

(4) Each door leaf shall incorporate a service-proven obstruction sensing system.

(5) No door closing warning shall be given.

b). Door Controls

i). Carbody End Door

(1) Body end door controls shall include the following features:

(a) A kick plate, and push buttons shall be installed on both sides of the body end door for passenger activation, and

(b) A three (3) position toggle switch shall be provided with three distinct modes of end door operation, NORMAL, DOOR OPEN, and MANUAL.

(i) The switch shall be mounted to a stainless-steel faceplate with engraved lettering and a red switch guard which shall fully close only when the switch is in NORMAL position.

(2) In NORMAL mode:

(a) The end door shall automatically open fully within 2.5 (± 0.5) seconds after the proximity sensor or push button is activated. However, this opening time shall be adjustable and will be validated through the design review process.

(b) The end door shall remain open for 8 to 15 seconds, then automatically close. However, the closing time shall be adjustable and will be validated through the design review process.

(c) All parameter settings and door timings shall be easily adjustable by PTU.

(3) In DOOR OPEN mode:

(a) The end door will automatically open and remain open.

(4) In MANUAL mode:

(a) Electrical power shall be removed from the end door operator.

(b) The force to open or close the doors manually shall not exceed 20 lbs.

(c) The door shall be held in either the open or closed position with the vehicle subjected to track super elevation up to 7 in. (178 mm).

ii). Vestibule Door

(1) Each interior passenger area door shall be passenger operated on each side by both a ceiling mounted infrared proximity sensor, side door frame mounted push button, and a kick plate electrical switch.

(a) The proximity sensor shall have an adjustable detection range, suitable for the railroad environment and shall not open the door for typical nearby passenger movements (such as accessing nearby luggage racks, etc.) when doorway passage is not intended.

(b) It shall easily permit future adjustments in sensitivity and detection zone by Amtrak.

(c) Details must be submitted for approval by Amtrak.

(d) Approved LED back lighted push plate switches shall be used.

(e) The switches shall be back lighted when the door operator is in Normal mode.

(2) A backup local manual control shall be provided.

(3) Each door operator shall have a local electronic control unit which controls the door operation, that is self-checking and provides fault identification information.

(4) The control unit, as part of its self-diagnosing capability, shall provide performance degradation diagnostics to identify components approaching possible failure. These features shall be accessible via the PTU.

(a) The above features shall be communicated to the CDU and shall be accessible remotely.

(5) Each door operator shall include a maintenance switch which will remove power from the motor to prevent operation while maintenance work is in process.

(a) All functions will be available, including diagnostics.

(6) The door equipment mounting and internal fasteners shall be such that once adjustments are made, and locked, they need not be disturbed until equipment overhaul or replacement.

(7) Access shall be provided from inside the vestibule to all points necessary for service, installation or removal of powered doors and operating apparatus.

c). Door Lock

i). Car Body End Door

(1) The car body end door shall be equipped with a robust and service proven door lock that shall be lockable from inside the car, using a crew key.

(2) The door shall not be lockable from the exterior side of the car.

(3) A separately operated safety override shall be provided to unlock the door from inside or outside the car in the event of an emergency.

(4) When the door is in the locked condition and the lock override is used, the door will return to the locked position when closed.

(5) The arrangement provided for locking the end door shall be approved by Amtrak.

d). Door Operator

i). Power Requirements

(1) The door operator and controls shall operate from nominal 74VDC car battery system.

(2) The door operator and controls shall operate normally over the entire voltage range of charging down to load shed without damage and without affecting the reliability and serviceable life of the operator.

ii). Opening and Closing Forces

(1) The drive mechanism shall be designed to minimize torque applied to the door panel during operation.

(2) The operator and linkage for the doors shall be arranged so the maximum force required to manually move a door panel with power removed shall not exceed 20 lbs.

(3) The door shall open or close successfully with no more than a 60 lbf applied perpendicular to the interior door surface at a height of 56 in., throughout the entire opening and closing cycle.

iii). Dampening and Door Motion

(1) The door operator shall preclude slamming or rebound and shall bring it to rest gently at the extremity of door leaf travel.

(2) The door motion shall be smooth and free of shock and impact.

(3) Damping shall be provided at the ends of travel of the door panel in both the opening and closing directions.

(4) In the opening direction damping shall preclude the door leaf from contacting the mechanical door stop.

(5) Door leaf travel shall be easily adjustable through a single adjustment point to set open and close positions.

iv). Door Holding and Locking Capability

(1) The operator shall be capable of holding the door, without oscillation, in either an open or closed position with the car in service.

(2) Also, the operator shall include an over-center mechanism so that a door will remain in the open or closed position upon loss of power.

v). Protection from Damage

(1) Operator design shall be such that a mechanical or electrical failure shall not result in subsequent damage to other equipment.

(a) For example, if the operator linkage to the leaf comes loose, it shall not be possible for the operator to damage itself from over-travel of the mechanism.

(2) The door operator and drive motor shall be protected from damage created by in-service conditions.

(3) Stall protection will be provided to prevent operator or control damage or degradation should a leaf be immobilized.

(a) When the problem is corrected, the operator will return to full functionality without a manual reset.

(b) Thermal cutouts shall not be used for motor protection.

vi). Limit Switches and Proximity Sensors

(1) All limit switches and proximity sensors used in the operator shall be hermetically sealed and easily replaceable.

(2) All limit switches and proximity sensors shall be precision units that are positively and precisely located so they may be replaced without the need for mechanism adjustment.

vii). Opening and Closing Times

(1) Door opening and closing times shall be independently adjustable and shall be initially set with DC bus voltage with HEP on, at:

(a) Opening: 2.5 (± 0.5) seconds

(b) Closing: 3.0 (± 0.5) seconds

viii). Door motor control and timing function shall be incorporated on the operator unit.

ix). Reliability

(1) The door operator shall require adjustments no more frequently than every 460 days.

(2) The door motor and operator assembly shall be suitable for operation without component replacement between heavy overhaul periods of at least eight years.

(3) The door motor shall be a sealed design and suitably protected from the surrounding environment.

x). Interchangeability

(1) All door operator motors shall be interchangeable from one door position to another.

e). Door Panel Construction

i). Doors shall be constructed of stainless steel and have a honeycomb core.

ii). In addition, when supported at both ends, the door leaf shall sustain a concentrated load of 250 lbs applied at the center of the front face, applied over 4 sq.in. at 90° to the plane of the panel, without deflecting more than 0.25 in. nor shall the panel take a permanent set.

iii). Door panels shall be equipped for emergency escape per 49 CFR Part 238.112.

iv). All door panel joints and edges shall be sealed against moisture.

v). Stainless steel reinforcements shall be provided at attachment points.

vi). Structure used to secure the door leaf to the door hanger shall ensure it lasts the life of the car, without fatigue cracks or similar failure, even if the door operator malfunctions and slams the door leaf repeatedly.

vii). A hand-hold recess shall be provided on both sides of the door panel to allow manual opening of the door from the inside and outside, with the operator deactivated.

viii). Cutouts shall be provided on the inside and outside panels for the two push and kick plates and associated wiring.

ix). All internal door leaf wiring and sensitive edge tubing shall be run through internally routed conduit.

x). Each door panel shall have window openings formed to accept FRA Part 223 Type II compliant glazing.

xi). The door window frame shall be an integral part of the door structure and shall be capable of retaining the window in the door opening when subjected to the impact applicable to the window location described in 49 CFR Part 223.

xii). The glazing and its mounting system shall not extend beyond the outer surface of the door.

xiii). Door panels shall be fully insulated against thermal and sound transmission and grounded per APTA Standard SS-E-005-98.

xiv). Door panels shall not rattle or vibrate.

f). Obstruction Detection

i). Each door leaf shall be equipped with a service-proven obstruction detection system. The system should include over-current detection and a sensitive edge.

ii). Should the door close against an obstruction, the obstruction detection system shall immediately initiate the door opening cycle.

iii). The force required to activate the system shall not exceed 20 lbf.

iv). The sensitivity of the obstruction detection system shall conform to APTA Standard SS-M-18-10.

v). The design of the obstruction detection system shall not allow the door to oscillate if no obstruction is present.

vi). The design of the obstruction detection system shall be subject to Amtrak acceptance during design review.

vii). The Contractor shall provide a detailed assessment of the obstruction detection system as proposed, including theory of system operation, proven service history, reliability and maintainability, compliance with applicable regulations and standards, and safety analysis.

g). Overhead Door Track

i). Door leaves shall be suspended from an overhead door track.

ii). The track and door hanger assembly shall have minimum service life of 25 years.

iii). The track shall be convex with the curve on top, so as to be self-cleaning from buildup of dust.

iv). The door track shall employ concave rollers, with sealed, permanently lubricated bearings.

v). The overhead door track and rollers shall not be affected by environmental conditions, including the accumulation of dust.

vi). The door hanger and track shall be able to resist without damage or permanent deformation a force of 200-lbf applied perpendicular at the center of the door panel both in either the inward or outward directions.

vii). The rollers shall be secured to the hanger assembly with a mechanism, both to adjust for level as well as control vertical free-play between the hanger assembly and door track.

viii). Door leaf adjustment shall allow the space between the nosing seal to be made constant from the top to the bottom of the leaf.

ix). The amount of track-to-roller free-play shall prevent the trailing edge roller from lifting on the track if the door leaf strikes an obstruction down low while closing.

x). Adjustment of free-play clearances shall be easily done using standard tools.

xi). The track itself and mounting to carbody (not the door-to-hanger connection) shall be adjustable to accommodate both carbody and door leaf tolerances, including both height and plumb.

xii). The door track and hanger shall not require lubrication over its life.

h). Bottom Door Guides and Thresholds

i). A door guide with corresponding threshold shall be provided at the bottom of the door.

ii). Wear strips, if provided, shall be easily replaceable without removing or readjusting the door panel.

iii). The bottom guide arrangement shall ensure operation with no binding or rattling.

iv). The door guide/threshold shall form part of the door weather seal and shall incorporate drain holes to carry off water to the underside the car.

v). The threshold and drain and their sealing to the carbody shall ensure water or other fluids do not enter the equipment room, nor do they seep underneath and cause deterioration of flooring, its substructure or insulation.

vi). Easy access shall be provided to the door guide/threshold for cleaning and maintenance.

vii). The guide shall be adjustable to accommodate both carbody and door leaf tolerances.

viii). The bottom guide shall not require adjustments more often than every 360 days.

i). Weather Seal

i). The leading edge of the door panel shall interlock with the door frame to form a weatherproof seal.

ii). The interior and exterior of the door opening, including any curves at the top, shall be equipped with a flexible weather seal.

iii). The rear edge of the leaf shall be equipped with a batten that positively engages the door seal when the door is fully closed, including any radius at the top of the door opening.

iv). This combination shall affect a dust- and weatherproof seal.

v). The seal shall be attached to the door frame with sufficient clearance so as to prevent chafing against the leaf as it moves, yet ensure every door

leaf seals on every car, despite the combination of all manufacturing tolerances.

vi). The interface between the bottom of the door and the threshold shall form a weatherproof seal.

vii). When door is manually locked a seal shall prevent air infiltration.

viii). Seal design shall also limit the entrance of dust and snow into the door pocket when the door is open.

ix). The entire door seal arrangement shall be demonstrated during the design review process to provide an effective door seal under all operating conditions and is subject to Amtrak acceptance.

j). Door Pocket (If provided)

i). The door pocket will accommodate the door leaf while the door is open.

ii). Since the bottom of the carbody end door pocket is a wet area, it shall be lined with corrosion resistant material to prevent deterioration of car structure and flooring.

iii). This pan shall be designed to drain water out of the pocket area through a tube to the underside of the car.

iv). It shall be designed to ensure that water does not seep underneath and cause deterioration of flooring, its substructure or insulation, nor does not it freeze in the drain.

v). The drain shall be easily accessible for cleaning and shall be equipped with a backflow preventer to keep dust and moisture from blowing into the pocket.

12.5 Powered Gap Filler, Trap Door and Folding Step

a). General

i). Trainline-controlled, power operated stainless steel trap door, folding steps, and a gap filler shall be provided for each car type with a vestibule.

ii). Each side of the vestibule shall be equipped with a modular electrically powered trap door, gap filler, and folding step assembly for safe boarding and discharging of passengers at both low and high level platform stations.

(1) The design shall meet the requirements of the clearance diagram per D-05-1355.

(2) The trap door and folding steps shall be compliant with all aspects of ADA requirements.

iii). An exterior/interior weatherproof coach key switch, complete with seal over key opening and detent latch, shall be provided adjacent to the side doors on

each side of all cars to allow crew to open or close the adjacent door leaves, the trap door and folding steps to enter or exit the car.

iv). Hand-operated latches and handles shall provide clearance for operation by a gloved hand.

v). The module shall be complete with mounting holes so that it can be applied to the car vestibule floor from the top as a complete assembly or removed intact for major repairs. The design shall be interchangeable with other cars within this procurement.

vi). Amtrak will work with the Builder to identify J.L. Howard Hardware suitable for this application.

vii). See Chapter 20 for testing requirements.

b). Design/Construction

i). Gap Filler

(1) The powered side door high level platform gap filler shall undergo proof-of-design testing to evaluate and verify that the filler meets all specification requirements for:

(a) Compliance with all applicable ADA requirements.

(b) Functional and operational performance under all design loads, track conditions as specified, and safety factors without deformation or deflection.

(c) Rate of travel for extension and retraction.

(d) Proper operation of all safety provisions and functional interlocks and isolation devices within the unit and with the door system, brakes and indicators.

(e) Maintainability and reliability requirements.

(f) Manual retraction with power or mechanical failures.

ii). Folding Stairs

(1) The folding stairs shall consist of four (4) steps, with the lowest step located 17 inches above top of rail.

(2) Tread depth shall be 11 inches, and riser shall be 7 inches maximum.

(3) Open risers shall not be permitted.

iii). Trap Door and Threshold

(1) The trap door when closed shall form an integral floor with no relative gradient between the vestibule floor and the trap door.

(2) A rubber bumper shall be provided to cushion the stop when the trap door is raised to the open position.

(3) The trap door shall have devices to retain the trap door horizontal in the closed position and vertically in the raised position without rattling using corrosion-resistant railroad proven hardware.

(4) Neither the latch nor the trap door shall encroach into ADA accessible clear opening.

(5) Threshold of the trap door shall be ADA compliant.

iv). Trap Door and Folding Step Operation

(1) Trainline control at 74 Volts Direct Current (VDC) via 27-point communication trainline cable, in compliance with Amtrak Drawing A-63-7676-1.

(2) The trap door and folding steps shall be operated from the local door control panel or via trainline OPEN or CLOSE commands from another location or car.

(3) The trap door and folding steps shall not prohibit egress in an emergency situation or in the event of HEP power loss.

(4) A local maintenance on/off switch shall be provided per traps door and folding step to de-energize the local circuits and motor during maintenance and/or troubleshooting.

(5) Relay-based logic and discrete trainlines shall be provided for the issuing of control commands to the trap door and folding step.

(6) Discrete trainlines shall also be used to monitor the trap door closed and locked status, and provide the required indications to the train crew.

(7) Manual operation with power or mechanical failures.

v). Safety Considerations

(1) The trap door control system shall incorporate logic that shall meet the requirements of EN 50126 SIL 3 so that no unsafe condition will be created:

(2) through normal operation of the trap door system, or

(3) due to a failure of the trap door system equipment or components.

(4) Trap door control system shall be able to tolerate two separate grounds anywhere in the train in the trap door circuits and not have an unintended opening.

(5) Control system design shall be fault tolerant to prevent unintended trap door or step openings.

(6) Each trap door and folding step shall be provided with a position sensor to detect that the door is fully closed and that it is mechanically latched.

(7) Zero Speed Protection

(a) The zero-speed protection from wheel slide control unit on each car shall include all of the following:

(i) Trap door and folding step control panel system deactivation if not at zero-speed.

(ii) Removal of power from the trap door and folding step operator's OPEN function if not at zero speed.

(iii) Trap door and folding step CLOSE command automatically issued in both directions on left and right door close trainlines when car motion is detected.

(b) Zero-speed signal supplied by the wheel slide control unit shall be required in order to issue an OPEN command to the trap door and folding step.

(i) Conversely, the absence of a zero-speed signal shall prohibit the issuance of an OPEN command to the trap door and folding step.

(8) Traction Interlock

(a) Traction interlock shall be provided, with the trap door, gap filler and folding stairs closed indication, that prevents the locomotive from developing tractive effort if any side trap door and folding step is not fully closed and latched, or mechanically locked and electrically isolated.

(i) There is no interlock between the trap door closed summary circuit and the brake system.

(9) Obstruction detection with over current on each trap door and folding step meeting the requirements of APTA Standard SS-M-18-10.

(10) Emergency Releases

(a) Manual emergency release for each trap door and folding step from inside the car, with frangible cover.

(b) Manual exterior emergency release for each trap door and folding step, fully enclosed behind a weatherproof cover.

(11) Mechanical lock which can be engaged manually with a coach key from inside the car which allows the on-board crew to secure the trap door and folding step closed and isolate the trap door operator electrically.

(12) All trap door and folding step control system signal and indicator lights shall use approved long life, high intensity Light Emitting Diode (LED) or LED arrays lamps having a rated life of at least 100,000 hours.

(13) Audible signal, near the trap door at each side door opening.

(a) Tone or audible message and volume of audible signal to be submitted to the Amtrak for approval during design review. **[CDRL 12-01]**

vi). Handles

(1) The underside of the trap door shall be provided with an inverted N-shape grab handle to aid passenger egress/ingress when the trap is open.

(2) In addition, a handle shall be provided to aid in lifting the door and in pulling the door from its vertical position in manual mode.

vii). Safety

(1) The trap door and folding step assembly shall be designed to minimize pinch points.

(2) Trap doors, either open or closed, shall be free of sharp edges and corners, burrs, nicks and gouges.

c). Environmental Considerations

i). The outer edge must be designed to ensure the side entrance door seal is watertight.

ii). The trap door when closed shall form a water-tight seal with the adjacent side entrance door.

iii). Threshold of the trap door shall have provision for protective heat system to prevent ice-build up.

iv). Trap door devices shall be ice breaking type.

v). The folding steps shall be designed to prevent buildup of ice and snow from forming that would prevent the folding steps from operating or make them unsafe to use. Drain holes shall also be provided at the back of each tread.

d). Manual Operation

i). The trap door and step operating mechanism shall be designed so that the trap door can be opened or closed with a maximum force of 25 pounds at any point in travel in the event there is an electrical failure to the assembly.

ii). It shall be an assembled module mechanically linked such that moving the trap door controls the movement of the folding steps.

iii). When the step is being lowered, the mechanism shall be damped so it cannot fall freely.

e). Materials

i). The modular trap door and folding step assembly shall be constructed of stainless steel and shall not corrode during the life of the car despite the frequent use of salt for thawing, operating in seashore air, salt spray from operating near highways and grade crossings, etc.

ii). The threshold and surfaces subject to foot traffic shall be of a non-skid material as defined by the ADA.

iii). The top surface of the trap door shall be an approved non-skid synthetic floor covering surrounded with stainless steel protected edges.

(1) The synthetic floor shall be the same as the fixed floor in the vestibule.

iv). Treads shall be constructed of approved anti-slip material.

v). Non-skid surfaces shall retain their non-skid rating in wet and dry conditions and shall retain their coefficient of friction for minimum of five years.

vi). Wearable non-skid components shall not be permanently affixed to the car.

f). Markings

i). Periphery of the trap door and folding steps shall be highlighted by two (2) inch federal yellow stripes that are integral to the trap door and have high corrosion-resistance and wear-life.

ii). Reflective tape shall be applied to all step risers.

iii). Contrasting step edging shall be applied in a manner which makes the tread detectable whether ascending or descending stairs.

12.6 Onboard Mobility Device Lift

a). The standard coach, premium accessible coach, accessible sleeper, diner/lounge and café/lounge shall have an onboard mobility device lift on each side of the car.

b). The lowest station platform height for the purposes of the lift's lower reach shall be assumed to be 8" below the top of rail, to allow for emergency egress.

c). The lift design shall also allow for operation when the car is on a curve with up to 7 in. of lean, due to super-elevation.

d). When the lift is lowered to the platform, the lift shall sit flush with the platform surface and shall not exhibit any skew, tilt, or misalignment.

e). The lift shall be fully compliant with 49 CFR Section 38.

f). The lift proposal shall be service proven, modular, and of compact design to facilitate easy removal and replacement for servicing/repair.

g). The lift operation and its associated equipment shall be automatic and suitable for use by one crew member under all ambient conditions through which these cars are expected to operate.

h). The Contractor may propose alternative control configurations for one crew member operation for review and approval by Amtrak

i). Controls for each Lift shall be adjacent to the Lift they control. The Accessibility Lift controls must enable one (1) train crewmember to effectively oversee all aspects of lift operation and the occupant's movements to and from the lift, without impeding or restricting the occupant's mobility. The crewmember shall be capable of assisting the occupant either within the car or on the platform, without the need to access the occupant through an alternative exterior door.

j). In the event of lift failure or a power failure, it shall be possible to manually operate the lift to or from any position in the raising/lowering cycle, regardless of whether the lift is loaded or unloaded, and to stow and deploy the lift platform.

k). Operation of the lift in manual mode shall not damage the lift or its components.

l). A standard Amtrak coach key shall be required to operate the switch for each lift.

m). The controls for the operation of the on-board lifts shall be interlocked to prevent train motion.

n). Under power operation, the complete cycle of deploying the platform, lowering the lift to platform height, raising the lift to car floor height and stowing the lift platform shall require no more than between 30 and 60 seconds.

o). The lift shall comply with the most recent RVAAC recommendations and any applicable ADA standards.

p). The wheelchair lift shall report alerts and faults to the car diagnostic system.

q). The Contractor may propose other innovative solutions for onboarding passengers with mobility devices as an option.

12.7 Passenger Room Entrance Doors (Sleeping Accommodations)

a). General

i). A robust and service proven lockable sliding pocket entrance door shall be provided for each passenger room entrance door.

ii). The door shall be designed for low weight, sufficiently rigid, and strong construction to withstand when mounted and closed, a horizontal load of 330 lbs. (149.82 kg) applied at any point without permanent deformation.

iii). The door shall not rattle or squeak in any position and shall be sealed when closed to provide a highly soundproof barrier.

iv). The interior door face shall be consistent in appearance with the room modules.

v). The door itself and the partition door frame shall be of sufficient strength to not deflect, bend nor deteriorate from door slamming typical of normal car operation in the railroad environment.

vi). A louver shall be provided at the bottom of the door as a path for HVAC return air to exit the room.

b). Windows

i). Polycarbonate windows in the partition shall be included to provide natural light and enhance the room spaciousness.

ii). Windows shall each be ¼" thick with the following nominal dimensions:

(1) 17" x 44" in the door

(2) 15½" x 30½" in the partition wall.

iii). The door window shall be removable from either side through the use of a pry-out rubber zip strip as an emergency escape route should the door be jammed closed requiring 25 lbf or less to remove the window.

iv). The window shall be equipped with a privacy screen or alternates to be proposed for privacy and to block out hallway lights for sleeping.

c). Door Operating Components

i). The door shall be suspended from an adjustable, self-cleaning, heavy duty overhead low friction track.

ii). The force to open or close the door shall not exceed 10 lbf, once the détent is overcome. No less than 15 lbf shall be required to overcome the detent.

iii). The track rollers shall be sacrificial to the track for wear.

iv). The door will be stabilized at the threshold by an adjustable, self-cleaning guide at its leading edge only.

v). An approved détent shall be provided to keep the door in the open position during Car motion under all train operating conditions at all authorized speeds on any FRA class of track.

vi). A damper shall be provided to dampen a slamming door.

d). Door Pocket

i). The door and pocket walls shall be free from resonance, rattles and/ or banging in open, closed or closed & locked positions when the Car is in motion under all train operating conditions at all authorized speeds on any FRA class of track.

ii). An approved flat spring or similar anti-rattle device shall be provided to keep the door from rattling.

iii). The gap between the door and the edges of the door pocket shall be sized to avoid pinch points.

iv). The door shall not rub the door pocket in any way that marks the door with horizontal lines or scratches, etc.

v). Door pocket design shall discourage inadvertent use as a trash receptacle; it shall be possible to access the rear bottom of the pocket for cleaning or to retrieve objects trapped there. It shall be intended that the door perimeter gaskets prevent a line of sight to the compartment from other passengers.

e). Door Latch/Lock System

i). A robust and service proven latch/lock shall be provided for sleeping accommodations.

(1) The door lock shall allow the passenger to lock/unlock the door from the interior and exterior of the accommodation and shall be designed to prevent accidental lockouts. The contractor shall propose several concepts for Amtrak's review and approval.

(2) It shall incorporate the Amtrak standard coach key for override.

ii). The attachment of the latch and its keeper to the door frame shall be sufficiently rigid so that it does not flex when the door closes, even if it is slammed; the intention is that this interface does not deteriorate over the life of the car.

iii). Likewise, the interior of the door construction shall incorporate interior stiffening in the area where the latch is attached to the door, so that the fasteners securing it to the frame have a solid surface on which to clamp, rather than a somewhat resilient one.

iv). The latch, when engaged, shall keep the door in the fully closed position under all Car operating conditions at all authorized speeds on any FRA class of track at any permissible train speed.

v). The latch and lock system shall meet all CFR and ADA regulations as well as RVAAC and the United States Access Board especially with respect to reach range, hand position/grab angle, and operating forces. The latch and lock system shall be usable with one hand and must not require tight grasp/grip or awkward wrist motion.

vi). In an emergency, it shall be possible to disengage the latch from the hallway side with a screwdriver.

vii). An instruction, in accordance with Amtrak specification # 697, located on the interior side of the door, shall provide latch operating instructions.

f). Reliability

i). The passenger room entrance door shall undergo endurance testing to verify the door installation is not subject to premature wear.

(1) This shall include:

(a) Simulated door installation: door, track, module structure supporting track, door frame with adjoining partition, door latch assembly, detent, etc.

(b) 24,000 Open-close cycles with every tenth slammed

(c) Every 100 cycles, latch/ unlatch the door

(d) Measurement of change from initial setting at every 1500 cycles

(e) Measurement of force required to open/ close door every 1500 cycles

(f) Mutually agreed upon pass/ fail criteria shall be determined for allowable wear in advance of starting the test.

ii). Both track and détent shall be able to operate over 5 year maintenance cycles without adjustments or maintenance required.

iii). The design life of the door track and complete door installation shall be at least 30 years.

iv). The latch system shall be able to operate over 5 year maintenance cycles without adjustments or maintenance required.

g). Maintainability

i). The following shall be possible with only the need to open the hallway ceiling panel outside the room; no disassembly of the room partition is allowed:

(1) Disengage the door from the door mechanism

(2) Remove room door through door opening

(3) Remove door track

(4) Remove door détent (all pieces)

(5) Remove door damper (all pieces)

(6) Adjust the track, damper and détent

12.8 Automatic Sliding Restroom Door

a). A powered sliding pocket door with lock. The lock shall be operable from the outside with a standard Amtrak Conductor coach key

b). A minimum 32 in. "clear passage" shall be provided through the doorway when the door is fully opened.

c). All controls, switches and amenities readily accessible and operable by passengers with disabilities.

d). The door leaf shall incorporate a service-proven obstruction sensing system.

e). An LED indicator light REST ROOM OCCUPIED on the outside of the restroom, and a LED indicator light DOOR IS LOCKED WHEN LIT on the inside of the restroom, activated when the door is locked (see Chapter 11).

f). A decal shall provide door lock operation instructions.

g). In the event that the door operator is in fault, the door shall be operational in manual mode to open, close, and lock.

h). The door operator shall include a maintenance switch which will remove power from the motor to prevent operation while maintenance work is in process.

i). All functions will be available, including diagnostics.

i). The door equipment mounting and internal fasteners shall be such that once adjustments are made, and locked, they need not be disturbed until equipment overhaul or replacement.

j). Access shall be provided to all points necessary for service, installation or removal of the powered door and operating apparatus.

k). The door operator and controls shall operate from nominal 74VDC car battery system.

l). The door operator and controls shall operate normally over the entire voltage range of charging down to load shed without damage and without affecting the reliability and serviceable life of the operator.

m). The drive mechanism shall be designed to minimize torque applied to the door panel during operation.

n). The operator and linkage for the doors shall be arranged so the maximum force required to manually move a door panel with power removed shall not exceed 20 lbs.

o). The door operator shall preclude slamming or rebound and shall bring it to rest gently at the extremity of door leaf travel.

p). The door motion shall be smooth and free of shock and impact.

q). Damping shall be provided at the ends of travel of the door panel in both the opening and closing directions.

r). In the opening direction damping shall preclude the door leaf from contacting the mechanical door stop.

s). Door leaf travel shall be easily adjustable through a single adjustment point to set open and close positions.

t). Opening and Closing Times

i). Door opening and closing times shall be independently adjustable and shall be initially set with DC bus voltage with HEP on, at:

(1) Opening: 2.5 (± 0.5) seconds

(2) Closing: 3.0 (± 0.5) seconds

ii). Door motor control and timing function shall be incorporated on the operator unit.

u). Reliability

i). The door operator shall require adjustments no more frequently than every 460 days.

ii). The door motor and operator assembly shall be suitable for operation without component replacement between heavy overhaul periods of at least eight years.

iii). The door motor shall be a sealed design and suitably protected from the surrounding environment.

v). Overhead Door Track

i). Door leaves shall be suspended from an overhead door track.

ii). The track and door hanger assembly shall have minimum service life of 25 years.

iii). The track shall be convex with the curve on top, so as to be self-cleaning from buildup of dust.

iv). The door track shall employ concave rollers, with sealed, permanently lubricated bearings.

v). The overhead door track and rollers shall not be affected by environmental conditions, including the accumulation of dust._

vi). The door hanger and track shall be able to resist without damage or permanent deformation a force of 200-lbf applied perpendicular at the center of the door panel both in either the inward or outward directions.

vii). The rollers shall be secured to the hanger assembly with a mechanism, both to adjust for level as well as control vertical free-play between the hanger assembly and door track.

viii). Door leaf adjustment shall allow the space between the nosing seal to be made constant from the top to the bottom of the leaf.

ix). The amount of track-to-roller free-play shall prevent the trailing edge roller from lifting on the track if the door leaf strikes an obstruction down low while closing.

x). Adjustment of free-play clearances shall be easily done using standard tools.

xi). The track itself and mounting to carbody (not the door-to-hanger connection) shall be adjustable to accommodate both carbody and door leaf tolerances, including both height and plumb.

xii). The door track and hanger shall not require lubrication over its life.

w). Bottom Door Guides and Thresholds

i). A door guide with corresponding threshold shall be provided at the bottom of the door.

ii). Wear strips, if provided, shall be easily replaceable without removing or readjusting the door panel.

iii). The bottom guide arrangement shall ensure operation with no binding or rattling.

12.9 Accessible Rooms

a). The requirements of the passenger room doors and automatic sliding restroom door sections in this chapter apply to the accessible room doors.

b). Accessible bedrooms shall have the same lock that is provided for the other sleeping accommodations.

c). The lock incorporates the standard Amtrak Conductor coach key for override.

d). In the event that the door operator is in fault, the door shall be operational in manual mode to open, close, and lock.

12.10 CDRLs

CDRL	Description	Due
CDRL 12-01	Tone and Volume of Audible Signal	30 days prior to PDR

CDRL 12-02	Engineering analysis of side door operator's ability to operate over full HEP voltage range without damage.	30 days prior to IDR
CDRL 12-03	Side Door System Failure Mode and Effects Criticality Analysis (FMECA) and Fault Tree Analysis (FTA)	30 days prior to IDR
CDRL 12-04	Proposed door signage samples, location and adhesive	30 days prior to IDR

Table of Figures

Figure 13-1: Feature Light Fixtures 13-4
Figure 13-2: Minimum Illumination Levels 13-23

13.1 Overview

a). This Chapter describes the interior and exterior lighting system that shall be provided on all car types.

b). The lighting system as designed shall enhance the appeal of interior furnishings and create a comfortable and pleasant atmosphere while providing for maximum passenger and crewmember safety.

c). Normal and emergency lighting shall conform to the requirements of all applicable APTA standards and FRA regulations.

d). Automatic load shedding of certain lights shall take place when the Head End Power (HEP) supply is interrupted, and the battery voltage drops to certain levels.

e). All lighting equipment shall meet the requirements of Chapters 15 and 20, the voltage swing requirements of Amtrak Specification 429, and the environmental requirements of Amtrak Specification 963.

f). Lighting system components shall not cause radio frequency interference (RFI) to any car or operations systems.

g). The lighting system shall provide six modes of interior lighting: normal, quiet car, night, standby, emergency and cleaning.

h). Interior and exterior lighting, as well as indicator lights, shall be provided by Light Emitting Diodes (LEDs) and will be supplied by the low voltage DC system

i). Other state-of-the-art lighting technology may be proposed to Amtrak for review and acceptance.

j). Elements of this lighting system will be available for use as standby lighting.

k). Fluorescent, Incandescent and Halogen lights shall not be used except as specified.

l). For lighting requirements in the food service areas, see Chapter 16.

m). The Contractor shall prepare and submit an interior and exterior lighting plan **[CDRL 13-01]** for Amtrak review and acceptance during the design review. The plan shall describe the type of lighting to be used in all applications, including:

i). fixture type,

ii). voltage and color temperature,

iii). illumination levels at specified locations for all lighting modes, and

iv). compliance with emergency lighting and signage regulations and standards.

13.2 General Requirements

a). Fixtures installed in the interior within 3 ft. of a doorway that can be exposed to

weather when the door is open, shall be watertight to IP55 or better.

b). Fixtures installed on the vehicle exterior shall be watertight to IP56 or better.

c). Car interior lighting shall provide adequate and convenient illumination under all ambient lighting conditions from complete darkness to bright sunlight.

d). Lighting in all locations shall be arranged to minimize shadows, avoid glare and excessive brightness ratios.

e). Lighting shall be appropriate for the application, easily maintainable and compliant with all regulations and standards, including this specification.

f). Luminaires of differing voltages shall not share the same base design, and luminaires shall not be interchangeable between fixtures with differing voltages.

g). Commonality and standardization of components between fixtures should be used wherever possible.

h). Unless otherwise specified, the interior lighting shall be based on the latest guidelines of all of the following:

i). the Illuminating Engineering Society (IES) of North America

ii). Code of Federal Regulations

iii). the requirements of the American Public Transportation Association (APTA) standards:

(1) PR-E-RP-002-98: Wiring of Passenger Equipment

(2) PR-E-RP-012-99: Normal Lighting System Design for Passenger Cars

(3) PR-E-S-013-99: Emergency Lighting System Design for Passenger Cars

(4) PR-PS-S-006-23: Emergency Egress/Access Signage and Low-Location Exit Path Markings (LLEPM).

i). All lighting components shall have prior experience in North American transit, commuter rail or intercity passenger rail application.

j). All lighting sources shall be suitable for rough duty service found in the railroad environment throughout North America.

k). At its sole discretion, Amtrak may accept other components based upon provided shock and vibration test results, and EMC interference analysis.

l). The Contractor shall provide drawings of the lighting arrangement of each vehicle type, and the location and quantity of each lighting fixture, switch, control, and luminary type.

m). All luminaires used in all fixtures shall be readily available through a U.S.

distributor and available from multiple sources.

n). All luminaires must be replaceable without replacing the entire fixture or requiring specialty tools, except where approved by Amtrak.

o). All controllers shall report alerts and fault information to the car diagnostic system if applicable.

p). The design and all components of the lighting system shall be submitted for review and acceptance by Amtrak during Design Review.

q). All materials and workmanship shall comply with Chapter 19.

r). The lighting fixture housing or socket shall not be used as a ground return for any other electrical circuits.

s). Lighting fixture and consumable types shall be consolidated as much as practical.

13.3 Lighting Plan

a). Design Review

i). The Contractor shall provide drawings of the lighting arrangement of each car type for Amtrak review and acceptance during Design Review. Outline drawings shall be submitted at PDR and updated for FDR submittal. **[CDRL 13-02]**

ii). Fixtures providing standby and/or emergency lighting shall be identified at Preliminary Design Review. **[CDRL 13-03]**

iii). The location of each lighting fixture, circuit breaker size and location, switch, control, luminary type, color, luminance value (in footcandles) and quantity shall be clearly identified at Intermediate Design Review and updated for FDR submittal. **[CDRL 13-04]**

iv). Required charging light levels for photo luminescent (HPPL) emergency exit signage and Low Location Exit Pathway Markings (LLEPM) components will be identified during Design Review and validated during qualification testing. **[CDRL 13-05]**

v). Physical examples of each lighting fixture shall be provided for Amtrak review and approval at the Final Design Review. **[CDRL 13-06]**

vi). Lighting fixtures shall not be a source of Electromagnetic Interference (EMI) and shall be included in the Electromagnetic Compatibility (EMC) plan required by APTA Standard PR-E-S-010-98. See Chapter 20.

vii). The Contractor shall provide certification to Amtrak that the car's lighting system meets all standards and regulations **[CDRL 13-07]**

b). Additional Feature Lighting Fixtures

i). In addition to light fixtures required to meet standards and regulations, the following light fixture types shall be integrated into the interior and food service areas. See Chapters 11, 16 and 31 for additional information.

Figure 13-1: Feature Light Fixtures

Area	Type	Location
Luggage Storage	Indirect	Under Shelf
Hallway	Wash light	top of wall panels across ceiling
Hallway	Panel Spot Light	ceiling
Entrance	Wash light	top of wall panels across ceiling
Entrance	Panel Spot Light	ceiling
Entrance	Step lights	Threshold and steps
Coach/ Premium Coach	Wash light	across side ceiling panel
Coach/ Premium Coach	Wash light	across central ceiling panel
Coach/ Premium Coach	Reading Light	Overhead track/On seat
Coach/ Premium Coach	Panel Spot Light	ceiling
Coach/ Premium Coach	Compartment Light	under seat
STR	Panel Spot Light	ceiling master light
STR	Wash light	across floor for the length of the vanity unit
STR	Wash light	across sink and vanity counter
STR	Compartment Light	mirror light
ATR	Panel Spot Light	Main ceiling light
ATR	Wash light	across floor light along length of vanity unit
ATR	Wash light	across sink and vanity counter
ATR	Compartment Light	mirror light
Roomette	Wash light	across both end walls
Roomette	Panel Spot Light	ceiling master light
Roomette	Compartment Light	bunk step light
Roomette	Compartment Light	under seat
Roomette	Reading light	at both ends of upper bunk (when deployed)
Roomette	Reading light	each end of lower bunk/at each lower seat
SoloSuite	wash lights	down end wall behind rack
SoloSuite	wash lights	ceiling master light
SoloSuite	compartment lights	Inside ottoman footbox
SoloSuite	compartment lights	Under ottoman luggage area
SoloSuite	reading lights	lower seating/bed position
Club Bedroom	Wash light	across both end walls
Club Bedroom	Panel Spot Light	ceiling master light
Club Bedroom	Compartment Light	bunk step light
Club Bedroom	Compartment Light	under seat
Club Bedroom	Reading light	at both ends of upper bunk (when deployed)

Club Bedroom	Reading light	each end of lower bunk/at each lower seat
Club Bedroom	Restroom wash light	down back wall behind towel rack
Club Bedroom	Restroom Panel Spot Light	ceiling master light
Club Bedroom	Wash light	across sink and vanity counter
Club Bedroom	Compartment Light	mirror light
Accessible Bedroom	wash light	across both end walls
Accessible Bedroom	Panel Spot Light	ceiling master light
Accessible Bedroom	Compartment Light	under seat
Accessible Bedroom	reading light	at both ends of upper bunk (when deployed)
Accessible Bedroom	reading light	each end of lower bunk/at each lower seat
Accessible Bedroom	Restroom Panel Spot Light	ceiling master light
Accessible Bedroom	Wash light	across floor for the length of the vanity unit
Accessible Bedroom	Wash light	across sink and vanity counter
Accessible Bedroom	Compartment light	mirror light
Communal Showers	Wash light	across changing area wall
Communal Showers	Panel Spot Light	ceiling master light
Communal Showers	Panel Spot Light	ceiling - inside shower area
Communal Showers	Wash light	across floor for the length of the vanity unit
Communal Showers	Wash light	across sink and vanity counter
Communal Showers	compartment light	mirror light
Diner Lounge	Wash light	across side ceiling panel
Diner Lounge	Wash light	across central ceiling panel
Diner Lounge	Panel Spot Light	ceiling
Diner Lounge	Compartment Light	under table and seating
Diner Lounge	Feature Light	wall lamp at each window pillar
Diner Lounge	Feature Light	table booth lamp at each fixed dining table
Diner Lounge	Bar area lighting	feature pendant/down light
Diner/ Galley	Wash light	across central ceiling panel
Diner/ Galley	Wash light	across central ceiling panel
Diner/ Galley	Panel Spot Light	ceiling
Diner/ Galley	Feature Light	wall lamp at each window pillar
Diner/ Galley	Feature Light	table booth lamp at each fixed dining table
Diner/ Galley	Hallway wash light	top of wall panels across ceiling
Café Car	Wash light	across central ceiling panel
Café Car	Wash light	across central ceiling panel
Café Car	Panel Spot Light	ceiling
Café Car	Cafe area lighting	feature pendant/down light
Café Car	Cafe area wash light	down length of counter
Café Car	Café Interior Spotlights	downlights on counter and worktops
Café Car	Café compartment light	Display lighting

Café Car	Compartment Light	under table and seating
Café Car	Feature Light	wall lamp at each window pillar

13.4 Interior Lighting Levels

a). Lighting Standards

i). All light level measurements shall be made in accordance with the minimum standards defined by the following APTA standards unless otherwise approved by Amtrak:

(1) PR-E-RP-012-99: Normal Lighting System Design for Passenger Cars (for Coach Cars)

(2) PR-E-S-013-99: Emergency Lighting System Design for Passenger Cars

(3) PR-PS-S-006-23: Emergency Egress/Access Signage and Low-Location Exit Path Markings (LLEPM)

ii). Where lighting levels in Figure 13-2 differ from APTA PR-E-RP-012-99, the requirements indicated in Figure 13-2 shall be used.

b). Lighting Color Temperatures

i). The lighting color for all white interior luminaires throughout the car shall be in the range of 3000°K to 3600°K, +/- 500°K between any lights, and accepted by Amtrak. LED luminaires shall have a color rendering index (CRI) of at least 80, with the same color consistency and color stability.

ii). The Contractor is to provide a suggested light color plan for Amtrak's review and approval during the preliminary design review. **[CDRL 13-08]**

c). Minimum Lighting Illumination

i). The minimum spatial average of illumination shall be at the points listed in Figure 13-2, and shall meet the minimum value(s), measured in foot-candles, with all lights on and at the rated voltage when the equipment is new.

13.5 Interior Lighting Modes

a). Mode Control

i). See Section 13.11 for Control Description.

b). Normal Lighting Mode

i). Normal lighting mode shall be available when the car is operating from a Head End Power source.

ii). All lighting fixtures and elements intended for use while the car is in revenue service shall be available during normal lighting mode.

iii). Minimum illumination levels for normal lighting mode are shown in Figure 13-2.

c). Quiet Car Mode

i). Normal lighting mode in the car shall be arranged to allow the level of lighting to be reduced for passenger comfort during early morning and late evening operation, while maintaining sufficient lighting for passenger and crew safety, and compliance with standards and regulations.

ii). This reduced light level, referred to as “Quiet Car” mode, may use any combination of lighting elements so long as minimum light levels are maintained at “Standby” illumination levels throughout the car, and all light fixtures operating during quiet car mode remain powered at all times.

iii). A dedicated, clearly labeled switch in the electric locker shall permit operating personnel to easily select either normal lighting or quiet car mode lighting.

iv). Minimum illumination levels for quiet car mode are shown in Figure 13-2 under the “Quiet Car” column.

v). The Contractor shall carefully design the lighting fixtures and their controls to permit the Quiet Car lighting mode to have a minimum of glare and annoyance to sleeping passengers, especially those seated adjacent to the aisle.

vi). Light reflections and glare from bright metal body end doors shall be minimized.

d). Night Lighting Mode

i). Night lighting shall only provide minimal illumination to aisleways to allow safe passenger movement and not disturb seated passengers from resting.

ii). Night lighting mode shall not negatively impact the light intensity levels of all food and beverage service locations. All FDA light intensity level requirements for food preparation counters, sinks, and workspaces shall be maintained by shelf lighting alone. See Chapters 11 and 16 for additional information.

iii). The selection of lights being powered in this mode will be determined during design review when the lighting arrangement concepts are drafted.

iv). Contractor may propose that Quiet Car Mode and Night Lighting Mode are equivalent for Amtrak to review and approve.

e). Standby Lighting Mode

i). Standby lighting is that which is available when the cars have lost 480VAC Head End Power (HEP), but the car battery has not yet discharged to load shed.

ii). This lighting mode is intended to keep sufficient lighting operational for a period of at least 90 minutes so that short term loss of HEP will not affect the passengers' ability to safely move throughout the cars.

iii). Minimum illumination levels for Standby mode are shown in Figure 13-2.

f). Emergency Lighting Mode

i). Emergency Lighting mode is that which is available after load shed has occurred. See Chapter 15 for load shed details.

(1) This lighting provides passenger orientation and sufficient light levels for passengers to move about safely within the car and if necessary, to find the nearest safe exit point.

(2) It is especially important in trap steps, aisles, vestibules and enclosed spaces, such as toilet rooms.

ii). Emergency Lighting mode shall operate by hardware only. Software control of emergency light mode or intensity levels is prohibited.

iii). Emergency Light Intensity shall be met using the L70 end of life cycle light output levels.

iv). Once the low voltage system reaches a pre-determined low-voltage threshold, all standby lighting is extinguished and emergency lighting shall illuminate.

v). This lighting system may use dedicated fixtures, may provide a reduced level of illumination from the normal lighting system, or may use some but not all of the normal lighting fixtures.

vi). The emergency lighting system shall be powered by independent power sources for a minimum of 90 minutes as defined in APTA Standard PR-E-S-013-99.

vii). End-of-life self-diagnostic and test functions shall be included with the emergency lighting system.

viii). Emergency lighting shall comply with 49 CFR Part 238.115 and APTA Standard PR-E-S-013-99.

ix). Energy storage components, batteries or capacitors must have all contacts and terminals covered to prevent shorting during storage or installation, and easily changed out using a connector.

x). Energy storage components shall be common between all fixtures whenever possible.

xi). The Contractor shall submit an Emergency Lighting Plan to Amtrak for review and acceptance during Design Review. **[CDRL 13-09]**

(1) The Emergency Lighting Plan shall describe and illustrate the emergency lighting system, including location, type and design of all

lighting fixtures and the level of illumination that shall be provided at all points as identified in APTA Standard PR-E-S-013-99.

xii). The Contractor shall demonstrate compliance with emergency lighting requirements and shall provide to Amtrak written certification of compliance. **[CDRL 13-10]**

g). Cleaning Mode

(1) Cleaning Mode is a temporary mode that increases the interior light intensity to 30 foot candles to facilitate cleaning. See Section 13.11.b). for additional details.

13.6 Interior Lighting Requirements

a). Passenger Area

i). General

(1) The following describes the individual lighting fixture applications and specifications for all passenger areas of the car.

(2) Light fixtures in toilet room ceiling, vestibule ceiling and hallway ceiling shall be identical units if possible.

ii). Main Ceiling

(1) Longitudinal rows of lights shall provide the primary lighting for the revenue seating areas of all car types, and the passenger area of the food service car.

(2) Indirect lighting shall be the source of illumination to meet minimum illumination levels.

(3) Other arrangements can be proposed but are subject to Amtrak review and acceptance.

(4) These LED fixtures provide the main light source to the car and provide lighting to the aisle as well as general lighting to the seating areas.

(5) The fixtures shall be trough-construction units, mounted end-to-end. They shall be equipped with terminal blocks or connectors, as accepted by Amtrak, wired in parallel fixture-to-fixture, including all bus wiring for the entire fixture string for normal, quiet car, night and standby modes.

iii). Hallway Ceiling

(1) Hallway ceiling lights shall be used to supplement main ceiling lighting to achieve necessary illumination levels. Lighting shall be the same indirect style as the main ceiling. Direct lighting shall not be used unless specifically requested by Amtrak.

b). Reading Lights

i). General

(1) Reading lights shall be white LEDs powered by 74 VDC, 24 VDC or other approved DC voltage.

(2) They shall be mounted such that illumination requirements are achieved. Each reading light shall have an on/off switch.

(3) Reading lights shall have a maximum light intensity of 20 foot-candles when measured at a seated passenger's lap. Light intensity shall be passenger adjustable by either a dimmer switch or an integrated on/off/dimmer switch.

(4) Reading light orientation shall be passenger adjustable within a limited range, and beam dispersion to prevent disturbing adjacent passengers.

ii). Reading Lights for Main Passenger Seating

(1) Individual reading lights built into each revenue seat shall be provided. Overhead reading lights may still be necessary in certain seating locations, especially accessible seating locations.

iii). Reading Lights for Roomette, Bedrooms and Solo Suite

(1) A reading light shall be provided for each seating location.

(2) Location and arrangement of reading lights shall be proposed to Amtrak for review and acceptance during PDR.

(3) Physical dimming switches that are rated for railway application shall be provided in each sleeping accommodation for individual passenger control.

c). Bedroom Lighting

i). General

(1) Each sleeper room shall be equipped with indirect overhead lighting, fixed color temperature accent lighting, and a night light.

(2) Each light source shall be controllable by local physical switch.

(3) The HPPL will be powered on regardless of any light switch position.

d). Vestibules and other Non-Seating Areas

i). Flush-mounted overhead light fixtures

(1) Overhead lighting fixtures in vestibules and non-seating areas shall be proposed to be aesthetically appealing rather than an industrial type fixture.

(2) Flush-mounted overhead light fixtures with LED light elements shall be provided in the following locations for the purposes of commonality and interchangeability:

(a) End passageway

(i) The end passageway light(s) shall be a weatherproof, sealed light unit mounted overhead adjacent to the diaphragms or gangways on all car types.

(ii) The unit shall cast adequate light throughout the passageway area including handholds, door panel, walkway surface, signage and handbrake.

(b) Ceiling at side entry doors

(i) Flush-mounted lighted ceiling panel fixtures shall provide overhead light to the areas adjacent to the side entry doors and adjacent station platform.

(ii) The lighted panel assembly shall provide indirect lighting towards the center of the panel.

(iii) The same fixture shall be used at all side entrance locations, including service vestibules in the food service and lounge cars.

e). Toilet Rooms

i). Toilet ceiling and mirror

(1) Light fixtures shall be mounted on the ceiling of each toilet room to provide general lighting to the toilet room.

(2) Care shall be taken to provide good color rendition for cosmetic makeup application and other personal grooming purposes.

(3) Lighted mirror designs shall be presented in the toilet rooms during design review.

(a) A concept for a rounded LED light that illuminates the mirror around the boarder shall be presented at Preliminary Design Review and updated for approval at Final Design Review.

(b) A concept for a backlit mirror shall be presented at Preliminary Design Review and updated for approval at Final Design Review.

(c) The mirror light shall only be activated when the door to the restroom is locked. It shall be off when the door is unlocked to raise awareness to the passenger.

(4) The lighting fixtures shall be provided as part of the toilet module.

(5) Toilet room occupied/out of service sign

(6) There shall be a toilet occupied/out of service light fixture associated with each shared toilet room.

(7) The toilet occupied/out of service light fixture shall be mounted on the toilet room exterior wall, adjacent to the toilet room door for all toilet rooms.

(8) This light shall consist of a two-light LED fixture with a sign containing text and/or a pictorial symbol which provides indication as to when the toilet room door is locked (occupied) and a second light that provides indication that the toilet room is “out of service” (when the toilet system is not functioning) as per Chapter 17.

(9) Lights shall be on when the toilet is occupied or out of service and shall be extinguished when the toilet is available for use. These LEDs shall be yellow.

(10) Artwork for the labels shall be submitted to Amtrak for review and acceptance during the design review. **[CDRL 13-11]**

(11) An indicator shall be provided inside the toilet room, adjacent to the door, that illuminates when the door is locked (parallel with the toilet occupied indicator outside the toilet room).

(12) This indicator shall be labeled “Door locked” when light is on.

(13) Concept for indicator can be incorporated into the door open button; however, Amtrak will review and provide approval during design reviews.

(14) The Contractor shall reduce the light level in the toilet room, which changes to full brilliance when the toilet room door is properly locked.

f). Service and Utility Rooms

i). Electric/Utility locker(s)

(1) All electric/utility lockers shall be illuminated by a minimum of one overhead light, controlled by an automatic door open magnetic switch that turns on the light when the door is opened.

(2) For the purposes of this chapter, storage lockers, and storage cabinets shall be considered utility lockers.

(3) The light fixture(s) shall be protected by a clear shatterproof glass or polycarbonate lens, or other suitable protection, and shall not be vulnerable to damage during normal maintenance activities.

(4) Lights shall be operable during all lighting modes.

(5) The lights shall be so located as to provide general illumination within the locker, provide sufficient illumination to read any signage within the room, and be readily accessible for replacement.

ii). Utility/Equipment Rooms and Closets

(1) For utility rooms adequate lighting shall be provided for all potential maintenance activities in the space.

(2) Lights shall only turn on when the magnetic proximity switch detects the door or access panel is open. The lights shall turn on if there is a proximity switch failure.

(3) General lighting shall measure 20 foot-candles at the floor.

(4) Sufficient lighting shall be provided to illuminate all signage to 20 foot-candles.

(5) Any other areas that are called out for running repair maintenance tasks shall have sufficient lighting in the general area of 20 foot-candles at the floor.

g). Food Service Areas (Café and Diner)

i). Lighting requirements for the food service areas and seating areas are described in Chapters 11, 16 and 31, except as noted.

ii). All food service areas are considered occupied areas and must have emergency lighting and emergency signage.

iii). Under-shelf spot or strip lights are preferred in the food service areas to localize the high light intensity and not impact the adjacent passenger interior areas.

iv). The Café and Diner must not depend on main interior car lighting as there are minimal lights on during quiet and night modes of operation.

v). Food preparation and serving areas shall meet the requirements of FDA Food Code 2022, Section 6-303 Lighting.

(1) All food preparation surfaces shall measure 50 foot-candles along the entire counter.

(2) Utility sinks shall measure 50 foot-candles at the center of the sink at the height of the faucet.

(3) Hand wash sinks shall measure 20 foot-candles at the center of the sink.

(4) All food and beverage displays shall measure 20 foot-candles at each shelf.

vi). General kitchen area shall measure 20 foot-candles measured at the floor.

13.7 Interior Backlighting

a). At a minimum, backlighting will be expected on all mirrors, displays and logos unless otherwise directed by Amtrak.

b). Backlighting shall be reviewed during the interior design review process with renderings to provide lighting effect on mirrors, displays, advertising, company logos or other features that could be showcased.

13.8 Exterior Lighting Requirements

a). Standards

i). All exterior lighting components shall meet the environmental conditions specified in Amtrak Specification 963.

ii). All exterior lights shall be rated IP56 or greater.

b). Marker Lights

i). All cars shall have two red marker lights at both ends.

ii). The marker lights shall be LED with thermostat-controlled heating elements to protect against frosting, or be recessed behind heated cover, and shall meet FRA requirements in 49 CFR Part 221.

iii). If LEDs with heating elements are used, the condition of the heating system must be readily determined by simple visual inspection so that there is no risk of the marker visibility being diminished or obliterated.

iv). Failure of the heating system will be considered a failure of the marker itself.

v). The marker lights shall be operable during all lighting modes operating off main car battery.

vi). The marker lights will be controlled by a crew-operated switch in the car electric locker.

c). Platform Lights

i). Each side door opening shall have a station platform light(s) that will illuminate the platform area adjacent to that door opening when those doors are opened.

ii). These lights shall be mounted flush into the carshell or the threshold area and not protrude beyond the side of the carbody.

iii). The lights shall be aimed downward so as to not shine directly into the eyes of passengers or crew standing on the platform or in the vestibule of the car and shall be mounted in an impact-resistant and waterproof housing.

iv). The platform lights shall illuminate when any door panel in the adjacent door opening is opened, either by command from the door control system, by use of the emergency door release or by a local manual switch of a manual door.

v). The platform lights shall remain off when the door panels are closed.

vi). Low level station platforms shall be illuminated to the requirements of Figure 13-2, which exceeds 49 CFR Part 38 and APTA recommended practice.

vii). The platform lights shall also be a part of the emergency lighting system and shall conform to APTA Standard PR-E-S-013-99.

d). Step Lights

i). The trap steps on each side door shall be illuminated to the requirements of Figure 13-2, which exceeds 49 CFR Part 38 and APTA recommended practice.

e). Exterior Indicator Lights

i). Each exterior indicator light shall be visible from both ends of the train of up to ten (10) car train length.

(1) Assemblies shall be designed to avoid false positive light indications from direct sunlight.

(2) Lens assembly shall be designed to avoid snow and ice buildup, either by shape of the assembly or by use of heated lenses.

ii). Each car shall be equipped with exterior door open indicator lights, one per side door.

(1) These indicators shall be red LEDs and shall be located on the exterior of the car above and adjacent to the door, so that the status of each side door is visible to the Engineer when viewed down the side of the train.

(2) The indicators shall display a red indication when any door in the adjacent vestibule is open (i.e., not closed and latched) and shall be dark when all doors in that vestibule area are closed and latched.

(3) A small ceiling mounted indicator light, located in the side door vestibule adjacent to each door, shall also illuminate when the adjacent door is not fully closed and latched, as an aid to the train crew.

iii). Each car shall be equipped with two exterior brake indicator light units, one on each side of the car, as per Chapter 9.

(1) Mechanical brake indicators may be used as an alternate to the indicator lights, if there is a brake status display elsewhere for the crew.

(2) Brake indicator light units shall use green, yellow, and flashing yellow LEDs.

(3) All indicator light assemblies shall be visible from both the front and the rear of the train, be able to withstand car washer brushes, and be located clear of any roof drains or gutters.

(4) The indicator lens material shall be polycarbonate.

13.9 Systems Indicator Panel

a). The systems in the cars should connect to a single user interface screen that allows monitoring of each by selection, preferably through the CDU or OTIS terminals. Control of systems will be set at different levels of authority.

13.10 Lighting Component Requirements

a). Light Emitting Diode (LED) Lighting

i). LED fixtures shall conform to the requirements of the *Energy Policy Act of 2005* or more recent requirements. The correlated white color temperature throughout the car shall be in the range of 3000°K to 4100°K, +/- 500°K between any lights, and accepted by Amtrak. Fixed color temperature accent lights shall be reviewed and accepted during design review.

ii). Where practical, the LED lighting should be supplied from the DC system and be available in both Normal and Standby lighting modes.

iii). All fixtures shall be dust and moisture resistant and shall be arranged to facilitate replacement of the LED luminary from the passenger compartment.

(1) Luminaires shall be removable without special hardware after removing only the hinged lens if they are not replaced as a whole.

iv). An LED driver designed to ensure proper operation of the LEDs shall be mounted on the LED assembly.

v). LED assemblies shall be connected via interlocking, self-polarizing and modular connectors accessible when the light fixture is opened. Connectors and jumper wires shall be white in color to minimize visible dark spots behind lenses.

vi). Power supplies shall comply with the requirements of Chapters 4, 15 and 20.

vii). LEDs used in passenger area overhead lighting shall be mounted on replaceable boards installed in the light fixture.

(1) Boards shall be connected to the fixture by screws and shall be plug-connected electrically for easy replacement.

(2) The LEDs shall be sized and spaced so that the failure of up to three LEDs on an individual board shall not create an appearance of a dark area on the fixture. This dark area may be driven by the number of LEDs in series within the array, depending on the design.

viii). LED lighting shall be sized to provide the level of lighting as outlined in Figure 13-2.

ix). Changeable LED luminaires are preferred, and LED lighting may be dedicated to its fixture where the design is necessary.

x). Using common LED/Driver boards is preferred whenever possible. The number of different boards shall be minimized.

xi). White LED luminaires shall have lumen maintenance of 70 percent (L70) for a minimum of 120,000 hours as measured per the Illuminating Engineering Society of North America (IESNA) standard LM-79-08, Electrical and Photometric Measurements of Solid-State Lighting Products.

xii). All minimum lighting levels per APTA shall be maintained at the end of the 120,000-hour period.

xiii). The Contractor shall propose designs that include automated scenarios to address the known reduced light output as components age.

xiv). As Amtrak passengers occupy cars for extended periods, simply increasing the initial light output with no age compensation to address end of life degradation is not acceptable.

xv). LED luminaires shall be provided with sufficient heat sinks capable of keeping LED junctions and associated electronics below 125°F, regardless of summer ambient temperature and continuous operation.

b). Independent Power Source

i). General

(1) There shall be two independent power sources on each car to provide maximum emergency lighting availability on each car.

(2) Each power source shall be at least 20 feet apart from each other to avoid a single point failure in case of a catastrophic accident that could disable all emergency lighting on the car.

(3) Lighting fixtures shall alternate power sources over the entire length of the car to maximize availability of emergency lighting according to 49 CFR 238.115(b)(1) equivalent level of safety.

(a) It is acceptable to exceed the APTA specified distance between independent power source and the light fixtures that it powers as long as the 49 CFR 238.115(b)(1) equivalent level of safety is achieved with the overall arrangement.

(4) Independent Power Sources shall have their own dedicated equipment enclosure for improved maintainability.

(5) Independent Power Source risks must be included in the hazard analysis at Intermediate Design Phase.

(6) There shall be power source charge level indications to quickly show emergency lighting readiness to operations inspectors and maintainers preparing cars for passenger service.

(7) Power source charge level shall be reported on both the lighting power source enclosure with status LEDs, and the car network to the diagnostic system.

(8) Self-test functions of the independent power sources shall consider time required to function test the controller, validate power source capacity, and display to the maintainer estimated time for self-test completion.

(9) It shall be possible to self-test power sources either one at a time, or both simultaneously to minimize test duration for maintenance personnel.

ii). Battery-Based Power Source

(1) Batteries shall comply with all requirements in APTA PR-E-S-013-99.

(2) Battery and Battery Management Charging System can be combined into the same enclosure, but they cannot be combined with other lighting controls that have longer periodic maintenance intervals.

(3) There shall be deep discharge protection for the battery.

(4) Battery Management System failures and battery venting risks must be considered when designing the initial equipment enclosures at Intermediate Design Phase.

iii). Capacitor-Based Power Source

(1) The required emergency lighting that has an alternate back-up to the vehicle batteries may be supplied by capacitor-based lighting.

(2) The capacitors must be rated for a minimum of 500,000 charge cycles.

(3) Capacitor terminals shall be covered to protect shorting and shall be connected to fixtures through connectors.

(4) The capacitor-based power source for emergency lighting shall have a label located on the side of the unit exposed for service that includes the following information:

(a) OEM name and address

(b) OEM part number — revision/modification level and date

(c) Date of manufacture

(d) Unit serial number

(e) Voltage and capacity rating

13.11 Housings, Lenses and Diffusers

a). General

i). The overhead light assembly shall be designed for luminary replacement from below. The hinged light lens shall swing down allowing easy luminary replacement.

ii). No material shall suffer any loss of performance when exposed to environmental conditions specified in Amtrak Specification 963 or exhibit degradation of properties (including color) under long-term exposure to ultraviolet light.

iii). Lighting fixtures shall have lenses designed to aid in light distribution, prevent glare, permit easy luminary cleaning and facilitate luminary replacement.

iv). Fixtures equipped with lenses shall have a one-piece polycarbonate lens, either clear or translucent white, uniform in color and smooth on the exposed side, which will provide the specified intensity of illumination on the reading plane, while diffusing the light to illuminate adjacent wall and ceiling surfaces, increasing the overall brightness level in the interior of the car.

(1) The lens shall be mounted on a hinged bezel and shall be secured with captive fasteners.

v). The lenses shall project light with an even brightness without patterns and shall have a smooth surface on all sides and edges that are open to the passenger seating area to avoid injury.

vi). Tamper-proof fasteners shall retain door to the housing.

vii). A neoprene foam gasket around the lens assembly shall make the joining of door and reflector dust-resistant and rattle free.

viii). The diffuser lens shall be removable for replacement.

ix). The lenses shall be easily replaceable without having to disassemble the light fixture and shall be made of an approved Ultraviolet (UV)-stabilized polycarbonate and meet the Flammability, Smoke Emission and Toxicity requirements specified in Chapter 19.

b). Apparent Light versus Illumination:

i). The primary function of lighting fixtures is to provide controlled illumination for the safety, convenience and comfort of the passengers and train crew.

ii). Lighting fixtures produce illuminating and apparent light.

(1) Illuminating light projects or otherwise illuminates objects and areas. The illumination levels for those areas are defined within the

specification according to the activities of those areas or other specific needs.

(2) Apparent light is the illumination that the passenger or crew person sees of the fixture itself.

(3) Lighting fixtures used for normal lighting (non-emergency) in continuously occupied passenger and crew spaces shall be designed so that the apparent light is unobtrusive to passengers. This is especially critical when cars are in Quiet Car Mode.

(4) Fixtures shall be lensed and baffled to prevent the apparent light from being annoying or distracting to passengers and crew.

iii). Lighting shall be designed to eliminate reflected glare beyond the intended illumination zone.

iv). All fixtures in continuously occupied passenger and crew spaces must be shown during design review to not have normal direct view of the light source (LED array) or diffusor.

13.12 Controls

a). Lighting Control Human Interface General

i). All lighting controls shall operate on an individual car basis, under the control of the train crew.

ii). Amtrak accepted method of easily providing various levels of interior car illumination by the train crew shall be provided.

iii). The controls in this section apply to the main common area car lighting and does not override lighting controls in the bedroom and roomette controls described in Section 13.6.

iv). The car lighting controls shall be located in the switch locker located within the electric locker.

v). Lighting modes as described in Section 13.5 shall be selectable using the car network HMI to control the lights on a per-consist level. Transitions between lighting modes shall have an Amtrak adjustable PTU parameter for time duration.

vi). There shall be an individual override switch on each car to force a lighting mode.

vii). The car network may also be used with consideration for priority levels with physical switches and failure conditions defaulting to conservative operating modes.

b). Lighting Control Override Switch

i). Each car shall have a manual lighting control override switch with positions for Quiet, Night, Auto, and Cleaning as described in Section 13.5.

ii). The switch positions shall be monitored by the diagnostic system and fault information messages when a train-level command and car override switch position are not the same.

iii). Cleaning mode position shall be momentary, and all other positions shall be maintained.

iv). Cleaning mode shall have a software parameter time setting adjustable by Amtrak.

v). An additional reading light test switch or feature shall be provided such that all reading lights in a car can be turned on and off at once from the central controls.

vi). Controls and switches designated for crew operation shall be located on electrical panels separate from devices designated for maintenance operation such as circuit breakers. See Chapter 15 Electrical Panels for additional requirements.

vii). All lighting shall be circuit breaker protected. Lights identified for on/off control shall have an on/off switch in addition to the circuit breaker. Controls shall be housed in the electric locker, except as listed below, where local controls shall be provided:

(1) Each reading light shall have an on/off switch located adjacent to the reading light.

(2) Each reading light at an accessible seating location shall have an on/off switch located in accordance with the requirements of ADA.

(3) Electric and Utility lockers shall have automatic light magnetic proximity switches located inside the locker adjacent to the entry door.

(4) Selected lighting circuits in the food service area shall have on/off switches. See Chapter 16 for details.

13.13 LLEPM and HPPL Emergency Signage

a). General

i). A low-level exit path floor marking system shall be installed in the car in compliance with APTA Standard PR-PS-S-006-23 Emergency Egress/Access Signage and Low-Location Exit Path Markings (LLEPM).

ii). The system shall operate in conjunction with the emergency lighting system. Details shall be submitted to Amtrak for approval during design review. **[CDRL 13-12]**

13.14 Minimum Illumination Levels

a). Light levels shall be reviewed and finalized during design review.

Figure 13-2: Minimum Illumination Levels

			Illumination Levels in Foot-Candles			
Area	**APTA REF**	**Measured At**	**APTA LEVELS**	**Normal Lighting**	**Quiet Car Lighting**	**Standby Lighting**
General Overhead	6.3	45 plain	20	10	5	5

14. Communication System

Revision 2

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Table of Contents

14.1 Overview 14-1
14.2 General Requirements 14-2
14.3 Public Address/Intercom (PA/IC) System 14-6
14.4 OTIS/PIS Capability 14-13
14.5 OTIS Requirements 14-18
14.6 Provision for Wireless Internet 14-36
14.7 Information Technology and Architecture 14-51
14.8 Ethernet Train Backbone (ETB) and Ethernet Car Network (ECN) 14-55
14.9 Electromagnetic Interference 14-59
14.10 CDRLs 14-60

14.1 Overview

a). System Manufacturer

i). This chapter describes the system requirements for the on-board communication system to be provided on each car of the supplied fleet.

ii). Amtrak is in-process of defining Televic based products or progeny as their enterprise-wide supplier of choice for all on-board communication systems.

iii). The contractor shall deliver a Televic or as an option, a comparable system that complies with the requirements of this specification. The contractor shall provide both solutions for Amtrak to evaluate.

b). System Composition

i). The communication system consists of:

(1) Public Address / Intercom (PA/IC) system, including

(a) Public Address Speakers

(b) Public Address Amplifiers

(c) Attendant call system

(d) Passenger Emergency Intercoms

(e) PA/IC Control Stations

(2) Onboard Train Information System (OTIS)

(3) A reservation display system (including seat, compartments, and other passenger reservable areas) – Option

(4) An electronic door lock system

(5) A video surveillance system – Option

(6) Ethernet Train Backbone (ETB)

(7) Ethernet Car Network (ECN)

c). System Functionality

i). These systems have discrete functions that are extensively integrated to provide a comprehensive communication system within each car and between the car and other cars in the assembled consist. Each car shall operate independently in situations where interoperability with the legacy fleet is required. New cars shall be interoperable with the existing legacy equipment, providing the full existing functionality of the legacy equipment when connected in consist on either, as well as both ends of contiguous sets of new cars. In addition to maintenance of existing functions of the legacy equipment

via 27-pin trainline connections, the new cars shall be capable of receiving and transmitting all analog audio functions implemented on the legacy fleet, as well as receiving, transmitting, and displaying attendant calls between the new fleet and legacy fleet. The Contractor shall prepare and implement an interoperability plan and demonstrate required interoperability with each identified fleet of legacy equipment.

ii). Where practical, this design shall be based on modern state-of-the-art technologies. It shall be built with an extensible architecture that shall both interface with systems that may already be in use in any existing rolling stock and in Amtrak's existing wayside environment, as well as support on-board systems, rolling stock, and wayside systems that may be added in the future.

iii). The communications system shall comply with the requirements of APTA Standard PR-PS-S-001-98 and all applicable federal and state regulations.

(1) In the event APTA standard couplers, air brake hoses, or passenger car Head End Power/Communications/locomotive MU control electrical trainlines are used inter-car, the connections must meet all applicable AAR, APTA, and Amtrak standards.

iv). The car's ECN shall be capable of multiple functions such as for destination sign and announcement control, diagnostics, video surveillance data transmission and download, and real-time health monitoring of on-board systems and components.

v). The consist ECN shall facilitate data transfer between the on-board systems of the car and train and wayside communication systems through cellular and Wi-Fi multi-modem, multi-carrier routers implemented as the Data Communication System (DCS).

(1) The Contractor shall utilize the ETB and ECN to facilitate the aforementioned data transfer.

(a) The Contractor shall identify cost savings by proposing alternate architectures.

vi). Consist Length

(1) Consists are typically configured up to 1,530 ft in length excluding locomotives.

(2) All car functions shall operate per the standards of this specification within this length range.

(3) Trainline functions may operate at reduced levels at lengths greater than 1,530 ft based on an Amtrak approved technical justification that includes revised limits.

14.2 General Requirements

a). General

i). The OTIS/PIS shall provide the passengers with both visual, audible, and digital information as configured and programmed by Amtrak such as the train destination, present station, next station, pre-set messages, train consist arrangement, car and consist information, emergency messages and visual graphics, including advertising.

ii). The information shall be provided through the interior and exterior signs, through interior and exterior speakers, through the inductive audio loop system, through Bluetooth LE Auracast broadcasts (option), and through other digital networked connections as required by Amtrak.

iii). The OTIS/PIS shall be a fully automated system, with the capability for overrides and adjustments by train crew and Amtrak wayside operations.

iv). Once the system is activated, through the selection of a pre-programmed route by train crew or an Amtrak wayside operation, it will automatically establish train location through the Global Positioning System (GPS) and sequentially display and announce the upcoming stations at programmed locations.

v). The system shall receive speed signals from the Ethernet Car Network to facilitate continued operation during times when GPS is not available and shall be capable of receiving train crew input to resynchronize train location.

vi). The network and software architecture, design, and configuration of the equipment identified in this section shall be maintainable and extensible by Amtrak, facilitating the addition or replacement of additional vehicle switches and end devices throughout the life of the vehicle through exposed APIs implemented at each device supplied as a part of these requirements which facilitate the interaction with Contractor supplied communication components.

b). EMI/EMC Design Requirements

i). The design and installation of the communications system shall ensure that it functions as intended, without interference to or from any other electronic equipment on the cars.

ii). It shall comply with the requirements of the Federal Communications Commission (FCC) for Class A radiation standards, the requirements of APTA Standard PR-E-S-010-98 and Chapter 19 for materials and workmanship.

c). Fault Tolerance and Recovery

i). The car and train level components of the system shall be fault tolerant, so that failure of one item shall not impair normal operation of the remainder of the system, and that any single point of failure does not result in good cause to remove the train from continued revenue service.

ii). To accomplish this, it is expected that multiple communications controllers will be required per train, and that multiple PA Amplifiers will be required per car, and that diagnostic information will be available through multiple controllers.

iii). The Contractor shall identify the fault tolerance capabilities, recovery time, and user interaction required to maintain system operation. **[CDRL 14-01]**

iv). Momentary Head End Power (HEP) power outages shall not cause the system to require any reset, and upon the loss of power for any reason while executing a journey, the system shall return to its previous route and location without re-programming or reconfiguration by train staff.

d). Public Address/Intercom (PA/IC) System Component Locations

i). PA / IC control stations shall be secured from unauthorized use in a physically locked area/cabinet and located at least in the following areas, to be confirmed based on proposed car design and layout:

(1) At least one located in each car

(2) One located at each crew area, including:

(a) Conductor's office (if equipped), paired with a control terminal

(3) Located at each serving counter area

(4) One located at each boarding area, paired with a passenger accessible control terminal

ii). Speakers shall be provided throughout all cars.

iii). Speaker zones shall be located in the following areas of each car:

(1) Interior public passenger areas

(2) Individual zones in each private passenger compartments such as bedrooms and roomettes

(a) Volume control shall be provided in each private passenger compartment, which can be overridden by the selection of the Interior – Override zone

(3) Exterior "left" zone

(4) Exterior "right" zone

iv). IP Based PA amplifier

(1) A minimum of two shall be provided in each car to provide redundancy of audible broadcasts.

v). Inductive Loop Amplifier

(1) Inductive loop amplifiers shall be provided on each car to provide passengers with assistive listening devices in passenger areas access to public PA announcements for that car.

vi). Interface to OTIS system

(1) The PA / IC system shall be controlled through OTIS Control Units throughout the train.

vii). Interface to analog trainlines

(1) Each car's Public Address / Intercom shall support interface to analog trainlines.

viii). Interface to Ethernet Train Backbone

(1) Each car shall interface with a redundant Ethernet Train Backbone (ETB) dedicated to support the functions of the Communication system and its components. The Communication system ETB shall be independent and isolated from any ETB used for train control, monitoring and diagnostics, and other onboard systems.

e). OTIS System Components

i). The Contractor shall provide the following equipment:

(1) Exterior destination signs; (all cars)

(2) Interior graphical displays; (all cars)

(3) Interior graphical displays with integrated control terminal; (all cars)

(4) OTIS Control Unit (OCU); (all cars)

(5) Data Communication System (DCS); (all cars)

(6) GPS; (all cars)

(7) Interface to Ethernet Train Backbone

ii). Some consolidation of functions may occur between PA and OTIS but the combined system must meet the requirements herein.

f). Cellular Telephones

i). The Contractor shall ensure that mobile cellular telephones can operate reliably inside all cars within each car, under all on-board equipment operating conditions and at all locations along the Amtrak operating system, provided that the necessary external facilities have been installed by others.

ii). The Contractor shall include appropriate considerations taken as a part of the carbody design and/or window design to limit the impacts on cellular reception inside the vehicles from car construction, and from electrical and electronic equipment integrated into the vehicle.

iii). At PDR, the Contractor shall submit for Amtrak approval a plan for minimizing the attenuation based on car construction, such as using etched window

coatings in vehicle glazing, RF transparent car-body components, or other approved approach.

iv). The Contractor shall submit a plan identifying the approach to reducing the attenuation of the carbody, on-board equipment, and glazing impact on cellular telephone reception to Amtrak for review and approval prior to PDR. **[CDRL 14-02]**

14.3 Public Address/Intercom (PA/IC) System

a). Public Address (PA) System General Requirements

i). Each car shall be equipped with a fully digital, IP Ethernet based PA system.

(1) Contractor shall provide alternate proposals to the use of IP Ethernet based system. Contractor shall determine cost effectiveness of options and present them to Amtrak for review.

ii). The system shall permit the train crew to provide a manual PA announcement to the passengers and allow it to be directed to loudspeakers on only the local car interior, to the interior of all cars and/or to the exterior speakers of all cars.

iii). The PA system shall also provide a means for a train crewmember to communicate by voice in an emergency situation to persons in the immediate vicinity of the car.

iv). The PA system shall provide Amtrak's Consolidated National Operations Center (CNOC) with the capability to control the Public Address System, including making audio, visual, video and graphical announcements for emergencies, service disruptions, and otherwise as commanded by authorized Amtrak personnel. Connectivity options shall be secured with appropriate authentication and encryption.

v). PA Amplifier Requirements

(1) Each PA amplifier shall have power supplied directly from the car low voltage battery circuit and protected by a dedicated circuit breaker.

(2) The PA amplifier shall interface with the OCU and with the control terminal over the DTL and drive the car speakers whenever audio messages are generated.

(3) The PA amplifier shall have a power output capacity sufficient to drive all the speakers on the car at the nominal speaker output power plus 25% spare capacity. The same PA amplifier unit model shall be installed on all car types.

(4) The PA system (from the input to the microphone to the output of the interior speakers) shall have a 90% intelligibility rating when tested according to ANSI Standard S3.2-1989 (R1999) and shall have the following performance characteristics for all modes of operation, including manual and automated digitized announcements:

(a) Frequency Response: ± 5dB from 250 Hz to 8 kHz

(b) Total Harmonic Distortion: Less than 1%

(c) Hum or Buzz: Signal-to-noise ratio greater than 40dB

(5) The PA amplifier shall incorporate a volume control adjustable only with the use of the Portable Test Unit (PTU) and through administrative access provided via the wayside systems. The sound level from the car's speakers shall be uniform within ± 5dB at all passenger locations.

(6) The PA amplifier shall be a programmable amplifier.

(7) The PA system shall have a Day/Night mode. The Day mode will be in normal operation. The Night mode will decrease the output by 8db. This mode should be able to be triggered by PA Control Panels, OCU, and car control terminals. The setting shall be overridable by individual passengers in sleeper rooms through the Passenger Compartment Control Unit.

(8) The PA amplifier unit shall incorporate at a minimum, the following indicators on the front panel (alternate designs may be presented for Amtrak approval):

(a) On-Off LED – indicates when device is ON and power is present

(b) Fault indicator LED – indicates when a fault has occurred with PA Amplifier operation

vi). PA and intercom systems shall be provided with sufficient battery capacity to provide for a minimum of 90 minutes of operation following loss of HEP. See Chapter 15.

(1) Intermittent communication shall be considered equivalent to continuous communication during the last 15 minutes of the 90-minute minimum period for the purposes of Direct Current (DC) load budget calculations.

b). PA/IC Control Station Functional Requirements

i). Each PA/IC Control Station shall be IP/Ethernet based.

ii). Each PA/IC Control Station shall be powered via PoE via the Ethernet Car Network.

iii). Each PA/IC Control Station shall allow the selection of audio zones, to be proposed at PDR and approved by Amtrak. Zones shall include, at a minimum:

(1) Exterior Left side

(2) Exterior Right side

(3) Interior

(4) Interior – local car

(5) Interior – Override

(a) Interior audio override is a way to override passenger compartments who have configured to mute interior announcements. So, despite what volume control says in those cabins, it allows conductors to communicate in those rooms by overriding audio settings

(6) All speakers

(7) Other specific channels as configured by Amtrak onboard staff (such as Rail and Trails, or other secondary audio programming channels).

iv). Each PA/IC Control Station shall be equipped with a handset.

v). PA/IC Control Station Handset Requirements

(1) Handsets shall be equipped with a push-to-talk switch.

(2) The handset cord shall be equipped with an adequate strain relief fitting where it is attached to the handset.

(3) A handset holder shall be provided with each handset for storage when not in use.

(4) Each Handset should be attached to the PA Control Station the standard Amtrak microphone and handset connector plugs (p/n 10623456) to facilitate quick replacement when damaged.

c). Interior and exterior speakers

i). Each vehicle shall be equipped with a sufficient number of speakers located throughout the interior of the car to provide a uniform audio level throughout each passenger compartment.

ii). The interior speakers shall be installed for replacement from the front, and sufficient length shall be provided in the wiring for this purpose.

iii). Each vehicle shall also be equipped with weatherproof exterior speakers installed on the exterior of the car sides, one speaker near each set of doors to enable the broadcasting of messages to passengers on the platform from the PA system from within the car.

iv). The speakers shall be phased so that when the primary is connected to the distribution network, all speaker cones shall move in the same direction at the same time.

v). The exterior speakers shall be fully weatherproof, mounted behind a strong, replaceable stainless-steel grille resistant to thrown objects and be immune to the chemicals and detergents normally used during vehicle washing.

vi). There shall be no feedback between car speakers and the control station handset when the public address system is in use.

vii). Speakers housed in private passenger compartments shall include a means for a passenger to control the volume on non-overridden audio announcements.

viii). Through the content management tool, individual announcements shall be marked as normal messages or override messages – such that routine station announcements could be muted, but special messages indicating critical information will play at a normal volume despite individual volume control.

ix). Through the PA/IC Control station, train staff shall be able to select the type of manual announcement.

d). Inductive Loop

i). Each car shall be equipped with an audio inductive loop antenna and transmitter system, to allow receipt of announcements by passengers wearing hearing aids.

ii). The system shall be integrated with the OTIS and PA systems to broadcast interior public messages that are broadcasted in the area of the inductive loop.

iii). The system shall be ruggedized for the railroad environment and shall be a high output current design (no less than 10 Amps RMS), feature a high frequency gain potentiometer, feature metal loss correction, operate on vehicle nominal DC voltage, and include status LEDs for status information.

iv). The solution shall meet all appropriate certifications for both Rail and Hearing Loop technology including, but not limited to EN-50155, EN-50121-3-2, EN-45545-HL2, IEC-60118-4, and IEC-62489.

v). The solution design and implementation plan should align to BS-7594 or EN-303-348 and testing should be completed to verify that:

(1) Background magnetic noise is minimized.

(2) Magnetic Field is strong enough to provide full car coverage while minimizing interference with RF on the train (Wi-Fi, Mobile Voice and Data, etc.).

(3) Frequency Response is appropriate to T-Switch capable equipment.

vi). The inductive loop shall cover all areas of the passenger compartments.

e). Bluetooth LE Broadcast (Option)

i). Each car shall be equipped with the capability to broadcast audio and pertinent passenger train information via Bluetooth-based transmitters.

ii). All interior messages shall be broadcast via Bluetooth Auracast technology on a primary channel.

iii). The OTIS system shall be programmable with alternative audio tracks – synchronized to be played back based on train position - that shall be broadcast on additional Auracast channels.

iv). These additional program channels may be used to provide additional translations for audio announcements, or scenic commentary.

v). Additional live PA audio channels shall be made available via Auracast when configured by onboard train staff to facilitate secondary live channels for specific programming, such as to enable receiving Amtrak's Rails & Trails programming throughout the train.

vi). Bluetooth LE data channels shall enable broadcasting of a selection of triggers of passenger announcements to facilitate applications running on passenger devices to receive train information via the Passenger network, and relay information displayed on the interior displays.

vii). The Bluetooth LE broadcasts in each car shall enable beacon technology to facilitate micro-location within a train consist and train car. Amtrak shall have the capability to adjust beacon messaging. The contractor shall demonstrate that enough beacons have been implemented in each car to provide positioning within 8 feet when using triangulation techniques on consumer handsets.

f). Two-way crew intercommunications (intercom)

i). The crew intercom (IC) system shall be designed to allow the crew to communicate with other personnel on the train.

ii). For IC communications between crew members within the train consist, the IC mode must be selected on the PA/IC Control Station.

iii). To signal other crew members that an IC call has been requested, the PA/IC Control Station should give visual and audio feedback until another handset has been connected to IC by lifting it off the receiver and selecting IC mode.

iv). Audio and visual messaging indication through the interior passenger compartment speakers and interior messaging signs shall be capable of displaying and alerting train crew to a waiting intercom request through configurable means available to Amtrak.

v). At PA/IC Control Stations with adjacent Control Terminals, it shall be possible for train crew to communicate with specific IC stations, with IC stations on specific cars, or with specific connected crew app users.

vi). The intercom communication on a train shall support one to one and party line communications between PA/IC Control Stations and crew app users.

g). Passenger Emergency Intercom (PEI)

i). Cars shall be equipped with a passenger emergency intercom system that conforms to 49 CFR Section 238.121 and provides a means for passengers and crew members to communicate by voice with each other in an emergency situation.

ii). At least two PEI stations that are accessible to passengers without using a tool shall be located on each vehicle with one located on each end of the car. An additional PEI shall be located in each accessible room,

iii). The location of each PEI station intended for passenger use shall be conspicuously marked with luminescent material and legible and understandable operating instructions shall be posted at or near each such intercom. Instructions shall include indication that the calls may be recorded.

iv). PEIs shall trigger event recording on the NVR in order to mark the section of video recordings (if equipped) relevant to the PEI call.

v). Amtrak, through a configurable setting, shall be provided the ability to enable or disable the NVR recording of the two-way audio calls synchronized with the video of the closest camera (if equipped) to the PEI.

vi). PEIs shall be configurable by Amtrak, such that calls may be routed and answered by one or more call center locations that are not on the train, given there is sufficient bandwidth available from the Data Communication System. The PEI configuration shall include whether the calls simultaneously ring to the onboard staff or to the wayside, to the onboard staff only, to the wayside only, or to the wayside only if the onboard staff do not answer within a predefined time limit.

vii). PEI calls shall be configurable to be annunciated by PA tone, through crew-app notification, and on the display screens, control terminal displays, crew control panels, and remotely. The annunciation shall be configurable to include car number, road number, relative position in train based on display location, and location in the vehicle.

viii). A duress button shall be placed in publicly accessible restroom, which shall provide a similar indication as a PEI as described above.

ix). PEIs shall be full duplex.

h). Attendant Call System – Sleepers

i). Incorporated into all sleeping accommodations, a simple LED indicator light outside of the compartment shall be provided for the following functions that correspond with simplified controls inside each sleeping accommodation:

(1) Do Not Disturb

(2) Make up Room

(3) Attendant Call

ii). The system shall be capable of handling multiple attendant call requests, indicating the number, order, and location of all pending calls.

iii). Status of attendant calls shall be made available on the Control Terminals, through the crew app, and to Amtrak systems on the wayside.

iv). Attendant calls shall be selectable and answerable by PA/IC Control Units, through the crew app, and/or by Amtrak systems on the wayside.

v). Additionally, each attendant room incorporates an attendant call, smoke-fire detection/annunciator, and PEI panel used to identify the site of a passenger requesting service or emergency.

vi). Each Control Terminal, and through APIs provided by the OTIS, each Crew App Instance, shall include the capability to configure the attendant call system to:

(1) select one or more compartments, lifts, and cars to receive calls for that station

(2) silence all attendant calls for that station

(3) Compartments or lifts that are not manually assigned to one station shall ring all stations.

(4) Unanswered attendant calls shall ring through to other stations after a Amtrak configurable period of time.

i). Attendant Call System - Other

i). Status of the attendant call (including pending call, answered call, and call on hold) shall be indicated through visual and audible means at the location requesting the call. The audible means, including sound and repetition, shall be configurable by Amtrak.

ii). When an attendant call is answered, the call button shall indicate the call has been answered, and a dedicated microphone “on” indicator shall be illuminated in the calling compartment. Microphone circuitry shall ensure the “on” indicator is illuminated any time the microphone is listening and include a means for passengers to mute the microphone.

iii). Attendant call LED indicators on the exterior of the compartments with pending attendant call requests shall be illuminated.

iv). The system shall be capable of handling multiple attendant call requests, indicating the number, order, and location of all pending calls.

v). Status of attendant calls shall be made available on the Control Terminals, through the crew app, and to Amtrak systems on the wayside.

vi). Attendant calls shall be selectable and answerable by PA/IC Control Units, through the crew app, or by Amtrak systems on the wayside.

vii). Public restrooms and showers shall have a one-way attendant call request without audio capability for the purpose of indicating when a restroom or shower requires staff attention.

viii). Each Control Terminal, and through APIs provided by the OTIS, each Crew App Instance, shall include the capability to configure the attendant call system to:

(1) select one or more compartments, and cars to receive calls for that station.

(2) silence all attendant calls for that station.

(3) Compartments that are not manually assigned to one station shall ring all stations.

(4) Unanswered attendant calls shall ring through to other stations after an Amtrak configurable period of time.

j). PA Wiring

i). PA/IC Control Stations and PEIs shall be connected to the Otis Control Unit (OCU) via the Ethernet Car Network (ECN).

ii). The preferred method of powering PA/IC Controllers and PEIs is via PoE, alternative arrangement shall be submitted for approval by Amtrak.

iii). The OCU should be able to communicate between cars using an analog trainline.

(1) If ETB is exercised, the OCU should be able to communicate between cars using the Ethernet Train Backbone. The OCU shall also include an analog fallback that interfaces with the analog trainline.

14.4 OTIS/PIS Capability

a). General Requirements of a Passenger Information System

i). Amtrak's goal is to provide near-real-time travel information to customers about their journey from Amtrak's operational and onboard train systems.

ii). Contractor shall deliver a solution that:

(1) Provides critical train and journey information to customers in compliance with applicable ADA regulations and accessibility standards, including but not limited to the ADAAG for Transportation Vehicles and any successor guidelines, standards, or applicable DOT regulations in effect at the time of the design. If no applicable guidelines, standards, or regulations exist for OTIS/PIS at the time of the design, the RVAAC report published by Rail Vehicles Access

Advisory Committee of the Access Board shall be used as a minimum standard of compliance.

(2) Reduces conductor workload by automating the delivery of routine passenger messages.

iii). The OTIS shall be capable of full graphic, template, and video display including advertising through the interior signs.

(1) The OTIS shall provide the passengers with both visual and audible information such as:

(a) the train destination

(b) the car number

(c) the consist arrangement, including current car and coupled cars in a graphical format showing train layout and amenities.

(d) present station

(e) next station

(f) dynamic route map

(g) pre-set messages

(h) emergency messages

(i) visual graphics

(j) advertising

(k) Time and date

(l) Current speed

iv). The information shall be presented through the interior and exterior signs and the PA system as configured by Amtrak.

v). A flexible, template-based system shall be provided for the creation, programming, and management of content for the OTIS displays. The requirements for such a system are specified in Chapter 26.

vi). The OTIS shall be a fully automated system, with manual override feature. Once the system is activated, it will automatically establish train location through the Global Positioning System (GPS) and sequentially display and announce the upcoming stations at programmed locations.

vii). It is the Contractor's responsibility to supply equipment capable of operation in the rail environment consistent with Amtrak Specification 963 and EN 50155:2021.

(1) All individual components used in the fabrication of the equipment shall meet or exceed the requirements of the above standards.

viii). The Contractor shall submit documentation and calculations for all individual components, and for the system as a whole for review and approval by Amtrak at the Preliminary Design Review (PDR) to demonstrate the conformance to the requirements in this technical specification and referenced standards. **[CDRL 14-03]**

ix). The equipment shall meet the requirements of IEEE Standard 1477 and all FRA, AAR and ADA applicable rules, regulations and guidelines.

x). The PA function of the carborne OTIS system shall utilize only digital communication signals between OTIS equipped cars but be able to generate and receive analog audio signals from other cars as specified.

xi). OTIS Equipment Power Requirements

(1) All carborne OTIS equipment shall be powered from the car's DC power supply.

(2) All equipment shall function normally and provide the specified performance for all supply voltage variations as required by EN50155 and based on the DC power supply design.

(3) Partial shutdown after load shed/drop of the equipment is acceptable, followed by automatic restarting as the voltage returns to the specified levels.

(4) No permanent damage shall be caused to the equipment following these conditions. See Chapter 13 for load shed/drop schedule.

(5) All carborne OTIS equipment shall be protected from damage from a polarity reversal of the voltage supply, and power supply shutdown and immediate reapplications.

(6) All carborne OTIS equipment shall have integral power conversion and conditioning. External power supplies are not acceptable.

(7) All carborne OTIS equipment shall be protected by external dedicated circuit breakers located on the car low voltage control panel.

(8) The circuit breakers shall be sized to protect the smallest size wire directly connected to the protected circuit.

(9) Fuses shall not be accepted either outside or inside the equipment.

(10) Internal circuit protection shall not be used, but if unavoidable must be a re-settable type of circuit protection approved by Amtrak.

(11) All low voltage power supply inputs shall be isolated from ground.

(12) All supply inputs shall be adequately filtered to minimize current and voltage ripple.

(13) All equipment enclosures and shock-mounted equipment shall be grounded in accordance with APTA Standard PR-E-S-005-98.

(14) Smart Power Management Capability: There shall be a capability of automatically power cycling the OTIS system without manual intervention to ensure that the system is not powered on 24/7/365. This capability is necessary to keep the system components such as control units and interior/exterior displays, operating within the optimum performance levels. This automated power-cycling must not occur when the train is in service and must be completed within a short duration. The full criteria, timing, and related requirements shall be agreed upon during the design phase.

xii). OTIS Equipment Connectors

(1) All equipment shall be connected to the Ethernet Car Network via M12 connectors.

(2) All connectors shall be located in the front of the equipment or other easily accessible locations for quick connection and disconnection.

(3) All connectors of the same type and size, with the exception of Ethernet M12 connectors, shall be keyed to avoid insertion into the incorrect location.

(4) Connectors shall be identified in accordance with the schematic designation. All connector types shall be submitted to Amtrak for approval prior to preliminary design review.

xiii). OTIS Equipment Maintainability

(1) Removal and installation of any component shall not require the removal of any other equipment.

(2) Replacement of any Communication system component of the same type shall not require manual re-configuration. This shall be implemented through car-side coding connectors, dynamic assignment of IP addressing from car network switches, or other method approved by Amtrak.

(3) The enclosure mounting attachments shall be accessible for easy installation and replacement of the unit.

(4) Whenever enclosures are supported by their mounting attachments, threaded studs and self-locking nuts shall be used to facilitate their installation.

(5) All onboard equipment shall be housed in dust tight enclosures no less than IP54.

(6) Heat generating equipment shall have suitable heat sinks located on external surfaces of the enclosures and be cooled by natural airflow.

(a) Cooling fans are not acceptable.

xiv). OTIS WaysideCustomer Experience Simulation Lab

(1) A fully featured customer experience simulation lab shall be provided to simulate all aspects of the OTIS customer experience on the wayside. See Chapter 26 for specific requirements for the physical test lab specification.

xv). OTIS Journey Logging

(1) A comprehensive set of logs shall be captured on each car and be collected and organized per consist for each journey initiated by Amtrak crew or systems.

(2) The log shall include the set of system inputs and triggers received by the on-board systems necessary to recreate system performance in the OTIS Off-Board Customer Experience Simulation lab for the purpose of troubleshooting a journey configuration, further content development, and other uses.

(3) The log shall include a summary of system operations and outputs, including actions taken per display screen, audio announcements made per car and per audio zone, and general status of communication equipment.

(4) The system shall be capable of maintaining journey logs for a minimum of 30 days.

(5) Log offload shall be enabled through the DCS based on as-demand and/or on a scheduled basis as configured by Amtrak.

b). System Operation

i). The OTIS system shall automatically identify all cars by their car number and their location in the consist as soon as the train is formed, and power is applied.

ii). The OTIS system shall determine the train location with the use of the GPS receiver, with fallback to tachometer received via the Ethernet Car Network.

iii). The system shall self-report faults and errors in real-time over the air, and issues reporting and logging shall be automatic and feed into Amtrak systems. Additional diagnostic requirements can be found in Chapter 24.

iv). System operation shall be a simple, clearly intuitive operation for the train crew.

(1) This shall include the commands necessary to initially establish the system operation at start of trip, making revisions during the trip (such

as adding station stops, skipping station stops, special messages, food service advisory messages and so forth) and the conclusion of a trip.

(2) Such actions should be easily performed in a simple way without the need to refer to instruction lists.

(3) Any manual mode PA announcement by the train crew shall override any automatic announcement which may be taking place.

v). The system shall be configured to easily allow the train crew to designate one or more cars as a “Quiet Car”. This information shall be displayed on the car interior and exterior sign displays, and permit adjustment of audio announcements to a lowered level, as well as other features to be selected by Amtrak.

vi). It shall be easily possible for the train crew to designate a car on a local car basis to be a deadhead car (out of service) and provide suitable interior and exterior sign messages.

vii). Trip Operation

(1) To establish the initial operation of the system at the start of a trip, the system shall use the train number and provide a means to confirm origin and destination.

(2) The associated content database entry for that train number will automatically establish the destination sign displays and the automated station announcements.

(3) The system shall permit programming flexibility to not make some or all destination sign displays (which may differ from the exterior and interior sign displays) or not make some or all automatic announcements.

(4) Such conditions may be encountered on late evening/overnight trains or on an individual “Quiet Car”. At end of trip, a means shall be provided to automatically clear all displays after a programmable display of the last arrival / standing message.

viii). The system shall take into consideration the length of trip for Long Distance operations and shall reliably operate across two days without manual or automatic reboots or train crew interaction.

14.5 OTIS Requirements

a). Display Signs

i). General Requirements

(1) Sign Performance Requirements

(a) Signs shall be clearly readable in all ambient light conditions including total darkness and direct sunlight.

(b) The minimum viewing angle shall be 160° and readable at a distance of at least 115 ft for exterior and 45 ft for interior signs.

(c) The display shall have a high contrast ratio and have an automatic LED luminosity control for different levels of ambient light conditions.

(2) LED dimming shall also be activated automatically by the OCU, to reduce low voltage supply consumption and extend backlight life, in case of car battery charging failure or during train layover.

(3) All signs shall resume normal operation following supply power interruptions. No abnormal sign behavior shall follow any supply power interruption and reapplication.

(4) The signs shall be housed in a dust-proof enclosure with a polycarbonate non-glare display faceplate with anti-graffiti resistant film applied, at each end of each car.

(5) Signs shall have a self-diagnostic testing capability and provide fault condition information to the OCU, including sign location and type of fault.

(6) OTIS shall monitor the uptime, availability, and performance of each individual sign, and provide reports and logs through onboard PTU and wayside interfaces.

(7) The sign unit, upon the insertion of the car wiring connectors, shall automatically recognize its own location in the car, through special coding in the car-side connector pins.

ii). Interior Display Requirements

(1) Interior display screens shall be located to ensure high visibility and legibility for passengers throughout the train. The intent is to provide consistent access to passenger information without prescribing exact screen sizes, orientations, or positions. Screen placement should support dynamic wayfinding, real-time travel updates, and service information, including advertising (e.g. Travel Media Network).

(2) Screen Format: Aspect ratio, orientation, and mounting should be selected to support clear visibility in each context. All screens shall feature anti-glare treatments and meet accessibility standards for legibility, contrast, and resolution.

(3) Interior signs shall be sufficiently sized to maximize display area in the identified locations and be 4K displays. They shall be capable of:

(a) Audiovisual automatic announcements that include information such as present station, next station, route map, and arrival times.

(b) Text displays that may include time and date, train number, destination, and on-time and delay information.

(c) Special messages received from the onboard personnel and/or triggered from the wayside.

(d) Animated graphic displays, including entertainment, advertising, and content driven by wayside feeds configured by Amtrak.

(e) Reservation information for specific areas of the train.

(f) Menu options in food service areas.

(g) Other requirements as defined in this section and in TS section 26.

(4) The displays shall utilize the maximum available space and maximize the sign display area, with minimal bezels or unused screen area.

(5) Displays shall include ambient light sensors and be configured for auto-dimming.

(6) The signs shall meet all applicable The Americans with Disabilities Act (ADA) regulations and requirements, and the ADA Accessibility Guidelines (ADAAG) for Transportation Vehicles, including Subpart F.

(7) The signs shall be mounted in a tamper-proof anti-theft enclosure with tamper-proof fasteners.

iii). Interior Display Types

(1) Vestibule Screens

(a) Screens shall be clearly visible upon entering or exiting the car, positioned to be readable from multiple angles.

(2) Ceiling-mounted wide aspect displays

(a) Two ceiling-mounted wide aspect ratio (16:9) signs shall be installed in aisle ways where possible.

(3) Coach car displays

(a) Screens shall be positioned such that at least 75% of passengers have a clear line of sight from their seated position. Where full visibility is restricted by luggage racks or partitions, multiple screens should be used to maintain coverage. Content should remain legible from a seated position, without obstruction from fittings or furniture. Use available bulkheads to maximize screen visibility across the car. Position screens to maintain adequate head clearance in walkways, avoiding any obstruction to passenger movement in low-ceiling areas.

(4) Sleeper Cars

(a) Screens should be positioned at the end of hallways or in transitional spaces to assist with wayfinding.

(b) Screens shall be clearly visible from typical passenger circulation paths

(5) Food Service Areas:

(a) Screens used for digital menus, Food & Beverage promotions or service information must be readable from multiple positions including while queueing (even when two or more people are in line), directly at the point of purchase and/or from seated dining positions.

(6) Alternative displays in passenger compartment

(a) Where ceiling mounted wide aspect ratio displays are not practical, the contractor shall propose alternative display types such that each seated passenger has the ability to view a high resolution graphical display screen from their seated position in all coach areas.

(7) Café, Diner & Lounge Areas

(a) Interior graphical display screens shall be located at each café, lounge, and diner area to display digital menu options, Food & Beverage promotions or service information and other information as configured by Amtrak. Screens must be readable from multiple positions, including:

(b) While queuing (even when two or more people are in line)

(c) Directly at the point of purchase

(d) From seated positions in the Café, Lounge, and Diner cars

iv). Exterior Sign Requirements (Base)

(1) An interchangeable display sign shall be provided on each side of the vehicle to indicate car number, car type, and service type.

(2) Signs must be removable without damage to the sign or car should the car type or service type be modified post delivery.

(3) Sign and mounting assemblies shall provide a service life for the sign to protect against weather, vibration, ultra violet rays, etc.

(4) Special attention shall be given to ensure that the exterior sign does not appear interchangeable or temporary.

(5) As Amtrak envisions that the Standard Coach will be utilized as a Business Class car on some routes especially on the Northeast Corridor, designs for this interchangeable display sign shall be presented at each stage of the design review process for Amtrak review and approval.

(a) A business class signifier shall be developed to accommodate this expected change in service type as well as the base car types.

v). Exterior Display Sign Requirements (Option)

(1) As an option, an alternative exterior display sign shall be proposed. Exterior display sign shall be provided on each side of each vehicle to provide clear indication to passengers boarding relevant information about the train, car type, and amenities of the car. Alternatives may be presented for Amtrak review and approval.

(2) Exterior display signs shall have a 16:9 aspect ratio and be oriented in a landscape fashion.

(3) Exterior sign messages shall be configurable, and be capable of displaying train number, car number, car type, service type, destination, and other messages as programed by Amtrak with fixed, paged, and scrolling text.

(4) The exterior signs shall be full-color LED matrix (red/green/blue), high resolution and high brightness (1,300 nits minimum), with full multi-colored text and graphical capabilities.

(5) Final selection of exterior sign capabilities, including pixel dot pitch, shall be reviewed and approved during Design Review.

(6) All LED modules shall be controlled to extend LED life for a service life of no less than 12 years.

(7) The signs shall be installed and supported to prevent any rattling, dust infiltration or movement of the sign itself.

(8) The sign support shall allow for sign tilting to allow cleaning of the glass behind the sign.

(9) Exterior sign glazing must meet FRA type 2 projectile resistance, unless installed on the outside of the carshell.

(10) The exterior signs shall be designed to prevent fog and condensation and shall be resistant to any dust ingress or short periods of immersion in water.

b). OTIS Control Unit

i). The OTIS Control Unit (OCU) shall control all interior and exterior signs on that car for visual messages and provide digital input to the PA amplifier for audio announcements.

ii). The OCU shall monitor the signs and PA status for fault diagnostics and shall communicate with all other OCUs in a car over the trainline to verify their car systems status.

iii). The OCU shall be a microprocessor-controlled device, have an open architecture and allow expansion for communication and interface with additional other systems including the car's central diagnostic unit.

iv). In addition to the ports required for this expandability, at least one spare port shall be provided on each switch.

v). The OCU microprocessor usage shall not be greater than 60% of the available processor capacity.

vi). See Chapter 28.1 for requirements related to authentication, authorization and encryption. All equipment must conform to Amtrak standards for authentication and authorization. Logs will be generated and retained in keeping with Amtrak standards. Appropriate encryption shall be implemented to maintain message integrity, prevent communication and/or session hijacking.

vii). The Contractor shall provide all the software needed to operate the OCU. Message capability shall include, but not be limited to the following:

(1) Standard station stops

(2) Advertising messages, including audit logs of advertising playback

(3) Public service messages

(4) Unique messages, including car specific messaging and car number messaging (for ticketing).

(5) Emergency messages

viii). The OCU-stored data shall be divided in several files, following their specific function, and stored in non-volatile memory.

(1) Modifications to the OCU-stored data shall be achieved by changes only to the parts affected, to minimize the transmission time.

ix). Back-up batteries shall not be used.

x). Where removal of the chip is required for reprogramming, memory chips shall be made to easily upgrade and replace.

xi). The OCU microprocessor control shall re-initialize automatically and safely at power up, and/or following loss of supply power.

xii). All OCU inputs and outputs shall be galvanically isolated from the external circuits. Shorting or opening of any of the inputs or outputs shall not result in any damage to the internal circuitry of the OCU.

xiii). The OCU shall have a specific port for connection to a PTU.

xiv). All fault, diagnostic, status, and log information on the OCU shall be made available to the car's central diagnostic unit for remote access.

xv). All OCUs shall be directly interchangeable and capable of performing the same functions without the need for re-programming or re-configuration.

xvi). All data communication between the train's OCUs shall be through the ETB.

xvii). The OCU shall also contain a bi-directional analog interface module that utilizes the 27-pin COMM trainline as a fallback or when interfacing with legacy equipment.

xviii). The OCU should output per APTA PR-E-RP-017-99 maintaining compatibility with legacy equipment.

xix). The OCU should also be able to receive signals from legacy cars and locomotives via the 27-pin COMM and convert them for transmission along the trainline to the remaining OCUs in the cars.

xx). The OCU shall have a self-diagnostic capability and store faults occurring in the OCU and in the other controlled systems, such as the signs and the PA amplifier.

xxi). The OCU shall have on a clearly visible location, separate from the display, a multicolor LED indicator providing indication of the car OTIS/PIS status.

Table 14-1 OTIS/PIS status Indicator

LED indicator	OTIS / PIS status
Green	Normal
Yellow	Fault
Red	Failure

(1) The yellow indication shows that the system is working at a diminished performance, and that investigation, reset or repair is required, but the train may remain in service.

c). OCU Diagnostic Capabilities

i). Faults shall be recorded with reference data including:

(1) car number

(2) time

(3) date

(4) location

(5) consist arrangement

(6) train number

(7) Other reference data defined by Amtrak at design review.

ii). The fault memory shall store at least 100,000 faults in a first-in, first-out sequence.

iii). The self-diagnostic system in the OTIS shall be capable of identifying the faulty component down to the replaceable unit and indicate the electronic module which requires replacement.

iv). All subsystem signals, including all system hardware inputs and outputs (whether they are used or not), and software variables that impact the functionality of the system shall be transmitted to the CDU for viewing and recording in data monitoring systems.

v). This information shall be stored in non-volatile memory locally and be transmitted for recording within the fault log in the CDU.

vi). The diagnostic capabilities, including the list of signals, list of faults, and demonstration.

d). Reservation Display System

i). A comprehensive reservation display system shall be provided that is controlled by the OTIS.

ii). The system shall be capable of displaying Amtrak configured reservation information at each passenger position on the train, including:

(1) Coach and Premium Coach Seats

(2) Mobility Positions

iii). The system shall be capable of displaying both availability of seats as well as reservation information on clear to read, high-resolution, TFT LCD based displays.

(1) Reservation displays shall be configurable on a per-location, per-car, and per-train basis based on pre-loaded templates that are configurable by Amtrak.

(2) Displays shall be full-color graphical displays.

(3) The displays shall be capable of displaying a line of text, minimum 30 characters long, for each passenger position in the train. Displays shall support smooth scrolling for messages that exceed the maximum text line size.

(4) Display size, capabilities, and resolution shall be based upon the location in which they are used, including the distance from the position of a passenger standing in the car aisle adjacent to the display. Displays shall be a minimum of 480x224 pixels of resolution, with a display area of 275x75x25mm. Amtrak will entertain smaller than required displays as proposed by carbuiders which will be subject to Amtrak approval.

(5) Display dimming shall be coordinated with interior passenger information signs and interior lighting status.

iv). Discrete RGB LED indicators shall be provided to indicate availability/occupancy status for each reserved location. The indicator shall be capable of being configurable by Amtrak to display a variety of colors based on the exposed Seat reservation API, and shall be initially configured to show:

(1) Reservation status, including but not limited to:

(a) Seat is reserved currently (red)

(b) Seat is available with no reservations for the remainder of the trip (green)

(c) Seat is reserved at a later point in the trip (yellow)

(2) Ticket lift status (orange, until a lift has been performed by an Amtrak conductor, or the customer has checked-in, in which case it will show reservation status).

v). The system shall be capable of receiving near-real-time updates on a seat-by-seat basis at all points of a trip via secure API from ground.

vi). The reservation display system screen installation shall be reconfigurable to match seat pitch and location and shall be approved during Design Review.

vii). Reservation displays shall be supplied at all seats and areas which may be reserved by passengers, such as handicap accessible locations and bike storage areas.

viii). In addition to the use of discrete reservation displays, Amtrak is open to supplier proposals which use alternative technologies, such as transversely mounted ultra-stretched TFT LCD displays at the ceiling to wall transitions, to functionally replace several reservation displays with one device.

ix). System shall support requirements for a car or class of service with an open seating model where seat assignment or seat selection is not offered by Amtrak. In such cars, Amtrak may desire flexibility to display a different fault text from the default text displayed in cars/classes of service with fully assigned seating e.g. “Open Seating.”

x). System shall support requirements for wheelchair spaces, transfer seats and similar accessible spaces or seats that are reserved for passengers with

accessibility needs or reduced/impaired mobility within a car with an open seating model where seat assignment or seat selection is not offered by Amtrak. In such cars, Amtrak may desire flexibility to display a different default text for the seats/spaces that are reserved than the default text displayed for standard seats that are open seating.

e). Video Surveillance System (Option)

i). Amtrak currently utilizes Genetec for surveillance video management throughout its enterprise, hereafter referred to as Amtrak's enterprise VMS. The Contractor shall be responsible for supporting the integration of the onboard video surveillance system with the existing wayside systems in use at Amtrak.

ii). Storage, functionality, and management of VSS video, metadata and any other associated data shall be completely segregated from any other recorded video onboard such as the head-end safety video from cab cars and locomotives. Any deviations from this requirement must be approved by Amtrak.

iii). Onboard VSS integration with the Wayside enterprise VMS shall include, but is not limited to, the following requirements. Additional requirements may emerge during the project analysis phase and will need to be elaborated and agreed upon.

(1) VSS shall allow wayside users to view, download, and manage the onboard video and associated metadata from the enterprise VMS platform.

(2) Video shall be remotely accessible using the Data Communication System (DCS).

(3) VSS shall support automated connection to a Wi-Fi network, and latest commercially available generations of cellular network technologies (when Wi-Fi is not available) and automated off-boarding of video to a ground-side repository. System should be designed to be readily upgradeable to subsequent generations of cellular technologies as they become available.

(4) The enterprise VMS shall have access to live videos from a dedicated camera stream configured for remote viewing.

(5) VSS shall queue up transmission of tagged video and associated metadata to the wayside enterprise VMS when certain, pre-defined events occur onboard.

iv). The VSS shall monitor and record data acquired from multiple onboard camera sources that shall be arranged to maximize the coverage of the vehicle and its operations.

v). VSS shall provide identification and recognition capabilities based on recommended pixel densities within applicable zones in accordance with

applicable standards in effect at the time of design and implementation including IEC/EN 62676-4: 2025 (OODPCVS) or successor standards.

vi). Each onboard camera shall include the following capabilities:

(1) have day and night capabilities with performance down to at least 0.1 lux.

(2) provide high quality color video.

(3) Cameras shall comply with EN50155, EN45545, and NFPA130.

(4) Camera housing shall meet IP66, IP67, and IK10 ratings.

(5) Cameras shall have electronic image stabilization built-in.

(6) Cameras shall include invisible IR LED built-in.

(7) The Cameras shall have adjustable resolution of at least 1080p.

(8) The Camera connector shall comply with 14.8e).

(9) Frame rates adjustable up to thirty (30) frames per second.

(10) The cameras shall natively support encoding in H.264 and H.265 video compression.

(11) A proven history of reliable operation on rail vehicles.

vii). VSS Power Requirements

(1) The system shall operate continuously off the low voltage power supply system and be backed up by car battery as a vital load.

(2) Prior to the loss of low-voltage power (e.g., due to load shed or train shutdown), the Genetec NVR shall be configured to safely shut down.

(a) This may be implemented using a dedicated uninterruptable power supply for the NVR, or

(b) through software means such that sufficient time is provided to the NVR to safely shutdown the system prior to load shed or vehicle shutdown from being triggered by a vehicle.

viii). Camera Locations

(1) A minimum of four (4) interior cameras shall be placed throughout each car to facilitate recognition of passengers and/or luggage onboard the rail vehicle.

(2) One camera shall be mounted in each vestibule with 360-degree coverage of the vestibule, lifts, and side doorways.

(3) No less than two cameras shall be mounted in each passenger seating area of each car.

(a) Cameras mounted in the passenger seating area shall be facing in opposing directions with overlapping viewing zones to maximize coverage.

(4) Cameras shall be mounted to provide coverage of hallways and loading areas.

(5) Each food service location, including café, and servery shall be covered by a minimum of two (2) cameras.

(6) Camera installation and arrangement shall support identification based on the IEC/EN 62676-4:2025 International Standard or a successor standard.

(7) The Contractor shall be responsible for submitting a coverage plan identifying the location, viewing angle, and details of the camera arrangement and capabilities to Amtrak for approval.

ix). Each camera shall deliver compressed video in real time to the NVR which can integrate to Genetec.

x). The surveillance system shall commence recording data when the car is powered on, and continue recording until the car is powered off, unless otherwise directed by the Engineer.

xi). NVR Requirements (Option)

(1) The NVR shall be configured with sufficient solid-state storage to capture a minimum of 90 days of full car video storage high-quality onboard transportation scenes at 1920x1080p resolution at a minimum of 15 fps continuous recording in each car before overwriting.

(2) The NVR shall be capable of incorporating telemetry data and other metadata received from onboard systems including CDU, the subsystems that report to the CDU, as well as the OTIS.

(3) Metadata recorded by the NVR, to be made available when viewing, searching, and downloading video shall include, but is not limited to:

(a) Synchronized date and time as other network components

(b) Global Position System (GPS) Location

(c) Consist speed

(d) Route information, including current trip, train number, most recent station location, next station location, location along the alignment

(e) Local car number for each camera stream

(f) Consist layout

(g) Signals required for the triggers identified in the following section

(4) Functionality shall exist to tag and persist segments of video beyond the 90-day limit based on specific train events or triggers.

(5) Tagged segments shall be capable of recording no less than 5 minutes prior to and 10 minutes following the trigger or event and be configured to apply to cameras relevant to the triggered event. Tagged segments and associated metadata shall be transmitted to the wayside enterprise VMS.

(6) Triggers events shall include, but are not limited to:

(a) Passenger Emergency Intercom request

(b) Door Emergency Egress / Ingress

(c) Door obstruction detection

(d) Emergency brake event (above zero speed)

(e) Penalty brake event (above zero speed)

(f) Fire suppression system activation

(g) Ride quality monitoring alert

(7) Using on-board intelligence, the system shall be capable of selectively recording only the video content that is determined to be relevant, and not ambient video. The intent of this requirement is to avoid the offloading of large amounts of ambient video to the enterprise VMS that has no value to Amtrak and adding to the wayside storage and management needs in the enterprise VMS. One way of meeting this requirement is through the use of a motion-detection feature, however, Amtrak is open to alternative designs.

(8) The system shall automatically overwrite non-tagged video after 90 days has elapsed.

(9) In the instance of the failure of a single NVR, a mechanism shall be implemented to facilitate the failover of cameras video archiving to an alternative NVR, such that failure of any single component of the Video Surveillance System does not impair all video recording on a car.

(10) The NVR shall be capable of supporting requirements for Onboard VSS integration with then Wayside enterprise VMS as specified earlier in this section.

xii). Chain of Custody Requirements

(1) If equipped, the surveillance system shall utilize methods and system controls to ensure chain of custody of all collected video and associated data from camera to ground.

(2) All acquired data shall be written, stored, and encrypted.

(3) All data shall reside on the rail vehicle on one or more solid state drives (SSD) that are designed and applied for the purpose of mobile data acquisition and storage.

(4) All storage shall be locked via a secure key to prevent access yet shall be easily removeable and replaceable to facilitate use as evidence.

(5) Data from the video surveillance system shall be available for real-time access for authorized personnel.

(6) An audit trail of personnel accessing the data shall be maintained on both the on-train VMS and within the wayside software (including video download, live view, and configuration).

xiii). Recording failures or system failures shall result in an alert available through the Control Terminal, CDU, and to Amtrak's enterprise VMS Platform (Genetec Security Center Platform).

xiv). All components supplied as a part of this contract, including Video Surveillance System cameras and NVRs, shall be compliant with the requirements of the National Defense Authorization Act.

xv). No equipment or services found on the Covered List as maintained by the FCC's Public Safety and Homeland Security Bureau as outlined in Section 1.50002 of the FCC's rules, and as directed by the Secure Networks Act, shall be supplied as a part of this contract.

xvi). The Contractor shall submit a comprehensive architecture and design package for review and approval. **[CDRL 14-04]**

(1) This submission shall include proposed camera layout, proposed calculation of retention, NVR software features and capabilities, redundancy capabilities, and details of integration between the on-board VSS and Amtrak's wayside enterprise VMS (Genetec installation).

f). Control Terminal

i). Each car shall be equipped with control terminals adjacent to each of the PA/IC control stations.

ii). Control Terminals shall be implemented as a high-resolution touchscreen display, and be multi-purpose devices that meet the requirements of the passenger graphical displays.

iii). The Control Terminal shall be a high-resolution touchscreen display

(1) Screen size shall be a minimum of 15” in crew rest areas and conductor’s office and

(2) At passenger boarding areas, the screen size, orientation, and look shall match the vestibule displays and be a minimum of 30” with 16:9 aspect ratio. When not in use by Amtrak crew, the display shall revert to a graphical information display.

iv). In cars with a conductor’s office, the control terminal shall be located in that office.

v). The control terminal shall be the main HMI between the operator and the car functions including providing access to the diagnostic information contained on the CDU, as well as control of the OCU and communication system functionality of the train. Alternative solutions that provide separate HMIs may be presented to Amtrak for review and approval.

vi). The Control Terminal shall implement the following functions:

(1) Allow train crew to input train number to configure the OTIS systems

(2) Initiate system and route start-up

(3) Trigger pre-programmed message selection and initiation

(4) Record and triggering of custom public address announcements that include a text component through an onscreen keyboard and editable speech-to-text and text-to-speech mechanisms.

(5) Control and adjustment of the reservation display system

(a) Modification of seat assignments / booking status

(6) live and recorded video surveillance review

(7) train formation display

(8) local display for fault annunciation

(9) Initiate system tests and verification

vii). The control terminal shall:

(1) Be of rugged heavy-duty construction.

(2) Include a projected capacitive touchscreen.

(3) Provide a high-resolution visual display, 1920x1080 minimum.

(4) The front panel shall have no exposed fasteners.

(5) The display shall be readable in both direct sunlight and total darkness.

(6) The display shall include auto-dimming features.

(7) The display shall be LCD with LED backlight and adjustable contrast and backlight intensity.

(8) Have a front-bezel rated to IP65.

viii). Control terminals shall implement a screen locking functionality utilizing personal identification and pin code. Access to enter ID and pin information shall be obscured, and pin and ID entry position shall move with each use. ID and pin validity shall be maintainable by routine updates by Amtrak through integrations with wayside systems.

ix). When the display is electronically locked, the display shall act as an additional OTIS graphical display and be capable of being configured by Amtrak to display electronic messages, route information as per the requirements of 14.4a).

(1) Displays located in the crew rest areas shall be configured to turn off the display upon activation of the electronic lock.

x). The control terminal shall be menu-driven for all the functions and the key legends shall correspond to the functions being performed.

xi). Data storage, if included in the control terminal, shall be via non-volatile solid-state memory.

xii). OTIS System Test Capability

(1) Through each control terminal, and through the PTU, a system self-test shall be possible to facilitate quick one-person confirmation of system functionality of all OTIS components throughout a coupled consist.

(2) The self-test shall include options for train crew to perform:

(a) Automated verification that each PEI works, including microphone and speaker transmission.

(b) Automated verification that individual PA Amplifiers and the speakers zones the power are functional.

(c) Automated verification that each hearing loop has continuity, and that current is flowing when audio is sent to the hearing loop amplifier.

(d) Automated verification that all displays, including graphical displays, accessibility displays, exterior displays, and seat reservation displays are connected and addressable.

(e) Automated verification that all electronic locks are online and responsive.

(f) Automated verification that all control units are addressable and functioning, including Control Terminals and Passenger Compartment Control Units.

(g) Automated verification that the NVR is communicating, and that all storage and cameras are operating.

(h) Guided verification of other system elements, such as display screens via a test pattern, physical buttons through a circle-check, and cameras via on-screen display.

(3) At the conclusion of the self-test, a report shall be recorded and displayed on screen that indicates the systems tested and the results of the test.

(4) Results shall be available to Amtrak Enterprise Systems via the Data Communication System.

(5) The contractor shall submit documentation defining the capabilities of the self-test functions for approval. **[CDRL 14-05]**

g). Data Communication System (DCS)

i). The Data Communication System (DCS) shall incorporate all the data transmission radios necessary to support the train to wayside communication as a part of the onboard systems, including communication required as a part of any system requiring offboard communication, including the OTIS / PIS / communications systems, the video surveillance system, the diagnostic systems, and bogie/carbody monitoring systems.

ii). To minimize the use of disparate communication systems requiring additional roof space, systems requiring dedicated wireless access outside the use of an integrated Data Communication System shall be submitted to Amtrak for review and approval.

iii). The DCS shall allow for data transmission between the onboard systems and wayside software provided by the Contractor, as well as support Amtrak's requirements as it relates to existing and future Amtrak system servers.

iv). The DCS shall automatically utilize and aggregate all available communication links throughout the train so that the highest data transfer capability is available for any train location.

v). DCS Antennas

(1) Antennas used for the DCS shall meet the requirements of Amtrak Specification 963.

(2) Each antenna shall support minimum 4x4 cellular MIMO supporting frequencies from 600Mhz to 4200MHz (US cellular operator bands) and GPS/GNSS, and 2x2 Wi-Fi 6e frequencies from 2400 to 2495 MHz and 5170 to 7125MHz.

(3) Two antennas shall be provided on each car for use by that cars DCS router.

(4) DCS shall offer satellite-based connectivity in support of Amtrak routes with poor or low cellular carrier coverage.

vi). DCS Router

(1) A DCS router shall be installed on each car to provide access to cellular and Wi-Fi infrastructure.

(2) Each DCS router shall provide two DCS modems to support redundant connections to major carrier networks.

(3) The DCS modems shall be compatible with the latest commercially available generation of cellular technologies with automatic fallback to a lower speed, earlier generation of cellular technology that is still supported by commercial carrier in US and Canada at the time of project design.

(4) The device shall be approved for use on all major carrier networks including Verizon, AT&T, and T-Mobile.

(5) Shall be connected to the Ethernet Car Network whose connection speed is to be determined.

vii). In conjunction with wayside software, the Data Communication System shall facilitate aggregation of all available DCS Router channels throughout the consist to maximize the available bandwidth to onboard applications, and to provide resiliency and redundancy in the event of any carrier, modem, router, or antenna failure, or in instances of limited signal coverage.

viii). The Data Communication System, in conjunction with on-board subsystems and wayside software supplied by the Contractor, shall provide:

(1) Transfer of consist monitoring and diagnostic data from the train to the wayside.

(2) Transfer of train status information from the train to the wayside.

(3) Remote troubleshooting of car systems.

(4) Transfer of content database updates from the wayside to the train, including:

(a) Content

(b) Schedule

(c) Informational Messages

(d) Editorial content

(e) Dynamic content (e.g., based on feeds)

(5) Transfer of software updates from the wayside to the train (for controlled installation on the train).

(6) Transfer of wayside initiated manual announcements (audio, text, graphical, and video) messages from the wayside to the train.

(7) Transfer the trigger of train wide pre-defined public and special message to the communication system.

(8) Transfer of recorded or real time video from the video surveillance system as configured by Amtrak's enterprise VMS Platform.

(9) Transfer of logs from the graphical displays, audio playback, and other OTIS performance indications.

ix). The DCS system components, including the 4G/5G and Wi-Fi modem and antenna shall be designed in such a way to facilitate future upgrades which will occur throughout the life of the vehicle.

x). The Contractor shall provide a document to Amtrak identifying the standard interface which would allow the integration of a replacement or additional DCS communications channels. **[CDRL 14-06]**

h). Global Positioning System (GPS)

i). The OTIS shall utilize a Global Positioning System (GPS) for the determination of the train location and the triggering of automatic station announcements and station display.

ii). The GPS receiver shall be a stand-alone unit or integrated into the DCS, powered by a dedicated power supply on each car and shall be capable of accuracy within 16ft.

iii). The OCU shall use the GPS for all location events. It shall not use wayside transponders or wheel rotation to determine the traveled distance when GPS is available.

iv). Door open signals shall be capable of triggering specified announcements as configured by Amtrak.

v). Whenever loss of GPS signal is experienced, the OCU shall maintain position via dead reckoning, and automatically re-establish train location once the GPS signal is again available.

vi). When the OCU loses GPS, all sign functions shall continue to be displayed. All OCUs shall be equipped with GPS.

vii). The antennas used for the DCS shall meet the requirements of Amtrak Specification 963.

14.6 Provision for Wireless Internet

a). General

i). The Contractor shall procure and install the infrastructure required to support a wireless network with a 10Gbps (per channel) Ethernet car bus.

ii). The scope of the requirements for this solution includes exterior and interior wireless and Wi-Fi antennas, exterior cellular antenna cabling, interior antenna cabling, data cabling, power cabling, a dedicated redundant Train Line, and defined locations for equipment installation.

iii). This Wireless Internet infrastructure is based on modular design for rapid component installation and simplified maintenance and serviceability. The design of the Provision for Wireless Internet shall be submitted for Amtrak review and approval throughout the design review. **[CDRL 14-07]**

b). Wireless Internet Components

i). MAR and AP Hardware Provisions

(1) All cars will supply a wireless Internet feed to the consist, distributed from the Mobile Access Router (MAR) over a DTL dedicated for passenger wireless internet to the rest of the consist.

(2) Additionally, all cars will provide Wi-Fi access to passengers and crew inside the car using multiple Access Points.

(3) All cars will include MAR hardware, AP hardware, and associated components.

(4) All cars shall include provisions and support for the following components:

(a) Two (2) MAR mounting locations (device names are MAR 1 and MAR 2)

(b) Two (2) Access Point (AP) mounting locations (AP names are AP1 and AP2)

(c) Three (3) Switch mounting locations (Switch names are SWITCH1, SWITCH2, and ANTENNA SWITCH) That antenna switch locations shall be near the MAR locations.

(d) Seven (7) 4x4 multiple-input multiple-output (MIMO) exterior antennas; two (2) antennas of the seven also support GPS and Wi-Fi capabilities. (Antenna names are ANT1, ANT2, ANT3...ANT7. Port names are P1, P2, P3, P4, WIFI 1, WIFI 2, and GPS). Each antenna location will also provide an ethernet connecting via M12x-coded connectors using the cable specification in (c) which lead to the switch locations.

(e) Three (3) Active 4x4 multiple-input multiple-output (MIMO) exterior antennas; these connect via M12x-coded connectors

using the cable specification in (c). (Antenna names are AANT1, AANT2, AANT3.)

(f) Four (4) 6x6 MIMO interior ceiling antennas for passenger connections. (Antenna names are PLAN1, PLAN2, PLAN3, and PLAN 4. Port names are P1, P2, P3,...P6.)

(g) Four (4) DTL bulk-head locations (two (2) on each end) (DTL connector name is DTLA1 or DTLA2 and DTLB1 or DTLB2 for A-end and B-end, left and right respectively. Port names are P1 and P4 for each DTL location. Each DTL umbilical shall house two (2) 10Gbps ethernet cables within their housing specifically for the Wireless Internet solution.

(h) Ethernet, RF, and power cabling to support the equipment.

ii). Train to Ground / Satellite Provisions

(1) In addition to the hardware found in all cars, cars shall include additional hardware to facilitate connection with a future Train-to-Ground (T2G) or Satellite connection.

(a) These cars shall include the following in addition to the requirements for MAR and AP Hardware:

(i) One (1) Train-to-Ground (T2G) Radio mounting location (T2G Radio name is T2G)

(ii) One (1) Satellite radio mounting location (Satellite radio name is SAT) with 10Gbps M12 X-Coded ethernet connectivity; 2 cables connecting to the switch location.

(iii) Power connections which support Starlink Tile:

1. Starlink Tile Antenna Input Voltage: 49VDC Input Current: 7.2A maximum Power Consumption: 360W Maximum See SpaceX drawing 06658000-102 for Antenna RF keep out zone requirements.

2. Starlink Power Supply Unit The Starlink Power Supply accepts standard aircraft AC power of 115VAC, 50-60 Hz and 400Hz. For aircraft without an AC power supply, the system can be powered using a 500W DC-AC inverter. Input Voltage: 115VAC Input Frequency: 50-60Hz or 400Hz Power Consumption: 400W Maximum (includes antenna power). It is Amtrak's preference to avoid the use of an inverter, and power this solution directly with 115VAC.

c). Ethernet Cabling Requirements

i). Cable and Connector Design Requirements

(1) CAT-7 rail-approved Ethernet copper cabling supporting 10Gbps throughput shall be utilized for all Ethernet cabling required to support the Provisions for Wireless Internet.

(2) All CAT-7 cabling shall be terminated with 8-pin M12 X-coded Male connectors, except where indicated (i.e. rooftop hand holes).

(3) The Contractor shall submit the cable and connector selection as well as the location of all cable terminations for approval by Amtrak.

(4) Cabling shall conform to the requirements of section 18.24.

(5) Cabling and equipment installation shall conform to EN50155:2017 rail standards.

(6) The DTL shall connect the consist, and this cabling shall support a fault-tolerant ring network.

ii). Cable Test Requirements

(1) After installation on each car, each Ethernet channel shall be certified to ISO/IEC 11801-1 – Class F for each copper cable.

(2) Test results shall confirm channel suitability for IEEE 802.3an-2006 10GBASE-T for each copper channel.

(3) The Contractor shall submit the test procedure to Amtrak for review and approval.

(4) The certification results for each cable shall be submitted to Amtrak as part of the vehicle history book.

iii). Cable Labeling Requirements

(1) All Ethernet cabling shall be labeled clearly on both ends of the wire, observable with less than 90° of cable rotation. The Wireless Internet naming convention for Ethernet and Fiber leads is:

(a) Prefix = Contractor cable number (as the Contractor convention requires)

(b) Underscore = use the '_' character between the prefix and origin

(c) Origin = <SWITCH1 or SWITCH2> (port name not required)

(d) Destination = <-device name> with <-port name;' when applicable> (see 12.6.1 for component and related port names)

(2) For example, the label on the Ethernet cable which terminates at one end to Switch #1 and the other to MAR#1 reads as:

Xxxxx-xxxx_SWITCH1-MAR1

(3) An Ethernet cable coming from Switch #2 does not require a port name on the label at the origin or destination; this example label terminates at AP#1 and is marked:

Xxxxx-xxxx_SWITCH2-AP1

(4) An Ethernet or fiber cable coming from Switch #2 does not require a port name on the label at the origin; this example label terminates at left-side DTL on the A-end at the Ethernet cable on port 4 it is marked:

Xxxxx-xxxx_SWITCH2-DTLA1-P4

d). Exterior Antennas and Cabling

i). RF Exterior Antenna Design Requirements

(1) The Contractor shall establish ten **(10)** flat (0° relative to the roofline angle) antenna mounting locations atop each car, with line-of-sight to both sides of the vehicle, and no elevation changes on the roofline which affect line-of-sight.

(2) The antenna elevation, not the roofline must be the catenary/structure envelope limit, not the roofline of the vehicles.

(3) Where Wi-Fi mobile Access Routers or train-to-ground, wayside, or satellite transceivers are to be installed, Amtrak requires a modular antenna mounting design using an interface plate in-between the train and the antenna allowing Amtrak to deploy or change antennas for the solution in all areas where antennas are used.

(4) Each interface plate shall support 10 kg (22 Lbs.), except for satellite antenna locations where the mounting plate shall support up to 25 kg (55 Lbs.). With antennas spaced no less than 600mm (24") apart, the antenna locations shall support an antenna of:

(a) Cellular and T2G/Wayside Antennas

(i) The design must facilitate the mounting of Eight (8) antennas, with the reference antenna being the Huber+Sunher SENCITY® Rail MIMO+ 4x4 Antenna (passive); 90mm x 508.7mm x 411.7mm (Height x Width x Depth). It is likely that other antennas shall be used, so the mounting location shall be designed with the use of intermediate mounting plates in mind.

(ii) These antennas will be selected by Amtrak at a later date with our Wi-Fi contractor of choice. All mounting positions shall be capped and watertight for Amtrak and their contractors to use them at their discretion and reseal them

with Sika Flex 227 or similar sealant at the date of antenna installation.

(iii) The option for inclusion of factory antenna installation by the Contractor for Amtrak's future antenna selection is required.

(b) Satellite Antennas – 900mm L x 900mm W x 300mm H (36" L x 36" W x 12" H). Satellite locations shall be provisioned.

(5) Amtrak shall inform the Contractor of the make and model of the exterior antenna and provide a template with the bolt pattern and cable port dimensions. Contractor shall procure and install all antennas.

(6) The Contractor shall provide the diagrams of the antenna locations and the bolt hardware specification for Amtrak review and approval. **[CDRL 14-08]**

ii). RF Rooftop Exterior Cable Design Requirements:

(1) Five (5) RF cables (four for cellular and one for GPS) and one (1) POE++ capable CAT-7 (or higher) Ethernet cable shall be plumbed between the MAR location and the hand hole at each antenna location on the roof.

(2) Two (2) of these eight antenna locations shall be plumbed with an additional pair (2) of RF cables to facilitate future Wi-Fi based train to ground communications.

(3) All RF cables shall be terminated with N-Male connectors at the rooftop hand hole, and N-Female at the MAR mounting location.

(4) M12 X-coded Female Ethernet connectors shall be in place at the roof hand hold and M12 X-coded Male connectors at the MAR or ANTENNA SWITCH locations.

(5) All of the eight (8) rooftop POE++ capable Cat-7 Ethernet cables shall have a long enough service loop at the MAR end to facilitate, connection to the MAR or local switch location.

(6) Intermediate RF connectors shall not be used. RF cables shall be at least one-half inch (½"; commonly referred to as "400" antenna cabling) in diameter.

(7) The cables shall support frequencies between 600MHz and 7125GHz.

(8) The location of all cable terminations shall be provided to Amtrak for approval.

iii). RF Rooftop Exterior Cable Testing Requirements

(1) Contractor shall test Cellular RF cables across cellular channels from 617MHz to 3.98GHz (the 4x4 MIMO array cables). Wi-Fi rooftop

RF cables shall be tested from 2400 – 2483MHz and 5150 – 7125MHz. GPS cables shall be tested from 1164 MHz to 1610 MHz.

(2) All VSWR results shall be 1.4 or less. All cable runs shall be tested when the cables are installed. GPS cables with antennas in place will not be swept, but a load shall be used to test the installed GPS antenna cables. All VSWR results will be provided to Amtrak for approval.

(3) Contractor shall measure the insertion loss of all RF cables. The insertion loss for each cable shall not exceed 2dB.

(4) Contractor shall test for return loss and distance-to-fault (DTF) for all RF cables after they are attached to exterior cellular and Wi-Fi antennas. The return loss value shall not exceed 13.7dB (VSWR 1.52).

(5) Contractor shall measure return loss values for the two (2) RF cables connected to GPS antennas with 50 ohm load only (no antenna). The insertion loss for each cable shall not exceed 2dB.

(6) Contractor shall confirm GPS/GNSS functionality from the MAR-end of the GPS cables by running a GPS program that validates GPS satellite signal strength, angles, acquisition, and counts.

(7) Contractor shall submit all test results to Amtrak for an approval. The test results for each cable shall be submitted to Amtrak as part of the vehicle history book.

iv). RF Rooftop Exterior Antenna and Cable Labeling Requirements

(1) All exterior antenna cabling shall be labeled clearly on both ends of the wire, observable with less than 90° of cable rotation.

(2) The Wireless Internet naming convention for the exterior antenna cables is:

(a) Prefix = Contractor cable number (as the Contractor convention requires

(b) Underscore = use the '_' character between the prefix and origin

(c) Origin = MAR1 (port name not required)

(d) Destination = <-antenna name> with <-port name; when applicable> (see 12.6.1 for antenna and related port names) GPS antennas shall be clearly called out with the inclusion of “GPS” at the trailing end of destination.

(3) For example, the label on the antenna cable which terminates at one end to MAR #1 and the other to exterior antenna 1 at the 4th cellular port shall read:

Xxxxx-xxxx_MAR1-ANT1-P4

(4) An antenna cable connecting MAR #1 and terminates at exterior antenna 6 Wi-Fi port 2 and is marked:

Xxxxx-xxxx_MAR1-ANT6-WIFI2

(5) Based on the previous example for MAR #1, a cable connected to the GPS port of antenna 10 is marked:

Xxxxx-xxxx_MAR1-ANT8-GPS

e). Interior Ceiling Antennas and Cabling – Passenger LAN (PLAN)

i). Interior Antenna Design Requirements

(1) Contractor shall mount a minimum of four (4) Huber & Suhner 1399.35.0020 Sencity® Rail Omni-SR 6x6 MIMO Antennas (PLAN antenna) on the ceiling within each car.

(2) The Wi-Fi system (APs with PLAN antennas) shall provide RSSI coverage of –65dBm for 95% of the passenger and crew occupying areas in each car, including the restrooms.

(3) With AP conducted power at 30dBm, RSSI shall measure less than -72dBm at 30 feet into the next car.

(4) Contractor shall conduct an RF propagation study to demonstrate the expected Wi-Fi coverage within the train car and the RF leakage to the adjacent cars with AP conducted power at 30dBm (any IEEE 802.11ac Wave 2 or ax AP with four or more antenna leads may be used for the study). The location of all cable terminations shall be provided to Amtrak for approval. **[CDRL 14-09]**

ii). Interior Ceiling Cabling Design Requirements

(1) RF cables connecting the APs and PLAN antennas shall be at least one-quarter inch (1/4-inch; commonly referred to as “240” antenna cabling) in diameter and shall not exceed three meters (3m) in length.

(2) Contractor shall terminate RF cables with QMA-Male connectors on the antenna-facing side and connect the cables with PLAN antennas.

(3) AP #1 connects to PLAN antenna 1 and 2, and AP #2 connects to PLAN antenna 3 and 4.

(4) Amtrak shall inform Contractor on connector type required on AP-end of the cable termination at a later date.

iii). Interior Ceiling Antennas and Cabling Testing Requirements

(1) All PLAN antennas and cables shall be tested across Wi-Fi frequency bands between 2400 – 2483MHz and 5150 – 7125MHz.

(2) Contractor shall measure the insertion loss of PLAN RF cables, and loss value shall not exceed 2dB.

(3) Contractor shall measure return loss and DTF with PLAN cables attached to antennas. The return loss value shall not exceed 13dB (VSWR 1.6).

(4) Contractor shall provide test all results to Amtrak for approval. The test results for each cable shall be submitted to Amtrak as part of the vehicle history book.

iv). Interior Ceiling Antennas and Cabling Labeling Requirements

(1) All PLAN antenna cabling shall be labeled clearly on both ends of the wire, observable with less than 90° of cable rotation. The Wireless Internet naming convention for PLAN cables is:

(a) Prefix = Contractor cable number (as the Contractor convention requires

(b) Underscore = use the '_' character between the prefix and origin

(c) Origin = AP1 or AP2 (port name not required)

(d) Destination = <-PLAN antenna name> with <-port name> (see 12.6.1 for antenna and related port names)

(2) For example, the label on the PLAN antenna cable connecting AP #1 and PLAN antenna 1 at port 4 shall read:

Xxxxx-xxxx_AP1-PLAN1-P4

(3) A PLAN cable connecting AP #2 to PLAN antenna 4 port 2 and is marked:

Xxxxx-xxxx_AP2-ANT4-P2

v). Interior Antenna Cutsheet

(1) The cutsheet for the Huber & Suhner 1399.35.0020 antenna is linked here:

https://www.mouser.com/datasheet/2/829/HUBER_2bSUHNER_1399_35_0020_SeriesDataSheet-2581677.pdf

f). Power and Wiring

i). Wireless Internet Power Requirements

(1) Sufficient power shall be provided to all components via WAGO or NEMA blocks (screw-type blocks supporting ring or fork connectors or friction connectors supporting tinned wiring between 12AWG and 18AWG are acceptable) for each equipment location.

(2) Contractor shall provide a Wireless Internet circuit of no less than 650w per car, connected to a single 10-amp circuit breaker. The location of all cable termination shall be provided to Amtrak for approval.

(3) Contractor shall provide sense power cabling to MAR locations to support post-run delay timer implementations (not required if located in load-shed circuit).

(4) In the event of 480V Head End Power (HEP) loss, power to all MAR locations shall remain by use of car side battery power.

(5) Ground post locations and 300mm (12") straps shall be provided and identified with easily visible green indicators to attach at each equipment mounting location.

(6) Amtrak shall provide leads connecting equipment to the WAGO or NEMA block at each equipment location.

ii). Power Wire Labeling Requirements

(1) Wiring labels for power leads shall state their origin and destination on both ends of the wire and both sides of the label.

(2) All power wiring shall be labeled clearly on both ends of the wire, observable with less than 90° of cable rotation. In the case of paired or multi-conductor power wires, one label per conductor is required. The Wireless Internet naming convention for power cables is:

(a) Prefix = Contractor cable number (as the Contractor convention requires

(b) Underscore = use the '_' character between the prefix and origin

(c) Origin = BRKR or SENSE or <device name> (port name not required; see 12.6.1 for component names)

(d) Source Voltage = voltage (if present; voltages exist from origin breaker or sense, but no voltage from MAR1, just pos or neg) Destination = <device name> (port name not required; see 12.6.1 for component names)

(3) For example, the label on the 72V power cable and the negative lead from the Wireless Internet circuit breaker to MAR1 WAGO block is respectively marked:

Xxxxx-xxxx_BRKR-72V-MAR1

Xxxxx-xxxx_BRKR-NEG-MAR1

(4) A positive and a negative power cable coming from MAR1 to the AP2 WAGO block would read respectively as:

Xxxxx-xxxx_MAR1-POS-AP2

Xxxxx-xxxx_MAR1-NEG-AP2

g). Equipment Locations

i). General Requirements

(1) Contractor shall provide a volume of space for each piece of Wireless Internet equipment as identified in 12.6.1.

(2) Each equipment location shall have one Ethernet link routed to the equipment location from each switch location; a total of two (2) Ethernet cables, labeled as described in c).iii).

(3) The location of all equipment shall be provided to Amtrak for approval.

ii). T2G Router/Mobile Access Router (MAR) locations

(1) Contractor shall provide a volume of space for two (2) T2G/MAR routers (including cable bend radius) in each car:

(a) T2G Router/MAR = 400 mm W x 320 mm L x 255 mm H (16" W x 12 5/8" L x 10" H)

(2) The two MAR positions shall be located within 300mm (12") of each other. Exterior antenna cabling (see 12.6.3.1) shall be routed to within 450mm (18") of the MAR locations.

(3) The location shall be accessible with a stepladder and locked behind a common keyed trapdoor, hinged panel, or in a cabinet.

(4) Components shall be serviceable/removable from that location without removing train components/panels.

(5) Load bearing specification per mounting position shall support 20 kg (44 Lbs.) and use no less than four (4) bolts.

(6) Contractor shall provide the volume dimensions and train fixture bolt hole patterns.

(7) A mounting plate/tray/bracket supplied by Amtrak shall be used to mount equipment into the cars; safe lifting or removal of this equipment should be a one-person task and there shall be enough access space for two persons to work there simultaneously.

iii). T2G Radio and Satellite Locations

(1) Contractor shall provide a volume of space for a T2G radio (T2G) and a satellite radio (SAT) in each end car as defined in 14.6b).ii).

(a) T2G Radio - 300mm W x 200 mm L x 100mm H (12" W x 8" L x 4" H)

(b) SAT Radio - 355mm W x 430 mm L x 152mm H (14" W x 17" L x 6" H)

(2) This space is for future use.

(3) Contractor shall install only power and Ethernet cabling to this location.

(4) T2G radios and satellite modems shall be placed in the ceiling within 2 meters of roof space not currently populated by antennas, facilitating future antenna installation.

(5) The location shall be accessible with a stepladder and locked behind a common keyed trapdoor or in a cabinet.

(6) Components shall be serviceable/removable from that location without removing train components/panels.

(7) Load bearing specification per mounting position shall support 10kg (22 lbs.) and use no less than 4 bolts.

(8) Contractor shall provide the volume dimensions and train fixture bolt hole patterns.

(9) A mounting plate/tray/bracket supplied by Amtrak shall be used to mount equipment into the cars; safe lifting or removal of this equipment should be a one-person task and there shall be enough access space for two persons to work there simultaneously.

iv). AP Locations

(1) Contractor shall provide a volume of space in the ceiling for two (2) AP radios in each car:

(a) AP - 273 mm W x 300 mm L x 100 mm H (10 ¾" W x 12" L x 4" H)

(2) The location shall be accessible with a stepladder and locked behind a common keyed trapdoor or in a cabinet.

(3) Components shall be serviceable/removable from that location without removing train components/panels.

(4) Load bearing specification per mounting position shall support 10kg (22 lbs.) and use no less than 4 bolts.

(5) Contractor shall provide the volume dimensions and train fixture bolt hole patterns.

(6) A mounting plate/tray/bracket supplied by Amtrak shall be used to mount equipment into the cars; safe mounting or removal of this equipment should be a one-person task.

v). Switch Locations

(1) Contractor shall provide a volume of space for switches that support two (2) switches (including cable bend radius) in each MAR Car:

(a) Switch - 300mm W x 430mm L x 255mm H (12" W x 17" L x 10" H)

(2) The location shall be accessible with a stepladder and locked behind a common keyed trapdoor or in a cabinet.

(3) Components shall be serviceable/removable from that location without removing train components/panels.

(4) Load bearing specification per mounting position shall support 10kg (22 lbs.) and use no less than 4 bolts.

(5) Contractor shall provide the volume dimensions and train fixture bolt hole patterns.

(6) A mounting plate/tray/bracket supplied by Amtrak shall be used to mount equipment into the cars; safe lifting or removal of this equipment should be a one-person task and there shall be enough access space for two persons to work there simultaneously.

Table 14-2 Equipment/Spacing Dimension References

#	Equipment	Qty	Location	Required Dimension	Remark
1	MAR	2	Interior	15" W x 12 5/8" L x 10" H	Volume Space
2	AP	2	Interior	10 ¾" W x 12" L x 4" H	Volume Space
3	Switch	2	Interior	12" W x 17" L x 10" H	Volume Space
4	T2G Radio	1	Interior	12" W x 8" L x 4" H	Volume Space (for future use)
5	SAT Radio	1	Interior	14" W x 17" L x 6" H	Volume Space (for future use)
6	T2G/SAT Antennas	1	Roof	36" L x 36" W x 12" H	Volume Space (for future use)
7	Exterior Passive Antennas	7	Roof	18 3/8" L x 14 ½" W x 8" H	Equipment
8	Exterior Active Antennas	7	Roof	18 3/8" L x 14 ½" W x 8" H	Equipment
9	Ceiling Antennas	4	Ceiling	TBD	Equipment

h). Regulatory and Quality Validation

i). The Contractor shall provide manufacturer cut sheets/datasheets for all cabling and equipment in consideration for this infrastructure design which includes the following specifications:

(1) Dimensions,

(2) Weight,

(3) Environmental (operating temperature/storage temperature/IP rating),

(4) Material Type,

(5) detailed RF parameters (operating frequency, insertion loss, and return loss) and

(6) Compliance/Regulatory.

ii). If the manufacturer does not provide the data requested in their spec sheets, the Contractor shall seek the missing data from the manufacturer.

i). Modular Mounting Design

i). Amtrak requires a modular mounting solution for all Wireless Internet equipment to facilitate rapid installation and removal.

ii). The Contractor shall provide the load capacity, mounting dimensions, hardware specification, and train fixture bolt hole patterns for all MAR, T2G radio, SAT modem, AP, antenna (exterior and interior), and Switch spaces.

iii). Amtrak shall affix components to plates/trays/brackets based on these measurements and apply these fixtures at the time of installation.

j). Test Requirements

i). Contractor shall provide all test procedures/reports of the Contractor and Subcontractor tests for an approval.

ii). All test results shall be provided with each vehicle history book prior to the conditional acceptance.

iii). Additionally, both routine and qualification tests by the Contractor during or after the production shall be witnessed by Amtrak.

iv). Sub-contractor Testing:

(1) Specifications of the RF cable(s) in use including applicable mechanical, electrical and regulatory information.

(2) “Birth certificates” of the RF cables with run length, return and insertion loss measurements between 617MHz and 7125MHz shall be conducted if cables are pre-assembled outside of the contractor facility.

(a) If cables are assembled by the contractor, cable measurements shall be provided from post-installation testing described in 1.5.3.1. and “Birth Certificates” are not required, as all cable(s) not passing specifications, and rejected by Amtrak will be remanufactured on-site by the contractor.

v). Contractor/Production Testing (as a Routine Test):

(1) Continuity, Megger and Hi-pot shall be performed on all power wires.

(2) All Ethernet cables shall be certified to ISO/IEC 11801-1 - Class F (CAT7) with an appropriate cable certifier (Ex. Fluke DSX series).

(3) All Fiber cables shall be certified to ISO/IEC 11801-1 – OM3.

(4) RF Cable Analyzer (time and frequency domain reflectometer (Ex. Anritsu Sitemaster Series, Keysite Fieldfox Series, or Bird Sitehawk SK series)) shall be utilized to perform on all RF Cables as stated in below conditions. (See Table 14-3 for criteria)

(a) Condition 1: Without connecting to Antennas, measure and verify the 'return loss' and 'insertion loss':

(i) MAR to Roof-mount Cellular Antennas

(ii) MAR to PLAN/Wi-Fi Antennas

(iii) MAR and GPS Antennas

(b) Condition 2: After connecting the connectors to Roof-mounted Cellular and PLAN/Wi-Fi Antennas, measure and verify the 'return loss' and 'distance-to-fault (DTF)'. DTF parameters (speed of propagation, insertion loss, etc.) shall be programmed into cable analyzer to ensure accurate DTF measurements.

(i) MAR to Roof-mount Cellular Antennas

(ii) MAR to PLAN/Wi-Fi Antennas

(c) Condition 3: After connecting the connectors to Roof-mounted GPS Antennas, measure and verify the GPS satellite signal strength, angles, acquisition and counts as well as GPS/GNSS functionality. These shall be measured/confirmed by connecting the portable GPS receiver to MAR-end of the GPS cable and running the GPS program. Note that detailed pass/fail criteria and designated GPS program for Condition 3 will be provided during the design review.

Table 14-3 RF Cable Criteria

Frequency (MHz)	Measurement Granularity (no. of points)	Type of Antenna Connection
617 to 894	>3000	Cellular
1710 to 2700	>3000	Cellular
3300-3980	>3000	Cellular
2400-2483	>3000	PLAN/WiFi
5150-7125	>3000	PLAN/WiFi

1164-1610	>3000	GPS

14.7 Information Technology and Architecture

a). Overview

i). Amtrak views real-time data from the cars a critical component of understanding and monitoring and proactively addressing safety issues, and meeting customer expectations.

ii). The ability to understand the health of cars in real-time is a critical component to ensure Amtrak can address safety, mechanical, operational, and customer service needs as the cars are in service.

iii). All information technology hardware, software, and data shall fully comply with the Amtrak Digital Technology requirements identified in TS Section 26.

b). Digital Architecture

i). The Contractor shall provide detailed architectural and design documentation for all digital assets and systems either on train or ground, including Information, Application, Networking, and Security.

ii). For software, platforms or systems operated on Amtrak's behalf, provide a high-level description of the environment, certifications, and incident response model as well example of Service Level Agreements and Operating Level Agreements for those managed systems.

c). Data: Sharing and Analysis

i). The Contractor shall indicate what data is created from systems, either on the vehicle or on the wayside in order to support the vehicles.

ii). All data generated as a part of the operation or support of the Amtrak equipment shall be made available and accessible for Amtrak use/reuse.

iii). Data dictionaries, interpreters, and tools suitable for automated batch processing to open formats shall be provided to Amtrak such that the full fidelity of all data is accessible by Amtrak personnel and digital systems.

iv). The Contractor shall also indicate any ownership or legal restrictions on data generated on Amtrak trains.

v). The Contractor shall describe any digital models used to support predictive or conditional maintenance and whether those models are available for Amtrak use.

d). Security Architecture

i). In addition to security requirements defined in Section 28, the Contractor shall provide detailed documentation for policies, processes, systems and tools

utilized to secure all digital assets, systems, and networks either on the equipment or on ground.

ii). This documentation shall include audits and certifications completed by third parties to show compliance with Industry Standards.

iii). The Contractor shall indicate the type of COTS and OEM software being provided, including embedded systems, aboard the car, and the processes and mechanisms used to ensure all software is kept up-to-date and safe from a cybersecurity perspective.

iv). Security locks shall be used to protect communication equipment from unauthorized access. Square keys shall not be considered as an appropriate measure of security to prevent unauthorized access.

v). Network devices shall not be installed in lavatory compartments, sleeper compartments, or other areas that are not subject to video surveillance.

vi). Access to the network shall require authentication, and the network shall be designed with security network zoning principles per IEC 62443 and TS 50701

e). Train Control Systems, IOT and Data

i). The Contractor shall indicate the types of onboard sensors and devices used to generate data to support either real-time or analytical data.

ii). The Contractor shall indicate if they have integrated external data such as Track Wayside Detectors into their management and analytics solutions.

iii). The Contractor shall indicate whether a GPS signal can be sent in real time to Amtrak to support accurate car movement for Amtrak customer channels and operational needs.

f). Onboard Train Information System (OTIS)

i). The Contractor shall provide detailed application and design documentation for all Onboard Train Information Systems deployed to communicate with passengers and employees including deployment, integration, information, and security requirements for all ground systems.

ii). This documentation shall include how content is created, managed, distributed and controlled.

iii). The Contractor shall indicate types of signage onboard the train, indicate Amtrak's ability to affect the digital signage, and whether digital signage has been provided to support Food Service sales.

g). ADA Compliance for All Passenger Information/Interaction Systems

i). All Onboard Information Systems shall comply with the latest ADA standards at time of delivery and detailed documentation shall be provided to verify compliance as well as ongoing support and maintenance.

h). Data Integration

i). Integration and data sharing are a critical component of success in ensuring Amtrak can deliver services safely and successfully to its customers.

ii). The Contractor shall identify how they have integrated data from railcar to customer.

iii). The Contractor shall provide application descriptions and high-level design/integration documents for ground systems that will integrate with Amtrak.

iv). These documents must include deployment, integration, information, and security requirements for all car and ground systems.

v). The Contractor shall indicate if they have integrated with platforms such as SAP, Maximo, Kronos and Adobe Experience Manager.

i). Software Updates, Training, and Licensing

i). The Contractor shall indicate how any software that is part of car and support equipment will be updated, including processes used to ensure software flaws, bugs, and obsolescence are mitigated.

ii). For all software, the Contractor shall indicate if training is necessary, and any training required.

iii). The Contractor shall indicate the type of license used for all software provided (perpetual/subscription).

iv). The Contractor shall indicate how Amtrak will retain the right to use and provide updates to software in the event the Contractor or software is purchased by a different entity.

j). Safety Data Collection and Sharing

i). The Contractor shall provide detailed application and design documentation for all systems utilized in the collection and distribution of Safety related information, including Operational Telemetry, Video and other communications required to monitor and manage Safety Systems and processes.

ii). The Contractor shall indicate whether this information is available in real-time and how data will be made available to Amtrak.

k). IT Systems to Support Maintenance

i). The Contractor shall describe the Ground Systems recommended or required to support the operation, maintenance and repair of the cars.

l). Interface with Passenger and Crew Applications

i). The Contractor shall provide on-board APIs that facilitate secure access to communication system functions that enable the development of handheld device applications that interface with or receive information from the onboard communication system. These APIs shall be:

(1) Easy to learn and understand – Developers should grasp how to use them quickly for basic cases.

(2) Easy to use – Follows conventions

(3) Hard to misuse – Design prevents common mistakes

(4) Consistent and predictable – Uniform naming and consistent response formats

(5) Well-documented – up-to-date documents including quick starts and examples.

(6) Complete and concise – Does exactly what it needs to

(7) Evolvable and versionable – Can grow without breaking existing clients. Backward compatible.

(8) Secure by default – Uses HTTPS and strong authentication, authorization, rate limits, input validation, and protection against common vulnerabilities.

(9) Reliable, performant, and scalable – Handles load, provides meaningful status codes, supports caching and pagination.

(10) Discoverable and self-descriptive – Uses standard HTTP methods correctly.

ii). The intended use for on-board APIs include:

(1) Crew applications, which, through the Contractor supplied API, shall be capable of the command and control of the communication system functions including:

(a) Setting and adjusting routes

(b) Making manual PA announcements (including graphics visual, text, and audio)

(c) Selecting pre-loaded special messages to play

(d) Answering PEI calls

(e) Making and receiving intercom calls, including general calls, calls to specific intercom clients, and call to specific cars

(f) Answering Attendant Call requests, resetting attendant calls, and configuring the attendant call functionality

(g) Configuring the reservation display system

(h) Viewing system, car, and train status and diagnostic information

(i) and other system functions identified by Amtrak during the design review process.

(2) Passenger applications, which, through the Contractor supplied secured API, shall support:

(a) The capability to display and playback onboard announcements and current train.

(b) The capability to display route information.

(c) The capability to display the consist configuration, individual car amenities, and current location in a car and train.

(d) and other communication system features identified by Amtrak during the design review process.

(3) The method of communication and control shall be secure, with configuration and security considerations identified during the design review.

14.8 Ethernet Train Backbone (ETB) and Ethernet Car Network (ECN)

a). General

i). The ETB is used to control and transmit communication information throughout a passenger train consists of between 2 and 22 vehicles and locomotives.

ii). The ETB shall carry information along multiple paths between adjacent vehicles.

iii). The ETB is designed to have no less than 1 Gbps of bandwidth when using the wired network for purpose of managing the traffic across the network.

iv). All cabling and connectors used for the ETB shall support speeds of 10 Gbps.

v). The IP addressing scheme of all onboard IP networks shall be based on EN 61735. The IP addressing scheme, and a list of all IP devices shall be submitted for review and approval by Amtrak. **[CDRL 14-10]**

vi). The Contractor shall provide a description of the ETB and ECN control and architecture for Amtrak review and approval. The description shall include details of the data network protocols, fault tolerance, degraded operating modes, redundancy arbitration, and a description of network initialization and configuration. **[CDRL 14-11]**

b). Equipment

i). The network architecture, network protocols, and all interfaces between all network components located on or off the car shall be non-proprietary. The use of proprietary protocols is prohibited.

ii). Network Interface Control Documents shall be submitted for Amtrak review and approval for all onboard and wayside interfaces between any two software executables. **[CDRL 14-12]**

iii). The ETB equipment is required to provide a high availability of the overall train network, so the system shall ensure that failure of a single active component or power failure within one vehicle shall not interrupt the ETB functionality for the remainder of the train.

iv). The ETB shall remain operational on battery power while in Standby operation.

v). All hardware should be adapted from PRIIA 305-919.

vi). All IP Switches shall be managed, and shall support:

(1) Ethernet Frame Switching as per IEEE 802.1D

(2) Quality of Service as per IEEE 802.1Q

(3) Virtual Local Area Network as per IEEE 802.1Q

(4) Link Layer Discovery Protocol as per IEEE 802.1AB

(5) Switches shall provide sufficient buffering and queuing capability to avoid network bottlenecks.

c). Ethernet Train Backbone (ETB) Switches

i). At least two managed railway grade Layer 3 Ethernet Train Backbone switches shall be installed at each end of the vehicle for the ETB OTIS, PA Communications, car diagnostic systems, and other operations-critical systems use.

ii). The switches shall incorporate bypass contacts to be capable of allowing the Ethernet signals from adjacent vehicles and switches to pass through them when they fail or lose power.

iii). The Contractor shall provide ETB switches that manage link redundancy and maintain network communications in the event of a link failure.

iv). The switches shall conform to the requirements of EN61375-2-5:2014.

v). Ethernet switches shall be mounted inside at each end of the vehicle near the locations where the jumper receptacle cables enter the vehicle, or at a location approved by Amtrak.

vi). One additional pair of switches, supplied by Amtrak as a part of the passenger wireless internet system, will be utilized for the passenger Wi-Fi and Entertainment system.

vii). Ethernet Train Backbone switches shall communicate successfully with other ETB nodes without limitation as to the sequence or orientation within the train, and without a requirement for manual configuration.

d). Ethernet Car Network Switches

i). Ethernet Car Network switches shall be connected to each other through a Gigabit speed fault tolerant ring topology to form the Ethernet Car Network (ECN).

ii). The ECN shall be connected to the ETB switches through redundant Gigabit speed links.

iii). When ECN nodes are replaced, the network system shall automatically identify the replacement equipment, and its communication links. Replacement of any subsystem controller or network switch shall not require any manual configuration of the controller or switch.

e). Cabling and Connectors

i). Eight Cat 6A Ethernet cables are installed within a direct conduit along the length of the vehicle to connect the switches at each end of the vehicle together.

ii). Details shall be provided during design review.

iii). The Ethernet terminations on both Ethernet switches and on the ends of the cable receptacles shall be fitted with four-way M12 connectors utilizing D-Coding for fast Ethernet and eight-way X-Coded for Gigabit or 10 Gigabit Ethernet.

f). System Interconnection

i). The car ETB shall at a minimum include eight category 6A cable end-to-end.

ii). Wi-Fi and Passenger entertainment systems defined in TS 12.6 shall utilize switches and cabling as defined in that section.

iii). The passenger Wi-Fi and Entertainment system shall be connected end-to-end utilizing at a minimum four dedicated Ethernet cables of the Ethernet Train Backbone.

iv). All remaining car systems including OCUs, PA Control Panels, OTIS displays, system controllers and other devices shall utilize this network.

v). Devices involved in the PA system shall have cables routed directly to the network switches.

g). ETB External Hardware

i). The components of the exterior vehicle-to-vehicle network are the fixed receptacles, receptacle housings, bulkhead connectors and jumper cables.

ii). Each car shall have one ETB header located on each corner.

h). Bulkhead Connectors

i). Each Fixed Receptacle will be pre-wired with two category 6A cables.

ii). Each of the category 6A cables shall be terminated with an eight-way X-Coded bulkhead M12 connector.

iii). Cables shall be routed in such a way that they are protected from EMI.

iv). The Fixed Receptacle shall be secured to the vehicle to ensure that the Ethernet Jumper attaches at an angle of approximately 15 degrees from vertical.

v). The center line of the fixed receptacle mounting junction box shall be 60 in. from TOR and 31.25 in. outward from the vehicle longitudinal center line.

vi). Alterations to this placement must be approved by Amtrak.

vii). For car-to-car interfaces Position 1 of each bulkhead shall be connected to the nearest Wi-Fi and Entertainment switch.

viii). Position 3 of each bulkhead shall be connected to the nearest car system switch.

ix). Positions 2 and 4 of the bulkheads shall remain empty for future expansion.

i). Jumper Cables

i). For car-to-car interfaces each jumper shall be composed of four Category 6A or Category 7 cables and shall be long enough to support a car-to-car connection while the car is tuning at the greatest angle of turn the vehicle is rated for.

ii). Each cable will provide bandwidth that is at least 10 Gbps.

iii). Each end of the jumper cable is designed to allow free movement, with a horizontal 270-degree arc of the mating face, in relation to the cable jumper to prevent excessive force on the jumper either when being mated to the vehicle or during normal vehicle movement.

iv). The jumper pulling failure force should be no greater than 100kg-ft which shall be less than the strength of the attachment of the receptacle housing to the carbody.

j). Integration and Fault Tolerance Testing

i). The contractor shall perform a Network Interface Card (NIC) test for each end station and each switch to verify compliance with IEEE standards.

ii). The Contractor shall perform a complete network integration test of all train subsystems, including transmission through jumper cables, to pre-qualify the proposed architecture of networks before vehicle implementation.

(1) This test shall consist of a simulated train with all train switches, actual cable and cable length, pins, and connectors that will be used on the vehicles.

(2) All intelligent system controls connected to the on-board networks shall be the actual units for one car of each type.

(3) The tests shall verify that all protocols, datasets, and messages used on all networks correspond to the Network Interface Control Document and the specific signal, message, and dataset documentation provided for each network.

(4) At the time of the integration tests, the Contractor shall demonstrate the fault tolerance of all networks by simulating all possible faults.

iii). Amtrak shall have the option of witnessing the tests.

iv). The test procedure **[CDRL 14-13]** and results **[CDRL 14-14]** shall be submitted to Amtrak for review and approval.

k). Protocol Analyzer

i). The Contractor shall provide a laptop-based Protocol Analyzer for Amtrak use to perform real-time monitoring of network activity on all networks provided under this contract. The Protocol Analyzer shall have the capability of:

(1) Displaying data in engineering units.

(2) Setting of capture filters to limit the recording of telegrams and network packets to only the ones that are targeted.

(3) Providing a visualization of the protocol stack in adjustable levels of detail.

(4) Developing and displaying statistical reports on traffic, errors, protocol types, etc.

(5) The Contractor shall submit for Amtrak review and approval the capabilities of the Protocol Analyzer for each Network. **[CDRL 14-15]**

14.9 Electromagnetic Interference

a). General EMI / EMC Requirements

i). All carborne supplied equipment and its wiring shall be electromagnetically compatible and have no negative impact on, nor suffer from a negative impact from the use of:

(a) All other components on the cars

(b) All components of the communication system

(c) Operational electronics used by crewmembers, including radios, wireless ticketing devices and others

(d) Consumer electronics used by passengers, including cell phones, computers, radios and others

(e) Wayside equipment including signaling systems

ii). The Contractor shall develop an Electromagnetic Compatibility (EMC) control plan, which shall describe the methodology used to measure control and mitigate all the Electromagnetic Interference (EMI) emissions by the supplied equipment.

iii). The Electromagnetic Compatibility Control Plan shall be submitted to Amtrak as part of the PDR for the communication system. **[CDRL 14-16]**

14.10 CDRLs

CDRL	Description	Due
CDRL 14-01	The Contractor shall identify the fault tolerance capabilities, recovery time, and user interaction required to maintain system operation.	30 days prior to PDR
CDRL 14-02	Plan identifying the approach to reducing the attenuation of the carbody, on-board equipment, and glazing impact on cellular telephone reception	30 days prior to PDR
CDRL 14-03	Documentation and calculations for all individual components, and for the system as a whole, demonstrating the conformance to the requirements in this technical specification and referenced standards.	30 days prior to PDR
CDRL 14-04	Comprehensive architecture and design package	30 days prior to PDR
CDRL 14-05	Documentation defining the capabilities of the OTIS self-test functions	30 days prior to PDR
CDRL 14-06	Document identifying the standard interface which would allow the integration of a replacement or additional DCS communications channels	30 days prior to PDR
CDRL 14-07	Design of the Provision for Wireless Internet	30 days prior to PDR
CDRL 14-08	Diagrams of the antenna locations and the bolt hardware specification	30 days prior to IDR
CDRL 14-09	RF propagation study	30 days prior to IDR
CDRL 14-10	The IP addressing scheme, and a list of all IP devices shall be submitted for review and approval by Amtrak.	30 days prior to PDR
CDRL 14-11	Description of the ETB and ECN control and architecture	30 days prior to PDR
CDRL 14-12	Network Interface Control Documents	30 days prior to IDR

CDRL 14-13	Integration and Fault Tolerance Testing Procedure	30 days prior to IDR
CDRL 14-14	Integration and Fault Tolerance Testing Results	30 days prior to FDR
CDRL 14-15	Capabilities of the Protocol Analyzer for each Network	30 days prior to PDR
CDRL 14-16	Electromagnetic Compatibility (EMC) Control plan	30 days prior to PDR

Table of Tables

Table 15-1: Communication Trainline Pin Assignments 15-29
Table 15-2: Multiple Unit (MU) Trainline Pin Assignments 15-30
Table 15-3: Power Phase Matrix 15-31

15.1 Overview

a). This Chapter describes the major electrical power distribution and control systems required for the car and locomotive-to-car power and signal trainline circuits.

b). The locomotive-to-car systems include 480V Head End Power (HEP), trainline, 27-point door control/communications and 27-point locomotive control trainlines (MU).

c). Alternative inter-car trainline connection arrangements can be proposed for review and approval.

d). The car systems may include:

i). 480 Volt Alternating Current (VAC) HEP trainline and power distribution,

ii). 208VAC power distribution,

iii). 120VAC power distribution,

iv). 74 VDC Low Voltage Power Supply (LVPS) power distribution,

v). battery,

vi). 27-pin trainlines for car-to-car multiple unit (MU) and communications (COMM), and

vii). electrical locker circuit breaker panels.

e). It is intended that all cars be configured with these standard trainlines or an agreed upon alternative design to permit flexibility in length and interchangeability of cars especially with legacy fleet.

f). Cars may be configured in train consists up to 1,530 ft in length. All car functions shall operate per the standards of this specification within this train length range.

g). Trainline functions may operate at reduced levels (tolerance to be approved by Amtrak) at consist lengths greater than 1,530 ft (due to trainline voltage drop).

h). The maximum power consumption for a 10-car consist shall not exceed 1000 kW under worst case conditions or cause the ALC-42 HEP to trigger self-protection. For calculation purposes, a train consist shall include one diner, one café, one premium accessible coach, one accessible sleeper, one diner/lounge, and any five car combination of sleepers or passenger seating car types. An additional 100 kW of overload is available for an undefined short period of time on cold equipment, but any use of this margin requires Contractor to demonstrate at Contractor's cost.

15.2 General Requirements

a). Hotel power to the cars shall be provided through trainline cables from an external 480VAC, 3-phase, 60 Hertz (Hz) source not located on the vehicles.

b). The system shall be designed for normal operation using power supplied by a locomotive HEP source, or from a wayside 480VAC power source that can have a

tolerance up to -15% to +10%. See 15.5 for additional phase imbalance requirements.

c). Each car shall be equipped with 27-point locomotive control (MU), 27-point communication (COMM), and digital (DTL) trainline receptacles connected at each end of the car. Receptacles shall be arranged so that existing legacy jumper cables can be used to couple a new car to a legacy car and meet all dynamic clearances defined in Chapter 1.

d). All trainline wires shall run the entire length of each car and be connected from end-end.

e). Cars shall be connected using standard jumpers.

f). The primary communication trainline within the car shall be one or more IP Ethernet based network(s) for car level diagnostics.

g). All electrical systems and components utilized on the cars shall be electromagnetically compatible with other electrical systems and components, including but not limited to:

i). crew radio,

ii). digital train line,

iii). ECP cabling (see Chapter 9 for additional information),

iv). on-board train information system,

v). on-board lighting,

vi). passenger wireless devices and

vii). laptop computers.

h). The electrical power distribution and all subsystem equipment shall be in accordance with all applicable FRA regulations, APTA standards (including but not limited to PR-E-RP-002-98, PR-E-RP-004-98, PR-E-S-005-98, PR-E-RP-007-98, PR-E-RP-009-98), IEC/EN railway standards (including but not limited to EN 50155, EN 50121-3-2, IEC 62597, EN 45502, and associated referenced standards), IEEE standards including IEEE Standard 16-2020 or latest version, and other recommended practices and industry standards.

i). In the event APTA standard couplers, air brake hoses, or passenger car Head End Power/Communications/locomotive MU control electrical trainlines are used inter-car, the connections must meet all applicable AAR, APTA, and Amtrak standards.

i). All materials and workmanship shall comply with Chapter 19.

j). Terminal blocks, connectors, and other car wiring devices shall be accessible for inspection, troubleshooting and re-terminating. There shall be no equipment blocking access that must be disassembled or removed.

k). Terminal blocks and connectors shall not be located on the floor.

l). As a supplement to APTA PR-E-RP-002-98 pertaining to wiring of passenger equipment:

i). Unterminated wire connections to terminal blocks are prohibited.

ii). All terminal blocks where the manufacturer states that terminals can be used with or without ferrules, all wires shall use crimp-type ferrules unless otherwise approved by Amtrak.

iii). Flexible conduit located exterior to the carbody shall be liquid-tight flexible metal conduit. Non-metallic conduit exterior to the carbody is prohibited.

iv). Non-metallic conduit shall not be used unless approved by Amtrak before Final Design Review.

m). Ribbon cable connections are prohibited.

n). Underframe junction box, conduit, cabling, and other equipment shall be adequately protected from debris strikes, snow and ice while traveling forward or reverse.

o). Any non-metallic enclosures or components located in the underframe shall be minimized. If used, they shall have additional stainless steel debris shields that will not accumulate debris, snow or ice while traveling forward or reverse.

p). All power supplies, controllers, motors, and other electronic devices shall report fault information to the car diagnostic system. Microprocessor-based devices shall communicate via the Ethernet Car Network to the car diagnostic system. Simple, non-microprocessor-based devices shall provide health and fault status via discrete outputs to the car diagnostic system, or Amtrak approved alternative.

15.3 Trainline Systems for Communication and Multiple Unit Wiring

a). General

i). Locomotive-to-car communication for MU and COMM shall be provided by 27-point plugs and receptacles.

1) Trainline communication shall be possible with legacy fleet for interoperability.

ii). The trainline system shall be compatible in function with APTA Recommended Practice PR-E-RP-017-99.

iii). The 27-point COMM, 27-point MU, DTL, and 480VAC HEP trainline control circuits shall each be run in separate conduits or wire trays.

b). Communication Trainline

i). The COMM trainline provides car-to-locomotive and car-to-car connections for systems such as door control, door closed summary circuit, public address, passenger information and brake status lights.

ii). Trainline pin assignments are shown in APTA PR-E-RP-017-99. See Table 15-1.

iii). The primary communication trainline within the car shall be the digital trainline. When coupled with legacy equipment, the train consist shall automatically provide relevant functionality using the legacy COMM communication connections.

c). End of Train Functions

i). To provide end of train circuit information, depending upon the train consist configuration, at the end cars of the train, a jumper cable may be connected between the right side COMM receptacle and an adjacent white dummy COMM receptacle, to provide end-of-train detection for on-board systems.

ii). Looping relays shall be provided for each car to establish "end of train" for the four communication trainline circuits (#19, #20, #23 and #26).

(1) The looping relay shall be energized when the 27-pin COMM jumper is connected between the COMM receptacle and the adjacent dummy receptacle.

(2) Alternate methods may be proposed to Amtrak for approval.

iii). The DTL system shall be capable of establishing end-of-train functionality to be used in place of the COMM dummy functionality for train summary circuits in the future.

(1) The DTL system shall be capable of handling all existing COMM functions that are not safety relevant.

d). Multiple Unit (MU) Trainline

i). In push-pull operation, locomotive control functions shall be transmitted through the cars from the locomotive by means of a standard AAR MU trainline.

ii). A single MU jumper cable (commonly 71 in. long) shall be used between the locomotive and the adjacent end car using the trainline pin assignments shown in Table 15-2.

iii). All MU trainline receptacles and functions shall conform to APTA PR-E-RP-017-99.

iv). Each MU trainline wire shall be pass-through, uninterrupted from end to end. There shall be no switching or disconnect device that can open the MU trainlines.

e). Trainline System Application to Vehicles

i). Two digital trainline receptacles shall be installed on each end of each car in accordance with PRIIA Specification 305-919.

ii). In addition, two sets of COMM and MU receptacles shall be installed on each end of all cars, one on each side of coupler pocket per APTA Recommended Practice RP-E-017-99.

iii). One MU and one COMM 27-point jumper cable shall be connected between the car and the locomotive.

iv). One or more dummy COMM receptacles may be required at the end of each car to ensure compliance with Section 15.3.

v). Alternative locations for these receptacles may be proposed to Amtrak for approval.

vi). The plate to which receptacles and jumper flanges are mounted shall be designed to resist a 500-pound force, without deforming, produced by pulling the locked jumper (with the receptacle cover locked down utilizing a rubber-O ring type retainer) out of the receptacle.

vii). There shall be no interference that restricts the receptacle cover from being fully opened to allow insertion or withdrawal of jumpers.

viii). Under all operating conditions, a minimum of 2 in. clearance for the trainline cables shall be provided between trainline jumpers and the carbody and all appliances including air hoses, couplers, uncoupling levers and other equipment.

ix). Each car shall be delivered with one loose jumper cable of each type for each connection that would need to be made.

f). Trainline Junction Boxes

i). Separate stainless steel weatherproof junction or switch boxes shall be provided at each end of each car for the communication (both DTL and COMM) and MU trainline systems.

ii). Trainline junction boxes shall be located behind the F-end truck or other Amtrak approved protected location.

iii). The inside of any exterior-mounted box shall be powder coated with an insulating paint or varnish.

iv). All wires shall be terminated using Amtrak approved termination method mounted onto terminal blocks in the junction boxes.

v). Trainline junction boxes shall be located where they are shielded from roadbed debris and car system liquid drains.

vi). All trainline junction boxes shall be weatherproof to NEMA4 requirements or IP56 if located on the exterior.

g). Additional Trainline Signals

i). Amtrak requires three additional trainline functions that are not currently allocated in the 27-pin COMM trainlines. These three functions shall be realized by other means on a per car basis and then communicated to the locomotive.

(1) Hot Journal bearing from any vehicle,

(2) Locked Axle from any vehicle,

(3) Fire/Smoke indication from any vehicle

(4) Any other signal that cannot be transmitted by car network

15.4 Digital Networks

a). General

i). Ethernet/IP (Internet Protocol) shall be the medium of communications between systems (HVAC, LVPS/BC, doors, communications system components, event recorder, cameras, brake system, etc.) inside a car and between cars that make up a train consist.

ii). A Car Ethernet Network, based on IEC 61375-3-4, shall provide communication for the devices / sub-systems within the car. It should provide programmable real-time data monitoring information.

iii). Ethernet Train Backbone, based on IEC 61375-2-5, shall be provided for communication between vehicles in the consist.

b). Car Ethernet Network

i). The primary communication method between on-board microprocessor-controlled subsystems is to be via a Car Ethernet Network. All systems and subsystems on-board the vehicle are to be connected by way of a Car Ethernet Network.

ii). The Contractor shall provide a list of all IP devices on the Car Ethernet Network and Ethernet Backbone. The IP addressing scheme, to be approved by the Project Manager, shall be based on ENI EC 61375.

iii). The network design of the Car Ethernet Network and Ethernet Backbone shall be non-proprietary. The network design should include protocols, such as those defined by TCN Open TRDP, that facilitate the addition and subtraction of components without requiring modifications to on-board software configuration items.

iv). The Contractor shall provide a description of the Car Ethernet Network control and architecture to the Project Manager for review and approval. This description shall include detail on the data network protocols, fault tolerance, degraded operating modes, redundancy arbitration, error detection, and a description of network initialization and configuration.

v). All networks (including the ETB) shall be based on the seven (7) layer open systems interconnection (OSI) model. Full documentation of each layer for each network shall be provided in a network interface control document to be submitted prior to the preliminary design review. The document shall be updated with all changes through testing and the end of the warranty period. **[CDRL 15-01]**

vi). Subsystem monitoring and control within the car shall be primarily by means of the Car Ethernet Network with minimal use of discrete control wires for non-safety-related functions. Systems controlled (non-safety-related functions) and/or monitored by the Car Ethernet Network shall, at a minimum, include the following:

(1) Door System

(2) HVAC System

(3) Brake System

(4) LVPS/BC System

(5) Lighting System

(6) PA Amplifiers

(7) Signs

(8) PEIU

(9) Communication System Components

(10) TWC Gateway

(11) Video Surveillance Systems (Option)

(12) Water and Waste System

(13) Monitoring and Diagnostics System

(14) Maintenance Display Units

vii). The Contractor shall perform a network interface card (NIC) test of each networked device to verify compliance with IEEE standards.

viii). When nodes on the network are replaced using parts supplied by the Contractor or equipment supplier, the network system shall automatically identify the replacement equipment and its communication links. Replacement of networked subsystem controllers shall not require any configuration of the controller or vehicle switches.

ix). For the purposes of network maintainability and diagnostics, full per interface statistics of each network connected device shall be available via PTE, on-board diagnostic screen and wayside diagnostic system. The interface

statistics shall include, at a minimum, packets transmitted, received, transmitted errors (broken down by type), received errors (broken down by type), packet types (unicast, multicast, broadcast, etc.), as well as interface connection duration, speed, and resets. The counters shall be capable of being reset on a per-interface basis via PTE, on-board diagnostic screen and wayside diagnostic system.

x). The PTE Ethernet port shall be located in an electrical locker in each car. Location to be determined during design reviews. A device shall provide the display of the network statistics showing an overview of the activities of the devices connected to the network and indicate issues such as interfaces which have a high number of errors and resets.

xi). The Contractor shall test to ensure each Car Ethernet Network channel link satisfies the complete Cabling Transmission Performance and Test Requirements of TIA/EIA 568-B.2, utilizing a device that meets the accuracy requirements of a Level III tester. Tests shall be performed each time a cable is replaced or re-terminated through test and warranty. Test results shall be recorded by the Contractor and provided to the Project Manager in a spreadsheet format for each car.

xii). The network diagnostic capabilities shall be submitted to the Project Manager for review and approval.

xiii). All software configuration items installed on any network connected device shall be maintained by an onboard controller to facilitate component replacements. A report of expected and current onboard software versions shall be accessible through the PTE, onboard diagnostic system, and wayside diagnostic systems. A software update command using a copy available on the update controller shall be available to maintainers when the report indicates that an expected version of a software configuration item is in conflict with the installed version on the network device.

c). Ethernet Car Backbone (ETB) General

(1) Communication between cars shall be implemented via a Gigabit Ethernet Train Backbone based on IEC 61375-2-5 that provides high speed trainline communication between cars, and between the cars and the wayside.

(2) The Contractor shall provide a description of the Ethernet Train Backbone control and architecture to the Project Manager for review and approval. This description shall include detail on the data network protocols, fault tolerance, degraded operating modes, redundancy arbitration, error detection, and a description of network initialization and configuration.

(3) An Ethernet Train Backbone Node (ETBN) shall be provided on all cars to provide routing between the ETB and the Car Ethernet Network. Each ETBN shall be implemented to provide link redundancy.

(4) The ETB configuration, receptacles, and jumpers shall be implemented. Two Category 6A or Category 7 cables (one in use, one for future provision) shall be run from the ETB receptacles to the location of the Ethernet Train Backbone Node.

(5) The ETB shall provide and support communication of data required to perform the following functions:

(a) Recognition of the train consist, including vehicle order, orientation, and number within the consist

(b) Automatic reconfiguration of the network when cars are coupled or uncoupled

(c) Car monitoring and diagnostics

(d) Train-to-wayside (TWC) data transfer

(e) Transfer of data needed from/by other ETB capable cars or locomotives in the consist

(f) Remote PTE/PTU access to Car Ethernet Network attached devices

(6) The ETB shall support all of the diagnostic and monitoring functions of the monitoring and diagnostic system.

(7) The cars shall be capable of operating in a consist with between 2 and 22 vehicles.

(8) The Contractor shall test to ensure each Ethernet Car Backbone channel link satisfies the complete Cabling Transmission Performance and Test Requirements of TIA/EI 568-C.1 for Category 6A (CAT6A) cables and the 1000BASE-T link transmission performance requirements specified in IEEE Std 802.3. Tests shall be performed as per TIA/EIA 568-B.2, utilizing a device that meets the accuracy requirements of a Level IIIe tester. Tests shall be performed each time a cable is replaced or re-terminated through test and warranty. Test results shall be recorded by the Contractor and provided to the Project Manager in a spreadsheet format for each car.

d). Interoperability

i). The ETB, and systems utilizing the ETB and Car Ethernet Network for communication, shall be designed for interoperability with future fleets without requiring configuration or software changes (that are not affected by the defined ETB interface).

ii). The vehicle specific definition of faults, alarms, screen and screen layouts, display panels, vehicle status, and vehicle network capabilities shall be transmitted by each vehicle via the ETB. The transmission of these data items shall enable future fleets to be integrated without modification to the vehicle's

software. It is anticipated that this will be accomplished utilizing a stack of technologies including service discovery protocols such as zeroconf, application protocols such as HTTP, markup languages such as XML or HTML, and scripting languages such as JavaScript.

iii). The technologies utilized shall be non-proprietary and fully defined by the Contractor to enable future fleets to add displays to the monitoring and diagnostic display, as well as allow access to the monitoring, diagnostic, and status information of the vehicle to the displays integrated on future fleets. This shall allow future fleets, including locomotives coach cars, and cab cars, display information on the maintenance display and driver display of the vehicles purchased under this contract without requiring modifications to software installed on this fleet of coach cars.

iv). Details of the interoperability shall be submitted with the Network Interface Control Document.

v). Optionally, to facilitate development and integration of current and future fleets into the ETB network, the Contractor shall supply a PC based network simulator software package which provides the capability to simulate ETB and Car Ethernet Network communication.

15.5 480 VAC Head End Power (HEP) Trainline System

a). General

i). HEP will be provided from the source to the car through receptacles and jumpers at standard locations on each end of the car and on both sides of the coupler, in accordance with APTA Recommended Practice PR-E-RP-016-99.

(1) Total should be 4 connectors (two male, two female) on each end of the car able to conduct 1600 Amps combined or 400 Amps each.

ii). Contractor shall propose alternative end-of-car cabling arrangements that would help mitigate low hanging debris strikes while still properly maintaining clearance around all track conditions on the Amtrak network. This alternative solution may include permanent or semi-permanent connections on one end of a car and/or fixed connections higher on the end sheet of one car but Amtrak has a keen interest in understanding how to prevent debris strike damage with low hanging cables with the future of this fleet.

iii). In addition to the three main power conductors, the HEP cabling shall also include three control wires to provide locomotive trainline complete information (indicating all cabling from car to car is in place), and a car-to-car carbody ground bond.

(1) HEP circuit assignments shall be in accordance with Amtrak Specification 963.

iv). Load Balancing

(1) The loads between phases shall be balanced so that the load on one phase will not exceed more than 5% of the load on either of the other two phases.

(2) The delta phase current between any phases shall always remain under 90A total for the train consist to prevent locomotive HEP shutdown faults. For calculation purposes, a train consist shall include one diner, one diner/lounge, one café, and any eight-car combination of sleepers or passenger seating car types coupled to a single locomotive.

(3) Load balancing shall take into account each car type and operational loadings including maximum heating, partial heating, maximum cooling, partial cooling, re-heat and ventilation only modes.

v). All HEP cabling shall be arranged and routed to minimize EMI emissions using techniques including trefoil arrangements, shielding, and other strategies.

b). Receptacles and Jumpers

i). Jumper Cables

(1) Both ends of the car shall be equipped with two jumper cables utilizing the latest fabrication techniques and two receptacles with housings, per APTA Recommended Practice PR-E-RP-016-99 and APTA Recommended Practice PR-E-RP-018-99.

(2) Components shall be in accordance with Amtrak Specification 223 and Amtrak drawing D-12-7191, and include 480VAC jumpers, 480VAC receptacles, and 480VAC receptacle housing.

(3) The HEP jumpers shall be of adequate length to reach from the end sheet to the car junction box.

(4) No portion of the HEP cables shall hang down to within 5 in. of the top of rail (vertically) when connected to an adjacent car on straight, level track.

(5) No portion of the cable shall pass below top of rail when navigating a 250 ft. radius turn.

ii). HEP Receptacles

(1) The receptacles shall be mounted with a downward slope of approximately 15° to provide drainage.

(2) Receptacles and fixed jumper flanges shall be mounted to the carbody with stainless steel bolts.

(3) All HEP receptacles shall be labeled with appropriate danger 480V warnings, in accordance with Amtrak Specification 696.

(4) Receptacle Mounting Plate

(a) The plate to which the receptacles and fixed jumper flanges are mounted shall be reinforced to resist, without bending, a 500 lb. force produced from pulling the locked jumper out of the receptacle, such as by an unintended uncoupling.

(b) They shall consist of a short length of stainless-steel tubing with a stainless-steel crossbar at the bottom, of a diameter to accept the 480V plug body, yet prevent it from sliding through.

(c) The holster shall be sloped steeply downward to allow any moisture which has accumulated in the plug to drain.

iii). HEP Trainline Junction Box

(1) The trainline junction box shall be located at the transition bulkhead or if there is no transition bulkhead, beyond the adjacent truck.

(2) This shall be accomplished without requiring connectors, splices or intermediate terminals.

c). Wiring and Connections

i). The 3-phase HEP trainline power cables per APTA Recommended Practices PR-E-RP-002-98 and PR-E-RP-009-98, with 1600-amp capacity, shall be routed along the length of the car.

ii). The wire used in the trainline power cables shall be 4/0 as specified in APTA Recommended Practice PR-E-RP-016-99.

iii). The voltage drop due to the impedance of the power trainline at the extreme end of the train consist shall be minimized under the train's heaviest load.

iv). The HEP cables may run between junction boxes of each car in a protected wire race.

v). All cables shall be enclosed in rigid galvanized steel conduit or trays, where possible, and shall be supported by heavy-duty stainless-steel conduit straps equipped with vibration resistant material at intervals not to exceed 48 in.

vi). All cables not able to be installed in rigid galvanized steel conduit shall be protected from debris strikes and will be supported by suitable cleats at appropriate intervals not exceeding 24 in. Cleat material shall not damage or breakdown cable insulation over time.

vii). Spare COMM and MU trainline wires shall be identified in the junction boxes.

d). Power Junction Boxes

i). An HEP trainline junction box shall be located at each end of the cars, where the jumpers and leads from the receptacles on the end sheet shall be terminated and connected to the trainline cables.

e). Emergency Backup Operation (OPTION)

i). In the event of a locomotive 480VAC HEP failure, there shall be an emergency backup power system for the following systems:

(1) HVAC System, operating at reduced capacity. See Section 10.08.g) for additional information.

(2) Water and Waste System, operating at reduced capacity. See Chapter 17 for additional information.

(3) LVPS System, operating in load shed mode. See Table 15-1 for additional information.

ii). Emergency backup mode shall provide the above functions for a minimum of 6 hours.

iii). The emergency backup power system must include all necessary controls, switch gear, interfaces and sensors to:

(a) Coordinate an automatic changeover from locomotive sourced HEP to emergency power.

(b) Provide full protection for the emergency backup power system from overload, supply overvoltage, and all transient events.

(c) Provide full protection for all connected loads from any failures or maloperation of the emergency power supply.

iv). The emergency backup power supply converter shall be designed and tested per IEC 61287, and all other requirements for power converters as detailed elsewhere in these technical specifications.

v). The emergency backup power supply system shall include a diagnostic interface to the car diagnostic system. See Chapter 24 for additional information.

vi). The emergency backup power system shall output a hardwire signal that will provide the signal for the emergency load systems to enter Emergency Operation Mode. The hardwire signal shall be monitored by the car diagnostic system.

vii). Details for the proposed emergency backup power supply system shall be submitted for review and approval **[CDRL 15-04]**

15.6 480VAC Power Distribution

a). General

i). The 480VAC power is distributed within the cars utilizing switch and circuit breaker panels located in the electrical and/or equipment lockers accessible from the car interior.

ii). 480VAC power shall be controlled and fed to all loads through this distribution system.

b). Each 480VAC circuit breaker auxiliary contact shall be monitored by the diagnostic system.

c). Main HEP Circuit Breaker:

i). One main circuit breaker shall be provided in the electrical locker to allow isolation of each car from the 480VAC trainline systems.

ii). The main 480VAC circuit breaker auxiliary contact shall be monitored by the diagnostic system by a dedicated I/O.

d). Power Transformers

i). All transformers shall be of a dry type, convection cooled, and in accordance with Amtrak Drawing D-65-7449, revision D, unless otherwise approved.

ii). All transformers shall have delta primary windings.

iii). All inputs and outputs shall be circuit breaker protected with suitable circuit breaker discrimination to avoid unnecessary loss of equipment functionality under load fault conditions.

iv). At a minimum, the following types of transformers shall be provided at a minimum on all car types:

(1) 480/120VAC transformers to provide 120VAC service with GFCI functionality.

(2) 3-phase 480/208-120VAC, delta-wye, to provide 120-208VAC, 3-phase service with a grounded neutral.

v). If the contractor can demonstrate that the 120VAC service, with acceptably stable voltage, with GFCI functionality may be provided from a tertiary winding from the 3-phase transformer, then the contractor may propose this arrangement at preliminary design review.

vi). Additional provisions shall be made for food service cars.

vii). All transformers shall be located inside the electrical lockers or under car in equipment boxes if necessary.

(1) If under the car, transformers shall be sealed to NEMA 4 unless it is located in an IP56 water sealed container.

viii). The Contractor shall demonstrate, by calculation, that there is sufficient ventilation to prevent transformer failure and/or damage resulting from excessive heat buildup during all operating conditions.

ix). Transformers shall be derated at least 10% for current, or other appropriate approved factor, based upon duty cycle.

x). Transformers shall be thermally rated such that their life expectancy shall exceed that of the vehicles when operated at full load and at specified maximum ambient temperatures.

xi). Maximum ambient temperatures shall include in the analysis increases in temperature above vehicle external ambient temperature in the transformer mounting locations, transformer efficiency losses, and heat generated from other equipment adjacent to the transformers.

xii). Calculations shall be provided to demonstrate that the transformers provided have sufficient capacity to supply their intended loads with 15% capacity reserved for future use and will have an expected lifetime exceeding that of the vehicle. **[CDRL 15-02]**

15.7 120VAC Power Distribution

a). General

i). The 120VAC power shall be distributed within the car utilizing 480/120VAC step down transformers, and switch and circuit breaker panels located in the electrical equipment lockers accessible from the car interior.

(1) Power shall be controlled and fed to all 120VAC loads through this system.

ii). A main circuit breaker shall control the power distribution to all 120VAC circuit breakers.

iii). The main 120VAC circuit breaker auxiliary contact shall be monitored by the diagnostic system by a dedicated I/O.

iv). Weather-proof, GFCI protected service outlets shall be provided undercar near subcomponent assemblies spaced no less than 25’ from any major system and isolated on a separate circuit independent of interior outlets.

v). Each 120VAC circuit breaker auxiliary contact shall be monitored by the diagnostic system.

vi). Passenger convenience outlets on single level cars shall be divided into a minimum of eight (8) separate circuits to mitigate nuisance tripping impacts.

b). Passenger Convenience Outlets

i). Passenger Seat Outlets

(1) A flush-style 120VAC duplex convenience outlet shall be installed in each revenue seat location using the GFCI circuits, as detailed in Chapter 11, and shall include an equal number of appropriate USB PD (Power Delivery) ports as approved by Amtrak.

(2) Provisions shall be included so that outlets do not limit the ability to reconfigure seats within the cars.

(3) The outlets are intended to provide power for passenger electronic equipment, such as laptop computers.

ii). Table Outlets

(1) Two duplex outlets supplied by a power strip, shall be installed at each table, located such that the table or seat does not interfere with access to the outlet.

(2) Each outlet shall also include an equal number of USB ports.

iii). An Amtrak-standard 120V decal per Amtrak Specification 697 shall be installed at each outlet location.

iv). The passenger convenience outlets shall be protected by a number of separate power circuits, each of which shall be equipped with a 20-amp GFCI breaker with test and reset buttons.

(1) The convenience outlets on each car shall be evenly divided into the power circuits.

(2) The number of power circuits will be determined by the Contractor, but they should use 1 amp per foot of carbody as a guide.

v). Each passenger convenience outlet shall include a power indicator light to indicate power at the outlet.

c). Interior Service Outlets

i). Duplex GFCI service outlets shall be located in each toilet room, electrical locker and utility lockers in all car types, in locations and quantities suitable for their intended use in those areas.

ii). The food service area of the food service car shall be equipped with GFCI protected service outlets as specified in Chapter 16.

iii). Service outlets shall be protected locally by GFCI outlet rated for 120VAC, single phase, 60 Hz, 20 amps at each service outlet location.

d). Special Service Outlets

i). In each accessible area there shall be a dedicated GFCI outlet or charging cable capable of charging mobility aid devices such as electric wheelchairs.

(1) The circuit shall be fed by a dedicated circuit breaker and all associated wiring shall be able to support up to 0A current draw.

(2) If the outlet itself cannot support 30A, the circuit breaker shall be rated to the weakest component in the arrangement.

e). Sleeper Room Service Outlets

i). Each sleeper room shall have 120VAC duplex convenience outlets with GFCI protection and shall include an equal number of appropriate USB ports as approved by Amtrak. See Chapter 11 for more information.

ii). A fault event in any sleeper room shall not impact any other sleeper room on the car.

15.8 Battery Charger

a). General

i). Each car shall have two solid-state DC battery chargers with temperature compensation.

(1) The second battery charger will act as an emergency hot standby in case the first battery charger has a failure and can no longer operate. If the first battery charger fails, the changeover to the second battery charger shall be automatic and not require any manual intervention.

(2) Battery chargers shall rotate to avoid extended periods of inactivity.

(3) There shall be a backup manual override that can be crew operated in case the automatic battery charger changeover fails.

(4) Each individual battery charger shall meet the reliability requirements in Chapter 4.

(5) The battery charger shall be either mounted under the car in an equipment box, near the battery box, oriented so that the indicator lights can be seen from outside the car without opening panels, or the battery charger shall be installed in the electrical locker.

(6) The battery charger shall be rated appropriately for the DC load it will be supplying.

(7) Alternative proposals, subject to Amtrak review, may be allowed if the performance criteria are satisfactorily accounted for.

(8) The battery charger function description shall be submitted at PDR and updated during design review. **[CDRL 15-03]**

ii). The battery charger shall provide DC power to support all DC loads, including battery charging, while the car is operating with HEP on.

iii). Upon the loss of HEP or the failure of the battery charger, the system shall automatically transfer the DC loads to the battery system without interruption of power and shall be demonstrated during design review.

iv). The DC battery system shall be responsible for feeding car loads and systems which must be available for operation independent of the availability of the 480VAC HEP, such as public address, digital trainline, marker lights, side and end door systems, standby lighting, and others, as specified in Table 15-3.

v). The battery and charger system shall be comprised of:

(1) Battery charger with temperature sensor

(2) Battery (multiple cells)

(3) Load drop device or devices

(4) Load drop controller (may be located elsewhere)

(5) The same battery type and battery charger shall be used on all car types.

b). Operation

i). The battery charger shall be connected in parallel to simultaneously charge the battery while supplying power to the individual car bus and shall be capable of supplying uninterrupted DC power during load transfer between LVPS and battery.

ii). The charging system shall incorporate modes for Current Limit, Normal Charge, and Trickle Charge.

iii). The Contractor shall propose an Amtrak approved method to incorporate battery charging and the output voltage will be regulated at a battery temperature-compensated value.

iv). The charger shall be sized with sufficient capacity to simultaneously recharge the battery from a fully discharged state and to support the maximum possible DC bus loads plus a 25% reserve beyond the worst-case continuous load condition.

v). Recharge time of a fully discharged battery shall not exceed five hours to reach at least 80% of capacity at 77°F, with all normal car DC loads on.

vi). The Contractor shall provide, at design review, a load budget assessment that includes calculations to demonstrate that the charger provided has sufficient capacity to meet these needs. **[CDRL 15-05]**

c). Basic Charger Characteristics

i). Basic charger characteristics shall include the following:

Input Voltage	480VAC nominal (tolerance range +10%/-15%), 3-phase, 3-wire
Input Frequency	60 Hz nominal (tolerance range 56-64 Hz)
Input Protection	3-pole circuit breaker (external reset)
Output Voltage, Temperature Compensated	73.6VDC at 68°F ambient; 80VDC maximum
Temperature Compensation	In accordance with the battery manufacturer's recommendation

Ripple	Maximum of 2 volts peak-to-peak any load within rating
Audible Noise	62 dBA maximum for components mounted inside the car
Ability to automatically recharge the battery from any state of discharge, including 0 volts on battery terminals.	
Charging voltage ambient temperature compensated as sensed at the battery.	
Following a HEP power outage, the charger shall restart with a reduced current load for a period of time after restoration of HEP in order to minimize the short-term startup HEP load.	
Diagnostic information for the battery charger and battery current and voltage levels shall be recorded and available remotely.	
See Chapter 4 Reliability, Availability, Maintainability for additional requirements.	

d). Circuit Breakers

i). The charger system shall be equipped with two circuit breakers, one for the charger output and one for the battery disconnect near the battery charger.

ii). If needed a second battery disconnect switch shall be located adjacent to the battery box.

e). Indicators

i). The charger shall include individual status indication LEDs that are displayed from the front face. These shall include:

Supply 480VAC On	Green
Current Limit (in current limit mode)	Amber
Load Dump Relay Energized	Amber
Supply 480VAC off/out of tolerance	Red
Rectifier Failure	Red
Temperature Sensor Failure	Red

ii). A lamp test pushbutton shall be provided, which when pressed will cause all lamps to light. All indicators and meters should be able to operate without 480VAC present.

iii). The charger shall include four meters on the front face:

DC Amps (total charger output)	0-100 amps
Battery Amps (current into/out of battery)	100-0-100 amps (zero center)
DC volts (charger output voltage)	0-100 volts
Battery Temperature	0-250 degrees F

iv). All metered information, diagnostics, and fault information shall be recorded and available remotely through the car diagnostic system.

f). Self-Protection

i). At a minimum, the charger shall be self-protected against the following fault conditions:

(1) Open circuit battery or wiring

(2) Short circuit battery or wiring

(3) Battery ground fault

(4) Temperature sensor fault

(5) Low input voltage

(6) Low output voltage

(7) Input phase loss

(8) Reversed battery connections

(9) System overload

(10) Voltage or current over limit

g). Temperature Sensor

i). The temperature sensor shall be sealed and mounted onto one of the inter-cell plates of the battery assembly and shall be sufficiently marked so as to be readily identifiable and accessible during maintenance or battery cell change out.

h). Operation of Battery Charger System

i). Operation of the battery charger shall be as follows. See Table 15-3 for additional details:

(1) **Normal Mode:** 480VAC HEP “ON”; DC system “ON”

(a) All AC and DC loads available

(b) All DC loads fed by battery charger

(2) **Standby Mode:** 480VAC HEP “OFF”; DC system “ON”

(a) Battery voltage above manufacturer recommended standby level based on battery type.

(b) All DC loads fed by battery

(c) Immediately after loss of HEP, the car shall go into standby mode, where most of the car lighting, all doors, ECP braking, and the communications system remain in operation.

(d) Refrigeration equipment shall remain on.

(3) **Load Shed Mode:** 480VAC HEP “OFF”; DC system “ON”

(a) Battery voltage potential range for load shed the manufacturer has recommended based on battery type.

(b) Only essential DC loads remain on, de-energizing non-essential systems.

(4) **Emergency Mode:** 480VAC HEP “OFF”; DC system “OFF”

(a) Battery voltage below the manufacturer recommended minimum level based on battery type.

(b) All DC loads are without power because the load drop device has disconnected the battery system, or the battery system is disabled due to equipment failure.

(c) In emergency mode only independently, powered systems remain on. Upon restoration of HEP, all DC loads shall be available immediately after a brief window to confirm HEP is stable, including those that were disconnected as part of standby, emergency or load drop. DC load transfer by the battery charger shall be independent of the state of the battery when HEP is available. The battery charger should be able to operate normally regardless of the condition of the battery set.

i). Load Shed/Drop Device

i). The low-voltage power system shall be equipped with a switching device(s), which shall shed load from the battery in accordance with Table 15-3 and the battery manufacturers recommendations.

15.9 Battery System

a). General

i). The battery shall provide power for necessary systems when the HEP system is not available.

ii). The battery system shall be compliant with APTA Recommended Practice PR-E-RP-007-098.

b). Batteries

i). The Contractor shall submit a battery design that:

(1) Meets the load requirements found in Table 15-3 with at least 25% extra capacity;

(2) Provides the longest life-cycle cost effective system; and

(3) Provides the latest technology that is available in passenger rail battery design.

ii). All car types shall utilize the same type of battery cell.

iii). The batteries shall be recharged by the battery charger as specified above.

iv). Batteries shall be nickel-cadmium (Ni-CAD) or nickel-metal hydride, or other Amtrak approved type.

(1) Lead-acid and Lithium-Ion batteries are prohibited.

v). The batteries shall be housed in cases of a fire-retardant design.

vi). The batteries shall be a low-maintenance type and shall not require the frequent adjustment of the electrolyte level.

vii). The battery system may utilize a centralized water fill apparatus that meets the ambient environmental requirements of the specification.

viii). The battery shall be designed to minimize hazards to operating personnel during service, operation, line maintenance and shop maintenance.

c). Battery Performance

i). Nominal battery voltage of 64VDC shall be provided to the DC power distribution system in each car when HEP is not present and the batteries are fully charged.

(1) Alternate methods of compliance for battery system voltage may be proposed but must still meet the requirements and relative performance characteristics and modes specified for the battery and battery charger systems.

ii). The batteries shall have a design service life of no less than twelve years and shall be capable of withstanding a minimum of 2000 deep cycles without failure.

(1) A deep cycle shall be defined as discharging the battery to 0.8V/cell to 1.0V/cell and recharging it to 80% of its rated capacity at 77°F in no more than five hours.

(2) The actual discharge voltage will be established in accordance with the battery manufacturer’s recommendations.

iii). The battery system shall be sized to carry the full DC load after loss of HEP, as defined in Table 15-3 (standby mode) for no less than two hours.

(1) The battery system shall provide a 25% power safety margin above the calculated load.

iv). A DC load budget shall be developed by the Contractor and submitted to Amtrak for approval during the design review process, demonstrating that the

battery system as proposed meets all requirements and provides adequate capacity for the required loads for the required duration.

d). Battery Markings

i). Each battery cell or battery unit shall be permanently marked with the following information:

(1) Manufacturer's name

(2) Battery type

(3) Catalog or part number

(4) Nominal rated capacity at five- and eight-hour discharge rates

(5) Serial number

(6) Date manufactured

(7) Amtrak name

(8) Amtrak part number

(9) Warning and safety precautions (i.e. use no acid, etc.)

(10) Blank space where installation date can be written

ii). Markings shall be resistant to the chemical and mechanical environment encountered in service for the design life of the cell.

iii). Polarity of the positive cell terminal shall be identified by a red post insulator or bushing and/or a plainly marked p, pos or + symbol.

iv). Polarity or the negative post shall be identified with a black post insulator or bushing and/or a plainly marked n, neg or - symbol.

e). Battery Enclosure

i). Design and Construction

(1) Battery Enclosures shall meet the requirements of 49 CFR 238.225 and EN 50272-2.

(2) The batteries shall be housed in an approved rattle-proof stainless steel battery box located in an approved location under the car floor unless isolated from the passenger seating areas by a non-combustible barrier.

(3) The battery box shall be of adequate size to accommodate a crated battery from at least two suppliers.

(4) Battery enclosure covers shall be hinged and designed to prevent the direct entry of water.

(5) No combustible material shall be used for the trays or cell blocking.

(6) The battery box floor shall have a drain inboard of the running rail.

(7) Means shall be provided to prevent lateral and longitudinal movements of the battery using approved fire-resistant material.

(8) The cells shall be installed such that the plates are parallel to the sides of the car.

(9) Wire terminations shall be both labeled and color coded red (for positive) and black (for negative).

(10) Battery enclosure shall be protected by the use of a fire suppression system that is adequate to contain/extinguish any type of battery fire.

ii). Accessibility for Maintenance

(1) The battery shall be mounted for ease of replacement and maintenance.

(a) All cells shall be fully and easily accessible for servicing.

(2) When open, the hinged covers should provide unimpeded access to the batteries for the replacement or routine maintenance and shall include a suitable prop rod or latching mechanism to hold the access door open.

(3) If the battery trays must be moved to provide access for servicing, they shall be mounted on a robust locking slide-out tray.

(a) The tray shall lock in the fully extended and fully retracted positions, with a safety latch.

(b) Sufficient slack shall be provided in the battery cables to permit tray movement, and anti-chafing materials such as cable carriers shall be applied to prevent damage to the cables.

(c) Use of cable disconnect plugs for tray movement is prohibited.

(4) The rearmost cells shall have vertical line of sight visibility to the filler caps well clear of the side of the carbody when the tray is extended.

(5) The battery box shall be completely self-draining to allow flushing of the battery with water.

iii). Ventilation

(1) Battery venting shall be designed so that there can be no accumulation of trapped gases.

(2) There shall be no devices that can cause sparking in the battery ventilation airflow.

(3) Ventilation holes shall be provided with a fine mesh that allows for proper ventilation but prevents intrusion of leaves or small debris.

(4) Fiberglass or other approved fire resistant easily replaceable filtering media shall be applied to ventilation openings to prevent dust ingress due to car motion.

f). Battery Disconnect

i). There shall be a battery disconnect available to first responders in case of an accident. The location shall be readily accessible in any accident scenario include a rollover derailment such as in the interior in the vestibule area.

ii). The battery disconnect concept and arrangement shall be submitted at Preliminary Design Review. **[CDRL 15-06]**

15.10 DC Power Distribution System

a). General

i). Power for all DC loads shall be distributed throughout the car through switch and circuit breaker panels located in the electrical equipment lockers accessible from the car interior.

ii). A master battery emergency OFF switch/pushbutton shall be included in the switch locker, which shall permit the train crew to totally disconnect the car battery from all car loads.

iii). Each DC branch return circuit shall be floated from the carbody.

iv). The low voltage power distribution arrangement concept shall be submitted at Preliminary Design Review. **[CDRL 15-07]**

b). 74VDC Power System

i). Systems and components that are operated on 74VDC shall be powered from the battery charger through a power distribution system that includes control switches, circuit breakers and load shed and load drop relays located in the electrical locker.

ii). Circuit breakers shall be sized and labeled according to their circuit and function.

iii). A main circuit breaker shall control power distribution to all 74VDC circuit breakers.

iv). The main 74VDC circuit breaker auxiliary contact shall be monitored by the diagnostic system by a dedicated I/O.

v). Each 74VDC circuit breaker auxiliary contact shall be monitored by the diagnostic system.

c). 24/12VDC Power System

i). If multiple systems utilize 24VDC or 12VDC power sources, then there shall be a consolidated 24/12VDC power distribution system located in the electric locker instead of using multiple DC/DC converters.

ii). A main circuit breaker will be supplied for the DC-to-DC converter and each sub system utilizing the 24/12VDC system shall have its own dedicated circuit breaker.

iii). Each converter shall report health to the diagnostic system.

iv). Each 24/12VDC circuit breaker auxiliary contact shall be monitored by the diagnostic system.

d). DC-to-DC Converters and Inverters

i). DC-to-DC Converters and Inverters used to supply other voltages, including commercially available units, shall be certified to EN 50121 and 50155.

ii). Converter and Inverter reliability shall meet the auxiliary power MDBCF requirements in Chapter 4.

15.11 Electrical Panels

a). General

i). An electrical locker shall be provided in all car types, locked with the standard coach key.

(1) All control switches, circuit breakers and indicators shall be located in this locker unless specified otherwise. These controls, breakers, and indicators shall not be located undercar in the event a reset is required during service by the onboard crew or maintenance personnel. Any controls, breakers, and indicators located undercar will need to be approved by Amtrak during the design review process.

ii). Controls and switches designated for crew operation shall be located on electrical panels separate from devices designated for maintenance operation such as circuit breakers.

(1) If crew and maintainer controls are located in the same locker, the panels shall have separate doors to prevent crew operators from accidentally using maintenance devices.

iii). All circuit breaker and switch panels shall meet all recommendations of APTA Recommended Practice PR-E-RP-002-98.

iv). The circuit breaker panels shall be dead front type, with removable front covers, of a design such that all components are front serviceable.

v). Circuit breakers shall be arranged so that the handles move vertically, with the ON position up.

vi). The panels shall be conveniently located, in the electrical locker, for ease of access by service personnel.

vii). Reduced wiring and ease of maintenance shall be of prime consideration.

viii). If it is impractical to house all circuit breakers in the electrical locker, additional circuit breaker panels may be proposed for Amtrak approval.

ix). A wiring gutter shall be provided along the top, sides and bottom, for the routing of high voltage leads to their designated circuit breakers.

x). Appropriate installation methods and materials (wire gutters, conduits, tie bars, etc.) shall be provided for routing high voltage leads to their designated circuit breakers internal to the electrical locker.

xi). The circuit breaker panel shall be configured for easy removal so that maintenance and repair action are not impeded.

xii). Electrical locker arrangement, including separation details of crew operated devices and maintenance operated devices, shall be submitted at IDR. **[CDRL 15-08]**

b). Switch and Circuit Breaker Panel Arrangement

i). Each circuit breaker panel shall carry apparatus arranged to be easily accessible to connections and designed to prevent an operator from coming in contact with live voltage when operating switches or circuit breakers.

ii). All switches and circuit breakers shall be provided with a nameplate clearly identifying the electrical circuit it controls with at least three spare slots for future circuit breaker installations.

iii). The ampere rating for each circuit breaker shall be indicated on the circuit breaker front plate, arm or toggle lever.

iv). All circuit breakers and switches shall indicate ON with toggle up and OFF with toggle down.

v). Circuit breakers for the different voltage power distribution systems shall each be grouped with their respective voltage and be labeled according to the appropriate voltage.

vi). A main circuit breaker shall be provided for each voltage level.

vii). Circuit breakers, whether in groups or individually, shall provide a means for locking out and tagging out with off-the-shelf Lockout Tagout (LOTO) devices.

viii). The Contractor shall illustrate the Lock Out Tag Out procedure during the design review process.

15.12 Spare Conduit

a). Spare conduits shall be installed for future use in concealed areas where there are no access panels. Spare conduits shall follow requirements in APTA PR-E-RP-002-98, Installation of Wire and Cable.

b). Areas include but are not limited to underneath the floor panels, sidewalls, vestibules, ceiling panels, etc. for running future wiring laterally across the aisle, or longitudinally down the car.

c). Spare conduits shall be uninterrupted from end to end. If pull boxes are needed, they shall be located in areas that have sufficient maintenance access.

d). Spare conduit size shall be a minimum 0.5 in.

e). Spare conduit shall have a pre-installed spare wire through the length of the conduit to facilitate easy wire pulling in the future. The spare wire shall be an appropriately size that can withstand the mechanical strength of pulling a bundle of wire without breaking.

f). There shall be separate spare conduits for 208V class, 120V class, 74V class, and communications and network class wiring.

g). From the 120V circuit breaker panel, there shall be conduits that can run wire to each corner of the car.

h). From the 74V circuit breaker panel, there shall be conduits that can run wire to each corner of the car.

i). For communications and network conduits, there shall be sufficient conduits between equipment lockers and vacant areas where future equipment could be installed.

15.13 Car Location Identifiers for All Subsystems

a). To consolidate LRU configurations, each LRU that can be installed in multiple locations within the car shall utilize a car location identifier key integrated into the car wiring.

b). Each LRU shall be able to read the location and determine on its own the appropriate functionality.

c). LRUs shall not be manually configured with different software, dip switch settings, or other manual means.

d). The system integrator shall be responsible to oversee that each subsystem is following this approach.

15.14 Integrated Schematics

a). The Contractor shall prepare and submit, for acceptance by Amtrak, an integrated schematic diagram package showing all electrical systems and including all components, wiring, and loads on the car. **[CDRL 15-09]**

b). Conduit, wiring, and locator diagrams should also be included. See Chapter 23.

Table of Figures

Figure 16-1: Appliance List – Kitchen 16-10
Figure 16-2: Appliance List – Café 16-38

16.1 Overview

a). This chapter defines the technical requirements, interior design, and configuration for the Café and Diner food service areas provided for the Universal Single Level Fleet.

i). Compliance with preliminary design concepts included in the specification and attachments does not relieve the Contractor of all the other requirements within the specification.

16.2 General Requirements

a). This chapter describes the required components and appliances for the food service areas, desired layouts, and functional criteria.

b). All food service area equipment and fittings shall meet the attachment requirements of 49 CFR Part 238.233 and APTA Standard PR-CS-S-006-98.

c). Compliance with the CFR requirements shall consider the worst-case scenario of the food service equipment when fully loaded with all supplies and an entire stock of fully loaded appliances.

d). A flexible, easily reconfigurable structural mounting system shall be provided for the food service equipment interface to the carbody.

e). Any location designated for alcohol storage shall be provided with a padlock hasp for lockability.

i). The capability to store alcohol in lockable refrigerated and lockable non-refrigerated storage areas is required. These areas will be finalized during the design review process.

f). General Mechanical Requirements

i). Food service components shall be designed to minimize noise.

ii). Replacement of any major appliance shall not require any disassembly of the food service area structure.

iii). Stainless steel fasteners with vibration-damping inserts shall be used to attach the food service area structure to the carbody.

iv). Metal surfaces of the food service area shall be suitably grounded to the carbody to prevent electrical shock.

v). All areas under sinks shall be constructed from stainless steel cabinetry with swinging doors.

g). General Appliance Requirements

i). All food service appliances shall be heavy-duty grade commercial food industry apparatus, suitable for the rail vehicle operating environment.

ii). Their structure shall be sufficiently robust for meeting the FRA mounting strength requirements without requiring framing reinforcement, unless otherwise approved by Amtrak.

iii). All appliances shall be mounted within the food service area in a manner that complies with regulations regarding attachment strength and resistance to acceleration forces.

iv). Wherever possible, appliances of the same manufacturer, model, and part shall be used for ease of spare management and maintenance.

v). Appliances with doors shall have mechanical latches and not solely rely upon magnetic latches to keep doors closed.

vi). Appliance change-out time (the time to remove a defective unit, install a replacement unit and verify function of the replacement unit) shall not exceed 30 min. for the food service appliances specified in this chapter.

vii). Appliances with refrigeration or freezing systems shall be self-contained units and not employ "split systems" with separate components located elsewhere such as under the floor.

(1) The retention mechanisms shall not interfere with the appliance's operation or routine cleaning or servicing and shall allow the removal and replacement of the appliances within the specified times.

(2) Equipment removal and installation shall require less than 50lbf.

viii). All appliances shall be installed to provide adequate ventilation for cooling/heat dissipation and to prevent heat buildup on adjacent surfaces, per the manufacturer's recommendations.

h). General Water System Requirements

i). Water system connections to individual appliances shall be made by FDA compliant quick-break connectors, with a labeled quarter-turn water supply ball valve.

ii). Any liquid drains shall be directed through the floor to drain under the car and clear of any undercar components, using easily accessible connectors.

iii). Potable water from the car supply tank using suitable water backflow checks shall be provided to the food service area for distribution to any appliance requiring the use of water.

iv). The potable water supply shall have a particulate filter and an antibacterial filter to purify the water to Public Health Service (USPHS) standards.

v). These filters shall be located between the freshwater tanks and the food service area equipment and shall be located for easy cleaning and replacement.

vi). These filters shall be identical to those specified for the potable water system on the other cars, to the extent possible.

vii). Individual ball type shut-off valves shall be provided for all appliances requiring the use of water. All water system components shall be of lead-free design.

viii). Manual ball type drain valves shall be provided to allow draining all of the food service area piping and appliances, either for water system servicing or manual draining of the car in advance of storage, or in anticipation of freezing conditions.

ix). These valves shall drain the water system to the ground under the car clear of any undercar components. Instructions shall be posted in an approved food service area location providing water draining instructions for the LSA, including the draining of water contained within appliances.

i). General Sanitation Requirements

i). The food service car shall be designed and constructed in full compliance with:

(1) US Food and Drug Administration (FDA) Food Code, 2017,

(2) FDA Handbook on Sanitation of Railroad Passenger Cars, 1964,

(3) Amtrak Food Service Sanitation & Public Health Standards, 1997

(4) 21 CFR Part 1250.

(5) All applicable Code of Federal Regulations concerning general sanitation, water, and interstate conveyance sanitation for:

(a) FDA

(b) US Environmental Protection Agency (EPA)

(6) The Contractor is required to arrange and comply with all Federal agency review, inspection and certification requirements for the food service area, such as described in 21 CFR Part 1250.41.

ii). Certificate Holder

(1) The food service area shall have a 5 in. high by 7 in. wide certificate holder on the inner face of a galley locker door to display under glass the FDA Form 2371, Certificate of Sanitary Construction when issued.

iii). The design and installation of countertops, wall panels, floor-to-wall joints, storage locations, recycling and trash and recycling receptacles and lockers and component mounting shall not permit food particles, debris, liquids or moisture to reside behind, over or under any of their surfaces.

(1) Countertops shall have a raised edge on all exposed faces and a cove on all edges adjacent walls and bulkheads and be properly sealed and caulked.

(2) All outside corners formed by two planes shall have a minimum radius of 0.25 in.

(3) Corners formed by three planes shall have a minimum spherical radius of 0.375 in.

iv). All approvals, including approvals from the FDA, are the responsibility of the Contractor.

(1) The Contractor shall be responsible for correcting any observations found during FDA inspections.

(2) All cars shall be certified for conformance with FDA regulations.

(3) All approvals shall be supplied with each car history book. **[CDRL 16-01]**

v). All countertops and serving counters must be non-porous, corrosive-resistant, and easily cleanable surfaces.

(1) The countertops for passenger use shall meet all ADA requirements.

(a) The area adjacent to the ADA service counter shall have a wheelchair turnaround circle for passengers using wheel mobility devices to turn around and travel back to their seating location.

(2) The countertops in food service preparation areas must comply with all FDA sanitation and lighting requirements.

vi). All storage locations below the countertop shall have:

(1) The inside of the storage location shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

(2) Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

(3) Easy to clean guides for all items stored within shall be provided on the sides and back of the locker and on the inside of the locker door. The guides shall prevent trash and liquids from getting between the container and locker wall.

j). General Safety Requirements

i). All food service equipment shall be designed to accommodate passengers and train crews from the 5th percentile female to the 95th percentile male ranges.

ii). Safety of passengers, crew and maintenance personnel shall be a prime consideration in design of all food service equipment.

iii). Emphasis shall be placed by the Contractor for inclusion of passenger and LSA handholds throughout the food service area, to assist if the car unexpectedly lurches or sways.

(1) They shall be provided for passenger use when entering the car from connecting cars, passing through the car, standing in the food service area, using the condiment stations, or other areas where a passenger or crew may be standing.

(2) In general, there should be a convenient handhold for passenger use throughout the car.

(3) The perimeter of the LSA food service area counters shall be equipped with a continuous safety handrail, or similar safety assist arrangement.

(4) Handrails shall be finished to be consistent with their surroundings and shall not infringe into clear passageway widths as defined by the ADA.

iv). Projections from the food service area face or edge of countertop which could injure crew members, including knobs, switches, outlets, and latches shall be recessed.

(1) There shall be no finger pinch points in the food service area, or elsewhere in the food service car.

v). In addition to the basic emergency equipment to be provided on all car types, the food service areas shall also have the listed emergency equipment in the food service area.

(1) The emergency equipment storage locations shall be labeled in accordance with all applicable Amtrak signage requirements.

k). General Electrical Requirements

i). The food service electrical distribution system shall provide suitable Head End Power (HEP) and low voltage power supply electrical power distribution, including 208VAC or 120VAC 60 Hz power, to the food service area (see Chapter 15).

(1) Each food service appliance shall have an identified dedicated simplex outlet and individual supply circuit breaker and switch.

ii). Located in the car main electrical locker shall be all main terminal boards, main circuit breakers and other items required for distribution of food service electrical power to a local food service area electrical panel.

(1) Each circuit breaker shall interrupt all lines of the circuit.

(2) Circuit breakers and electrical outlets intended to provide a dedicated power circuit to a specific food service appliance shall be permanently and clearly labeled for that appliance.

(3) The appliance operation shall be supported during Head End Power (HEP) outages using approved designs.

iii). The Contractor shall provide both a complete electrical schematic and a wiring diagram for all food service equipment.

iv). Each appliance shall be powered from its own circuit breaker located in the food service equipment electrical locker, and the appliance shall be grounded to the carbody through its wiring harness.

(1) Individual labeled electrical outlets shall be provided for each appliance.

(2) In addition, a toggle switch shall be provided in an approved food service area location for each appliance to allow the unit to be switched off manually.

(3) A Light Emitting Diode (LED) pilot shall be provided for each switch, wired so that it will illuminate when power is on at the load side of the respective closed appliance switch.

(4) Alternate power connection arrangements may be proposed during design review.

v). The food service area shall have a local dedicated circuit breaker panel for LSA use which shall include circuit breakers and switches for the food service equipment and food service lighting.

(1) It shall be covered with a polycarbonate door (to allow the positions of the switches and circuit breaker to be seen) with a paddle latch to keep the door closed.

(2) The dedicated circuit breaker panel shall meet the requirements in Chapter 13.

l). General HVAC Requirements

i). The car HVAC system will provide ventilation, heating and cooling to the food service area as part of the overall car HVAC system, as described in Chapter 10.

ii). The Contractor shall ensure that the HVAC system is designed to remove the heat produced by the appliances and any other heat sources.

(1) HVAC cooling/heating distribution shall be designed to accommodate all Food Service arrangements and be adjustable depending on arrangement load demands.

(2) Details to be reviewed during Design Review.

iii). The Contractor will supply a heat load analysis to Amtrak for review.

(1) All food service equipment shall be installed with sufficient free space between the equipment and walls to permit circulation of cooling/ventilation air in accordance with the manufacturer's recommendations.

m). General Lighting Requirements

i). All food service appliance area lighting shall be in accordance with APTA Recommended Practice PR-E-RP-012-99 and the latest revision of the USPHS FDA Food Code.

(1) All normal light levels along the entire length of the food service area shall be a minimum of 30 foot-candles, and all standby lighting shall provide a minimum of 10 foot-candles.

ii). Types and styles of lighting fixtures shall be presented by the Contractor during initial bid and shall be submitted for approval by Amtrak during the design review. All lighting shall be controlled by switches in the food service circuit breaker area.

iii). Lights shall be located so they will not produce glare, nor shine into the face either of passengers or the LSA.

(1) The fixtures selected shall be suitable for the railroad environment and shall be robust, easy to clean and maintainable for the life of the food service area.

n). General Cart Requirements

i). The carts described below are intended to function interchangeably across the fleet and with the Airo platform carts for standardization.

ii). The carts shall be capable of being used as refrigerated carts and dry storage carts.

iii). The intention is for the same carts to be used as room service delivery carts.

(1) The cart shall be sturdy and robust enough for frequent movement throughout the cars of the consist.

(2) The cart must have the capability to deliver food and beverages to all cars at constant temperatures to comply with all federal regulations.

16.3 Material Preferences

a). The food service and seating areas shall be designed to provide an aesthetically pleasing and efficient area for passengers and train crew.

i). The Contractor shall be responsible for providing a comprehensive and unified appearance throughout all areas of the car as well as being

complimentary and consistent with any other car type(s) built to this Specification.

ii). Choice of finish materials shall be submitted for Amtrak review and approval.

iii). Please refer to Exhibit F for more information.

16.4 Diner Kitchen Requirements

a). Vision

i). The kitchen area shall be ergonomically designed to minimize the number of steps the chef and kitchen crew need to take to prepare, plate, and deliver food to passengers.

ii). The kitchen area shall be designed with the idea that there is a preparation and a washing area where applicable appliances and features are kept apart as much as possible.

iii). Preserving landing spaces and work areas is very important to Amtrak.

iv). The Kitchen should be a pleasant space to work. The arrangement of the kitchen and kitchen equipment should be safe, practical, and ergonomic with a layout that delivers operational efficiencies.

v). The design of the back of house should be future ready – The design of this area should be considered as modular so that equipment can be upgraded or changed as service models and technologies evolve over time.

b). Layout

i). The layout shall provide the desired approximate locations and relative footprints for each element of the kitchen from an ergonomic and preparation flow perspective.

(1) The Contractor shall submit layouts at each stage of the design review process for Amtrak's review and acceptance. **[CDRL 16-02]**

c). Appliances

i). Figure 16-1 lists the desired appliances along with an example part number and the quantity required within the kitchen food service area.

(1) Example part numbers are given to establish a starting place for appliance performance and will be finalized during the design reviews. Example part numbers are given to plan for adequate space requirements as well as pricing proposal.

(2) The car builder will propose a compliant manufacturer and part number for each appliance that meets requirements for functionality, shock and vibration, service history, power requirements, and ability to meet crashworthiness requirements for mounting.

(3) Appliances that exceed the capabilities of the example appliances are acceptable to be proposed for Amtrak review and approval.

Figure 16-1: Appliance List – Kitchen

Appliance	Description	Example Part No.	Quantity Desired
Utility Sink	This is a 3-compartment sink used for washing food preparation and storage items.	-	1
Refrigerated Cart Docking Station (2 cart)	2 cart docking station with cart chiller, cart sensor, temperature monitoring,	-	1
Refrigerated Cart	Insulated food cart with capability to maintain food temperature of 40 degrees F for one hour after loss of power	Bucher BA700036	2
Dishwasher	Dishwasher with 13 racks per hour capacity under heavy setting, holds standard size dish racks, 17” door opening, 0.62 gallons of water per rack, NSF rated high temperature,	Hobart LXeR advansys	2
Handwashing Sink	Sink basin with IR faucet for handwashing purposes, includes soap dispenser and paper towel holder mounting	-	1
Microwave	Steamer oven with 3500W, pull down door, heavy volume, 4 stage cooking, touch control	Amana AMSO35	1-
Trash and recycling Storage	Stainless steel module for storing removable trash and recycling bin. Trash and recycling bin is accessible through a drawer.	-	1
Steam Table/ Induction Table	Hot food well, drop in, (4) 12” x 20” pan capacity with 4” deep well, individual adjustable thermostatic controllers	Alto-Shaam 400-HWI/D4	1
Flat Top Grille	Countertop griddle with 48” cooking surface, ¾” thick polished steel plate, thermostatic controls, grease trough	Royal Range RTGE-48	1
Rapid Cook Oven	0.83 cu ft capacity, rapid cook, impingement, and convection options, operate each section at different temperatures touch control, ventless	TurboChef PLEXOR M2	1
Convection Oven	Combitherm CombiOven that fits (5) 12’x20’ full size hotel pans, stackable kit	Alto-Shaam 6-10E PRO	2
Freezer	Insulated freezer cabinet with ability to keep food goods at or below 0 degrees F	-	4
Warming Drawers	Insulated warming drawer with ability to keep food goods between 60 and 200 degrees F.	-	2
Storage Cabinets	Stainless steel cabinets or open shelving for dry storage to maximize space usage within food service area.	-	As space allows
Refrigerated Cabinets	Insulated refrigerator cabinet with ability to keep food goods between 32 and 40 degrees F	-	4
Countertop Workspace	Clear available workspace for food preparation with 6” backsplash and 0.25” radii.	-	As space allows
ATLAS Carrier Storage	Stainless steel cubbies for ATLAS Carrier storage to maximize space usage within food service area.	-	At least 3
ATLAS Carrier	Atlas sized dry goods container for storage and transport of goods between commissary and food service area	Bucher BA740012	At least 21
Scrap Sink	A scrap sink for rinsing food scraps off dirty dishes shall be provided. This sink shall include a scrap block and trash bin located directly below.	-	1

ii). Detailed functional requirements for each appliance are listed on the following pages.

iii). In addition to these requirements, the Contractor shall factor in FDA cleaning clearances, radii, and sanitary design. An FDA inspection and subsequent approval will be required for all car types. The Contractor will be responsible to rectify any discrepancy discovered by the FDA inspector at any time until a certificate of sanitary construction is issued.

iv). Appliance accessory storage/placement if applicable will be reviewed during the design reviews (i.e., turbo chef paddle, dishwasher racks).

(1) Utility Sink

(a) A three-compartment sink shall be provided where each sink basin is large enough to submerge the largest washable item.

(b) The compartments and sink counterspace shall be made from welded stainless steel.

(c) Marine edges shall be included on the front edge of the utility sink area.

(d) A backsplash of at least 6” shall be included on the other edges of the utility sink area.

(e) The radius between the backsplash and the utility sink shall be at least ¾”.

(f) The three-compartment sink shall include overflow provisions in each sink basin.

(g) The overflow piping shall join in a central location before draining through the floor penetration.

(h) The drain in the bottom of each sink basin shall be 2” in diameter and shall be capable of being plugged with a ball valve attached to an L shaped rotational lever mechanism.

(i) The L shaped rotational mechanism shall extend to the front of the module so that it is easy to reach this lever.

(j) All requirements described in the water and waste chapter of this specification shall apply to the utility sink.

(k) The faucet for the utility sink shall be centered above the middle sink and shall pivot to the right and left sinks for filling each basin.

(l) The faucet shall have a mechanical handle for turning on and off the water flow through the faucet.

(m) Under the Kitchen Utility Sink Only, a retractable hose shall be included.

(i) The hose shall be mounted on a reel that can retract. The hose shall be long enough to reach both ends of the kitchen.

(ii) The water supply shall be independently controlled with hot and cold water.

(iii) Convenient access to this hose and associated plumbing fixtures is required.

(2) Refrigerated Docking Station

(a) Refrigerated carts shall be stored within a docking station built into the food service area as a module.

(b) Each cart docking compartment shall include carrier stops, guide rails, and retention latches.

(c) Drainage from cart condensation shall be directed away from the front of the docking station to avoid flooding, spills, and water leakage onto the floor of the food service area.

(i) The module shall have a base pan with a cross break and 0.25” radii on all edges.

(d) Locations for the cart docking shall be designed for the carrier door to remain closed when in the stored position.

(i) Carts will remain closed in ‘stored’ configuration due to spacing and optimizing space in the galley.

(ii) In order to access goods in a cart, the retention latch must be rotated, and the door of the cart must be opened.

(e) The retention latches shall be used to retain the cart in its position.

(i) The latches shall rotate 180° so that they can be rotated clockwise or counterclockwise to release the carts.

(f) The guide strips inside the docking station shall be made from a polymer material that prevents damage to the carts while also securing them in place to prevent rattling.

(i) The guide strips shall be replaceable in case of significant damage.

(g) Cart Identification Sensor

(i) These sensors indicate to the chiller cart if there is at least one cart docked to the refrigerated docking station.

1. If there is a cart docked, the chiller will function as

normal.

2. If there are no carts detected, the chiller will not be on.

(ii) This will prevent potential damage to the internal components of the chiller.

(h) Cart Chiller

(i) The cart chiller shall be mounted on wheels that allow the cart chiller to easily traverse the threshold of the refrigerated docking station.

(ii) The chiller cart is intended to dock semi-permanently inside the refrigerated docking station.

1. This chiller would only be removed for maintenance or replacement.

(iii) The cart chiller shall be roughly (12” x 37” x 21”) and shall be interchangeable with the chiller carts used in the Amtrak Intercity Trainset (Airo) Procurement.

(iv) The cart chiller shall function to keep food at or below 40˚F.

1. The cart chiller will be suitably insulated to prevent all condensation from appearing on the outside of the module.

2. The temperature within the exhaust and return ducts of the module shall be monitored and reported to wayside.

(v) There will be alarm annunciation to the train crew that the refrigerated display is malfunctioning if the temperature in the display case reaches 41˚F for a continuous one-hour period or if the temperature ever reaches 50˚F.

(vi) The cart chiller shall be suitably sized to maintain pre-chilled stock to 40 ˚F or lower within 90 min of startup as determined by refrigeration system capabilities.

(vii) The cart chiller will be qualified using the EN ISO 23953-2:2015 test.

(viii) Refrigerant used in the refrigeration equipment shall be presented and approved by Amtrak during PDR.

(ix) The cart chiller shall have the following features:

1. Push handle at the front

2. Mounted on 4 wheels

3. Quick locking mechanism to secure in docking station

4. Connection to the cooling area on the back side

5. Power connection for 120V AC/48V DC with Harting plug

6. Protection against evaporator freeze-up during low load operation

7. Digital Controller with touch panel that includes alarm annunciation, status displays, and password protection for setting adjustment

(x) The refrigeration system shall be controlled by the suction line pressure signal and the supply air and exhaust air temperature sensors.

1. Depending on the changes in pressure, the speed of the compressor shall be adjusted accordingly between the minimum and maximum speed.

2. The unit shall be turned on and off based on the temperature sensor readings.

(i) Ducting

(i) The ducting on the back of this module directs the warm and cool air to and from the food carts so that the carts are always within the expected temperature range.

(ii) The ducting also is directed to the car's HVAC exhaust system to take heat away from the refrigeration equipment.

(iii) The ducting shall be insulated so that the condensation is limited as much as possible.

(iv) Insulation should be mechanically fastened to the duct with no exposed insulation fibers. The use of insulation tape is not allowed.

(j) Electrical Connection

(i) The electrical connection between the chiller cart and the docking station shall provide a quick connect, not damage any electrical connectors, and be properly insulated from moisture.

(3) Refrigerated Cart

(a) Carts are intended to move food items from the commissary to the train, dock in their compartment and be taken back to commissary for restocking after a trip is complete.

(b) The cart shall be roughly (16” x 21” x 37”) and shall be interchangeable with the carts used in the Airo fleet. Example part number listed as Bucher BA700036.

(c) The refrigerated cart shall be delivered with 12 trays loaded on shelves inside.

(d) The cart shall be able to move seamlessly in and out of the docking station.

(e) The Contractor is responsible for ensuring that the tolerances between the docking station and the refrigerated cart both:

  (i) Do not cause rattling of the cart while the train is in motion.

  (ii) Are not so tight that the cart is damaged during docking and undocking.

(f) Carts shall continue to keep items at FDA acceptable temperatures from the time food is placed inside until the food is removed for consumption.

  (i) Food cart interior will be accessed semi-regularly and will be docked to a refrigeration docking station when used as a refrigerated cart on the café car.

(g) The cart is expected to function with limited wear and tear damage for the lifespan of the train.

(h) Stainless steel push-to-close or slam latches shall be used on the cart doors.

  (i) Sealant on the door gasketing is subject to FST testing-silicone is recommended.

(i) The cart will come with a padlock hasp for locking the contents of the cart when the cart is unattended.

(j) A card holder shall be provided at the top of the cart door.

  (i) This material will be aluminum and clear anodized.

(k) A 75 mm diameter wheel will be used on all carts.

  (i) The top of the cart handle shall be 30 mm above the top surface of the cart to allow for items to be placed on top of the cart during transport.

(l) The cart shall be capable of a maximum loading of 115 kg, or similar as determined by the supplier.

(i) The cart shall be 25 kg empty, or similar as determined by the supplier.

(m) The bottom of the module will be a single pan that includes the lower portion of the sidewalls to contain any condensation.

(i) The main sidewalls of the module will be fastened to the lower pan so that water does not exit the module.

(ii) The cart module will be adequately sealed to prevent leakage of cart contents into the galley during normal train operation.

(n) The inner and outer surfaces of the cart will be non-porous, corrosive resistant, and easily clean-able.

(i) Any seams will need to be sealed with silicon or mounted with gaps of < 1/32" to meet FDA requirements.

(ii) No sharp edges, chips, or surface defects will be present.

(iii) The interior of the cart shall have 0.25” radius or greater on all corners for cleaning.

(o) The cart in conjunction with a compliant working chiller shall function to keep food at or below 40˚F.

(p) The cart will be suitably insulated to prevent all condensation from appearing on the outside of the module.

(q) The cart shall be suitably insulated to allow a compliant working chiller to bring room temperature stock down to 40 ˚F or lower within 90 min from startup or pull down pre-chilled stock to 40 ˚F or lower within 90 min of startup as determined by refrigeration system capabilities. (i.e., no gaps or cold air leaks)

(r) The cart shall be capable of holding up to 12 trays inside.

(i) The tray dimensions will be determined by the inside dimensions of the cart.

(ii) These dimensions will be relayed in drawings to the customer.

(iii) It is understood that trays for these carts will likely be custom size.

(iv) Trays shall be provided by the Contractor within the cart upon delivery.

(s) The refrigerated cart module will be aesthetically pleasing. The supplier shall provide sublimation treatment to all cart panels.

(t) The supplier shall provide either anodizing with clear or single color on the structural extrusions for the cart.

(u) Any required labeling from the manufacturer shall be placed in a location that is not visible while the cart is in the stored position.

(v) The Contractor shall provide a manufacturer drawing showing all critical dimensions for the cart for Amtrak approval.

(4) Dishwasher

(a) A purchased, off-the-shelf dishwasher shall be provided which meets or exceeds the features from the example part number. Example part number listed as Hobart LXeR advansys.

(i) Dishwasher with 13 racks per hour capacity under heavy setting,

(ii) holds standard size dish racks,

(iii) 17” door opening,

(iv) 0.62 gallons of water per rack,

(v) NSF rated high temperature

(b) Dedicated dish rack storage for up to 8 racks shall be provided.

(5) Handwashing Sink

(a) A sink shall be provided where the sink basin is at least (12” x 10” x 6”).

(b) The basin and sink counterspace shall be made from welded stainless steel.

(c) Marine edges shall be included on the front edge of the handwashing sink area.

(d) A backsplash of at least 6” shall be included on the other edges of the utility sink area.

(e) The radius between the backsplash and the handwashing sink shall be at least ¾”.

(f) The drain in the bottom of the sink basin shall be 1.25” in and shall be capable of being plugged with a ball valve attached to an L shaped rotational lever mechanism.

(g) The L shaped rotational mechanism shall extend to the front of the module so that it is easy to reach this lever.

(h) All requirements described in the water and waste chapter of this specification shall apply to the utility sink.

(i) The faucet for the handwashing sink shall use an IR sensor to allow water to run through the faucet. The faucet shall be sized and shaped to allow the water to flow to the center of the handwashing sink basin.

(j) Power for the faucet shall be hard wired. Battery replacement arrangements are prohibited.

(k) Faucet spout shall be located centered over the drain of the sink basin.

(l) The soap dispenser used by Amtrak is manufactured by Celeste Industries Corporation.

(i) The Contractor should supply the mounting base for the soap dispenser.

(ii) The base is made of Delrin and is tapered.

(m) The paper towel holder shall be SanTRAL Plus PTU 31 E ST or similar.

(i) This shall have anti-fingerprint coating, have a filling volume of 500-600 sheets of folded paper towels, be lockable, and be wall mounted.

(6) Microwave

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as Amana AMSO35.

(i) Steamer oven with 3500W,

(ii) pull down door,

(iii) heavy volume,

(iv) 4 stage cooking,

(v) touch control

(b) A spare microwave shall be provided in storage in the event of failure.

(7) Trash and Recycling Storage

(a) Trash and recycling will be stored in a stainless-steel module with drawers for the trash and recycling bins to slide in and out of the module.

(b) The drawer shall be mounted on sturdy, durable, cleanable drawer slides that allow for continuous cycles of opening and closing and operate smoothly.

(c) The drawer shall operate with push to open, slam to close latches.

(d) The stainless-steel or aluminum trash and recycling bins shall be completely sealed so that no liquid can escape the trash and recycling bin.

(i) These bins are intended to be removable for emptying the trash and recycling and for cleanability.

(e) In this food service area, the cumulative minimum internal volume for the trash and recycling required is 44 cu ft.

(i) 18.8 cu ft (31 in horizontal x 35 in tall x 30 in deep).

(ii) Plus 25.2 cu ft (39 in horizontal x 35 in tall x 32 in deep).

(f) The trash and recycling drawers shall be designed with cleanability features including 0.25” radii at the bottom of the drawer and there shall be no fastener protrusions into the base of the drawer.

(8) Steam / Induction Table

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as Alto-Shaam 400-HWI/D4.

(i) Hot food well,

(ii) drop in,

(iii) (4) 12” x 20” pan capacity with 4” deep well,

(iv) individual adjustable thermostatic controllers

(9) Flat Top Grille

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as Royal Range RTGE-48.

(i) Countertop griddle with 48” cooking surface, ¾” thick polished steel plate,

(ii) thermostatic controls,

(iii) grease trough

(iv) Shall be accompanied by exhaust hood with a fire damper.

1. This shall be an overhead cabinet exhaust hood with 120 VAC control and remote 208VAC 3-Phase exhaust fan. The suggested part number is Gaylord: CG3-BDL-XXX; however, Amtrak does not want any water sprays.

2. Exhaust from the hood should not result in grease collecting on the car's exterior.

(10) Rapid Cook Oven

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as TurboChef PLEXOR M2.

(i) 0.83 cu ft capacity

(ii) rapid cook, impingement, and convection options,

(iii) operate each section at different temperatures

(iv) touch control,

(v) ventless

(11) Convection Oven

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as Alto-Shaam 6-10E PRO.

(i) Combitherm CombiOven

(ii) fits (5) 12'x20' full size hotel pans,

(iii) stackable kit

(12) Freezer

(a) The freezer shall function to keep food at or below 0˚F.

(b) The freezer shall be suitably insulated to prevent all condensation from appearing on the outside of the module.

(c) The temperature within the module shall be monitored and reported to wayside.

(d) There shall be alarm annunciation to the train crew that the freezer is malfunctioning if the temperature in the freezer reaches 1˚F for a continuous one-hour period or if the temperature ever reaches 5˚F.

(e) Drainage for the freezer condensation shall take into account ice melt in the freezer and condensation generated by the evaporator.

(f) The freezer shall be easily cleanable with a base pan that has a backsplash and 0.25” radii.

(g) In this food service area, the cumulative minimum internal volume for each freezer required is 27 cu ft. (46 in horizontal x 40 in tall x 26 in deep). Four total freezers are included in this area for a total of 108 cu ft of internal freezer volume at a minimum in this area.

(h) At least 5 adjustable shelves shall be included in the freezer.

(i) Refrigerant used in the refrigeration equipment shall be presented and approved by Amtrak during PDR.

(13) Warming Drawer

(a) A warming drawer shall be placed directly below the steam/induction table. The module shall be constructed from stainless steel.

(b) In this food service area, the cumulative minimum internal volume for the warming drawer required is 7.3 cu ft. (44 in horizontal x 12 in tall x 24 in deep).

(c) The drawer shall be mounted on sturdy, durable, cleanable drawer slides that allow for continuous cycles of opening and closing and operate smoothly.

(d) The drawer shall operate with push to open, slam to close latches.

(e) The warmer shall be suitably insulated to maintain temperature ranges from 60 degrees F to 200 degrees F and the temperature shall be controlled or set with up and down arrow buttons.

(f) There shall be a digital temperature display that indicates the set temperature and a signal to identify when the drawer is outside of the setpoint by more than 5 degrees.

(g) The drawer shall be sized to be capable of holding bread rolls, hotel pans, and potatoes.

(14) Storage Cabinets

(a) Storage Cabinets shall be constructed from stainless-steel.

(b) These modules shall be designed to retain goods while the train is in motion.

(c) Storage cabinets can come in the form of a cabinet with hinged doors or open shelving with retaining bars.

(d) This will depend on the item stored in each location and shall be determined with Amtrak during the design reviews.

(e) Storage cabinets that function as cabinets shall have:

(i) hinged doors with stainless-steel hinges,

(ii) push to open, slam to close latches,

(iii) door swing limiting mechanism to prevent the doors from colliding and denting

(iv) option for adjustable shelving to accommodate varying products

(f) Storage cabinets that function as shelves shall have:

(i) Option for adjustable shelving to accommodate varying products

(ii) Stainless steel retention bars to prevent items from sliding off the shelf while the train is in motion.

(g) In this food service area, the cumulative minimum internal volume for the storage required is 180 cu ft

(i) 89.9 cu ft. (148 in horizontal x 35 in tall x 30 in deep).

(ii) Plus 63.1 cu ft (104 in horizontal x 35 in tall x 30 in deep).

(iii) Plus 26 cu ft (114 in horizontal x 20 in tall x 20 in deep)

(15) Refrigerated Cabinet

(a) The temperature within the module shall be monitored and reported to wayside.

(i) There will be alarm annunciation to the train crew that the refrigerated display is malfunctioning if the temperature in the display case reaches 41˚F for a continuous one-hour period or if the temperature ever reaches 50 ˚F.

(b) The refrigerated display shall be suitably sized to bring room temperature stock down to 40 ˚F or lower within 90 min from startup.

(i) The refrigerated display shall be suitably insulated to maintain temperature within limits during a power loss of 60 min.

(c) The refrigerated display shall function to keep food at or below 40˚F.

(i) The display case will be suitably insulated to prevent all condensation from appearing on the outside of the module.

(d) Drainage for the refrigerated cabinet condensation shall take into account liquid spills and condensation generated by the evaporator.

(e) Shelves in the refrigerated cabinet shall be mounted on drawer slides that allow ease of access and cleaning for each storage area within the refrigerated cabinet.

(i) Shelves shall have sufficient strength to hold 30 lbs. of goods.

(ii) Shelves shall have sufficient perforations to allow for airflow within the refrigerated cabinet to maintain required temperatures.

(iii) Shelves shall have a short raised, hemmed edge on all sides to prevent items from sliding off the shelf while the train is in motion.

(iv) Shelf drawers shall only slide out when activated so that if the train lurches suddenly, the drawers do not slide out on their own.

(v) The shelf shall be mounted on sturdy, durable, cleanable drawer slides that allow for continuous cycles of opening and closing and operate smoothly

(f) Refrigeration cabinet doors shall be constructed from stainless steel with sufficient insulation to help maintain temperatures within the cabinet and to prevent condensation on the outside of the doors.

(g) In this food service area, the cumulative minimum internal volume for the refrigerated cabinets required is 99 cu ft. (184 in horizontal x 31 in tall x 30 in deep).

(h) Refrigeration equipment shall be easily accessible behind a plate with a grille for air flow and locked with square locks for maintenance or replacement of equipment. Refrigeration equipment shall be mounted on a removable skid for changeout that will constitute as the LRU for the refrigerated cabinet.

(i) Refrigerant used in the refrigeration equipment shall be presented and approved by Amtrak during PDR.

(16) Countertop Workspace

(a) A stainless-steel workspace is required for food preparation.

(b) The workspace shall have 6” backsplash and 0.25” radius minimum for cleanability.

(c) The countertop shall be of a usable height between 36” and 38” tall.

(d) The countertop shall be attached to the adjacent modules with no holes for fasteners on the top of the workspace.

(e) In this food service area, the minimum surface area for workspace required is 78.9 sq ft (175 in horizontal and 65 in deep).

(17) ATLAS Carrier Storage

(a) ATLAS carriers shall be stored within carrier compartments built into the food service area module.

(b) Each carrier compartment shall include carrier stops, guide rails, and retention latches.

(c) Carrier storage modules shall be made from stainless-steel.

(d) Locations for the carriers are designed for the carrier door to remain closed when in the stored position.

(i) Carriers will remain closed in ‘stored’ configuration due to spacing and optimizing space in the galley.

(ii) In order to access goods in a carrier, the retention latch must be rotated, and the door of the food storage container must be opened.

(e) The carrier storage compartments will include carrier stops to ensure the carrier is located toward the front of module.

(f) The retention latches shall be used to retain the carrier in its position. The latches shall rotate 180° so that they can be rotated clockwise or counterclockwise to release the carriers.

(g) The guide strips inside the storage cabinets shall be made from a polymer material that prevents damage to the carriers while also securing them in place to prevent rattling.

(i) The guide strips shall be replaceable in case of significant damage.

(18) ATLAS Carrier

(a) This carrier is designed to fit into modules throughout the galley as dry storage containers.

(b) This carrier is made from standard Atlas carrier dimensions and is subject to a 25lb single person lift regulation.

(c) This includes the weight of the carrier and the contents of the carrier.

(d) The carrier shall be able to move seamlessly in and out of the carrier storage compartments and the Contractor is responsible for ensuring that the tolerances between the storage location and the carrier both do not cause rattling of the carrier while the train is in motion and is not so tight that the carrier is damaged during docking and undocking.

(e) The carrier is expected to function with limited wear and tear damage for the lifespan of the train.

(f) Stainless steel push-to-close or slam latches shall be used on the carrier doors. Sealant on the door gasketing is subject to FST testing.

(g) A card holder shall be provided at the top of the cart door. This material will be aluminum and clear anodized.

(h) The carrier shall be capable of a maximum loading of 9 kg, or similar as determined by the supplier. The carrier shall be 2.5 kg empty, or similar as determined by the supplier.

(i) The carrier module will be adequately sealed to prevent leakage of carrier contents into the galley during normal train operation.

(j) The inner and outer surfaces of the carrier will be non-porous, corrosive resistant, and easily cleanable.

(i) Any seams will need to be sealed with silicon or mounted with gaps of < 1/32" to meet FDA requirements.

(ii) No sharp edges, chips, or surface defects will be present. The interior of the carrier shall have 0.25” radius or greater on all corners for cleaning.

(k) In alignment with the Atlas Standard, this carrier shall be capable of holding 4 half size Atlas trays.

(l) The carrier module will be aesthetically pleasing.

(i) The supplier shall provide the carrier with sublimation treatment to only the door of the carrier.

(m) The supplier shall provide either anodizing with clear or single color on the structural extrusions for the carrier.

(n) Any required labeling from the manufacturer shall be placed in a location that is not visible while the carrier is in the stored position.

(o) The Contractor shall provide a manufacturer drawing showing all critical dimensions for the cart for Amtrak approval.

(19) Scrap Sink

(a) A scrap sink for rinsing food scraps off dirty dishes shall be provided. The sink shall be located next to the dishwashers to facilitate the loading of dishes after rinsing.

(b) The basin and sink counterspace shall be made from welded stainless steel.

(c) Marine edges shall be included on the front edge of the scrap sink area.

(d) A backsplash of at least 6” shall be included on the other edges of the scrap sink area.

(e) The radius between the backsplash and the scrap sink shall be at least ¾”.

(f) The sink shall be a 4 inch deep stainless steel pan formed into the countertop.

(g) A faucet-fed spray nozzle, equipped with back-flow prevention, shall be located on the backsplash and shall be secured to prevent the nozzle from entering the sink both when in use and when stored.

(h) The sink shall be comprised of two parts, a scraping area and a rinsing area.

(i) The scraping area shall include:

(i) This sink shall include a scrap block directly over a trash chute in an elevated hole to prevent water from entering the trash bin located directly below.

(j) The rinsing area shall include:

(i) Normal drainage piping is also required for this sink in the sink basin portion.

d). Functional Criteria

i). The following items shall be reviewed with the criteria listed below for each.

ii). Sanitary Design Review Criteria

(1) Appropriate cleaning radii of at least 0.25” on worksurfaces and 0.75” on sink areas.

(2) Backsplashes of at least 6” on worksurfaces and sink areas.

(3) Appropriate cleaning clearances around appliances such that a 95th percentile male can fit their hand and a rag easily between objects for cleaning.

(4) All edges and seams are sealed with food grade silicone sealant and gaps greater than 1/32” are sealed in food storage, food preparation, and all other food related areas such as trash compartments shall be sealed in this manner.

(5) Floor drains are provided for locations prone to spills and leaks, especially near water piping to eliminate water pooling on the floor.

(6) Openings are protected from allowing pests and vermin to congregate

(7) Proper sealing methods are used to prevent moisture from corroding or otherwise damaging the food service area

(8) All drain pans and catches are accessible for cleaning

(9) No tools are required to remove objects subject to daily cleaning rituals

iii). Refrigeration and Freezer Equipment Review Criteria

(1) Temperature Monitoring System Functionality

(a) Temperature monitoring shall be accomplished through a set of redundant sensors.

(i) The refrigeration controller shall relay temperatures for each of the refrigerated modules locally and in one location on a panel in the kitchen.

(b) Additionally, temperatures shall be reported to wayside through the use of a PT100 sensor.

(i) The PT100 sensor and the controllers for the equipment shall be calibrated to ensure they are reporting the same temperature.

(ii) Temperatures shall be logged and accessible for at least a 6 month period of time after the date of data collection.

(c) Temperatures for the refrigerated food carts shall be monitored in the ducting between the refrigerated docking station and the refrigerated cart.

(i) Industry standard is to monitor the temperature and combine 80% of the temperature for the return air and 20% for the air supply.

(d) This calculation shall be used to determine the likely warmest temperature of the air in the food cart and shall inform the setpoint and need for temperature adjustment. Temperatures for refrigerated cabinets shall be monitored directly in the refrigeration cabinet at the warmest temperature location and shall inform the setpoint and need for temperature adjustment.

(e) Presently, Amtrak monitors the temperature of a refrigerated food cart by placing a yogurt in the center of the cart and manually records the temperature of the yogurt on an interval. If the yogurt is out of temperature the food in the cart is considered out of temperature and therefore spoiled. The Contractor shall provide a system that consistently functions without allowing the yogurt to test out of temperature and cause loss of revenue from spoiled goods.

(2) Type Tests

(a) Type Tests for refrigeration and freezer systems shall be evaluated using ISO 23953-2 to determine the temperature probe location and validate performance of the system and produce a test report for Amtrak's evaluation and approval as specified in ISO 23953-2 **[CDRL 16-03]**.

(b) The following elements of design validation are of particular interest to Amtrak and shall be performed as type tests if information is not included in the ISO 23953-2 test report:

(i) Operational Temperature

1. The system shall maintain food safe temperatures between 33°F to 40°F (1°C to 4°C) consistently for 24 hours.

2. The freezer module will need to maintain temperature ranges below 0°F (-18°C) consistently for 24 hours.

3. The supplier will propose a test to show the units maintain operational temperature under standard conditions:

a. 74.6°F (23.7°C) and 55% rH.

b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

4. The refrigeration systems shall be suitably insulated to maintain the specified temperature limits during a

power loss of 60 minutes to avoid condemning of perishable food products.

5. The refrigeration system shall have real-time and remote temperature monitoring and alarm annunciation capabilities that shall alert onboard crew.

6. The Contractor shall propose a test to show the units maintain operational temperature under standard conditions:

    a. 74.6°F (23.7°C) and 55% rH.

    b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

(ii) Probe Placement

1. The temperature probe will need to be placed in the warmest location of the refrigerated compartment so that all food items stay within the acceptable temperature range.

(iii) Air Flow

1. The air flow through the module will need to be evaluated to ensure that there are no warm air pockets within the refrigerated compartment.

(iv) Operational Load Testing

1. The operational load of the refrigeration module needs to be evaluated to ensure that the refrigeration unit functions within the acceptable temperature range with simulated service loading conditions.

2. Amtrak will provide loading conditions prior to test procedure approval.

3. Three total tests will satisfy the operational load requirement: full load, half load, empty load.

4. The operational temperature of the refrigeration system should maintain food safe temperatures.

5. The refrigeration module will need to maintain temperature ranges between 33°F to 40°F (1°C to 4°C) consistently for 24 hours.

6. The freezer module will need to maintain temperature ranges below 0°F (-18°C) consistently for 24 hours.

7. The Contractor shall propose a test to show the units

maintain operational temperature under standard conditions:

a. 74.6°F (23.7°C) and 55% rH.

b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

(v) Condensation Evaluation

1. The refrigeration module, freezer, and chilled cart modules shall function with zero condensation on the outside surface of a module when exposed to the following environmental conditions:

a. 74.6°F (23.7°C) and 55% rH.

b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

c. Zero condensation is defined as no fogging, beading, or dripping liquid on any outside surface of the module.

2. The Contractor shall perform a test to observe modules while they are functioning at the specified temperatures for 24 hours.

(vi) Pull Down

1. The refrigeration and freezer modules are expected to pull down to temperature within 90 min with an inlet temperature of 70°F and repeated with inlet temperature of 110°F.

2. The module will be completely empty for this test.

3. The refrigeration unit shall reach a temperature range of 33-40°F within the specified time.

4. The freezer unit shall reach a temperature of below 0°F within the specified time.

iv). Warming Equipment Review Criteria

(1) Type Tests for warming equipment shall be evaluated using DIN 18868-2 to determine the temperature probe location and validate performance of the system and produce a test report for Amtrak's evaluation and approval as specified in DIN 18868-2. **[CDRL 16-04]**

e). Additional Equipment Requirements

i). Crew Comfort

(1) Two crew tip up seats shall be provided

(2) Handholds shall be provided at locations determined during the design review process

ii). HVAC

(1) Food service areas generate a large amount of ambient heat, smells, and humidity in the air; as a result, the HVAC system calculations must take into account the appliances and usage case of each food service area. Detailed HVAC requirement information can be found in Chapter 10, HVAC System.

(2) Kitchen Area Ventilation

(a) Ventilation to area in the kitchen shall include appliance generation of large amount of ambient heat, smells, and humidity in the air.

(b) HVAC shall be separately controlled for the kitchen for mitigation of the issues listed above and for staff comfort.

(3) Appliance-Specific Ventilation

(a) Ventilation to specific appliances is required.

(b) This ventilation can come in the form of recycled air through the HVAC system or directly exhausting the outlet air for an appliance.

(c) The Contractor shall submit a proposal for which appliances listed below will be directly exhausted and provide all relevant calculations as justification.

(d) The submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 16-05]**

(i) Ovens

1. Convection Ovens
2. Rapid Cook Ovens
3. Microwave Ovens

(ii) Refrigeration

1. Refrigerated Docking Station
2. Refrigerated Storage

(iii) Freezer

(iv) Other Appliances

1. Steam/Induction Table
2. Flat top Grille
3. Dishwasher

iii). Electrical Equipment

(1) Electrical equipment information is shared in the points below; and detailed electrical requirements can be found in Chapter 15, Electrical System.

(2) Convenience Outlets

(a) Convenience outlets shall be located during design reviews after discussion and approval from Amtrak.

(b) At least 8 duplex convenience outlets shall be located within the kitchen food service area.

(c) Only the convenience outlet near the attendant seat shall have USB ports.

(d) General purpose convenience outlets in these areas shall not have USB ports.

(3) Appliance Outlets

(a) Appliance outlets shall be located directly behind a desired appliance.

(b) The outlets shall be properly sized and selected to safely power each appliance and the electrical system shall provide a dedicated breaker for each type of outlet.

(c) Appliance outlets shall not have USB ports.

(4) POS Ticket Screen Outlet

(a) A provision for a POS Ticket Screen Outlet shall be linked to the POS at the Server Station in the Diner with both communications cabling and share the same electrical circuit and dedicated breaker as the POS.

(b) The POS outlet shall have USB ports.

(c) The POS outlet must be available on car battery power and follow the battery load table 15-3: Power Phase Matrix.

iv). Lighting

(1) General lighting information is shared in the points below; and detailed lighting information can be found in Chapter 13, Lighting System.

(2) Overhead Lighting

(a) Overhead lighting shall be from flush mounted panel lights in the ceiling panels and/or from spotlights.

(b) Overhead lighting can be turned off if the car lighting mode is set to night mode.

(c) These overhead light fixtures cannot be required to meet FDA light intensity level requirements for food preparation counters, sinks, and workspaces.

(3) Shelf Lighting

(a) Shelf lighting will be from surface mounted strip lights. These strip lights will be different brightness levels based on the area they are illuminating.

(b) Shelf lighting alone shall be the main source of illumination to meet FDA light intensity level requirements for food preparation counters, sinks, and workspaces.

(c) To illuminate a shelf, the shelf or underside of the top of the module above the shelf shall have a strip light mounted.

(d) To illuminate a workspace, the underside of the shelf above the workspace shall have a strip light mounted.

v). Communications Equipment

(1) Communications equipment for the kitchen area are described below; and detailed information regarding communications equipment can be found in Chapter 14, Communications.

(2) PA Speakers

(a) PA speakers shall be located on the ceiling panels at both ends of the kitchen.

(b) The speakers used in this location shall be identical to PA speakers used in other cars for ease of maintenance and replacement.

(3) PA Intercom

(a) PA Intercom shall be mounted near the side loading door of the kitchen area.

(b) This intercom shall be identical to the PA intercom used in other cars for ease of maintenance and replacement.

(4) Security Cameras (Option)

(a) As an option, security cameras shall be mounted to ceiling panels and shall give surveillance view of all areas of the kitchen for security, theft protection, and identification of possible hazards.

(b) At least 4 cameras shall be used to achieve this goal.

(5) POS Ticket Display Screen

(a) This screen shall be wired to communicate with the POS and display ticket items for plating and delivery to customers in the diner.

(b) The screen shall be 32” and more information can be found in Chapter 11: Interiors, Chapter 14, and Chapter 26 in regard to this display.

(c) The screen shall be resistant to damage from steam and humidity within the kitchen area.

(d) Alternatives may be proposed to Amtrak that may be more cost effective and provide a similar solution for the Amtrak personnel working in the galley.

(6) Smoke Detectors

(a) Smoke Detectors shall be mounted on the ceiling panels at both ends of the kitchen.

(b) The smoke detectors used in this location shall be identical to the smoke detectors used in other cars for ease of maintenance and replacement.

vi). Emergency Equipment

(1) The following emergency equipment pieces shall be included and stored in a conspicuous, accessible, and labeled location. Please refer to Chapter 18 Emergency Equipment for more information.

(a) Snap lights

(b) First aid kit

(c) Fire extinguisher

(d) AED

(e) Fire Suppression System shall be provided as an option and is discussed in detail in Chapter 25.

vii). Security

(1) Many items within the food service area will need to be secured. The following items are identified with specific locking preferences. Any other locking or security items will be discussed with Amtrak during design reviews.

(a) Cart Locking

(i) The cart storage compartments shall include mechanisms that will lock the carts in the compartment as well as prevent the cart door from opening.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the carriers.

(b) Cabinet Locking

(i) Cabinets shall include padlock hasps as determined with Amtrak during design reviews.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the selected cabinets.

(c) Carrier Locking

(i) The carrier storage compartments shall include mechanisms that will lock the carriers in the compartment as well as prevent the carrier door from opening.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the carriers.

(d) Refrigeration Cabinet Locking

(i) Refrigeration cabinets shall include padlock hasps as determined with Amtrak during design reviews.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the selected cabinets.

(e) Freezer Locking

(i) The freezer shall include padlock hasps as determined with Amtrak during design reviews.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the selected cabinets.

viii). Color Material and Finish (CMF)

(1) Please refer to Exhibit F for exact color, material and finishes desired in this food service area.

(2) Please also refer to Materials and Workmanship in Chapter 19 and be expected to work with Amtrak through the industrial design review process to ensure Amtrak's brand vision is accurately captured in all customer-facing elements of the food service cars.

(3) General expectations are listed below.

(a) Stainless Steel Modules

(i) Stainless Steel Modules shall be created from sheet metal that is sized to prevent denting, oil canning, or otherwise non-sturdy structures.

(ii) The modules shall be constructed from 304 stainless-steel with a #4 finish (320 grit) or as approved during design reviews with Amtrak.

(b) Carshell Walls

(i) Carshell walls shall be lined to create interior walls for the kitchen. Sidewall liners shall be made from molded thermoplastic with an easy to clean surface finish.

(c) Partition Walls

(i) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(ii) The finish of the wall and material of the outside skin shall be inspired by the CMF document and meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(d) Ceiling Panels

(i) Ceiling Panels shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(ii) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall be inspired by the CMF document and meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(iii) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

(e) Kitchen Area Countertops

(i) Countertops within the kitchen area shall all be made from stainless-steel and shall follow the requirements from point (1) above.

(f) Kitchen Area Flooring

(i) Flooring within the kitchen area shall be made from rubber flooring with a friction, no-slip texture.

(ii) Flooring will be durable to withstand spills, leaks, and all methods of cleaning.

(iii) Flooring shall also not become frequently damaged or worn by cart movement or by kitchen staff standing in specific locations.

(iv) Flooring shall have enough flexibility to prevent fatigue from standing.

(v) Anti-fatigue mats and anti-slip mats shall be provided for onboard crew in all applicable areas.

(vi) Floor design shall have incorporate drains to prevent standing water during static and dynamic movements.

16.5 Café

a). Vision

i). The café provides an opportunity for all coach passengers to purchase food and refreshments on board, however it also provides a chance to relax and enjoy the beautiful landscape of the United States of America. In this way, it is a focal destination as well as a functional space.

ii). The café should have a large, open and continuous counter at an accessible height. This highly visible area should have a passenger friendly aesthetic.

iii). A space should be reserved on the outside wall of the café for branding.

iv). The counter should be kept clear of equipment to allow for future food service opportunities such as a ‘grab and go’ location.

v). The design should be future ready – The design should be considered as modular so that equipment can be upgraded or changed as service models evolve over time.

vi). Please refer to Exhibit F for more information.

b). Appliances

i). Figure 16-2 lists the desired appliances along with an example part number and the quantity required within the café food service area.

ii). Note that example part numbers are given to establish a starting place for appliance performance and will be finalized during the design reviews.

iii). The car builder will propose the exact manufacturer and part number for each appliance based on functionality, shock and vibration, service history, power requirements, and ability to meet crashworthiness requirements for mounting.

iv). Detailed functional requirements for each appliance is listed below.

v). In addition to these requirements, the Contractor shall factor in FDA cleaning clearances, radii, and sanitary design. An FDA inspection and subsequent approval will be required for all car types. The Contractor will be responsible to rectify any discrepancy discovered by the FDA inspector at any time until a certificate of sanitary construction is issued.

(1) Refrigerated Docking Station

(a) Refrigerated carts shall be stored within a docking station built into the food service area as a module.

(b) Each cart docking compartment shall include carrier stops, guide rails, and retention latches.

(c) Drainage from cart condensation shall be directed away from the front of the docking station to avoid flooding, spills, and water leakage onto the floor of the food service area.

(i) The module shall have a base pan with a cross break and 0.25” radii on all edges.

Figure 16-2: Appliance List – Café

Appliance	Description	Example Part Number	Quantity Desired
Refrigerated Cart Docking Station (3 cart)	3 cart docking station with cart chiller, cart sensor, temperature monitoring,	-	1
Refrigerated Cart	Insulated food cart with capability to maintain food temperature of 40 degrees F for one hour after loss of power	Bucher BA700036	3
Handwashing Sink	Sink basin with IR faucet for handwashing purposes, includes soap dispenser and paper towel holder mounting.	-	1
Microwave	Countertop stackable microwave, 0.6 cu ft capacity, 2100 watts, heavy volume, 4 stage cooking, touchscreen	Amana HDC212	2
Trash and Recycling Storage	Stainless steel module for storing removable trash and recycling bin. Trash and recycling bin is accessible through a drawer.	-	1
POS	Point of Sale machine for commercial transactions. POS provided by Amtrak, provisions provided by Contractor	-	1

Appliance	Description	Example Part Number	Quantity Desired
Rapid Cook Oven	0.54 cu ft capacity, ventless, cool touch exterior, touch control	TurboChef ECO ST	1
Freezer	Insulated freezer cabinet with ability to keep food goods at or below 0 degrees F.	-	1
Storage Cabinets	Stainless steel cabinets or open shelving for dry storage to maximize space usage within food service area.	-	As space allows
Countertop Workspace	Clear available workspace for food preparation with 6” backsplash and 0.25” radii.	-	As space allows
Coffee Maker	Twin coffee brewer with 1.5 gallon satellite servers,	Wilbur Curtis GEMTS16A-1000	1
Ice Maker	590 lb., 26” wide water cooled, cublet-nugget style ice machine and waster dispenser with bin, countertop mounting, 40lb bin ice storage	Hoshizaki DCM-500BWH	1
ATLAS Carrier Storage	Stainless steel cubbies for ATLAS Carrier storage to maximize space usage within food service area.	-	As Space Allows
ATLAS Carriers	Atlas sized dry goods container for storage and transport of goods between commissary and food service area	Bucher BA740012	As Space Allows

(d) Locations for the cart docking shall be designed for the carrier door to remain closed when in the stored position.

(i) Carts will remain closed in ‘stored’ configuration due to spacing and optimizing space in the galley.

(ii) In order to access goods in a cart, the retention latch must be rotated, and the door of the cart must be opened.

(e) The retention latches shall be used to retain the cart in its position.

(i) The latches shall rotate 180° so that they can be rotated clockwise or counterclockwise to release the carts.

(f) The guide strips inside the docking station shall be made from a polymer material that prevents damage to the carts while also securing them in place to prevent rattling.

(i) The guide strips shall be replaceable in case of significant damage.

(g) Cart Identification Sensor

(i) These sensors indicate to the chiller cart if there is at least one cart docked to the refrigerated docking station.

1. If there is a cart docked, the chiller will function as normal.

2. If there are no carts detected, the chiller will not be on.

(ii) This will prevent potential damage to the internal components of the chiller.

(h) Cart Chiller

(i) The cart chiller shall be mounted on wheels that allow the cart chiller to easily traverse the threshold of the refrigerated docking station.

(ii) The chiller cart is intended to dock semi-permanently inside the refrigerated docking station.

1. This chiller would only be removed for maintenance or replacement.

(iii) The cart chiller shall be roughly (12” x 37” x 21”) and shall be interchangeable with the chiller carts used in the Amtrak Intercity Procurement.

(iv) The cart chiller shall function to keep food at or below 40˚F.

1. The cart chiller will be suitably insulated to prevent all condensation from appearing on the outside of the module.

2. The temperature within the exhaust and return ducts of the module shall be monitored and reported to wayside.

(v) There will be alarm annunciation to the train crew that the refrigerated display is malfunctioning if the temperature in the display case reaches 41˚F for a continuous one-hour period or if the temperature ever reaches 50˚F.

(vi) The cart chiller shall be suitably sized to maintain pre-chilled stock to 40 ˚F or lower within 90 min of startup as determined by refrigeration system capabilities.

(vii) The cart chiller will be qualified using the EN ISO 23953-2:2015 test.

(viii) Refrigerant used in the refrigeration equipment shall be presented and approved by Amtrak during PDR.

(ix) The cart chiller shall have the following features:

1. Push handle at the front
2. Mounted on 4 wheels
3. Quick locking mechanism to secure in docking station
4. Connection to the cooling area on the back side
5. Power connection for 120V AC/48V DC with Harting plug
6. Protection against evaporator freeze-up during low load operation
7. Digital Controller with touch panel that includes alarm annunciation, status displays, and password protection for setting adjustment

(x) The refrigeration system shall be controlled by the suction line pressure signal and the supply air and exhaust air temperature sensors.

1. Depending on the changes in pressure, the speed of the compressor shall be adjusted accordingly between the minimum and maximum speed.
2. The unit shall be turned on and off based on the temperature sensor readings.

(i) Ducting

(i) The ducting on the back of this module directs the warm and cool air to and from the food carts so that the carts are always within the expected temperature range.

(ii) The ducting also is directed to the car's HVAC exhaust system to take heat away from the refrigeration equipment.

(iii) The ducting shall be insulated so that the condensation is limited as much as possible.

(iv) Insulation should be mechanically fastened to the duct with no exposed insulation fibers. The use of insulation tape is not allowed.

(j) Electrical Connection

(i) The electrical connection between the chiller cart and the docking station shall provide a quick connect, not damage

any electrical connectors, and be properly insulated from moisture.

(ii) 3 carts shall be docked in the café docking stations.

(2) Refrigerated Cart

(a) Carts are intended to move food items from the commissary to the train, dock in their compartment and be taken back to commissary for restocking after a trip is complete.

(b) The cart shall be roughly (16” x 21” x 37”) and shall be interchangeable with the carts used in the Airo fleet. Example part number listed as Bucher BA700036.

(c) The refrigerated cart shall be delivered with 12 trays loaded on shelves inside.

(d) The cart shall be able to move seamlessly in and out of the docking station.

(e) The Contractor is responsible for ensuring that the tolerances between the docking station and the refrigerated cart both:

(i) Do not cause rattling of the cart while the train is in motion.

(ii) Are not so tight that the cart is damaged during docking and undocking.

(f) Carts shall continue to keep items at FDA acceptable temperatures from the time food is placed inside until the food is removed for consumption.

(i) Food cart interior will be accessed semi-regularly and will be docked to a refrigeration docking station when used as a refrigerated cart on the café car.

(g) The cart is expected to function with limited wear and tear damage for the lifespan of the train.

(h) Stainless steel push-to-close or slam latches shall be used on the cart doors.

(i) Sealant on the door gasketing is subject to FST testing-silicone is recommended.

(i) The cart will come with a padlock hasp for locking the contents of the cart when the cart is unattended.

(j) A card holder shall be provided at the top of the cart door.

(i) This material will be aluminum and clear anodized.

(k) A 75 mm diameter wheel will be used on all carts.

(i) The top of the cart handle shall be 30 mm above the top surface of the cart to allow for items to be placed on top of the cart during transport.

(l) The cart shall be capable of a maximum loading of 115 kg, or similar as determined by the supplier.

(i) The cart shall be 25 kg empty, or similar as determined by the supplier.

(m) The bottom of the module will be a single pan that includes the lower portion of the sidewalls to contain any condensation.

(i) The main sidewalls of the module will be fastened to the lower pan so that water does not exit the module.

(ii) The cart module will be adequately sealed to prevent leakage of cart contents into the galley during normal train operation.

(n) The inner and outer surfaces of the cart will be non-porous, corrosive resistant, and easily clean-able.

(i) Any seams will need to be sealed with silicon or mounted with gaps of < 1/32" to meet FDA requirements.

(ii) No sharp edges, chips, or surface defects will be present.

(iii) The interior of the cart shall have 0.25” radius or greater on all corners for cleaning.

(o) The cart in conjunction with a compliant working chiller shall function to keep food at or below 40˚F.

(p) The cart will be suitably insulated to prevent all condensation from appearing on the outside of the module.

(q) The cart shall be suitably insulated to allow a compliant working chiller to bring room temperature stock down to 40 ˚F or lower within 90 min from startup or pull down pre-chilled stock to 40 ˚F or lower within 90 min of startup as determined by refrigeration system capabilities (i.e., no gaps or cold air leaks).

(r) The cart shall be capable of holding up to 12 trays inside.

(i) The tray dimensions will be determined by the inside dimensions of the cart.

(ii) These dimensions will be relayed in drawings to the customer.

(iii) It is understood that trays for these carts will likely be custom size.

(iv) Trays shall be provided by the Contractor within the cart upon delivery.

(s) The refrigerated cart module will be aesthetically pleasing. The supplier shall provide sublimation treatment to all cart panels.

(t) The supplier shall provide either anodizing with clear or single color on the structural extrusions for the cart.

(u) Any required labeling from the manufacturer shall be placed in a location that is not visible while the cart is in the stored position.

(v) The Contractor shall provide a manufacturer drawing showing all critical dimensions for the cart for Amtrak approval.

(3) Handwashing Sink

(a) A sink shall be provided where the sink basin is at least (12” x 10” x 6”).

(b) The basin and sink counterspace shall be made from welded stainless steel.

(c) Marine edges shall be included on the front edge of the handwashing sink area.

(d) A backsplash of at least 6” shall be included on the other edges of the sink area.

(e) The radius between the backsplash and the handwashing sink shall be at least ¾”.

(f) The drain in the bottom of the sink basin shall be 1.25” in and shall be capable of being plugged with a ball valve attached to an L shaped rotational lever mechanism.

(g) The L shaped rotational mechanism shall extend to the front of the module so that it is easy to reach this lever.

(h) All requirements described in the water and waste chapter of this specification shall apply to the sink.

(i) The faucet for the handwashing sink shall use an IR sensor to allow water to run through the faucet. The faucet shall be sized and shaped to allow the water to flow to the center of the handwashing sink basin.

(j) Power for the faucet shall be hard wired. Battery replacement arrangements are prohibited.

(k) Faucet spout shall be located centered over the drain of the sink basin.

(l) The soap dispenser used by Amtrak is manufactured by Celeste Industries Corporation.

(i) The Contractor should supply the mounting base for the soap dispenser.

(ii) The base is made of Delrin and is tapered.

(m) The paper towel holder shall be SanTRAL Plus PTU 31 E ST or similar.

(i) This shall have anti-fingerprint coating, have a filling volume of 500-600 sheets of folded paper towels, be lockable, and be wall mounted.

(4) Microwave

(a) a purchased off the shelf item that meets or exceeds the features from the example part number. Example part number listed as Amana HDC212.

(i) Countertop stackable microwave,

(ii) 0.6 cu ft capacity, 2100 watts,

(iii) heavy volume,

(iv) 4 stage cooking,

(v) Touchscreen.

(5) Trash and Recycling Storage

(a) Trash and recycling will be stored in a stainless-steel module with drawers for the trash and recycling bins to slide in and out of the module.

(b) The drawer shall be mounted on sturdy, durable, cleanable drawer slides that allow for continuous cycles of opening and closing and operate smoothly.

(c) The drawer shall operate with push to open, slam to close latches.

(d) The stainless-steel or aluminum trash and recycling bins shall be completely sealed so that no liquid can escape the trash and recycling bin.

(i) These bins are intended to be removable for emptying the trash and recycling and for cleanability.

(e) In this food service area, the cumulative minimum internal volume for the storage required is 20.2 cu ft. (50 in horizontal x 35 in tall x 20 in deep).

(f) This includes the features for the trash and recycling bin.

(6) Point-of-Sale (POS)

(a) A Point-of-Sale unit will be provided by Amtrak in the food service area.

(b) The POS unit will be manufactured and installed in accordance with Amtrak POS standards in effect at the time of design and manufacture of the cars.

(c) The POS operation shall be supported during Head End Power (HEP) outages according to the Table 15-3 Power Phase Matrix battery table.

(d) The system shall also support real time inventory management of on-board food service items.

(e) Shortages shall be annunciated to onboard crew as well as transmitted wayside for mitigation by Amtrak Food and Beverage Services.

(f) Details of the wayside messaging shall be clarified during mobilization.

(7) Point of Sale System

(a) As an option, the Contractor shall submit an option to provide a point-of-sale system as part of this contract.

(b) A Point of Sale (POS) system is a specialized computerized system that facilitates the processing and completion of retail transactions. It serves as the central hub where passengers make a payment for goods on-board the train.

(c) Hardware:

(i) Terminal/Checkout Counter: This is the physical location where the POS system is set up. It includes a computer terminal with a display, a barcode scanner, receipt printer, and a customer-facing display.

(ii) Barcode Scanner: Used to scan the barcodes on products, providing quick and accurate identification.

(iii) Card Reader: Allows customers to make electronic payments using credit or debit cards.

(iv) Cash Drawer: Safely stores cash received during transactions.

(v) Receipt Printer: Prints transaction receipts for customers.

(vi) Customer Display: A screen facing the customer that displays the items being rung up and the total cost.

(d) Software:

(i) Point of Sale Application: The core software that manages and processes transactions. It includes a user interface for the crew to input items, calculate totals, and finalize sales.

(ii) Inventory Management: Tracks the quantity of products available for sale and updates inventory levels after each transaction.

(iii) Sales Reporting: Generates reports on sales, inventory, and other key metrics.

(iv) Employee Management: Manages user accounts and permissions.

(v) Payment Processing Integration: Links with payment gateways to process electronic transactions securely.

(vi) Security Features: Includes measures like user authentication, transaction encryption, and audit trails to ensure data security and integrity.

(vii) Network segregation is critical to Amtrak and must be addressed and handled through Design Review with Amtrak.

(8) Rapid Cook Oven

(a) A purchased off the shelf item that meets or exceeds the features from the example part number. Example part number listed as TurboChef ECO ST.

(i) 0.54 cu ft capacity

(ii) ventless

(iii) cool touch exterior

(iv) touch control

(9) Freezer

(a) The freezer shall function to keep food at or below 0˚F.

(b) The freezer shall be suitably insulated to prevent all condensation from appearing on the outside of the module.

(c) The temperature within the module shall be monitored and reported to wayside.

(d) There shall be alarm annunciation to the train crew that the freezer is malfunctioning if the temperature in the freezer reaches 1˚F for a continuous one-hour period or if the temperature ever reaches 5˚F.

(e) Drainage for the freezer condensation shall take into account ice melt in the freezer and condensation generated by the evaporator.

(f) The freezer shall be easily cleanable with a base pan that has a backsplash and 0.25” radii.

(g) In this food service area, the cumulative minimum internal volume for the freezer required is 9 cu ft. (24 in horizontal x 36 in tall x 18 in deep).

(h) Two adjustable shelves that can only be removed with tools at a maintenance facility shall be included.

(10) Storage Cabinet

(a) Storage Cabinets shall be constructed from stainless-steel.

(b) These modules shall be designed to retain goods while the train is in motion.

(c) Storage cabinets can come in the form of a cabinet with hinged doors or open shelving with retaining bars.

(d) This will depend on the item stored in each location and shall be determined with Amtrak during the design reviews.

(e) Storage cabinets that function as cabinets shall have:

(i) hinged doors with stainless-steel hinges,

(ii) push to open, slam to close latches,

(iii) door swing limiting mechanism to prevent the doors from colliding and denting

(iv) adjustable shelving to accommodate varying products shall be provided

(f) Storage cabinets that function as shelves shall have:

(i) Adjustable shelving to accommodate varying products

(ii) Stainless steel retention bars to prevent items from sliding off the shelf while the train is in motion.

(g) In this food service area, the cumulative minimum internal volume for the storage required is 6.25 cu ft. (27 in horizontal x 20 in tall x 20 in deep).

(11) Countertop Workspace

(a) A stainless-steel workspace is required for food preparation.

(b) The workspace shall have 6” backsplash and 0.25” radius minimum for cleanability.

(c) The countertop shall be of a usable height between 36” and 38” tall.

(d) The countertop shall be attached to the adjacent modules with no holes for fasteners on the top of the workspace.

(e) In this food service area, the minimum surface area for workspace required is 23.75 sq ft. (90 in horizontal x 38 in deep). An alternative workspace may be proposed if space is a constraint.

(12) Coffee Maker

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as Wilbur Curtis GEMTS16A-1000.

(i) Twin coffee brewer

(ii) 1.5 gallon satellite servers

(iii) A spare coffee maker shall be provided in storage in the event of failure.

(iv) All coffee maker drains shall have the capacity to drain both warmers without overflowing or splashing liquid onto the counter.

(13) Ice Maker

(a) A purchased off the shelf item shall be provided that meets or exceeds the features from the example part number. Example part number listed as Hoshizaki DCM-500BWH.

(i) 590 lb. production capacity in 24 hour period

(ii) 26” wide

(iii) water cooled, cublet-nugget style ice machine

(iv) waster dispenser

(v) countertop mounting,

(vi) 40lb bin ice storage

(14) LSA Seat

(a) A seat similar to a coach seat shall be provided with an associated table for the LSA to rest during breaks as to not occupy one of the passenger seats in the seating area.

(b) The table shall be designed to support 50 lbf at the edge of the table.

(c) This seat shall be capable of supporting 300lbs downward force in all loading conditions.

(15) ATLAS Carrier Storage

(a) ATLAS carriers shall be stored within carrier compartments built into the food service area module.

(b) Each carrier compartment shall include carrier stops, guide rails, and retention latches.

(c) Carrier storage modules shall be made from stainless-steel.

(d) Locations for the carriers are designed for the carrier door to remain closed when in the stored position.

(i) Carriers will remain closed in ‘stored’ configuration due to spacing and optimizing space in the galley.

(ii) In order to access goods in a carrier, the retention latch must be rotated, and the door of the food storage container must be opened.

(e) The carrier storage compartments will include carrier stops to ensure the carrier is located toward the front of module.

(f) The retention latches shall be used to retain the carrier in its position. The latches shall rotate 180° so that they can be rotated clockwise or counterclockwise to release the carriers.

(g) The guide strips inside the storage cabinets shall be made from a polymer material that prevents damage to the carriers while also securing them in place to prevent rattling.

(i) The guide strips shall be replaceable in case of significant damage.

(16) ATLAS Carrier

(a) This carrier is designed to fit into modules throughout the galley as dry storage containers.

(b) This carrier is made from standard Atlas carrier dimensions and is subject to a 25lb single person lift regulation.

(c) This includes the weight of the carrier and the contents of the carrier.

(d) The carrier shall be able to move seamlessly in and out of the carrier storage compartments and the Contractor is responsible for ensuring that the tolerances between the storage location and the carrier both do not cause rattling of the carrier while the train is in motion and is not so tight that the carrier is damaged during docking and undocking.

(e) The carrier is expected to function with limited wear and tear damage for the lifespan of the car.

(f) Stainless steel push-to-close or slam latches shall be used on the carrier doors. Sealant on the door gasketing is subject to FST testing.

(g) A card holder shall be provided at the top of the cart door. This material will be aluminum and clear anodized.

(h) The carrier shall be capable of a maximum loading of 9 kg, or similar as determined by the supplier. The carrier shall be 2.5 kg empty, or similar as determined by the supplier.

(i) The carrier module will be adequately sealed to prevent leakage of carrier contents into the food service area during normal train operation.

(j) The inner and outer surfaces of the carrier will be non-porous, corrosive resistant, and easily cleanable.

    (i) Any seams will need to be sealed with silicon or mounted with gaps of < 1/32” to meet FDA requirements.

    (ii) No sharp edges, chips, or surface defects will be present. The interior of the carrier shall have 0.25” radius or greater on all corners for cleaning.

(k) In alignment with the Atlas Standard, this carrier shall be capable of holding 4 half size Atlas trays.

(l) The carrier module will be aesthetically pleasing.

    (i) The supplier shall provide the carrier with sublimation treatment to only the door of the carrier.

(m) The supplier shall provide either anodizing with clear or single color on the structural extrusions for the carrier.

(n) Any required labeling from the manufacturer shall be placed in a location that is not visible while the carrier is in the stored position.

(o) The Contractor shall provide a manufacturer drawing showing all critical dimensions for the cart for Amtrak approval.

c). Functional Criteria

i). The following items shall be reviewed with the criteria listed below for each.

ii). Sanitary Design Review Criteria

(1) Appropriate cleaning radii of at least 0.25” on worksurfaces and 0.75” on sink areas.

(2) Backsplashes of at least 6” on worksurfaces and sink areas.

(3) Appropriate cleaning clearances around appliances such that a 95th percentile male can fit their hand and a rag easily between objects for cleaning.

(4) All edges and seams are sealed with food grade silicone sealant and gaps greater than 1/32” are sealed in food storage, food preparation, and all other food related areas such as trash compartments shall be sealed in this manner.

(5) Floor drains are provided for locations prone to spills and leaks, especially near water piping to eliminate water pooling on the floor.

(6) Openings are protected from allowing pests and vermin to congregate

(7) Proper sealing methods are used to prevent moisture from corroding or otherwise damaging the food service area

(8) All drain pans and catches are accessible for cleaning

(9) No tools are required to move objects subject to daily cleaning rituals

iii). Refrigeration and Freezer Equipment Review Criteria

(1) Temperature monitoring of the refrigeration and freezer equipment shall be provided.

(2) Temperature monitoring system functionality

(a) Temperature monitoring shall be accomplished through a set of redundant sensors.

(i) The refrigeration controller shall relay temperatures for each of the refrigerated modules locally and in one location on a panel in the kitchen.

(b) Additionally, temperatures shall be reported to wayside through the use of a PT100 sensor.

(i) The PT100 sensor and the controllers for the equipment shall be calibrated to ensure they are reporting the same temperature.

(ii) Temperatures shall be logged and accessible for at least a 6 month period of time after the date of data collection.

(c) Temperatures for the refrigerated food carts shall be monitored in the ducting between the refrigerated docking station and the refrigerated cart.

(i) Industry standard is to monitor the temperature and combine 80% of the temperature for the return air and 20% for the air supply.

(ii) This calculation shall be used to determine the likely warmest temperature of the air in the food cart and shall inform the setpoint and need for temperature adjustment.

(d) Temperatures for refrigerated cabinets shall be monitored directly in the refrigeration cabinet at the warmest temperature location and shall inform the setpoint and need for temperature adjustment.

(e) Presently, Amtrak monitors the temperature of a refrigerated food cart by placing a yogurt in the center of the cart and manually records the temperature of the yogurt on an interval. If the yogurt is out of temperature the food in the cart is considered out of temperature and therefore spoiled. The Contractor shall provide a system that consistently functions without allowing the yogurt to test out of temperature and cause loss of revenue from spoiled goods.

(3) Type Tests

(a) Type Tests for refrigeration and freezer systems shall be evaluated using ISO 23953-2 to determine the temperature probe location and validate performance of the system and produce a test report for Amtrak's evaluation and approval as specified in ISO 23953-2. **[CDRL 16-03]**

(b) The following elements of design validation are of particular interest to Amtrak and shall be performed as type tests if information is not included in the ISO 23953-2 test report:

(i) Operational Temperature

1. The system shall maintain food safe temperatures between 33°F to 40°F (1°C to 4°C) consistently for 8 hours.

2. The freezer module will need to maintain temperature ranges below 0°F (-18°C) consistently for 8 hours.

3. The supplier will propose a test to show the units maintain operational temperature under standard conditions:

   a. 74.6°F (23.7°C) and 55% rH.

   b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

4. The refrigeration systems shall be suitably insulated to maintain the specified temperature limits during a power loss of 60 minutes to avoid condemning of perishable food products.

5. The refrigeration system shall have real-time and remote temperature monitoring and alarm annunciation capabilities that shall alert onboard crew.

6. The Contractor shall propose a test to show the units maintain operational temperature under standard conditions:

   a. 74.6°F (23.7°C) and 55% rH.

   b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

(ii) Probe Placement

1. The temperature probe will need to be placed in the warmest location of the refrigerated compartment so that all food items stay within the acceptable temperature range.

(iii) Air Flow

1. The air flow through the module will need to be evaluated to ensure that there are no warm air pockets within the refrigerated compartment.

(iv) Operational Load Testing

1. The operational load of the refrigeration module needs to be evaluated to ensure that the refrigeration unit functions within the acceptable temperature range with simulated service loading conditions.

2. Amtrak will provide loading conditions prior to test procedure approval.

3. Three total tests will satisfy the operational load requirement: full load, half load, empty load.

4. The operational temperature of the refrigeration system should maintain food safe temperatures.

5. The refrigeration module will need to maintain temperature ranges between 33°F to 40°F (1°C to 4°C) consistently for 8 hours.

6. The freezer module will need to maintain temperature ranges below 0°F (-18°C) consistently for 8 hours.

7. The Contractor shall propose a test to show the units maintain operational temperature under standard conditions:

   a. 74.6°F (23.7°C) and 55% rH.

   b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

(v) Condensation Evaluation

1. The refrigeration module, freezer, and chilled cart modules shall function with zero condensation on the outside surface of a module when exposed to the following environmental conditions:

   a. 74.6°F (23.7°C) and 55% rH.

   b. An allowable tolerance to this would be +/- 2 degrees F and +/- 5%.

   c. Zero condensation is defined as no fogging, beading, or dripping liquid on any outside surface of the module.

2. The Contractor shall perform a test to observe modules while they are functioning at the specified temperatures for 8 hours.

(vi) Pull Down

1. The refrigeration and freezer modules are expected to pull down to temperature within 60 min with an inlet temperature of 70°F and repeated with inlet temperature of 110°F.
2. The module will be completely empty for this test.
3. The refrigeration unit shall reach a temperature range of 33-40°F within the specified time.
4. The freezer unit shall reach a temperature of below 0°F within the specified time.

d). Additional Equipment Requirements

i). HVAC

(1) Food service areas generate a large amount of ambient heat, smells, and humidity in the air; as a result, the HVAC system calculations must take into account the appliances and usage case of the food service area. Detailed HVAC requirement information can be found in Chapter 10, HVAC System.

(2) Appliance-Specific Ventilation

(a) Ventilation to specific appliances is required.

(b) This ventilation can come in the form of recycled air through the HVAC system or directly exhausting the outlet air for an appliance.

(c) The Contractor shall submit a proposal for which appliances listed below will be directly exhausted and provide all relevant calculations as justification.

(d) The submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 16-05]**

(i) Ovens

1. Rapid Cook Ovens
2. Microwave Ovens

(ii) Refrigeration

1. Refrigerated Docking Station
2. Refrigerated Storage
3. Refrigerated Alcohol Display

(iii) Freezer

(iv) Other Appliances

1. Coffee Maker

2. Ice Maker

ii). Electrical Equipment

(1) Electrical equipment information is shared in the points below. Detailed electrical requirements can be found in Chapter 15, Electrical System.

(2) Convenience Outlets

(a) Convenience Outlets shall be located during design reviews after discussion and approval from Amtrak.

(b) At least 8 duplex convenience outlets shall be located within the café food service area.

(c) Only the convenience outlet near the attendant seat shall have USB ports.

(d) General purpose convenience outlets in this area shall not have USB ports.

(3) Appliance Outlets

(a) Appliance Outlets shall be located directly behind a desired appliance.

(b) The outlets shall be properly sized and selected to safely power each appliance, and the electrical system shall provide a dedicated breaker for each type of outlet.

(c) Appliance outlets shall not have USB ports.

(4) POS Outlet

(a) POS shall have an electrical circuit and dedicated breaker.

(b) The POS outlet shall have USB ports.

(c) The POS outlet must be available on car battery power and follow the battery load Table 15-3: Power Phase Matrix.

iii). Lighting

(1) Lighting general information is shared in the points below.

(2) Detailed lighting information can be found in Chapter 13, Lighting System.

(3) Overhead Lighting

(a) Overhead lighting shall be from flush mounted panel lights in the ceiling panels and/or from spotlights.

(b) Overhead lighting can be turned off if the car lighting mode is set to night mode.

(c) These overhead light fixtures cannot be required to meet FDA light intensity level requirements for food preparation counters, sinks, and workspaces.

(4) Shelf Lighting

(a) Shelf lighting will be from surface mounted strip lights. These strip lights will be different brightness levels based on the area they are illuminating.

(b) Shelf lighting alone shall be the main source of illumination to meet FDA light intensity level requirements for food preparation counters, sinks, and workspaces.

(c) To illuminate a shelf, the shelf or underside of the top of the module above the shelf shall have a strip light mounted.

(d) To illuminate a workspace, the underside of the shelf above the workspace shall have a strip light mounted.

iv). Communications Equipment

(1) Communications equipment for the café is described below.

(2) Detailed information regarding communications equipment can be found in Chapter 14, Communications.

(3) PA Speakers

(a) PA speakers shall be located on the ceiling panels at both ends of the café car.

(b) The speakers used in this location shall be identical to PA speakers used in other locations for ease of maintenance and replacement.

(4) PA Intercom

(a) PA Intercom shall be mounted near the entrance door of the café.

(b) This intercom shall be identical to the PA intercom used in other locations for ease of maintenance and replacement.

(5) Security Cameras

(a) As an option, security cameras shall be mounted to ceiling panels and shall give surveillance view of all areas of the café car for security, theft protection, and identification of possible hazards.

(b) At least 3 cameras shall be used to achieve this goal.

(6) Smoke Detectors

(a) Smoke Detectors shall be mounted on the ceiling panels at both ends of the café.

(b) The smoke detectors used in this location shall be identical to the smoke detectors used in other locations for ease of maintenance and replacement.

v). Emergency Equipment

(1) The following emergency equipment pieces shall be included and stored in a conspicuous, accessible, and labeled location. Please refer to Chapter 18 Emergency Equipment for more information.

(a) Snap lights

(b) First aid kit

(c) Fire extinguisher

(d) AED

vi). Security

(1) Many items within the food service area will need to be secured. The following items are identified with specific locking preferences. Any other locking or security items will be discussed with Amtrak during design reviews.

(a) Cart Locking

(i) The cart storage compartments shall include mechanisms that will lock the carts in the compartment as well as prevent the cart door from opening.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the carriers.

(b) Cabinet Locking

(i) Cabinets shall include padlock hasps as determined with Amtrak during design reviews.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the selected cabinets.

(c) Carrier Locking

(i) The carrier storage compartments shall include mechanisms that will lock the carriers in the compartment as well as prevent the carrier door from opening.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the carriers.

(d) Freezer Locking

(i) The freezer shall include padlock hasps as determined with Amtrak during design reviews.

(ii) The locking mechanism shall use an Amtrak supplied padlock to secure the selected cabinets.

vii). Countertop Heights

(1) Countertop shall be 36” maximum.

viii). Dispensers

(1) The following dispensers shall be provided in the café:

(a) Cold beverage cup dispenser

(b) Paper towel dispenser

(c) Napkin dispenser

(d) beverage stirrer dispenser

(e) utensil dispenser

(f) condiment holders

ix). Color Material and Finish (CMF)

(1) Please refer to Exhibit F for more information.

(2) Please also refer to Materials and Workmanship in Chapter 19.

(3) General expectations are listed below.

(a) CMF will be finalized with Amtrak after the mockup review.

(b) Stainless Steel Modules

(i) Stainless Steel Modules shall be created from sheet metal that is sized to prevent denting, oil canning, or otherwise non-sturdy structures.

(ii) The modules shall be constructed from 304 stainless-steel with a #4 finish (320 grit) or as approved during design reviews with Amtrak.

(c) Carshell Walls

(i) Carshell walls shall be lined to create interior walls for the café. Sidewall liners shall be made from molded thermoplastic with an easy to clean surface finish.

(d) Partition Walls

(i) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(ii) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(e) Ceiling Panels

(i) Ceiling Panels shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(ii) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall be inspired by the CMF document and meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(iii) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

(f) Café Area Countertops

(i) Countertops within the cafe area shall all be made from solid surface material at the service counter and from stainless-steel at the LSA workstation area.

(g) Café Area Flooring

(i) Flooring within the café area shall be made from rubber flooring with a friction, no-slip texture.

16.6 Reference Information

a). Planned Dishware

i). Please refer to the attachment regarding dishware China storage needs

ii). The following dimensions shall be used for estimating storage provisions:

(1) 10.25” diameter dinner plates and entrée bowls

(2) 7.5” diameter bread and butter plates

(3) 16 oz bowl with 7.25” diameter

(4) 10 oz bowl with 6.25” diameter

b). Passenger Flow

i). The Contractor shall diagram expected passenger flow through/past food service areas for Amtrak agreement and approval.

(1) This shall be presented by the Contractor at the IDR phase. **[CDRL 16-06]**

c). Hotel Pan Sizing Information

i). Hotel pans shall be used and placed in many appliances including the warming drawers, steam/induction table, convection ovens, and refrigerated cabinets. Reference information on the sizing of the hotel pan is included below.

(1) Size of hotel pan: 21” L x 12 ¾” W

(a) (this includes the outer flange that holds the pan in the well)

(2) Size of half hotel pan: 10 3/8” L x 12 ¾” W

(a) (this includes the outer flange)

d). Bussing Tub

i). Bussing tub dimensions are assumed as follows:

(1) 20” x 15” x 7” deep

(2) Fully loaded tub can be assumed to be less than or equal to 25 lbs.

e). Serving Tray

i). Serving tray dimensions are assumed as follows:

(1) 10” x 14” x 9/32” deep

(2) Fully loaded tray can be assumed to be less than 25 lbs.

Amtrak Universal Single Level Fleet Replacement

Technical Specification

17. Water and Waste System

Revision 2

Table of Contents

17.1 Overview 17-1
17.2 Water System 17-3
17.3 Freeze Protection 17-11
17.4 Waste Retention System 17-13
17.5 Status Indicators 17-18
17.6 Waste System Controls 17-19
17.7 Emergency Operation 17-20
17.8 CDRLs 17-20

17.1 Overview

a). General

i). Each car shall have a water supply system and toilet rooms consistent with the arrangements and requirements in Chapters 1,11 and 31.

(1) For rooms and cars having an Accessible Toilet Room (ATR), the layout shall meet the requirements of 49 CFR Parts 27, 37, and 38 or latest regulation, and U.S. Department of Transportation Section 504 covering the barrier free transportation of the elderly and handicapped.

(2) The Food Service cars shall have systems of larger water capacity for food preparation needs, as detailed in Chapter 16.

ii). All water, waste and sanitation systems on all cars shall comply with:

(1) All applicable Federal regulations, including:

(a) the most recent edition of the US Food and Drug Administration (FDA) Food Code,

(b) the requirements of the US Public Health Service (USPHS), and

(c) the applicable Code of Federal Regulations for the FDA and the Environmental Protection Agency (EPA) concerning general sanitation, water, toilets and interstate conveyance sanitation, including 21 CFR Part 1250.

(2) The latest edition of the Amtrak Food Service Sanitation regulations and the Amtrak Public Health Standards.

iii). The Contractor shall work with Amtrak to arrange for an FDA inspection of the design and completed installation of the water and waste system of the cars to ensure that it meets all requirements, in accordance with 21 CFR Part 1250.41.

(1) Documentation of compliance shall be submitted to Amtrak. **[CDRL 17-01]**

iv). All materials and workmanship shall comply with Chapter 19 requirements.

v). The water and waste system shall be able to operate without damage or failure under all specified environmental temperatures and elevations per Amtrak Specification 963.

(1) All components selected by the Contractor shall be designed to withstand the railroad environment from a durability and debris damage perspective especially with respect to freeze protection.

(2) All freeze protection components shall have a complete and automatic draining function for all fresh water from the system whenever water

temperature approaches freezing with a minimum of specialized hardware being required.

(3) Means for alerting train crew in advance of automatic draining shall be provided to avoid nuisance activation of this feature.

(4) Any undercar water and waste piping and systems shall be housed within undercar protective enclosures and shall not be exposed.

vi). It is required that the water supply piping systems be designed to provide gravity drainage with a minimum of automatic freeze protection valves, manual drain valves and vacuum breakers being required for complete drainage in freezing conditions when power is not available.

vii). Gasket selection for the water system shall be suitable for the application. Any water that flows to a drinkable source shall be suitable for potable water. Cork gaskets are explicitly prohibited.

viii). Ease of servicing and maintenance, rapid repair, reliability, resistance to winter freezing conditions, and safety shall be major design considerations.

(1) Where servicing of consumable items is required, such as filters, accessibility shall be gained from the interior of the car.

(2) Maintainable components of the in-room faucets, shower components, food service components, and piping shall be easily accessible

(a) Easily accessible means an access panel that provides a comfortable working environment to remove and replace parts.

(3) The design of the water system on all car types shall incorporate means to easily sanitize and flush the entire water system, as periodically required by the FDA.

(4) All potable water lines shall be isolated from flush water lines through appropriate valves or by alternate means.

ix). Each water consuming device on the car, such as each sink, drinking water dispenser, shower, toilet, coffee maker, etc., shall have an individual stainless steel quarter-turn supply line shutoff valve located adjacent to the device that can be accessed by the train crew without the use of tools, to deal with in-service failures during train operation.

(1) This device shall not be accessible to passengers.

(2) Servicing and shutoff valves shall be stainless steel quarter-turn ball valves unless otherwise specified.

(3) Each shutoff valve, drain valve, reset switch or other control device for the water and waste systems shall have an exterior locker identification label and shall have identification and operating instructions on the valve or device itself.

x). Complete details of the water and waste systems on all car types, including Food service appliances and restrooms, shall be presented to Amtrak for approval during design review.

(1) This shall include maintainability analysis and access provisions, and winterization details.

b). Capacity

i). In all but the food service cars, the water supply system shall have sufficient capacity to serve a fully seated passenger load for the car configurations described in Chapter 1 for a 72-hour period without replenishment for all water consumption needs, including hand washing, and toilet flushing operations.

(1) The car providing the greatest water capacity demand shall be used in determining water capacity. This size tank shall be applied to all passenger car types other than the Food service cars.

(a) In the food service cars, the water supply system shall have a capacity sufficient to supply all food service functions along with normal restroom and drinking water requirements for a full passenger carload for at least 72 hours.

ii). The waste retention system capacity shall be based upon providing 0.05 gallons of volume for each car passenger seat per hour, plus an additional 8 ounces of water per flush, for 72 train operating hours, with sufficient tank capacity to permit a toilet servicing cycle of five days. Expected capacity for waste retention system is 250 gallons.

iii). The car requiring the greatest waste retention shall be used in determining waste capacity, with this same size tank applied to all passenger car types which contain toilet facilities.

17.2 Water System

a). General

i). Each car shall be provided with a water system which will supply hot and ambient temperature potable running water for various crew and passenger needs. The water shall be provided for drinking, hand washing, cafe requirements and toilet system operation.

ii). Particular emphasis shall be placed on meeting the winterization and maintainability requirements.

iii). Refer to Chapter 16 for additional galley requirements.

iv). The water system shall include:

(1) water tanks,

(2) fill system,

(3) drain system with freeze protection valves,

(4) protective heaters,

(5) water pressurization equipment (if used),

(6) filter,

(7) water distribution piping with service valves,

(8) water heater and thermal insulation

v). The water system shall be pressurized or gravity fed.

(1) If pressurized, it shall use filtered air derived from the main reservoir system using a governor system, with adjustable water system pressure, or pressurized system by means of an electric pump.

vi). The potable water supply shall have a particulate filter and an antibacterial filter to purify the water to Public Health Service (PHS) standards.

(1) These filters shall be located between the freshwater tanks and the dispensing equipment and shall be located for easy cleaning and replacement.

(2) All filters shall be easily replaced.

vii). Means for complete freeze protection, system drainage, maintainability and periodic sanitation shall be included.

viii). The entire water system shall conform to FDA and USPHS regulations and shall use lead-free components.

ix). Plans for construction of the water system shall be submitted to the FDA for review for conformity with FDA requirements. **[CDRL 17-02]**

x). The design and materials shall be approved by Amtrak.

xi). The water system shall be designed to allow complete drainage of all equipment by gravity.

xii). Potable water piping shall be designed to allow periodic sanitization by an Amtrak approved process.

xiii). As an option, the Contractor shall supply an on-board Ozone system to support filtration, disinfection and odor control of the water and waste system. The system shall operate reliably under all environmental conditions defined in Amtrak Specification #963, including freeze protection and debris shielding while being integrated into the water distribution system, ensuring no backflow. The system shall be demonstrated through water sample analysis before and after treatment using NSF/ANSI-certified methods.

(1) If the option is not exercised, the water and waste system shall be designed to accommodate an external filtration system allowing for a closed system flush.

b). Storage Tanks

i). Storage tanks shall be stainless steel or other approved materials having equal durability and include internal baffle plates.

ii). The tanks shall be located in a protected equipment enclosure and fully covered with water resistant fiberglass insulation and supplied with protective heating for winter operating conditions.

iii). All storage tanks shall be constructed in accordance with the latest revision of Section VIII of the American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code for Unfired Pressure Vessels designed to withstand a static water pressure of 110 psig.

iv). Each storage tank shall have a manual drain valve, a manual shutoff valve, an ASME pressure relief valve and a freeze protection automatic drain valve or approved alternate design.

v). A permanent sign shall be installed on the inside face of the electric locker door identifying the total car freshwater tank capacity.

vi). A manual drain valve shall be provided to permit the water tanks to be flushed and drained.

vii). All water tanks shall be located and designed to allow full accessibility for servicing, removal and replacement. All tanks shall incorporate lifting/supporting points for handling by maintenance personnel.

viii). Water storage tanks shall be implemented with safe and reliable water treatment system to minimize the requirement for regular cleaning of water tanks. Amtrak is open to alternatives regarding water treatment solutions to reduce the amount of cleaning requirements for water storage tanks.

ix). Storage tanks shall be designed so as not to allow accumulation or sediment or other debris, a flat bottom shall not be permitted.

c). Water System Fill Stations

i). General

(1) The water fill point itself shall be a barbed male nozzle, which shall be enclosed in a blue painted metal housing with a self-closing cover.

(2) The water fill point shall be compatible with existing Amtrak wayside filling equipment and shall use a minimum 0.75 in. diameter fill piping.

(3) All water fill stations shall be easily cleanable and so located and protected as to minimize the hazard of contamination of the water supply.

(4) Complete identification signage and refill instructions shall be provided.

ii). Fill Station Locations

(1) A water fill point for the car's water system shall be provided on each side of the car at approved locations, at a sufficient distance to prevent contamination from the waste tank drain stations.

(2) The fill points shall be located and self-protected to minimize contamination hazards arising from wastewater system discharge, dust, dirt and debris.

iii). Fill Station Enclosures

(1) Each fill station shall be mounted in a recessed corrosion resistant enclosure and covered with a spring loaded, top-hinged, weather-tight, corrosion resistant, gasketed cover.

(2) The cover shall be labeled and equipped with over-center springs to securely keep the cover either open or closed.

(3) The bottom surface shall be designed to allow complete drainage of fluid from the enclosure interior

(4) The design of the water fill point shall be adequately dimensioned for ease of use by maintenance personnel wearing heavy winter gloves. The water fill point itself shall be a male nozzle, which shall be enclosed in a blue painted metal housing with a self-closing cover.

iv). Water System Pressurization Valve

(1) If required for pressurization, adjacent to the fill point shall be a three-way water system pressurization valve in compliance with the requirements of Amtrak AAMPS catalog number 22 946 70710.

(a) This valve must have the enlarged vent port design to permit rapid venting of the water tank within seconds.

(2) The valve shall have two positions, FILL and WATER.

(a) In the FILL position, the valve shall cut off tank pressurization air, if used, rapidly vent the water tank and permit filling the tank. This will allow the tank to be filled via a check valve located immediately behind the fill nozzle.

(i) The system shall permit complete filling from one side of the car, without requiring access to the other side of the car.

(ii) A means shall be provided to indicate when the water tanks are completely filled.

(iii) Any excess water shall be directed to the bottom of the car and easily visible from the side of the car.

(b) When the valve is placed in the WATER position, the vent will be closed, and air pressure applied to the water in the tank, if used.

(c) The air valve and check valve shall be enclosed behind sheet metal, easily serviceable from the front, with only the valve operating handle exposed.

d). Hot Water

i). Each car shall be capable of producing hot water.

(1) One hot water tank shall be provided for each car with the capacity of the tanks dictated by the car with the most demand on the longest long-distance route. The water heater shall operate from 480 VAC, 3-phase and shall be rated at 9kW. Hot water temperature shall be maintained at approximately 180° F in the tank.

(2) An active mixing valve shall deliver hot water at 118° F to the hot water distribution system. A temperature and pressure gauge shall be provided at the tank and a temperature gauge downstream of the mixing valve.

(3) The water heater shall include, but not be limited to the following features: electric immersion heater, a factory installed thermostatic control, and low water protection. Tank shall be well insulated thermally. The tank shall be located to permit removal of the heater elements without disturbing the tank. Elements shall be replaceable in one hour or less.

(4) Control voltage to the electric water heater system shall be 120 VAC from car power supply.

(5) Status, faults, errors, and diagnostics (overload contactor switch, heating elements, water level, etc.) for the hot water heater shall be accessible by PTU.

(a) All freeze protection shall be monitored by the car's diagnostic system

(b) The above shall be communicated to the CDU. Details to be discussed during design reviews.

ii). Hot Water Delivery

(1) The water heating system shall be capable of providing continuous water heated to 100°-105°F at every faucet.

(2) The water heating system shall be capable of providing continuous water heated to 110°-119°F in the food service area for a minimum of 15 minutes.

(3) Wherever hot water is dispensed, the system shall be designed to deliver heated water immediately.

(4) The water heating system design, potentially using a mixing valve, shall be capable of delivering water at the required temperatures while minimizing the volume of water used.

iii). Hot Water Storage Tanks

(1) All hot water storage tanks shall be stainless steel or other corrosion resistant approved material and suitably insulated.

(2) They shall be constructed in accordance with the latest revision of Section VIII of the ASME Boiler and Pressure Vessel Code for Unfired Pressure Vessels at a setting pressure of 75 psig.

(3) Gravity drainage provisions shall be incorporated into the design.

(4) The storage tanks shall have an easily accessible manual drain valve, a manual shutoff valve and a freeze protection automatic drain valve.

(5) Storage tanks shall be designed so as not to allow accumulation of sediment or other debris, a flat bottom shall not be permitted.

iv). Water Heater Protection

(1) Each water heater shall be equipped with an accessible thermostat, an ASME temperature and pressure sensitive relief valve piped to drain under the car and be equipped with low water protection.

(2) No damage shall result to the water heater and related devices and wiring if the water supply is cut off causing it to run dry, or if electrical power is disconnected in freezing conditions.

(3) Information labels shall be installed on all doors where reset switches are located.

v). Maintainability

(1) The water heater elements shall be easily replaceable with the tank installed in the car.

e). Drinking Water Dispenser

i). Each dispenser shall be constructed of stainless steel, have a touchless or otherwise self-closing dispenser spigot, include a drain system for any spillage, and be dimensioned to permit 1-quart containers to be refilled. It shall dispense filtered water from the supply system.

ii). Water Cooler

(1) Locations of water coolers and dispensers is detailed in Chapter 11.

(2) The water cooler shall be capable of producing at least 5 gal of 50°F chilled drinking water per hour and be capable of chilling water from 80°F to 50°F within ten minutes.

(3) The cooler shall use an environmentally acceptable refrigerant and meet USPHS regulations.

(4) It shall be unitized for quick removal and replacement, with suitable piping and electrical connectors.

(5) The water-cooling system shall allow for easy access for cleaning, sanitization and servicing.

(6) It shall be supplied from the potable water tank after the filtering system.

iii). Water dispensers and coolers shall have an easily accessible manual drain valve, a manual shutoff valve and a freeze protection automatic drain valve.

iv). Supply piping shall be arranged to facilitate gravity drainage.

v). Alternate designs can be submitted for review and approval by Amtrak.

f). Water Piping

i). All water system piping and fittings, unless otherwise approved by Amtrak, shall be seamless stainless-steel tubing, piping or other approved materials having equal durability.

ii). Layout and installation shall be accomplished with a minimal number of connections.

iii). Anti-water hammer air chambers shall be provided as required.

iv). Waterproof plastic identification labels shall be applied to all piping where connections are made to valves or devices.

v). All water supply piping and components shall be of lead-free construction and shall comply with the requirements of Chapter 19.

g). Water Backflow Checks

i). The water system shall be configured to prevent water backflow into the water raising system under all conditions, in compliance with USPHS regulations.

ii). If points of connection between potable and non-potable water exist, backflow and back siphon protection devices meeting American Society of Sanitary Engineers (ASSE) standards shall be installed to protect against mixing of potable and non-potable water.

iii). These devices shall be located to also protect against potential backflow or back siphon conditions may occur.

iv). They shall be arranged to allow easy replacement if necessary.

h). Water Raising

i). If a water raising system is required, it shall use compressed air supplied by the cars main air reservoir pipe through an approved governor and regulator valve to pressurize the water system, per Chapter 9, or pressurized system by means of an electric pump.

ii). Particulate and desiccant type air filters with an automatic drain and an oil removal filter shall be provided to remove all contaminates and moisture from the air supply to the system.

(1) The arrangement shall easily allow replacement of the filters.

iii). All air regulation valves shall be mounted above the top of the water level in the storage tanks.

iv). An ASME pressure relief valve shall be provided.

v). The potable water supply to the sinks and drinking water dispenser shall be provided through a check valve and adjustable pressure reduction valve.

vi). The potable water supply used for toilet rinse water shall be separately taken from the water supply tanks through a check valve and adjustable pressure reduction valve.

vii). All pressure adjustment settings shall be easily accessible for inspection with pressure test ports being provided, and backflow protection shall be provided.

i). Restroom Sink Supply

i). Hot and cold water shall be piped to each sink faucet.

ii). Water supply for all faucets shall be 0.5GPM.

iii). In all cases where there is a toilet, a sink is expected to be provided next to or within close proximity.

iv). The faucet shall be touchless.

v). Power for the faucet shall be hard wired. Battery replacement arrangements are prohibited.

vi). All exposed parts shall be stainless steel.

vii). All fixtures, dispensers and appliances shall be constructed in accordance with the requirements of USPHS.

viii). The faucet design shall be approved by Amtrak.

ix). See Chapter 11 for additional details.

j). Shower Supply

i). Hot and cold water shall be piped to each shower

ii). Water supply flow shall be 1.5GPM in all showers

iii). All fixtures, dispensers and appliances shall be constructed in accordance with the requirements of USPHS.

iv). The shower design shall be approved by Amtrak.

v). See Chapter 31 for additional details.

k). Galley Supply

i). The food service cars shall draw filtered, potable water from the car supply, and distribute it to the hand sink, utility sinks, coffee brewers, ice makers and other water consuming appliances in accordance with the requirements of Chapter 17.

ii). All water system exposed parts shall be stainless steel.

iii). All fixtures, dispensers and appliances shall be constructed in accordance with the requirements of USPHS.

iv). The galley hand wash sink shall provide 110°F-119°F water per FDA requirements.

17.3 Freeze Protection

a). During Operation

i). The freeze protection system shall consist of automatic water drain valves, insulation, protective heaters, manual drain valves, self-draining pipes and similar devices configured to provide the required protection.

ii). The system shall have sufficient capacity to permit train operation without damage or failure under all operating and environmental conditions specified by Amtrak Specification 963.

iii). There shall be sufficient excess capacity of insulation to allow for time-related deterioration over the design life of the equipment.

iv). The freeze protection system shall be designed to permit pipes and fittings to be disassembled for maintenance and repair without removing the entire protective system.

v). The freeze protection system shall be fully automatic in operation and not require any train crew or maintenance personnel action to activate or reset.

vi). All freeze protection valves shall meet the requirements of Amtrak Specification 1004, latest revision or approved equal.

b). Out of Operation

i). The water system shall be freeze protected to enable it to be disconnected from Head End Power (HEP) indefinitely in subfreezing temperatures, with no damage resulting to any component of the water system under any condition.

ii). Complete manual means shall also be provided to permit the system to be fully drained when desired.

iii). The entire water system, including its piping and all appliances, shall be free-draining and shall avoid arrangements where water may become trapped.

iv). Automatic vacuum breaker valves shall be installed at all elevated points and other locations as necessary to permit complete venting of the system when draining.

v). The system shall be designed and geometrically arranged so as to require the absolute minimum of drain valves.

vi). All pipe insulation shall be water resistant.

vii). A permanent sign shall be installed on the inside face of the electric locker door providing instructions for the manual draining of the car's water system.

c). Drain Valves

i). The freeze protection system shall make use of an Amtrak approved automatic, self-contained drain valve which will automatically open when sensing an adjacent ambient air temperature of approximately 38°F (temperature falling) and close at 40°F (temperature rising) when there is no electrical power on the car.

ii). All drain valves shall be equipped with a quick warm-up heater to close the drain valves when HEP is available, to allow a car in freezing temperatures to be immediately watered when placed on electrical power.

iii). All drain valves shall have a manual override feature located near the fill valve to allow the car to be filled at any time regardless of temperature or HEP availability.

d). Electrical Protective Heat Tape

i). The water storage tanks and all water supply components exposed to ambient temperatures shall be protected against freezing by electrically powered self-regulating heat tape and thermal insulation.

ii). To prevent unnecessary electrical consumption, all heat tapes shall be supplied electrical power only when the exterior ambient temperature is below 45°F.

iii). All electrical protective heat tape shall be of an automatic self-limiting 120VAC design which can be cut to length from bulk rolls for replacement.

iv). All connections shall be made using the manufacturer's watertight splicing kit, and each individual length shall be terminated with a power monitoring system.

v). Such heat tape shall be of a design that can withstand the application of live steam at 225°F without damage, as this is often the only method available in an Amtrak maintenance facility for thawing a frozen car.

e). Electrical Heat Tape Monitoring System

i). An approved system shall be provided in the electrical locker inside the car to indicate the operating status of all heat tape systems.

ii). To verify the proper operation of all antifreeze protective heat tapes for the water and waste system, the Contractor shall arrange a monitoring system and associated indicators to verify that electrical power is present at the far end of every heat tape segment when power is being supplied to the system.

iii). A logical, organized system layout shall be provided, with each indicator labeled for ease of maintenance personnel quickly identifying an individual defective heat tape.

iv). A POWER ON test pushbutton shall be located on the panel to allow electrical power to be supplied to all of the heat tapes on the car when ambient temperature is above the setting at which the system would be energized.

v). Monitoring of the current or ground fault circuit breaker status, as well as the presence of voltage at the end of each heat tape, shall be provided.

vi). Alternate methods for detecting and reporting the failure of any heat tape segment may be employed subject to Amtrak approval.

f). Maintainability

i). Maintainability aspects of the system shall be demonstrated on the interior mock-ups.

g). All details of the freeze protection system shall be submitted to Amtrak for approval during design review. **[CDRL 17-03]**

17.4 Waste Retention System

a). General

i). All waste collection fixtures and components shall be constructed in accordance with the requirements of 21 CFR Part 1250 and USPHS.

ii). The system shall have previous successful application in rail passenger service.

iii). All toilet system piping, the waste tank and all associated fittings, drain piping and serving valves, unless otherwise permitted by Amtrak, shall be manufactured from acid-resistant stainless steel suitable for sewage service.

iv). All waste retention system servicing valves shall be quarter-turn stainless steel ball valves with full diameter port openings.

v). The WCRS shall be a positive/negative pressure type system with sufficient useable capacity to collect and retain all toilet waste generated on the car during a 72-hour period in a single tank, for discharge at a wayside dumping facility. Minimum waste capacity shall be per Section 17.1b).

vi). Electrical and plumbing connections shall be designed so that components can readily be installed, removed and exchanged.

vii). Modular construction shall be utilized in the design of all components and subassemblies.

viii). No special tools shall be required for maintenance or replacement of system components.

ix). As there are frequent foreign object blockages of the toilet system encountered in toilets, sufficient easily accessible leak-tight access caps and cleanout ports shall be provided in all waste system piping to permit rapid and easy removal of clogs by maintenance staff during servicing stops.

x). The waste tank, all waste piping, and waste system components shall be designed to prevent accumulation of mineral deposits and scale and provide a procedure for their removal.

xi). The waste system shall be designed to operate over all operating and environmental conditions specified by Amtrak Specification 963 and avoid damage from freezing.

xii). Plans for the toilet system shall be submitted to the FDA for review for conformity with FDA requirements. **[CDRL 17-04]**

(1) Complete details on the system design shall be presented to Amtrak for approval during design review.

b). System Requirements

i). The system shall be designed for fail-safe operation and protection of passengers, crew, service personnel and equipment.

ii). Ease of servicing and maintenance, reliability and safety shall be major design considerations.

iii). Compressed air shall be supplied by the main reservoir trainline pipe.

(1) This system shall be kept separate from any compressed air supply system which may be required for the water supply system.

(2) Air lines and valves shall be sized for air pressures up to 150 psig.

(3) Any use of pressurized air for the WCRS or a water raising system shall not impact the functionality of the air brake system under any scenario.

iv). Designs shall incorporate features to limit the amount of air consumed during flush cycles or leaks or failures within the system.

v). The toilet system shall automatically recover from loss of power (including interruptions of HEP and/or compressed air) without nuisance alarms.

c). Toilet Operation

i). A toilet flush cycle shall be initiated by the passenger by operating a touchless, ADA-compliant flush actuator, which shall be mounted on the wall, unobstructed by a raised toilet lid, and easily apparent to the passenger.

ii). Signal indicator lights may be provided for passenger information on system status and any delay in mechanical flushing action shall be supplemented with visual feedback of a flush request.

iii). Rinse water shall be sprayed into the toilet bowl during the flush cycle to adequately clean the bowl without allowing water to exit the bowl.

iv). The toilet waste shall be drawn by vacuum and / pressure from the toilet to the waste tank, for later discharge at a collection facility.

v). Filtering shall be provided to protect the pressure generating device from blockage due to waste debris, waste fluid or water.

vi). It is desired that the water consumption during the flush cycle be minimized.

vii). The toilet shall not flush if the waste tank is full, or if system logic determines that a complete flush cycle is not possible and shall protect against excessive air consumption created by unnecessary multiple flush requests or multiple flushes on cars with multiple toilet rooms.

viii). The flush control unit shall be approved by Amtrak during design review. **[CDRL 17-05]**

d). Toilet

i). All toilets shall be ADA-compliant, where applicable.

ii). The toilet shall be designed as a service-proven, self-contained unit with an elongated bowl, interchangeable between all car types.

iii). The shroud shall be coordinated with the toilet module design.

iv). The toilet shall be securely mounted to the restroom, using stainless steel or approved corrosion resistant mounting fasteners.

v). The toilet bowl shall be easy to maintain and clean.

vi). It shall be designed to prevent waste matter and mineral deposits from adhering and shall not rust or corrode.

vii). Bowl surfaces shall curve in a continuous fashion and shall be free of recesses and inaccessible areas.

viii). The sides of the bowl shall be steep and sloped toward the discharge to allow waste to accumulate for evacuation.

ix). To prevent downstream blockage of waste system piping, the bowl outlet shall be a smaller diameter than the piping to serve as the most restrictive point in the piping system.

x). Overflow protection shall be provided to prevent the bowl from flooding should the outlet be plugged.

xi). Rinse water shall be injected into the bowl with sufficient force and distribution to push all waste matter toward the bowl outlet and completely clean the bowl unless otherwise approved by Amtrak.

xii). The bowl shall be easily and completely cleaned with ordinary cleansing agents and tools.

xiii). The flush-drain valve shall be a self-contained unit which provides a zero-leakage seal at the bowl outlet after operation.

xiv). The toilet system shall be designed to retain a hermetic seal over the opening of the waste pipe when closed to prevent odors from entering the restroom.

xv). The valve design shall be self-cleaning and prevent waste material from being trapped in it.

xvi). The design shall survive closing on solid objects without damage.

xvii). Cutout valves shall be easily accessible, without tools, for operation en route from inside the car.

xviii). The toilet assembly and its components shall be mounted so as to be accessible and removable for service and maintenance.

xix). Special attention shall be given for ease of clearing foreign object clogs from the piping system, and additional piping cleanout ports with suitable maintenance access should be provided in the toilet to waste tank piping to facilitate rapid cleanout.

xx). A special design shall be installed in the toilet bowl that prevents larger objects from being flushed into the waste system. The specially designed large object preventer shall be thoroughly cleaned during each flushing cycle to prevent waste build up.

xxi). A special decal shall be installed clearly outlining that no trash can go in the toilet. Details on the decal to be discussed during design review.

e). Waste Tank Assembly

i). The waste tank assembly shall be designed as a self-contained unit. Waste tanks shall be located and designed to allow full accessibility for servicing, removal and replacement. Waste tanks shall incorporate lifting/supporting points for handling by maintenance personnel.

ii). The waste tank assembly shall be constructed to withstand debris damage.

iii). The waste tank shall be constructed of acid-resistant stainless steel.

iv). The tank design shall prevent sloshing during normal train operations but shall not impede normal tank drainage nor flushing operations and shall not retain excessive sludge deposits during operation.

v). The tank design shall allow all internal portions of the tank to be cleaned by maintenance personnel.

vi). Suitable interlocks shall be applied to prevent system operation when draining the waste tank. Waste tank drainage shall be readily possible from either side of the car, through a 4 in. diameter Amtrak standard Andrews 400A style quick-disconnect adapter. The 4" waste drain handle shall be ergonomic requiring less than 50 LBF to operate.

vii). The hose connection and any necessary valve handle to operate shall be easily accessible without the need to open any covers but shielded from debris damage.

viii). A hose connection to the adapter shall interface with the wayside servicing facility.

ix). Only one person shall be required to drain and service the waste tank from a single point outside of the car without needing to crawl under the equipment.

x). The drain connection arrangement shall minimize the amount of possible waste spillage when the drain hose is disconnected.

xi). All waste tank assembly exposed surfaces which are liable to waste spillage during servicing shall be sealed as water resistant and as nonporous as practical and shall be easily sanitized by Amtrak maintenance forces without damage.

xii). Storage tanks shall be designed so as not to allow accumulation or sediment or other debris, a flat bottom shall not be permitted.

xiii). The waste tank shall be heated to prevent freezing as well as all waste lines to the tank.

(1) During climate chamber testing, Contractor shall ensure that waste tank does not freeze in extreme ambient conditions.

f). Vent

i). The exhaust from any waste tank system device shall be routed to the top of the car or underside of the car, and designed to prevent passengers, both

inside and outside the car, from being exposed to objectionable odors from waste gases, or from odors being ingested by the car fresh air intakes.

ii). The Contractor shall also model behavior when the car is in motion as well as when adjacent cars are in motion. Air flow modeling shall be presented at Design Reviews for Amtrak review and approval.

iii). The Contractor shall design the ventilation system with a charcoal muffler filter arrangement that is easily changed every 3-6 months to further prevent odors from exiting the restroom.

g). Waste System Piping

i). All waste system piping shall be seamless acid-resistant stainless steel or approved alternative materials suitable for sewage service.

ii). All piping shall be installed with generous radius sweep bends and elbows to avoid blockages.

iii). Cleanout access ports shall be provided throughout the waste piping.

iv). The system shall be designed to facilitate the clearing of any line blockage.

v). All piping and tubing shall have a smooth interior finish.

vi). Any pneumatic system piping used shall comply with Chapter 19.

vii). All drain piping not connected to the WCRS shall be seamless stainless steel.

(1) This shall include the piping from all restroom sink drains, Cafe car sink drains, and coffee brewer drains and all other drains not handling human wastes.

(2) Such drains shall be piped using a suitable penetration through the car floor to discharge under the car, well clear of the track rails and adjacent undercar apparatus.

viii). All waste system drain piping shall be installed with positive gravity drainage slope, and have generous radius sweep bends and elbows to avoid blockages.

(1) The piping shall be designed to facilitate the clearing of any line blockage between the toilet and waste tank.

(2) Ice shall not be allowed to build up at the drain point.

(3) Kazoos or approved alternate shall be placed on all through floor gray water drains to prevent insect intrusion into the car.

17.5 Status Indicators

a). The status of the water and waste system, including the volume of water in the water tank, and the volume of waste collected in the waste tank, shall be

monitored continuously, and displayed on an indicator panel or screen inside the car. Water and waste tank fill levels shall be provided in no less than four even increments.

b). A separate system shall provide car level diagnostic status of the antifreeze protection heat tapes on the car when HEP is present and shall be accessible remotely.

c). The design of all status indicators shall be approved by Amtrak. **[CDRL 17-06]**

d). Water and waste tank fill levels shall also be displayed on the car exterior in close proximity to the water fill stations.

e). An OUT OF SERVICE indicator shall be located on the outside of each restroom, which shall indicate if the control system has determined the toilet to be out of service due to a full waste tank or other malfunction, or if the train crew has locked the restroom.

17.6 Waste System Controls

a). An Amtrak approved control system shall be supplied to provide proper control and maintenance diagnostics for the WCRS.

b). Design and materials shall comply with all applicable requirements of this specification.

c). The system shall be designed for the railroad passenger car environment and shall not be affected nor need to recycle itself due to interruptions of the HEP, trainline air pressure, en-route waste tank system servicing or other normal aspects of intercity train operation per this Specification.

d). All controls, switches and sensors shall be unaffected by the environment, and be maintenance free for a six-year period.

i). All diagnostic information for the waste system shall be available to the car diagnostic system and shall be available remotely.

ii). Each portion of the waste lines shall be monitored via the diagnostic system to identify clogs and the exact location of any clog in the system.

e). The Contractor during design review shall present for Amtrak approval a matrix of all normal, abnormal and fault conditions, and the water and waste system response to each condition. **[CDRL 17-07]**

f). All logic parameters shall be designed for ease of future adjustments and reprogramming by Amtrak, with complete software provided to Amtrak to make such adjustments.

g). All limit switches shall be environmentally sealed, nonadjustable, keyed to ensure proper installation and permanent setting, provided with one wiring configuration, color coded and labeled.

h). color coded and labeled.

17.7 Emergency Operation

a). As an option, the toilet system shall be designed for emergency service during extended loss of HEP and main reservoir trainline.

b). The toilet system must provide equivalent usage rate as specified in Section 17.1 for a minimum of 6 hrs.

c). At the start of the 6 hour emergency condition the train will be fully considered fully operational with all fluids on board, car batteries charged to 100% and main reservoir trainline pressure at 140 psi.

d). Lighting requirements for the toilet room space are to be controlled by the lighting supplier and emergency light requirements of Chapter 13.

e). Usage of load shedding such as disabling sub-systems, disconnecting water heaters, reduced flow or flushing speed etc., maybe proposed.

f). Local storage of power via integrated batteries is acceptable subject to Amtrak approval.

g). Batteries must meet all requirements of Chapter 15 and be replaceable.

h). Local storage of pneumatic pressure is preferred but an auxiliary compressor maybe proposed if its usage provides a better energy management and is subject to Amtrak approval.

i). Operation of emergency mode maybe key selectable such that a conductor must enable emergency mode operation, to be determined by Amtrak during the design review process.

j). Emergency toilet operation shall be provided for all ADA accessible spaces and a select number of additional units up to 100% of on-board toilets to be determined during design review process.

18. Emergency Equipment

Revision 2

Table of Contents

18.1 Overview 18-1
18.2 General Requirements 18-1
18.3 Emergency Equipment Lockers 18-1
18.4 Automated External Defibrillator (AED) 18-3
18.5 Seat-Back Safety Information Card 18-4
18.6 CDRLs 18-4

18.1 Overview

a). Each car shall be equipped with emergency equipment per the requirements of 49 CFR Part 239.101.a.(6) as well as outlined in this chapter.

b). Emergency equipment provided shall include fire extinguishers, pry bars, sledgehammers, first aid kits, chemiluminescent snap lights and seat-back passenger safety information cards.

c). One storage container for an Automated External Defibrillator (AED) shall be provided in each of the Café and the Diner cars. Final locations will be determined during the design review process.

18.2 General Requirements

a). Emergency equipment as provided shall meet all applicable regulations, standards and specifications.

b). Equipment provided shall be located and installed in a manner that facilitates identification and access of the emergency equipment when needed by passengers and crew members without the use of keys or tools, unless otherwise specified.

c). Emergency equipment shall be located as to be available to passengers in the range from the 5th percentile female to the 95th percentile male, and in accordance with applicable ADA regulations.

d). All emergency equipment shall be new and shall be qualified for use for a minimum of one year after delivery of the car.

e). Each car shall be shipped with a full complement of emergency equipment unless otherwise specified by Amtrak.

18.3 Emergency Equipment Lockers

a). General

i). An emergency equipment locker shall be provided on each car in a location approved by Amtrak.

ii). The location of the locker shall be in compliance with all applicable ADA requirements.

iii). The emergency equipment locker shall be recessed into the wall and shall have a clear polycarbonate hinged front panel, equipped with sealing provisions.

iv). The polycarbonate panel shall be mounted in an equipment locker door equipped with a non-lockable paddle latch, so crewmembers can access the emergency equipment without breaking the seal.

v). There shall be a light fixture located inside the equipment locker that will always be illuminated regardless of door position.

vi). Alternate emergency equipment locker designs can be submitted for approval by Amtrak.

vii). The locker shall be marked with emergency equipment signage that is compliant with Federal emergency signage standards and compatible with Amtrak standard signage per Amtrak Specification 697 for the safety equipment contained therein.

viii). All emergency signage shall be HPPL decals unless otherwise approved by Amtrak.

ix). At a minimum, the emergency equipment locker shall be designed to include emergency tools, a fire extinguisher, a first aid kit and snap lights.

x). The equipment shall be securely attached to the interior of the locker and shall not be loose nor rattle within the locker but shall be easily removed in the event of an emergency.

b). Emergency Tools

i). Each emergency equipment locker shall include the following emergency tools:

(1) A 6 lbs. sledgehammer with an 18 in. handle

(2) An 18 in. pry bar

ii). The tools shall be installed in a manner that will prevent vibration and rattling and be readily available for emergency use.

iii). The Contractor shall incorporate the same tools currently in use by Amtrak. Vendors and part numbers shall be provided during Design Review.

c). Fire Extinguisher

i). The fire extinguisher shall be securely mounted in a manner that will prevent vibration and rattling and allow its prompt removal in case of fire.

(1) The installation shall conform to the requirements of NFPA Specification No. 10.

(2) The fire extinguisher shall be clearly marked with instructions in accordance with NFPA Specification No. 10.

(3) The extinguisher shall be installed so that the pressure gauge can be easily seen for inspection without opening the locker cover.

ii). A dry-chemical, 10-pound fire extinguisher, UL rated 2A-40 type B/C shall be included in the emergency equipment locker of each car.

iii). A dry-chemical, 2.5 lbs. fire extinguisher, UL rated 1A-10 type B/C shall also be included in the food service cars. See Chapter 16.

iv). Fire extinguishers shall have all required certifications prior to shipment of the car and be within their current annual inspection date.

v). The Contractor shall incorporate the fire extinguishers currently in use by Amtrak. Vendors and part numbers shall be provided during Design Review.

d). First Aid Kit

i). A first aid kit, compliant with the requirements of 49 CFR Part 239.101a.(6).(ii), Pac-Kit model 6311AMT or approved equal, shall be included in the emergency equipment locker.

ii). First aid kits, identical to those specified above, shall be located in the emergency equipment locker, and in the cafe area of the Cafe cars (see Chapter 16).

iii). The Contractor shall incorporate the first aid kit currently in use by Amtrak. Vendors and part numbers shall be provided during Design Review.

e). Snap Lights

i). Each emergency equipment locker shall include one package (quantity of 10) of 6 in. yellow 12-hour chemiluminescent snap-lights, Cyalume model 9-01360 or approved equal.

ii). Snap lights shall also be provided in the Food service car.

iii). The Contractor shall incorporate the snap lights currently in use by Amtrak. Vendors and part numbers shall be provided during Design Review.

iv). Appropriate storage should be provided assuming snap lights are delivered in a loose plastic bag.

f). Trauma Kits/Stretchers

i). The Contractor shall provide one (1) trauma kit and one (1) stretcher in each Café car and each Diner car, in accordance with Transport Canada “Railway Passengers Car Inspection and Safety Rules” Section 21.5.

ii). A dedicated storage location for these items shall be provided.

iii). Location of the trauma kits/stretchers will be reviewed and approved during Design Review.

iv). The Contractor shall incorporate trauma kits and stretchers currently in use by Amtrak. Vendors and part numbers shall be provided during Design Review.

18.4 Automated External Defibrillator (AED)

a). One storage container for an Amtrak-provided Automated External Defibrillator (AED) shall be provided in each of the Café and the Diner cars that is accessible to everyone, in accordance with Amtrak AED installation specification.

i). The container shall be a minimum of 9 in. wide by 20.5 in. deep and shall provide no less than 19 in. of vertical storage clearance.

ii). If the AED is to be lifted vertically out of the holder, a minimum clearance of 24 in. must be provided above the top of the holder.

iii). The containers shall securely retain the AED under all car accelerations. Appropriate signage shall identify the locations of the AED units.

b). Details of location and installation of the defibrillator shall be submitted for Amtrak review and approval. **[CDRL 18-01]**

18.5 Seat-Back Safety Information Card

a). The Contractor shall develop the artwork for a passenger seat-back safety information card illustrating the type, location and use of all safety features, emergency equipment, emergency signage and emergency exit pathways for each car type.

b). Only a single safety information card shall be provided, which shall adequately describe all car types in a possible consist.

c). This safety card shall be designed in the format of Amtrak's "Passenger Safety Instructions" and shall include a clear Braille overlay.

i). Artwork is to be provided for Amtrak review and approval.

d). Electronic artwork, suitable for printing, shall be provided to Amtrak prior to the delivery of the first batch of cars. **[CDRL 18-02]**

e). The Contractor shall be responsible for the printing and delivery of the first 10,000 copies of the seat-back safety card prior to the delivery of the first batch of cars.

f). Seat-back safety cards shall be shipped to a location to be determined by Amtrak.

g). Seat back safety cards are required for all potentially occupied seating locations in each car.

h). Additionally, a dedicated seat back safety card holder shall be included at each seating location. This must be different than the main passenger storage area.

i). In the event of interference with assemblies such as workstation tables, alternate holder locations and designs shall be the responsibility of the Contractor.

j). The holder design for all locations should be identical unless approved by Amtrak.

19.1 Overview

a). This Chapter defines the requirements for materials and workmanship that shall apply to the design and manufacture of systems and subsystems for assembly into Amtrak's passenger vehicles.

b). This Chapter shall apply to all phases of the project.

c). It shall be the responsibility of the Contractor to inform its suppliers of the requirements of this Chapter as well as enforce them.

19.2 Sustainability

a). The Contractor shall consider environmental responsibility throughout the performance of this contract.

b). By emphasizing sustainable measures and materials, the goal is to minimize the overall environmental impact, surpassing standard alternatives and contributing to a more resilient and eco-friendly future.

c). When selecting materials, the Contractor shall evaluate and prioritize materials with lower environmental footprints, considering factors such as resource extraction, production processes, and end-of-life recyclability. The Contractor shall prioritize the use of renewable and recycled materials over non-renewable alternatives wherever feasible.

d). The Contractor shall consider throughout the design review process initiatives to optimize energy usage throughout the project's lifecycle, from construction and operation to decommissioning.

19.3 General Requirements

a). Applicability

i). This Chapter defines the requirements for all material and workmanship which shall apply to the design and manufacture of the vehicles, and all systems, subsystems and components contained therein, that are to be built to this specification.

ii). All materials and methods of assembly shall be in conformance with the applicable requirements of this Chapter, and all applicable standards, specifications, and references.

(1) Those references, standards and specifications listed constitute a partial listing; the Contractor shall be responsible for identifying and complying with all applicable regulations, industry standards and material specifications whether listed herein or not.

(2) The revision of these references that are current at time of issuance of Notice To Proceed (NTP) shall apply unless a specific revision of a given specification or standard is referenced.

b). Marking and Storage

i). All materials intended for use on these vehicles shall be marked or stored so as to be readily identifiable and shall be adequately protected during handling and storage.

ii). All stored material subject to corrosion shall be protected by waterproof covers, coatings or packaging. Equipment covers, cable entrances and openings shall be closed to prevent ingress of water or dirt.

iii). All dated material shall have the expiration date clearly marked. Expired material or material expiring within one year of car acceptance shall not be used.

iv). Material or components which require maintenance during storage shall be properly maintained per the component(s) manufacturer's instructions. The Contractor shall document such maintenance, and provide these records as requested by Amtrak.

v). Rejected material shall be clearly marked and stored in an area specifically designated for that purpose.

vi). Carshells stored outside shall have open cavities covered to prevent water and dirt ingress. Covers should be inspected weekly to check for damage.

c). Prohibited Materials

i). The following materials shall not be used in the construction of the vehicle:

(1) Polyvinyl Chloride (PVC)

(2) Asbestos

(3) Cadmium (except for batteries) and cadmium plating

(4) Lead (excluding solder used on safety-critical electronics or in brake shoes)

(5) Butyl Products

(6) Urethane foam

(7) Carcinogenic materials as listed by current publication of the American Conference of Governmental Industrial Hygienists (ACGIH):

(a) Where there are materials that contain trace amounts of carcinogenic substances, they shall be clearly identified in the Safety Data Sheet.

(b) Exposure to classifications A1, A2, and A3 carcinogens shall be carefully controlled to levels as low as possible below the TLV (Threshold Limit Value) set by the ACGIH.

(8) Materials in the List of Highly Hazardous Chemicals, Toxics and Reactives, 29 CFR 1910.19, Appendix A.

(9) Chlorofluorocarbons (CFCs) and Hydrochlorofluorocarbons (HCFCs)

(10) Materials that, in their normal installed state, emit products that are known to be toxic or irritants.

(11) Magnets, unless approved by Amtrak. Magnets for transformers and proximity switches that do not exceed IEC 60601-2-23 are acceptable.

d). Material Reporting Requirements

i). Whenever a commercial material is not covered by a specification or standard, the Contractor shall identify the material by the commercial trademark, name and address of the Supplier. The Contractor shall submit a description and the technical data specifications of the material composition along with independent laboratory test results of material being tested per 49 CFR Part 238 requirements for approval at the intermediate design review. **[CDRL 19-01]**

ii). The Contractor shall keep on file Safety Data Sheets (SDSs) for all chemical materials (paints, solvents, adhesives, lubricants, etc.) used in the manufacture, maintenance, operation or repair of the vehicles, and shall provide a copy of each SDS in the appropriate maintenance manual. SDSs shall comply with 29 CFR Section 1910.1200 (g).

iii). The Contractor shall maintain records that trace all materials to their manufacturers and production specifications and methodologies.

(1) The Contractor shall propose a digital material passport for all materials to track data involved in its life cycle and can facilitate data mining in supply management during the production process.

19.4 Joining and Fastening

a). General

i). Certain combinations of materials require particular care in joining to avoid the possibility of corrosion. Isolating and moisture-proofing materials, appropriate to the materials being joined, shall be used at all times where these combinations exist.

ii). The Contractor shall submit joining and fastening data, specifications and standards for all types and methods of fastening and joining used to Amtrak for review and approval at the design review. **[CDRL 19-02]**

iii). All hinges shall be stainless and piano hinge style.

(1) The use of any other hinge must be submitted to Amtrak for review and approval on a case-by-case basis.

iv). The Contractor shall submit to Amtrak a dissimilar metals report, identifying all locations where dissimilar metals, or metals and wood are joined, and describing the methods used for mitigating galvanic or chemical corrosion at those locations. Merely treating a surface with primer, anodization, or coating may not be acceptable if it is likely to be compromised during maintenance and handling over the life cycle of the equipment. These methods shall be subject to review and approval by Amtrak. **[CDRL 19-03]**

b). Joint Fitting

i). Joints shall be properly fitted, whether exposed or concealed. When not otherwise specified in drawings or specifications, materials between 0 and 0.5 inches of thickness shall have gaps between joints held to a dimension not greater than 10% of the thinner material being joined, or 0.002 in., whichever is greater. Materials with thickness greater than 0.5 inches shall be held to a maximum gap of 0.06 inches. Gaps shall be uniform in width. The edges of panels shall have a smooth, finished appearance.

ii). Where excessive gaps (greater than those permitted by approved drawings or standards) are found to exist at the faying surfaces of structural bolted or riveted connections, metal shims of the same material as that of the deficient part may be used, but only with the written permission of Amtrak. Shims, if used, shall be mechanically fastened to one of the base parts being joined. The use of epoxy or other plastic filler at such locations is prohibited.

iii). Cut-to-fit, match drilling, filing, and other hand-fitting practices are prohibited.

iv). Location and process for implementing seams must be submitted for approval.

v). All seaming plans must be submitted for Amtrak acceptance.

c). Metal-to-Metal Connections

i). Where metals contact each other, the contact surfaces shall be free of dirt, grease, rust and scale. Unless specified otherwise, the contact surfaces shall be coated with a metal-base primer that conforms to GSA Federal Standard TT-P-664D or alternate coating technology meeting or exceeding the applicable performance requirements noted in TT-P-664D. Metal primer may be omitted for like-stainless steel to like-stainless steel joints.

d). Wood-to-Metal Connections

i). Where wood and ferrous metal surfaces are placed together, except as bonded surfaces in plymetal, the exposed wood shall be coated with two coats of aluminum paint conforming to GSA Federal Standard TT-P-3E, that prevents moisture intrusion, and the metal shall be coated appropriately with an Amtrak approved primer that conforms to GSA Federal Standard TT-P-664D.

ii). Additionally, all bolts or rods passing through wood shall be coated with aluminum paint conforming to GSA Federal Standard TT-P-38E.

e). Wood-to-Wood Connections

i). Where wood and wood are placed together, both abutting surfaces shall be coated with two coats of aluminum paint conforming to GSA Federal Standard TT-P-38E that prevents moisture intrusion.

19.5 Fasteners

a). General

i). The Contractor and all suppliers are responsible for selecting fastener types, sizes, styles, lengths, materials, grades and finishes that will meet the requirements of this Specification. The Contractor shall minimize the number of different sizes and styles of fasteners used. Whenever a maintenance process requires the removal or application of a fastener, consideration shall be given to the ease of access to such fasteners.

ii). Fasteners used throughout the vehicle shall be metric fasteners. All fasteners used on the vehicle shall be specified under one of three categories: electrical and electronic; structural and safety-related; or decorative.

iii). Safety-related fasteners include, but are not limited to, those applied to trucks, bolsters, brake equipment attachment, couplers and attachment of interior components or other fasteners as identified by Amtrak. A fastener is safety related if a single fastener failure will create an unsafe condition.

iv). The following are prohibited:

(1) Self-tapping and self-drilling screws, Velcro/dual lock and double-sided tape shall not be used without approval by Amtrak.

(2) Protruding screws, mounting bolts, or similar items on the vehicle interior or exterior, except for those appointments that cannot be built into the structure in any other manner.

(3) Tapped holes in structure, brackets, and other vehicle assemblies. Tapping plates shall be used when installing fasteners into vehicle structure or subassemblies.

(4) Fasteners installed into blind holes, unless specifically approved by Amtrak.

(5) Use of elastic stop nuts for electrical connections.

(6) Self-adjusting compression latches.

b). Threaded Fasteners

i). If approved by Amtrak, all inch-standard threaded fasteners shall dimensionally conform to ANSI Standard B1.1 or Industrial Fasteners Institute Fastener Standards. All approved inch-standard threaded fasteners shall conform to SAE J429 and J995, or ASTM F593 and ASTM F594 for both material and strength.

ii). Prevailing-torque type locknuts shall be nylon insert type, ESNA or approved equivalent, conforming to IFI Fastener Standards or NASM21044. Distorted thread locknuts shall only be used where the locknut may be exposed to temperatures above 200°F.

iii). When making connections to heat producing apparatus, thermal expansion of the components shall be taken into consideration for selection of fastener materials. If the joined components are high expansion alloys such as copper or austenitic stainless steel, austenitic stainless-steel fasteners shall be used. If the joined components are low expansion materials such as carbon steel or ferritic stainless steel, zinc plated carbon steel fasteners of minimum Grade 5 shall be used.

iv). All screws or bolts used to secure access panels to the interior, undercar, or roof equipment shall be made captive to the panel in which they are used.

v). When bolts are used to secure apparatus where the bolt head is not accessible, a reusable mechanical locking device shall be used to prevent the bolt head from turning when the nut is being turned. Threaded inserts shall not be permitted without prior written Amtrak approval.

vi). At least 1.5 screw threads shall be visible beyond all nuts. When used without elastic stop nuts, bolts shall not project more than 1.5 threads plus 0.25 in. for bolts 0.25 in. diameter or less and shall not project more than 8 threads for larger diameter bolts. With elastic lock nuts, bolt threads shall not project more than 0.25 in., regardless of bolt size.

c). Metric Fasteners

i). Metric fasteners shall be utilized on all components and assemblies in all cars. All components, control groups, or individual units that are supplied by a supplier or sub-supplier to the Contractor, shall be supplied with metric fasteners conforming dimensionally to ANSI B1.13M (ISO-metric) Standards. Metric fastener material and strength shall conform to ISO 898-1 and 898-2 or ISO 3506-1 and 3506-2. All internal fasteners and threaded components of the approved assembly shall have ISO-metric threads. Internally, there shall be no mixing of metric and inch threaded fasteners. Replacement, repair or maintenance parts supplied under this Specification shall contain all necessary replacement fasteners of the correct size and grade.

ii). Metric fasteners shall be marked as required in *Metric Fastener Standards*, Industrial Fasteners Institute, latest edition.

d). Structural Fasteners

i). All structural fasteners shall have documentation identifying manufacturer and purchase specifications available for examination by Amtrak at the Contractor's Quality Assurance (QA) department. This documentation shall include the fastener material or grade and finish including plating material and specifications, when applicable. Whether the purchaser is a subcontractor, supplier or the Contractor, the Contractor shall obtain and hold this documentation for a period of not less than the expiration of the warranty period of the last vehicle accepted.

ii). All safety-related fasteners shall either: a) be manufactured, tested, and distributed in accordance with ASME Standard B18.18.3M, including the requirements of ASME accreditation or b) have a representative sample of each production lot of fasteners tested for conformance to purchase specifications by an independent laboratory accredited by the American Association of Laboratory Accreditation (A2LA), or approved equivalent. A production lot is defined as one size of fastener, from one manufacturer, and produced during one continuous production run. Fasteners not meeting this definition of production lot shall be treated as separate lots. Testing shall be performed using sample quantities as proposed by the Contractor and approved by Amtrak. Tests conducted shall confirm that fastener material meets specified chemistry, strength and manufacturing method requirements. The purchaser shall obtain certified test results from the testing laboratory and the Contractor shall obtain and hold the documents for a period of not less than the expiration of the warranty period of the last vehicle accepted.

iii). All structural or safety-related fasteners that have been subjected to processes introducing the risk of hydrogen-embrittlement must have certification of hydrogen-embrittlement testing. The certification must be based on a representative sample of actual production fasteners that have been tested for hydrogen embrittlement following SAE USCAR 7 procedures. The plating process must be certified to ASTM F519 procedures. An ASTM F606/F606M wedge test sample may be used in place of the ASTM F519 standard samples. Test loads must be a minimum of either proof load or 80% of ultimate tensile strength and held for a minimum of 168 hours. If any failures occur the entire lot shall be rejected.

iv). All structural bolts, nuts and washers for undercar equipment shall be a minimum Grade 8 and the bolt diameter shall be no less than 0.375 in., regardless of design load. Stronger fasteners shall be used if the application requires. The mounting and attachment bolts for undercar mounted equipment and equipment support structures or brackets shall be sized to the design strengths required plus an appropriate safety factor. Undercar mounted equipment shall be supported by brackets or other structures whenever possible. Bolts or screws used for structural connections shall have full size bodies in areas subject to bearing and/or shear loads.

v). Drawings containing all dimensions, standards, plating and any other requirements for the fastener shall be provided for all structural or safety-related fasteners. For fasteners of similar design with the same properties a schedule drawing showing each part number, and its specific requirements

maybe provided. Drawings for structural or safety-related fasteners shall be provided prior to delivery of the first cars to Amtrak.

e). Decorative and Appearance Fasteners

i). All interior fasteners exposed to view shall be limited whenever possible and be either bright or finished to match the surfaces being joined and installed such that the fastener head is flush with the mating surface. The fastener head shall be tamper-proof. Bright finished fasteners used for stanchions shall be austenitic stainless steel. Bright finished interior fasteners may be either austenitic or plated martensitic stainless steel. Type A sheet metal screws shall not be used. Amtrak reserves the right to approve all exposed fasteners in the customers view.

ii). All exterior fasteners visible to passengers shall be austenitic stainless steel for steel, High Strength, Low Alloy (HSLA) steel and stainless-steel car bodies. Exterior aluminum shall be joined by austenitic stainless steel or aluminum alloy fasteners, as appropriate to the design and appearance requirements. Fasteners used on the side sill to attach heavy equipment brackets shall be considered structural fasteners.

iii). All fasteners used to secure access covers or panels to equipment boxes or interior panels shall be made captive to the panel in which they are used. Where access for service is expected more often than every five years, access panels shall be equipped with stainless steel draw-down latches. Quarter- turn fasteners shall have a minimum shank diameter of 0.25 in. and be of adequate strength.

iv). All decorative and appearance fasteners shall have documentation that identifies the manufacturer, base material, plating or finish if applied and the fastener type. The Contractor or supplier shall maintain this documentation on file for Amtrak to review for a period of not less than the expiration of the warranty period of the last vehicle accepted.

f). Torquing

i). All safety-related fasteners, including truck and brake equipment bolts and all fasteners exposed to fatigue loads, shall be torqued to industry standard torque values for the size and grade of fastener and "torque striped" after torquing by paint or other approved means. All other fasteners shall be torqued to a value appropriate to the application, so that they do not loosen in service.

g). Washers and Lock Washers

i). Appropriate grade flat washers, conforming to ASME B18.21.1 or ASME B18.22M, shall be used under the heads of all bolts and under all nuts where enlarged holes, slotted holes or soft mating metals are being fastened.

Where high strength fasteners are applied, flat washers shall be hardened and comply with ASTM F436/F436M.

ii). Helical lock washers shall not be used. If applicable, prevailing torque nuts or standard nuts with the use of appropriate Loctite or equal thread locking compound shall be used for these applications.

iii). Other types of washers, including Belleville, NORD-Lock, or Nomel washers, may only be used for special applications with Amtrak's approval.

h). Rivets and Lock Pins

i). Rivets and lock pins exposed to passengers or crew shall be austenitic stainless steel or aluminum, as appropriate to the materials being joined. Structural steel rivets shall conform to ASTM A502-03 or ANSI B18.1.2 Standards. Rivets may be hand driven when hot and shall completely fill the rivet holes. Rivets driven cold shall be mechanically driven. Exposed heads shall be concentric with the shank and free from rings, fins, pits and burrs.

ii). Swage-locking (Huck bolt type) fasteners shall conform to Military Specification MIL-P-23469/1B. All rough surfaces of the collar end of these fasteners shall be machined or ground smooth where accessible to passengers, crew or maintenance personnel.

i). Plating of Fasteners

i). All carbon, alloy and martensitic steel fasteners shall be plated with zinc with clear or yellow chromate finish, unless specifically waived by Amtrak.

ii). Zinc plating shall conform to ASTM B633-07, Type VI, Hexavalent Chromium Free.

iii). Requests for alternative coatings must be submitted to Amtrak for review and approval.

iv). The Contractor shall submit qualification results for each process used at each subcontractor applying the proposed coating, as noted below.

v). Any request for alternative coating shall, as a minimum, include:

(1) coating manufacturer's product data including required thickness,

(2) ASTM B117 test results from an accredited third-party laboratory,

(3) documentation of torque/tension characteristics, and

(4) supporting documentation from the coating manufacturer regarding the propensity for the coating process to cause hydrogen embrittlement of the fastener during coating.

vi). Regardless of the coating's propensity for hydrogen embrittlement, each lot of high strength fasteners, including OEM zinc or yellow chromate plated bolts (Grade 5 or Metric Grade 8.8 or higher) shall be tested for hydrogen

embrittlement. Each lot of lower strength fasteners shall be tested for hydrogen embrittlement if the coating has the possibility of causing hydrogen embrittlement. If the proposed coating results in a change in the K-value for the plated fastener to outside the range of 0.13-0.15, as defined by Industrial Fasteners Institute Standard IFI-543, the Contractor shall use the alternate coating on all fasteners within the particular LRU. The LRU shall contain an indelible label identifying the coating type used within the LRU and the required torque values for each size fastener used therein. Fasteners internal to a subcomponent within an LRU may use the standard coating system if they are not subject to removal during Amtrak's maintenance activities. Alternative coatings shall not be used unless specifically approved by the Project Manager.

j). Bolt Holes

i). All bolt holes shall be accurately located and aligned, and when necessary, during assembly, holes may be reamed round to a specified size in position, as approved by Amtrak. Bolt hole clearances shall not exceed the Industrial Fasteners Institute's requirements. Slotted hole size for length, width, and edge distance should follow industry standards.

19.6 Stainless Steel

a). General

i). Contractor shall provide structural stainless steel that complies with the following requirements:

(1) Austenitic stainless steel shall meet the Certification Provisions of ASTM A666.

(a) Structural applications: Contractor shall test for susceptibility to intergranular corrosion in accordance with ASTM A262:

(i) Practice A: Shall be used to accept material only.

(ii) Practice E: Required for final determination of acceptance or rejection of material that is not acceptable by Practice A.

(2) Any connected or abutting visible metal parts will be of a matching metal (aluminum or stainless steel) in single grade and should match in color and finish, unless specifically called for to be contrasting in the specification.

(3) Sustainability

(a) As stainless steel is one of the most predominately materials over the car body the upmost efforts must be main to ensure sustainable sourcing.

(b) The stainless-steel supplier shall optimize the use of green energy and maximize the percentage of recycled material while maintaining all material composition and strength requirements.

(4) Duplex stainless steel may be used only with specific Amtrak approval:

(a) General requirements:

(i) As per ASTM A480/A480M

(ii) When CVN impact tested, based on lots, shall have minimum absorbed energy of 27 J (20 ft-lb) at -29 C (-20 F)

(b) Structural applications:

(i) Test for susceptibility to intergranular corrosion in accordance with ASTM A923:

1. Practice A: Use to accept material only.

2. Practice C: Required for final determination of acceptance or rejection of material that is not acceptable by Practice A.

(ii) Where duplex stainless steels are welded to other structural steels, paint the less-noble steel with weld-through primer.

(5) Structural components assembled by fusion or resistance welding:

(a) Specification and composition of austenitic stainless steel shall conform to:

(i) AISI type 201L, 301L, 301LN or SUS301L (with Nitrogen), 316L

(ii) ASTM A666 requirements, except that the carbon content shall not exceed 0.03% and type 301LN and SUS301L (with Nitrogen) shall not exceed 0.25% nitrogen.

(b) Austenitic Stainless steel used in structural applications covered by the Specifications shall also conform to APTA PR-CS-S-004-98.

(6) Other stainless steels conforming to ASTM A666 are acceptable for non-welded applications.

(7) Use:

(a) Contractor shall comply with uses as permitted throughout the Specifications.

(b) Austenitic and duplex stainless steels may be unpainted.

(c) Unpainted austenitic or duplex stainless steels exposed to passengers shall be a single grade in which both the color and surface finish of abutting pieces shall match, except where the design specifically calls for contrasting appearance.

b). Testing

i). Tensile strength shall be determined with a testing machine having a maximum head speed of one-half inch per minute. The bend test shall be made with the axis of the bend parallel to the direction of rolling; after bending, no cracks shall be visible to the naked eye. Gauge (thickness) tolerances of materials shall be in accordance with standard industrial tolerances.

c). Flatness Tolerance

i). Coil stock shall meet standard mill flatness tolerances, unless otherwise specified. Sheet stock shall be of stretcher-leveled quality. The camber of the sheet stock shall not exceed 0.25 in. in 8 ft.

d). Finishing Methods

i). Unless otherwise specified, all smooth surfaces exposed to passengers shall be given a medium-grit finish on the exposed side. Grain shall be in a direction to suit the decorative treatment in the interior of the car and shall be specified on the component drawings. Alternate finishes shall be submitted to Amtrak for approval.

ii). 120-180 grit finish on interior and exterior surfaces (#4 Brushed Finish), 30 Ra µin MAX.

e). Surface Treatment

i). All stainless-steel portions which contribute to the car aesthetics such as car shell or interior fittings shall be treated with a nitric or citric acid passivation bath.

(1) Passivation medium, concentration level and duration of treatment, as well as the rationale for selection, shall be proposed by the Contractor for review and approval by Amtrak. **[CDRL 19-04]**

(2) Waivers from passivation may be granted on a case-by-case basis excepting carshell components which cannot be exempted from passivation.

ii). Stainless steel shall be cleaned in accordance with American Society for Testing and Materials (ASTM) A380. Post passivation testing shall be

performed in accordance with ASTM A967. Test results, as well as visual approval of the aesthetics of the FAI pieces, shall be subject to Amtrak review and acceptance. The approved FAI piece shall form the basis of pass-fail acceptance criteria of all future vehicles.

19.7 High-Strength Low-Alloy (HSLA) Steel

a). General

i). HSLA steels shall be more than twice as corrosion resistant to atmospheric exposure as plain carbon steels, as measured by the ASTM G101 corrosion index. It is preferred that HSLA steels used for welded structure meet specified weld- and heat-affected zone toughness requirements without post-weld heat treatment or heat-generated stress relief. As a minimum, HSLA steels shall conform to ASTM A572, ASTM A588, ASTM A606 - Type 4, ASTM A1008 or A1011- Grade A or 70 or ASTM A710, Grade A, Class III.

ii). Exposed sheet steel shall have a smooth surface free from pitting. Mill test reports for each heat of steel used in the construction of these vehicles shall be retained on file by the Contractor, shall be available for inspection by Amtrak upon request and shall be submitted with the vehicle history book.

iii). Heat treated parts made of HSLA steel shall be certified. A record of this certification, including hardness test results, shall also be retained on file and available for inspection by Amtrak upon request.

19.8 Steel Castings

a). General

i). The Contractor shall be responsible for selecting casting grade, composition, strength, heat treatment, finishing, and design best suited for the intended application. As a minimum, steel castings for structural use, including cast-weld designs for truck frames and bolsters, shall comply with AAR M-201 Grade B plus 2% Nickel, with the following mechanical properties:

(1) Minimum tensile strength: 75 ksi (517 MPa)

(2) Minimum yield strength: 48 ksi (331 MPa)

(3) Elongation: Minimum 25% in 2 inches

(4) Reduction of area: Minimum 50%

ii). Design and testing of truck bolsters and side frames shall comply with AAR M-202 and AAR M-203, respectively. Cast steel to ASTM A27/A27M, grade 65-35, may be used for truck structure, bolster and center bearing arrangements as an alternative to the AAR M-201 material specified above.

iii). Coupler, drawbars, and anchors shall comply with AAR M-201, Grade "C", quenched and tempered.

iv). Pattern markings and serial numbers shall be applied in a manner that does not impair the casting strength. If castings are found to be non-conforming to requirements determined by the design qualification castings, the material shall be repaired, retested, and re-inspected or destroyed at the Contractor's expense.

v). Qualification Test: The quality of steel castings shall be checked in accordance with the requirements of AAR M-201. The contractor shall perform a Qualification Test on one casting, selected by Amtrak, from the first lot of production castings to verify the casting design. The Contractor shall have radiographic testing performed per ASTM E94 or E1030 using reference radiographs from ASTM E446- or E186, as may be applicable. The radiographic sensitivity shall be at least 2% (2- 2T) for sections >3/4 in. thick and (2-4T) for sections ≤3/4". Acceptance levels for the radiographic testing shall be submitted to Amtrak for review and approval. The surface quality of the steel castings shall be evaluated in accordance with ASTM A 802/802M. Radiographs resulting from the Qualification Test shall be made available to Amtrak for review.

vi). Welding: All weld repairs shall be qualified in accordance with the requirements of AWS D15.1 or ASTM A488/A488M. When castings are found to be unacceptable, they shall be repaired in the original factory of manufacture prior to shipment or by another repair process approved by Amtrak. Castings requiring repair or modification by welding after completion of heat treatment may be stress relieved locally by using electrically controlled heating to not greater than 1,150°F, followed by slow cooling. Manual torch stress relief shall not be permitted. For cast-weld designs, the entire length of all welds on any welded assembly of several separate castings selected for design qualification shall be radiographically inspected to ASTM E94/E94M using reference radiographs from ASTM E390.

vii). The Contractor shall prove the quality of castings by either destructive or 100% radiographic inspection. Following the establishment of a satisfactory procedure, quality control shall be maintained by testing one or more of each lot at a frequency to be determined by Amtrak, the Contractor and the subcontractor. This frequency shall be influenced by the critical requirements of the part.

viii). Steel castings used in locations not specifically referred to shall be selected by the Contractor or its subcontractor for composition and characteristics best suited to the application but shall be subject to review by Amtrak.

b). Heat Treating

i). Where physical strength is gained by heat treating, a physical test shall be conducted on each treating charge of each heat of castings. Where more than one heat is represented in a treating charge, a physical test shall be conducted on each heat represented in each treating charge.

ii). All steel castings used in the truck structure shall be made of electric furnace or controlled open hearth steel and shall be heat treated.

19.9 Aluminum

a). General

i). Aluminum alloy mill products shall be identified by designations prescribed by The Aluminum Association and shall conform to specifications contained in the Association's publication *Aluminum Standards and Data*. Aluminum alloy castings shall only be used for trim and for door thresholds. Such castings shall conform to ASTM B26, B85 or B108 for, respectively, sand, die or permanent mold castings. Aluminum alloy forgings shall conform to ASTM B247-02a. Copies of all test reports for sheet, extrusions, and forgings used shall be retained on file by the Contractor, shall be available for inspection by Amtrak upon request and shall be submitted with the vehicle history book.

ii). Unpainted aluminum used for interior surfaces exposed to contact by passengers and the crew shall have anodic coating, with a minimum coating thickness of 0.0004 in. and a minimum coating weight of 21 milligrams per square inch (mg/sq. in.) to protect the material.

(1) Color and coating type shall implement the Customer Experience Vision and CMF requirements of the contract and shall be subject to Amtrak approval.

(2) Scratched or damaged anodized aluminum components may not be repaired and delivered to Amtrak as part of the assembly.

iii). All aluminum surfaces of the car body, including not only surfaces in contact with dissimilar metals but also surfaces in contact with aluminum and surfaces not in contact with any materials at all, but excluding exterior uncolored surfaces, shall be cleaned and given one coat of zinc chromate primer or approved-equivalent.

iv). Aluminum used for heat sinks shall be nickel plated to minimize contact corrosion and surface pitting.

v). All interior Aluminum components, trims, and finishes shall utilize 100% recycled Aluminum wherever possible. Where virgin grades are required, production must incorporate the use of renewable energy.

b). Fabrication and Fastening

i). The forming of aluminum parts, their joining by bolting, riveting, and welding, and the protection of contact surfaces shall conform to the requirements of the Aluminum Company of America's (ALCOA) Technical Report Number 524 Specification Covering Use of Aluminum in Passenger Carrying Railway Vehicles, except as specified otherwise.

ii). The specific measures to be taken to prevent risk of contact and resultant possible electrolytic corrosion shall depend upon determination of the most suitable method which shall be adapted to the design involved, and the

following instructions are provided for general guidance. These instructions shall not supersede recommendations of the aluminum manufacturer.

iii). Aluminum alloy surfaces shall not be secured to, nor make direct metal-to-metal contact with, the surfaces of copper, brass, bronze, silver, nickel and nickel-plated parts or alloys thereof, lead, tin and ferrous materials. The surfaces of aluminum alloy parts secured to steel parts shall be protected with a one-part polysulfide sealant, zinc chromate paste, silicone sealant or Amtrak approved equal used as the joint compound. Alternatively, an insulating material shall be non-hygroscopic and, if fibrous, shall be impregnated with bitumen or other water-repellent substance.

iv). Wood shall not be placed in contact with aluminum alloy except with written permission from Amtrak.

v). Some form of surface covering, or insulation shall be provided for all bolts, rivets, securing clips and devices to prevent contact with the aluminum alloy, if the bolt or other device does not also consist of a compatible aluminum alloy. Stainless steel and carbon steel fasteners, including washers and nuts, plated in accordance with provisions of this Specification, shall be coated with a protective non-chromate paste before installation. Where possible, only the head and unthreaded portion of the shank of the bolt shall be in contact with the aluminum part when secured in place. Suitable bushings may be used in place of the protective non-chromate paste. Rivets driven hot shall be covered by a protective oxide coating due to the heating; but the method of riveting shall, if possible, always be with the formed rivet head in contact with the aluminum alloy.

c). Gauge

i). Aluminum sheet gauge size shall be in accordance with the American or Browne and Sharp Standard Gauge.

19.10 Elastomers

a). General

i). All elastomeric parts shall be of neoprene, or approved equal, unless otherwise specified. The elastomer shall be compounded and cured to perform satisfactorily in the temperature range specified. The elastomers shall have high resistance to ultraviolet and other solar radiation, weather, all Amtrak car washing fluids, and the longest possible life consistent with other specified characteristics. All elastomeric parts shall be resistant to ozone, oxidation, heat, oil, grease and acid.

ii). All resilient mounts shall be of natural rubber. Synthetic rubber compounds may be substituted for natural rubber only when approved for a specific application.

iii). All elastomeric parts are to be marked with the date of manufacture and shall not have aged more than 12 months when assembled into the vehicle.

b). Tests

i). All tests shall be conducted according to the latest revisions of the specified ASTM test procedures, unless otherwise specified. All resilient, natural rubber mounts and elastomeric truck suspension components shall be tested in accordance with the performance requirements for the following and must be provided by the manufacturer: ASTM D2240-05, ASTM D412-06ae2, ASTM D1149-07, ASTM D573, ASTM D395-03.

ii). (Method B), ASTM D624-00 (die C) and ASTM D746-07. All joints shall be vulcanized. The durometer hardness shall be suitable for the construction and conditions specified.

iii). Unless otherwise agreed by the Contractor:

(1) ASTM D412-06ae2 tensile strength shall be 1500 psi (min.)

(2) ASTM D412-06ae2 elongation for sheet material shall be 300% (min.)

(3) ASTM D412-06ae2 elongation for extruded material shall be 275% (min.)

(4) ASTM D573 loss in tensile strength shall be 15% (max.) when subjected to 168 hours at 158°F.

(5) ASTM D1149-07 shall have no cracks when subjected at 100 parts per hundred million (pphm) at 104°F for 100 hours and a specimen elongation of 20%.

iv). The test specimens shall be cut out from the extruded material, and at least one tensile strength and elongation test and one accelerated aging test shall be made on the material used for each order. If the compound or cure, or both, are changed during the production of material for one order, at least one test of each type shall be made for each different batch.

v). The ozone resistance of the elastomer shall be tested in accordance with ASTM Standard D1149 using an ozone concentration of 100 ppm, an exposure time of 100 hours at 100°F, and a specimen elongation of 20%. The elastomer shall not exhibit any cracks during the test period.

c). Life Expectancy

i). For all parts made by vulcanizing an elastomer to metal, any premature failure (less than five years) between metal and the elastomer or in the elastomer, occurring when the parts are used in normal service and according to the provisions of this Specification, shall be considered as having been caused by defect of materials or workmanship.

d). Metal Parts

i). Metal parts to which elastomeric material is vulcanized shall be made of SAE 1020 or 1045 hot-rolled steel, except for air brake equipment.

e). Bonding

i). The joining of elastomeric pieces shall be conducted by the hot vulcanization process. Bonding of elastomers shall not be allowed unless the Contractor submits the application, bonding procedure, and bonding agent technical data for approval prior to the purchase of any materials.

f). Truck Parts

i). Truck bumpers and snubbers shall be compounded to be resistant to abrasion, oil, grease and acid.

g). Air Brake Parts

i). Brake control system elastomer compounds shall be selected by the air brake supplier guidelines.

h). Glazing Strips

i). Glazing strips shall be of neoprene conforming to ASTM C542-05, or of rubber fulfilling fire safety requirements of this specification.

ii). The compounding of the rubber shall be such as to preclude discoloration or staining of neighboring areas, particularly from water drainage.

iii). Window glazing sections shall be service proven and constructed of high-quality elastomeric compounds containing neoprene subject to approval by Amtrak.

iv). Glazing strips and other elastomeric extrusions shall be continuous and made from neoprene or other compounds suitable for the purpose and shall be free of major defects of material or workmanship.

19.11 Glazing Materials

a). General

i). All window glass shall be provided with tints, screens, or other solar/thermal limiting measures as required by the Heating, Ventilation and Air Conditioning (HVAC) design. The tints shall not preclude passengers from being seen from outside the car or limit their vision when looking out the body side windows. The window glass shall meet Amtrak Specification 336 or be otherwise approved by Amtrak.

b). Safety Glass

i). All safety glass must meet the requirements of ANSI Z26.1, Table 1, Safety Glazing Material for Use Anywhere in Motor Vehicle. Where specified, safety glass must also meet the requirements for the following:

(1) FRA Type I as specified in 49 CFR 223 and 49 CFR 238

(2) FRA Type II as specified in 49 CFR 223 and 49 CFR 238

ii). Where FRA Type I or Type II glass is required, the glazing, its mounting to the vehicle, and the vehicle structure must meet the requirements for ballistic impact and large object impact as required by 49 CFR 238. All glazing performance requirements must be met both with and without the application of the glazing protective film. All safety glass must be of the laminated type.

iii). Flatness

(1) When an individual window of glass is laid on a truly flat surface, such as a surface plate, the glass shall not indicate a bow of more than 0.030 inch per linear foot.

iv). Dimensional Tolerance

(1) The overall dimensions of any window supplied shall not exceed ± 0.060 in. dimensional deviation. The thickness of individual pieces must be held within 5% of the specified thickness.

v). Overlap Tolerance

(1) The overlap of one laminate of the window with respect to the other at an edge shall not exceed 0.03125 in. Corners and burrs shall be ground smooth and all edges shall be treated in accordance with SAE J673, Edge No. 4.

vi). Color

(1) When new, there shall be no more than ± 4% variation in the color of individual windows of laminated sheet glass when examined over a white background.

vii). Haze

(1) All the laminates of the safety glass shall be so nearly free from haze that the laminated glass shall have approximately the same clarity as non-laminated plate glass of the same nominal thickness.

viii). Internal Contamination, Dirt, Specks and Scratches

(1) Occasional specks of foreign material and scratches are permissible, provided such specks do not exceed

(2) 0.020 in. in greatest dimension and scratches do not exceed a total of 3 in. in length and neither are within the central three-quarters area of the window. Amtrak reserves the right to determine which windows are to be rejected.

(3) The visual inspection criteria for laminated glazing shall be submitted for Amtrak approval as part of the glazing design review. **[CDRL 19-05]**

ix). Bond Separation

(1) The bond between two sheets of glass and the membrane shall be of such quality that when the glass is broken by twisting or by direct impact, there will be no separation between the glass sheets. Windows that contain un-bonded areas shall not be used.

c). Light Transmission

i). Average visible light transmission through clear safety glass must be a minimum of 85%.

d). Plastic Glazing

i). Plastic glazing must meet the requirements under ANSI Z26.1, Table 1, Item 4, Safety Glazing Material for use in Motor Vehicle only in Specific Locations. Where specified, safety glass must also meet the requirements for the following:

(1) FRA Type I as specified in 49 CFR 223 and 49 CFR 238

(2) FRA Type II as specified in 49 CFR 223 and 49 CFR 238

ii). Where FRA Type I or Type II glazing is required, the glazing, its mounting to the vehicle, and the vehicle structure must meet the requirements for ballistic impact and large object impact as required by 49 CFR 238. Material must be selected from Sabic “Margard,” Atohaas “Tuffak CM 2,” or approved equal, meeting 49 CFR 223. The installation must meet 49 CFR 238.113, Emergency Window Exits, and 49 CFR 238.221, Glazing.

e). Material Physical Properties

i). Plastic materials used in the glazing of side windows and door windows must meet the following requirements.

f). Strength

i). Samples must be prepared and tested according to 49 CFR 223 and 49 CFR 238 and ANSI Z26.1, Section 5.10, Impact, Test 10 (Dart Drop, Table 2 Heights). Samples must not shatter or break when subjected to the falling dart impact requirements of Test No. 10. The dart tip must be no more than 0.5 in. radius. Denting or marring of the surface of the tested piece in this test is permissible.

g). Light Transmission

i). Visible light transmission through clear plastic glazing must not be less than 85% in 0.125 in. thickness, 82% in 0.25 in. thickness, 80% in 0.375 in. thickness, and 78% in 0.5 in. thickness.

h). Color

i). Materials must have UV stabilizer additives to inhibit fading and loss of properties due to extended exposure to direct sunlight. When new, there must be no more than 4% variation in the color between lights of plastic material of a specified color and thickness, when examined over a white background, and measured by the appropriate light transmission or colorimeter inspection and test instruments.

i). Abrasion Resistance

i). Plastic glazing materials must be silicone-coated on both sides to increase resistance to abrasion. The coated plastic must meet ANSI Z26.1, Section 5.17, Abrasion Resistance, Test 17 (Plastics). The change in percent haze after 100 cycles must be less than 6%. The glazing material supplier must perform the following test prior to qualification: The plastic glazing material after 300 hours of weatherometer testing must pass abrasion resistance ANSI Z26.1, Section 5.17. This test must be performed for initial product certification and the results must be provided with drawing submittal.

j). Chemical Resistance

i). Samples must be prepared and tested per ANSI Z26.1, Section 5.19, Chemical Resistance, Test 19 (Non-stressed). The exposed fabricated edges of the test samples may be coated with the same material as the face surfaces by the manufacturer. In addition to the chemicals specified in this test, the test must include, but not be limited to, such cleaning solutions as dilute oxalic acid solution (3% by weight), half-strength Neleco Products Subway Soil Solvent – (one gallon Part 1 to 2 pounds Part 2, in 10 gallons water), and Electrosol. The exposure time of the test must be increased to 1-hour intimate contact with the test chemicals on the faces of the test sample. The contaminants must be either wiped or sprayed onto the coated faces of the test sample. Any tackiness, crazing, or apparent loss of transparency is cause for rejection. After immersion, a change in percent haze greater than 55, as measured by ANSI Z26.1, Section 5.17, Abrasion Resistance, Test 17, is cause for rejection.

k). Dimensional Tolerance

i). The overall dimensions of individual units as supplied must be within 0.030 in. of the nominal dimension specified. The thickness of the plastic materials must be within a tolerance of + 5% of the nominal thickness.

l). Flatness

i). When an individual piece is placed on a truly flat surface, such as a surface plate, the material must not indicate a bow of more than 0.030 inch per linear foot, in any direction.

m). Edge Work

i). All edges must be straight and perpendicular to the surface and must be sawed or routed and free of burrs in order to prevent cutting of the rubber glazing strips. Sharp corners must be removed around the entire periphery.

n). Optical Quality

i). Optical quality of the plastic glazing materials must be in accordance with ANSI Z26.1, Section 5.15.2.2, Visibility Distortion. No light and dark patches, existent over the entire area, may appear in the shadow of the unmasked area of the specimen before the specimen has been moved a distance of at least 14 in. from the screen.

o). Weathering

i). The plastic glazing material must pass the long arc Xenon lamp Weathering ANSI Z26.1, Section 5.16, Weathering, Test 16. No detectable cracks in the coating must develop when the specimen is strained 2%. Stress may be applied by imposing 6,000 psi loading, using a tensile testing machine.

p). Material Quality

i). Foreign Material and Inclusion Defects

(1) Foreign material and inclusion defects must not exceed the following limits:

(a) Less than 0.009 in.: Allowed to the extent that they do not constitute a severe defect such as clustering.

(b) 0.009 in. to 0.020 in.: Allowed up to 10 per square foot average over the area of the piece.

(c) 0.021in. to 0.050 in.: Allowed up to three per square foot average over the area of the piece.

(d) 0.051 in. to 0.065 in: Allowed one per square foot average over the area of the piece.

(e) 0.0651 in. to 0.15 in.: Allowed one per edge, only in the outer 25% of the piece.

(f) Above 0.15 in.: Not allowed.

(2) There must be no black speck clusters of three or more above 0.02 in. in a 1 in. diameter circle.

(3) Defects occurring in those areas of the lights that are covered by the glazing strips is not cause for rejection.

ii). Fibers and Scratches

(1) Fibers and scratches must not exceed the following limits:

(a) Less than 0.060in. in length: Allowed to the extent that they do not constitute a severe defect such as clustering.

(b) 0.061 in. to 0.125 in. in length: Allowed up to a maximum of two per square foot average over the area of the piece.

(c) 0.126 in. to 0.250 in. in length: Allowed up to a maximum of one per square foot average over the area of the piece.

(2) Greater than 0.250 in. in length: Not allowed.

(3) Fine scratches that are detectable only when viewed in bright back lighting are acceptable.

iii). Bubbles

(1) There must be no clusters of bubbles, no chain bubbles, and no bubbles larger than 0.030 in. in diameter. If present, bubbles 0.020 in. to 0.030 in. in diameter must have a minimum separation of 3 in. In any 2 in. diameter area of glazing material, there must be a maximum of four bubbles with diameter between 0.010 in. and 0.020 in.

iv). Apparent Runs

(1) Apparent runs must not exceed the following limits:

(a) Less than 0.125 in.: Allowed to the extent that they do not constitute a severe defect such as clustering.

(b) 0.125 in. to 0.250 in.: Allowed up to a maximum of four per square foot average over areas of piece but not to the extent that they constitute a severe defect.

(c) 0.251 in. to 0.500 in.: Allowed up to a maximum of one per square foot, if it does not constitute a severe defect.

(d) 0.501 in. to 1.00 in.: Allowed up to a maximum of one per edge, only in the outer 25% of piece area.

(e) Above 1.00 in.: Not allowed.

v). Orange Peel

(1) “Orange peel” in the surface is cause for rejection of the material.

vi). Marking

(1) All glazing shall be marked with proper identification in accordance with FRA 49 CFR Part 223 requirements. Each window shall be marked for identification by the supplier in legible letters 0.125 in. to 0.25 in. high in the lower right-hand corner as viewed from the inside of the vehicle. This identification shall be no closer than 0.375 in. to the edge. The identification shall give the product name, the manufacturer, the serial number and FRA Type designation. Markings shall be legible

and permanent for this application and shall be applied in such a manner so as not to reduce the integrity of the coating.

vii). Shipping

(1) The material shall be carefully prepared for shipping and shall be properly protected to prevent damage. If a pressure sensitive masking is used, it shall be easily strippable from the material and not leave a gummy or sticky residue.

q). Window Shades

i). Fire Resistance and Durability

(1) All shades, blinds and nets should meet the requirements for 14 CFR 25, Appendix F, Part 1, (Vertical test) Flame time ≤ 10 sec and Burn length ≤ 6 inches. As well as ASTM E 662-01 Ds (4.0) ≤200.

(2) The materials must display high dimensional nubility under extreme climactic conditions and fluctuations as well as high UV resistance and high degree of tear resistance and resilience.

ii). Certificates Required:

(1) GREENGUARD Gold

(2) STANDARD 100 Class IV by OEKO-TEX®

(3) Environmental Product Declaration (EPD)

(4) Health Product Declaration (HPD)

r). Sunshades

i). Quality and Composition

(1) Sunshades should block out glare and solar heat, while having a excellent rate of visibility in order to enjoy the view with the shade down, aiming for a visible light transmittance (vT) of 10%. Composition should be made up of 100% knitted polyamide or rPET with a metalized backing.

(a) Sunshades shall be installed on the Café, Diner, and Diner/Lounge.

s). Blackout Blinds

i). Blackout Blinds should be constructed of a weave with 1-2% openness and aim to have a vTlevel of 0%, by using a laminated back layer to block out visible light.

(1) Blackout blinds shall be installed on the Sleeper Cars and Coach Cars.

19.12 Luggage nets

a). Luggage nets should be made up of knitted polyamide with open round geometry and intergraded edging.

b). The material should have a level of dimensional stretch to allow for easy access storage by customers.

c). Material must meet all flammability, smoke and toxicity requirements of this specification.

19.13 Rubber Floor Covering

a). General

i). The rubber flooring shall be made of a synthetic rubber compound mixed with multi-colored speckles of the same material dispersed throughout the material thickness, with a semi-matte finish.

ii). Rubber floor covering shall meet ADA visibility and coefficient of friction requirements, with a static coefficient of friction of at least 0.6 on level surfaces and 0.8 on ramps, even when wet with both rubber and leather soled shoes.

iii). Rubber floor covering shall be non-staining, non-discoloring, and 100% non-oil extended.

iv). Only high-quality hard clay shall be used as filler.

v). No whitening (limestone) shall be used in the compound. At room temperature, the rubber flooring shall bend around a 0.75 in. (19 mm) diameter mandrel without breaking, cracking, crazing or showing any change in color.

vi). The rubber flooring material shall be fully homogeneous throughout and shall meet the requirements of ASTM F1344-04. Rubber flooring shall conform to the criteria below.

vii). The flooring shall meet TRRL Pendulum Dry 91 Wet 29.

b). Sustainability

i). The raw material should be sourced from suppliers who adhere to ethical and sustainable practices.

ii). The rubber flooring must contain a minimum of 15% recycled content.

c). Thin Skinned Blister

i). A thin-skinned blister is a blister, which when finger-pushed, will collapse upon itself. Thin skin blisters of the indicated sizes will be permitted as follows and shall be repaired as indicated:

(1) Maximum Size – 0.030 in. (0.8 mm) height, 0.80 in.^{2} (5.2 cm^2) area with longest dimension of 2 in. (51 mm).

(2) Maximum Population – 3 blisters in a 12 in. (30.5 cm) by 12 in. (30.5 cm) area, and there shall be only one other blister within 3 ft (0.91 m) of this area.

(3) Repair Method – using a hypodermic needle, apply just enough Super Bond 420 or Bostik 1685 to bring to a flush surface.

d). Thick Skinned Blister

i). A thick-skinned blister is a blister, which when finger-pushed, will collapse and then return to its original condition. Thick skin blisters of the indicated sizes will be permitted as follows and shall be repaired as indicated:

(1) Maximum Size – 0.030 in. (0.8 mm) height, 0.80 in.^{2} (5.2 cm^2) area with longest dimension of 2 in. (51 mm).

(2) Maximum Population – 3 blisters in a 12 in. (30.5 cm) by 12 in. (30.5 cm) area, and there shall be only one other blister within 3 ft (0.91 m) of this area.

(3) Repair Method – no repair authorized.

e). Lumps

i). A lump is a blister without a void, consisting of solid material. Lumps of the indicated sizes will be permitted as follows and shall be repaired as indicated:

(1) Maximum Size – 0.030 in. (0.8 mm) height, 0.80 in.^{2} (5.2 cm^2) area with longest dimension of 2 in. (51 mm).

(2) Maximum Population – 3 lumps in a 12 in. (30.5 cm) by 12 in. (30.5 cm) area, and there shall be only one other lump within 3 ft (0.91 m) of this area.

(3) Repair Method – no repair required.

f). Holes

i). A hole is a defect, which is 100% through the material. Holes of any size or population will not be permitted nor shall holes be repaired.

g). Thin Area

i). A thin area is a defect where the sheet is below thickness locally. Thin areas of the indicated sizes will be permitted as follows and shall be repaired as indicated:

(1) Maximum Size – 0.030 in. (0.8 mm) deep at the lowest point, 3 in.^{2} (19.4 cm^2) area with the longest dimension of 5 in. (127 mm).

(2) Maximum Population – one thin area in a 40 in. (1 m) by 40 in. (1 m) area, and there shall not be another thin area within 3 ft (0.91 m) of this area.

(3) Repair Method – rub with #00 steel wool to blend this area into the normal thickness material and then buff to a normal surface finish.

h). Color and Marbling Distribution

i). Tolerances for color and marbling variation shall be submitted to Amtrak for approval during preliminary design review. If the base coloring is not within 5% between production runs, or the marbling is not consistent over the entire surface, the roll shall be rejected.

ii). Additives should provide UV resistance to prevent fading or discoloration from sunlight exposure through windows. Pigments must withstand cleaning chemicals without bleeding or loss of color.

19.14 Paneling

a). Plymetal

i). The term "plymetal" as used in this Specification covers metal-faced plywood and shall conform to the following requirements when tested per ASTM D2718 and ASTM D3930:

Test Conditions	Minimum Metal to Wood Average Shear Value (or 80% Wood Failure)
Dry shear	250 lbf/in.^{2} (1.7 MPa*)
Boil shear, 3-hour boil, tested wet at room temperature	150 lbf/in.^{2} (1 MPa) – Flat, non-textured sheet 60 lbf/in.^{2} (0.4 MPa) – Textured sheet
Soak shear, 48-hour soak wet at room temperature	150 lbf/in.^{2} (1 MPa) – Flat, non-textured sheet 60 lbf/in.^{2} (0.4 MPa) – Textured sheet
Creep or cold flow, under static load for 48 hours, at room temperature	250 lbf/in.^{2} (1.7 MPa)
* **MPa** = Megapascal	

ii). Plymetal that is faced with melamine shall have the melamine bonded to the metal sheet in accordance with this Specification, and the melamine-faced metal sheet shall then be laminated to the plywood core in accordance with this Chapter. Melamine shall be pressure bonded to marine grade plywood using industry approved adhesives. No contact bonding of melamine to plywood is permitted. The term "cored panels" means honeycomb panels bonded to melamine or to metal faced hardboard (similar to Metalcomb, as

marketed by Cored Panels, Inc., Farmingdale, New York). Such panels must comply with United States Department of Agriculture Forest Products Laboratory Report No. 1937, Shear-Fatigue Properties of Various Sandwich Construction.

iii). All exposed edges of the panels shall be covered in a fireproof manner.

iv). Plymetal prohibited for use in flooring.

b). Plywood

i). All plywood shall be manufactured to conform to the requirements of NIST PS 1, and then stored under cover. All plywood panels shall be formed from one piece and shall be sealed with two coats of epoxy paint on all edges and cutouts as soon as possible after fabrication. All exposed edges of the panels; joints between panels, fastener heads and openings of panels used in areas accessible to moisture shall be waterproofed and sealed in accordance with MIL-P-8053, paragraph 3.4, prior to installation in the car.

c). Honeycomb Panels

i). The term "honeycomb panels" as used in this Specification refers to an assembly of honeycomb material bonded to melamine-faced metal panels or to metal panels. Aluminum honeycomb core material shall be commercial-grade meeting the requirements of MIL-C-7438G per AMSA-81596 and shall meet the requirements of AMS-C-7438. Bonding shall be sufficient to develop the full strength of the honeycomb material. Stainless steel honeycomb panels shall be constructed in accordance with the requirements of MSFC-SPEC-445. The adhesive bond strength of the honeycomb core to the stainless-steel face shall not be less than 15 lb/in. (2.68 kg/cm) climbing drum strength when tested in accordance with SAE-AMS-STD-401. The adhesive bond strength of the integral stainless frame to stainless steel face shall not be less than 30 lb/in (13.6 kg/2.5 cm) climbing drum strength when tested in accordance with SAE- AMS-STD-401. Stainless steel honeycomb panels shall be tested in accordance with SAE-AMS-STD-401 to demonstrate the following requirements. Test results shall be subject to Amtrak review and approval.

(1) Core shear yield at 200°F (93°C) 250 lbf/in.^{2} [1.72 Megapascal (MPa)]

(2) Flatwise tension at 200°F (93°C) 250 lbf/in.^{2} (1.72 MPa)

(3) Beam flexure at 200°F (93°C) 75,000 lbf/in.^{2} (517.13 MPa)

(4) Core shear fatigue at R.T. 150 lbf/in.^{2} @ 106 cycles (1.03 MPa)

(5) Flatwise tension at R.T. 250 lbf/in.^{2} @ 106 cycles (1.72 MPa)

(6) Beam flexure at R.T. 50,000 lbf/in.^{2} @ 106 cycles (344.75 MPa)

ii). Honeycomb panels meet the relevant flammability and smoke emission requirements. Results shall be subject to Amtrak review and approval. No other honeycomb materials will be permitted.

d). Melamine-Faced Aluminum

i). Melamine-faced aluminum panels shall be constructed by laminating melamine to aluminum sheets as follows: The melamine impregnated papers shall be directly molded to the aluminum sheets at temperatures of no less than 270°F (132°C) and pressure no less than 1000 psi (6.9 MPa). The surface characteristics, after manufacture, shall be no less than that required of type GP (General Purpose) in the NEMA Standards Publication No. LD-3. The melamine and the required binder sheets shall be 0.020.

ii). ± 0.005 in. (0.51 ± 0.13 mm) thick. The aluminum sheets shall not be less than 0.025 in. (0.64 mm) in thickness when used as a facing on plywood. The aluminum sheets shall not be less than 0.081 in. (2.1 mm) in thickness when not laminated to a substrate such as plywood. Aluminum sheets shall be properly cleaned by etching, sanding or other approved process to ensure full, permanent, acceptable adhesion.

iii). The use of any adhesives to bond the melamine sheets to the aluminum backing will not be acceptable. The bond between the melamine and aluminum sheets shall, as a minimum, meet the following requirements:

ASTM D952 Internal Bond	2,600 lbf/in.^{2} (17.9 MPa)
ASTM D790 Flexural Strength - (S)	with grain: 26,500 lbf/ in.^{2} (183 MPa) crossgrain: 25,300 lbf/ in.^{2} (174 MPa)
ASTM D790 Modulus of Elasticity - (E)	with grain: 2.8 x 106 lbf/ in.^{2} (19.3 GPa) crossgrain: 3.1 x 106 lbf/ in.^{2} (21.4 GPa)
ASTM D638-08 Tensile strength	with grain: 22,300 lbf/ in.^{2} (154 MPa) crossgrain: 20,300 lbf/ in.^{2} (140 MPa)

e). Melamine Panels

i). Unbacked melamine panels may be used in the vehicle interior. The panels shall be a minimum of 0.125

ii). ± 0.005 in. (3.2 ± 0.1 mm) thick. The surface characteristics shall be no less than that required of type GP (General Purpose) in the NEMA Standards Publication No. LD-3. Sidewall panels shall be of unbalanced melamine. However, ceiling panels located under air ducts must be balanced melamine to prevent warpage from duct condensation.

f). Phenolic Composite Floor Panels

i). Phenolic composite floor panels shall be designed to withstand the following physical requirements with no visible or audible indications of delamination of the panel skin from the core and permanent deformation of the top surface shall be less than 0.010 in. (0.25 mm) unless otherwise specified. There shall be no puncture or damage to fibers of the top surface. There shall be no separation of any internal core from the top or bottom skin. There shall be no fracture of the balsa core.

(1) Indentation Resistance – The floor panel shall withstand a concentrated load of 300 lbs. (136 kg) applied to a test dowel that has an overall 0.375-sq in.^{2} (242 sq. mm^2) surface area, with a 0.0625- in. (1.6 mm) radius on bottom edge of test dowel.

(2) Static Load Test – Average Loading – A representative sample section of the flooring (without rubber floor covering attached) shall be supported on beams spaced at the maximum spacing used on the car using production bonding and fastening techniques. A uniformly distributed load in accordance with the crush loading requirements of Chapter 2 shall be applied to both sides of the joint (butt and/or shiplap). There shall be less than 0.088-in. (2.2 mm) deflection.

(3) Static Load Test – Maximum Loading – Using the identical floor panel-mounting configuration as described above, a uniformly distributed load of 200 lb/ft^2 (976 kg/m^2) shall be applied to both sides of the joint (butt or shiplap).

(4) Small Area Static Load Test – Using the identical floor panel mounting configuration as described above, a 300 lb (136 kg) load shall be applied to a 1.0 in. (25.4 mm) by 3.0 in (76 mm) contact area directly over the midspan, 6 in. (152 mm) from the outer car body sidewall edge. The footprint shall be machined flat within 0.010 in. (0.24 mm) and the edges shall have a radius of not more than

(5) 0.125 in. (3.17 mm) – There shall be less than 0.200 in. (5.08 mm) deflection as a result of the load applied.

(6) Small Object Impact Test – Using the identical floor panel mounting configuration as described above, a 16 lbs. (7.26 kg) standard bowling ball shall be raised directly over the mid-span, 24 in. (610 mm) from the edge of the panel and dropped from height of 60 in. (1500 mm). Permanent deformation of the top surface shall be less than 0.0625 in. (1.587 mm).

(7) Large Object Impact Test – Using the identical floor panel mounting configuration as described above, a 150 lb (68 kg) load shall be dropped upon a 3.0 in. (76 mm) by 8.0 in. (200 mm) contact “footprint” pad located directly over the midspan, 24 in. (610 mm) from the edge of the panel and dropped from a height of 12 in. (305 mm). The “footprint” pad shall have a rubber pad on the downside surface with a Shore D 70 minimum, at a 1.00 in. (25.4 mm) thickness machined flat within 0.060 in. (1.524 mm) with edges having a radius of not more than 0.030 in. (0.762 mm). Permanent deformation of the top surface

shall be less than 0.030 in. (0.762 mm). Some damage to the top phenolic composite skin will be allowed.

(8) Rolling Load Test – Using the identical floor panel mounting configuration as described above, a four-wheel cart with a load of 200 lbs. (91 kg) per wheel shall be rolled on the panels laterally, longitudinally and in a circular path 24 in. (610 mm) radius. The wheels shall be 3 in. (75 mm) in diameter, 1 in. (25.4 mm) wide with a 0.125 in. (3 mm) radius on each edge with a Shore A durometer of 80.

(9) Flammability and Smoke Emission Tests – Floor panels meet the relevant flammability and smoke emission requirements.

g). Acoustic Wood Paneling

i). Acoustic wood paneling provides a premium experience in the luxury suite, mitigating the high volume of auditory disturbance experienced within the train. The acoustic dampening properties combined with the real wood veneerers elevate this space to a luxury choice, reflecting the on-cost of ticket purchase and manufacture.

ii). Acoustic wood paneling structure should be made up of:

(1) Real wood decorative surface with an FR treatment (matching the wood used across the train)

(2) Laminated onto 16 mm MDF substrate (natural color)

(3) Balancing + black 100% PET felt paneling.

iii). Design details of spacing will be determined during design reviews.

iv). The material shall meet all flammability, smoke and toxicity requirements of this specification.

v). All wood must be FSC certified, backing materials will be comprised of recycled materials.

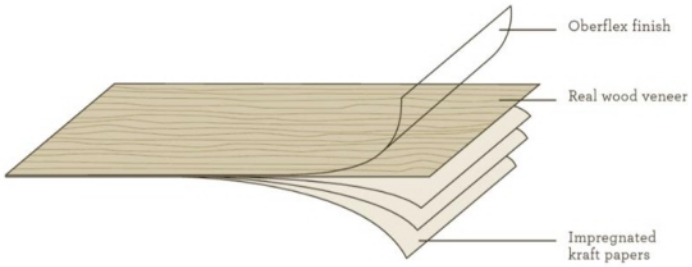
vi). Acoustic Performance

(1) The panels shall demonstrate sound absorption coefficients (αw) of at least 0.95, determined through accredited lab testing in accordance with ISO standards.

(2) Absorption values for common frequency ranges shall meet or exceed specified targets.

vii). Panel thickness shall be approximately 16-18mm. Weight shall be kept to a minimum while maintaining acoustic performance and durability.

viii). The panels shall stand up to common impacts and surface wear. Their decorative finish shall resist scratching, abrasion, and scuffing. Panels shall be repairable if damaged.



h). Real Wood Laminate

i). The laminate shall have a decorative real wood veneer surface with a satin finish, protected with a Tedlar Cap layer.

ii). The material shall meet all flammability, smoke and toxicity requirements of this specification.

iii). The laminate shall utilize FSC certified wood from responsibly managed forests. Adhesives and resins shall have low VOC content, per 40CFR59 Subpart C. It shall be recyclable at end of life.

iv). The application of the Tedlar cap will provide good abrasion, chemical and UV resistance to the material.

19.15 Woven Fabrics

a). The texture of fabrics on trains should be soft and comfortable to the touch, while also being durable and easy to clean. Woven fabrics for Amtrak cars must be breathable, moisture-wicking, temperature regulating, and comfortable to the touch. A composition of 60% Wool and 40% cotton is recommended to provide breathable, moisture wicking and natural antibacterial properties.

b). Sustainability

i). All raw materials should be sourced from suppliers who adhere to ethical and sustainable practices.

ii). Natural materials should be sourced organically, while synthetic materials should be made from recycled or renewable sources.

iii). Where possible OEM and suppliers should prioritize non dyed coloring to minimize processing and impact on the environment.

c). Fabrics must be fire-resistant, passing NFPA-130 seat upholstery, BSS 7239 FAR 25.853 (a) Appendix F, part 1. FR should not be affected by when exposed to liquids or conventional cleaning methods (wet shampooing or dry cleaning).

d). Woven fabrics must pass the abrasion ASTM D3884 test, passing <50% wear with 150 cycles of wear with a CS-10 wheel under a 1000 gram load. Tear resistance is defined by ASTM D2261 by applying a force of 15 lbf to a tear in the material in both the warp and fill directions. The test passes if the material does not tear

completely in either direction.

e). Burst/puncture resistance is defined by FTMS 191A Method 5122 and tested by applying a force of 200 lbf to the material. The test passes if the material does not burst or puncture under the applied force.

f). Anti stain treatment should be applied to ensure longevity and cleanability.

g). Dyes and finishing treatments must ensure UV resistance and color fastness.

19.16 Non-Woven Fabrics

a). Microfibre Cloth

i). The faux suede fabric shall have a soft, plush, supple texture and handle. It shall be made from a non-woven structure of fine microfibers to ensure it is lightweight, draping, stain resistant, and exceptionally durable. The composition should be made up of the following layers, totaling a minimum weight of 27 ounces per linear yard:

(1) FACE: 100% recycled polyester microfiber 0,15d

(2) INNER SCRIM: 100% recycled polyester 150d

(3) BACKING: 10% recycled polyester microfiber 0,15d and 90% polyester FR 0,50d

ii). Sustainability – As above, the composition of the cloth should come from predominantly recycled polyester with >60% over the finished article.

iii). The fabric shall meet all flammability, smoke and toxicity requirements of this specification.

iv). The fabric shall have a thickness of 1.2mm +/- 20% and demonstrate breathability.

v). The fabric shall withstand 200,000 double rubs per Wyzenbeek method and have a minimum breaking strength of 115 lbs. warp and 118 lbs. fill per ASTM D5034. It shall be resistant to sagging, crocking, pilling, and shrinking. The fabric shall be spot cleanable and machine washable for easy maintenance. It shall achieve grade 4.5 minimum for colorfastness to light and crocking per AATCC 16.3 and 8.

b). Acoustic Felt

i). Acoustic felt should be made up of 90% wool and 10% Nylon or 100 percent Trevera.

ii). Acoustic felt shall meet the same performance characteristics as microfiber.

iii). The fabric shall meet all flammability, smoke and toxicity requirements of this specification.

19.17 Seat Cushion and Upholstery

a). Cushion Material

i). The bottom seat cushion shall be molded polyurethane foam with an approved fire barrier material or silicone. It shall meet Amtrak Specification 665 or be otherwise approved by Amtrak. Indentation Force Deflection (IFD) measured at 25% compression of 50 ± 5 lbs., 3.5 +/-0.4 lbs./cubic ft. density with a support factor of 2.1 min or be otherwise approved by Amtrak.

ii). The back cushion shall be molded polyurethane foam meeting Amtrak Specification 665 or be otherwise approved by Amtrak.

iii). IFD measured at 25% compression of 33 ± 3 lbs., 3.1 ± 0.3 lbs./cubic ft. density with a support factor of 2.1 min. or be otherwise approved by Amtrak.

iv). The Engineer's and Assistant's seat in the Engineer's cab shall be silicone or a molded polyurethane foam with an approved fire barrier material.

v). Approved fire barrier fabrics are Tex Tech Industries TTI 8174 and DuPont Nomex 17253. Alternative fire barrier materials will be considered. Approval is contingent upon submittal of the following tests to Amtrak's Industrial Design group for review and written approval.

Test Identification	Test Description	Test Pass/Fail Criteria
ASTM D3884 (CS-10 wheel, 1000 gm wt.)	Abrasion Resistance	150 cycles @ 50% wear through
ASTM D2261	Tear Resistance	15 lbf (in both the warp and fill directions)
FTMS 191A Method 5122	Burst/Puncture Resistance	200 lbf

b). Lamination

i). All visible surfaces must be made from a tri-laminate panels. The laminate is a heat set polymer web adhesive (Min 0.9 OZ/SQ YD) that allows the fabric to bend and breathe easily. The durability of the laminate is a key performance requirement for Amtrak and each vendor submitting a bid must be able to demonstrate that they have at least two years of experience in manufacturing laminated textile panels, they have a quality control system to ensure repeatable performance, and their lamination panels have been tested under jounce and squirm conditions to 100,000 cycles with no visible delamination, puckering, crack marks, bubbles, or blisters. Tests must be conducted to Daimler Chrysler Test Specification PF-10254 Change A, S6.4 Jounce and Squirm or approved equivalent. Additionally, the laminate must meet the 12 second vertical burn flammability requirements of 14 CFR Part 25.853(a) Appendix F, Part I(1)(a)(ii) as defined in FRA 238.103 appendix B.

ii). Alternate materials may be suggested and must be submitted to Amtrak Industrial Design for initial approval.

c). Synthetic Leather

i). The grain of synthetic leather shall complement traditional top grain leather.

(1) It shall be a soft organic texture which shall approximate a top grain finish but without an animal hide appearance.

ii). The synthetic leather shall have a weight of approximately 410 Grams Per Square Meter and a thickness of approximately 1.15 Millimeters.

iii). Synthetic leathers should be comfortable and sustainable over the product lifetime, both in their material composition and longevity.

(1) All synthetic leathers should be primarily bio-based and where possible sourced from agricultural waste as opposed to potential food sources.

iv). Backcloths to be 100% bio-based, constructed of rayon along with a bio-based PU layer, achieving an overall bio-based content of >60%.

v). Requirements

Test Identification	Test Identification	Test Pass/Fail Criteria
ASTM D-3884	Abrasion	1000 cycles, 500g H-18 wheels. No wear through
AATCC 8	Colorfastness	Dry/Wet grade 5
ASTM D-4705	Stitch tear strength	23.85 lbf. Warp/Weft average
ASTM D-4157		300,000 Double Rubs
ASTM D-2261	Tear strength	

vi). Synthetic leather shall have the cushioning foam laminated to the back to achieve a soft feel.

vii). Material must meet the flammability, smoke and toxicity requirements of this specification.

viii). Color Accuracy

(1) The color differences between any measured production component and the accepted color sample for that component shall be less than ± 1 dE.

d). Top Grain Leather

i). All upholstery leather applications shall have a top-grain finish, ensuring a consistent color and texture devoid of any defects or imperfections. The thickness of the hide will be between 1.0 and 1.2 mm. Leather strap applications must use belting leather at a thickness of 2.8-3.2 mm.

ii). Leather should be sourced from suppliers who adhere to ethical and sustainable practices (i.e. minimize impact on water scarcity, run on renewable energy, reuse of waste material, etc.). The tanning process used to treat the leather should also be environmentally friendly.

iii). The leather must comply with smoke, toxicity, and flammability requirements of this specification.

iv). The leather should offer a superior and comfortable seating experience for passengers, with excellent breathability to ensure comfort during long journeys. It should withstand 60,000 cycles on the BS EN ISO 5402-1 (Flexometer Method) without cracking of the finish.

v). The color differences between any measured production component and the accepted color sample for that component shall be less than ± 1 dE.

vi). Durability and Maintenance

(1) The leather must exhibit resistance to regular wear and tear, as well as fading when exposed to sunlight. It should pass a 72-hour UV light exposure test with a score of 4 or better on the AATCC greyscale for color change.

(2) The leather should also have anti-stain treatments and anti-soiling properties to ensure easy cleaning and maintenance.

(3) The leather's color fastness will be tested according to ASTM D5053 (50 cycles wet & dry), and it must achieve a score of 4 or better on the AATCC greyscale for color change. The following standards must be met:

(a) Flex ASTM D 2097: 70,000 Flexes

(b) Elongation: ASTM D 2211: 30-50% at 50lb

(c) Slit Tear ASTM 2212: 15lb

(d) Tear strength: ASTM D 4705: 40 lb

(e) Abrasion ASTM D 7255: 4000+ cycles (CS-10 wheels), 300+ cycles (H-18 wheels)

19.18 Carpet

a). All carpets shall meet all flammability, smoke and toxicity requirements of this specification.

b). The carpets should be easily maintained with regular vacuums and cleaning products. The final construction of all carpets should work towards durability without significant wear for 8 years + Anti stain.

c). Wherever possible suppliers should use non-dyed yarns to minimize processing and use of dye, by utilizing naturally occurring colors such as natural whites, light

and dark greys. All polyamide (PA) to be Econyl® 100% recycled material.

d). Location and process for implementing seams must be implemented for approval.

e). All seaming plans must be submitted for Amtrak acceptance.

f). High Traffic Areas

i). Carpets for use in corridors, aisles and any other high traffic areas should be highly durable and easy to traverse with a suitcase, food cart or wheelchair.

ii). Quality and Composition

(1) Four colors: Yarn dyed carpet with a square woven, level loop pile construction, 100% PA Econyl®, with a low pile hight (approximately 0.106 inches). Total weight

(2) 49.95 oz. Per yd². Backing material to be 100% synthetic yarns, from recycled feedstock where possible.

iii). The carpet should be installed directly on to the floor surface, without an additional underlay.

g). Low Traffic Areas

i). These areas, such as sleeper cabins should have a luxurious feel and maintain a ‘new’ appearance over repeated use.

ii). Four color: Yarn dyed carpet with a square woven, level loop pile construction, high quality 90% wool, 10% PA Econyl®, with a medium pile height (approximately 0.177 inches). Backing material to be 100% synthetic yarns, from recycled feedstock where possible. To be used with an additional pad or underlay for comfort with a weight of 17.0 oz. Per yd².

iii). Total carpet weight minimum 66.5 oz. Per yd²

h). The carpet will have a stain resistant chemical applied.

i). The carpet will have a secondary, moisture resistant backing applied that will not delaminate. The thickness shall be nominally 0.09375 in. with a density of 18 lb/ft3, and a weight of 30 oz./yd2. The compression resistance shall be 5 lb/in.

j). The carpet shall be easily removable without extensive labor while eliminating the likelihood of damaging the floor paneling.

k). Carpet adhesive shall be submitted to Amtrak for approval.

l). Alternate carpet types may be submitted for review but must meet or exceed the performance requirements of this Chapter.

19.19 Counters

a). All counter surfaces shall be made from Amtrak approved materials. All countertop

material shall be made from FDA and NSF approved non-porous material.

b). All stainless-steel countertops shall be made from type 304 stainless steel with a thickness of at least 14 gauge. Stainless steel countertops shall have a brushed satin finish. All seams shall be finished to match the counters brushed satin finish. Counters shall be built in a manner that do not flex, deform, rattle or “oil can”.

19.20 Welding and Brazing

a). Responsibility

i). The Contractor shall be responsible for the quality of all welding and brazing. All welders employed in the making of welds on structures or products built under this Specification shall have been tested and qualified to determine their ability to operate the welding equipment to be used in making the types of welds required hereunder and to produce satisfactory welds therewith.

ii). All welding practices shall be according to requirements of AWS D1.1, *Structural Welding Code – Steel*; AWS D1.2, *Structural Welding Code – Aluminum*; AWS D1.3, *Structural Welding Code – Sheet Steel*, AWS D1.6, *Structural Welding Code – Stainless Steel*, AWS D15.1 Railroad Welding Specification for Cars and Locomotives, and the AWS Handbook. AWS Standard D1.1 shall apply to steel of ⅛-in. and greater thickness, and AWS Standard D1.3 shall apply to steel less than 0.125 in. thickness. Requirements for cyclically loaded structures shall be applied. Cast steel welding shall be according to AWS D15.1 or ASTM A 488/488M, *Steel Castings, Welding, Qualification of Procedures and Personnel*. Resistance welding shall be in accordance with AWS D17.2/17.2M, *Specification for Resistance Welding in Aerospace Applications*. Laser welding, if used, shall comply with AWS C7.2, *Recommended Practices for Laser Beam Welding, Cutting, and Drilling*.

iii). All welding practices not specifically covered in this Chapter shall be in accordance with the applicable requirements and recommendations of the American Welding Society (AWS). Should the Contractor propose an alternate standard, it shall be subject to Amtrak’s approval.

iv). All arc Welding Procedure Specifications (WPS) shall be fully qualified by the Contractor, accompanied by Procedure Qualification Records (PQR) containing welding test results, and subject to approval by Amtrak and a Certified Welding Inspector, welding engineer, or other individual qualified to review said documentation. The use of WPS qualified per AWS B2.1 shall not be permitted in their original form. WPS and PQR originally qualified per AWS B2.1 may be rewritten to conform to the requirements of the applicable structural welding code and used within the limitations of that code. Resistance welding schedule certifications and machine qualifications shall be submitted for review and approval by Amtrak along with the arc welding WPSs and PQRs.

v). Welders shall make only those welds for which they have been qualified according to the requirements of the applicable AWS code, ASTM A

488/488M, or other approved qualifying procedures. Records of welder qualification tests shall be made available for review.

b). Test Welds

i). Amtrak shall have the right to require an operator to make test welds to determine their ability to produce satisfactory welds of any given type. Amtrak shall also have the right to require the making of test welds to settle any question that shall arise as to the suitability of any welding method or procedure used during production. The recommendations of the AWS shall be followed in the making of tests and the settlement of other questions that may arise hereunder regarding welding practice.

ii). Fatigue allowable stresses shall not exceed the lesser of fatigue limits in AWS D1.1, or 50% of the joint strength level calculated from ASME maximum allowable stress values. Higher values shall only be used if qualified by Contractor tests.

c). Cleaning

i). Prior to welding, parts to be joined shall be properly cleaned of coatings and films such as rust, oxide, mill scale, oil, grease, corrosion products, and other foreign materials. Cleaning materials and processes shall be in accordance with applicable parts of Section 2, MIL-HDBK-132, *Protective Finishes*. Finished welds shall present a clean appearance.

d). Welding Rod

i). All welding rod, wire, electrodes or filler metal; shall be chosen by the Contractor or subcontractor with respect to manufacturer, type and size necessary to achieve the highest quality work. The Contractor shall have full responsibility for the character of the work produced. It shall be purchased in packages which shall be marked with the Manufacturer's name and the specification, diameter, and net weight of the material.

ii). The material shall be stored in accordance with recommendations of the AWS *Structural Welding Code* so as to protect it from damage, and so that it shall be easily identified. Material shall be issued and handled in such a way as to prevent it from being mixed with that of another specification.

iii). The ferrite number for austenitic stainless-steel welds shall be between WRC4 and WRC10, or as proposed by the Contractor and approved by Amtrak.

iv). In case a question arises regarding the suitability of welding rod, wire, electrodes or filler metal, the provisions of AWS Standard D1.1/D1.1M shall govern.

e). Control

i). Current, voltage, distance, flame, and other variables shall be so controlled as to give a smooth weld, free of gas pockets, oxide inclusions, variations in width and thickness, wandering and spattering.

f). Penetration

i). Penetration of weld metal into the bottoms of angles and vees and fusion, shall be complete. Weld metal shall run into the base metal at the finished surface of the weld in a smooth curve approximately tangent to the surfaces of the base metal to avoid sudden change of section and resultant concentration of stress. Undercutting shall not exceed 10% of the thickness of the thinnest element, or 0.030 in., whichever is less.

g). Warpage

i). The method of depositing weld metal shall be chosen so as to minimize warpage and locked-up stresses. Tack welding, skip welding, offset welding and other comparable procedures shall be used for this purpose.

h). Intermittent Weld Spacing

i). Intermittent fusion-weld spacing pitch shall not exceed 5 in. for 2-in. (minimum) weld lengths, such that a minimum weld length of 40% of the overall joint length is achieved. Exceptions may be granted, for example to avoid warpage in thin sheet, where the design exhibits sufficient strength with welds applied on larger spacing, subject to Amtrak review and approval.

i). Fusion Welding

i). Manual fusion welding by the gas process may only be used on sheets more than 3/32 in. (2.38 mm) in thickness. Any other application of this process must be approved by Amtrak.

j). Resistance Welding

i). Resistance welding shall be in accordance with AWS Standard D17.2/D17.2M Class B for structural applications and Class C for non-structural applications. Production witness testing requirements shall be followed unless specifically waived or modified by Amtrak in writing.

ii). Stainless steel parts shall be joined, insofar as possible, by resistance welding. Procedures shall employ accurate control of current, time, electrode size and shape, and tip force, to produce uniform welds of specified strength which shall not be subject to surface corrosion. Resistance welds in materials other than austenitic stainless steel shall be arranged to avoid tension or "peeling" forces on the welds under any anticipated loading condition.

iii). Spacing of resistance and spot welds shall be appropriate to the design. Spacing shall not exceed 2 in. plus twice the weld nugget diameter for any structural application, including car body side sheets. For any corrugation application, if the pitch of the corrugation nodes does not allow the above weld spacing, there shall be two spot welds between each node.

iv). Surface indentation shall not exceed 20% of material thickness (t) or 0.01 in., whichever is greater. However, for exterior resistance-welded areas exposed

to passenger view, indentation shall not exceed 10% of material thickness or 0.005 in., whichever is greater. For exposed welds, the Contractor shall vary welding parameters and conditions within their acceptable ranges to minimize indentations. Surface burn and discoloration shall be removed by chemical cleaning, or an approved equal method, and sanding or polishing to match the surrounding surface.

k). Special Welding

i). Procedures for structural welding of stainless steel to HSLA, or other combinations of metals or conditions not covered by AWS specifications or codes, shall be submitted for approval. Welding PQRs for these dissimilar welds shall include a Vickers microhardness traverse spanning both base metals, the weld metal and both Heat Affected Zones (HAZ) and shall demonstrate that the hardness does not exceed 400 HV.

ii). Austenitic stainless-steel electrodes or wire specifically intended for welding of dissimilar metals, such as 309L or 312L, shall be used to join carbon or HSLA steels to stainless steels.

iii). For the application of welding processes not addressed in other parts of this specification, the Contractor shall submit equipment qualifications, procedure qualification records, and welding procedure specifications either conforming to identified industry standards or consistent with the approach of AWS Standard D17.2/17.2M, *Specification for Resistance Welding in Aerospace Applications*.

iv). Standards that may apply to selected processes include:

(1) AWS Standard D17.3/D17.3M, Specification for Friction Stir Welding of Aluminum Alloys for Aerospace Applications.

(2) ANSI/AWS Standard C7.2, Recommended Practices for Laser Beam Welding, Cutting, and Drilling.

(3) ANSI/AWS Standard C7.4/C7.4M, Process Specification and Operator for Laser Beam Welding.

(4) ISO/DIS Standard 15609-4, Specification and Qualification of Welding Procedures for Metallic Materials - Welding Procedure Specification - Part 4: Laser Beam Welding.

v). Galvanized steel shall not be welded to stainless steel. Brazing shall not be used to join stainless steel to either stainless steel or to any other metals.

l). Toughness of Welded Assemblies

i). The Contractor shall prove all welded steel structures are above the ductile-brittle transition temperature for the specified environmental exposure. Specifically, the weld Heat-Affected Zone (HAZ) and base metal shall resist service impact loads at the lowest specified operating temperature without brittle failure. If the Contractor's approved design does not require greater

toughness, the minimum impact value for Charpy V-Notch (CVN) specimens shall be 20 ft-lbf of absorbed energy at the lowest specified operating temperature. CVN test results shall be submitted along with Procedure Qualification Records (PQRs) for all structural steel welding procedure specification (WPS) qualifications.

m). Torch Brazing

i). All brazing, characterized by heating above 840°F, shall follow the recommendations contained in the AWS *Welding Handbook*, Volume 2. Procedures and personnel who do brazing work shall be qualified in accordance with AWS Standard B2.2, *Standard for Brazing Procedure and Performance Qualification*.

n). Torch Soldering

i). All structural (not electrical) soldering, characterized by heating below 840ºF, shall follow the recommendations contained in the AWS *Welding Handbook*, Volume 2. Procedures and personnel who do torch soldering shall be qualified in accordance with AWS Standard B2.3/B2.3M, *Specification for Soldering Procedure and Performance Qualification*.

19.21 Exterior Marking Films and Graphics

a). General

i). Graphics shall be transportation grade materials, printed on opaque background with clear, vandal resistant overlayment. All graphics materials are to be approved by Amtrak. Application techniques shall be in accordance with manufacturer's recommendations.

b). Physical Properties

i). Shall be able to withstand long-term exposure to all environmental and operating conditions specified in Amtrak Specification 963.

ii). Lettering film shall be sufficiently opaque so that, when applied, films shall completely hide any contrasting background and shall be readily legible.

iii). There shall be an initial 60-degree gloss value of 40 when tested in accordance with ASTM Standard D523-08.

iv). Films shall retain adhesive properties after one week of continuous exposure to a temperature of 66°C (150°F).

v). Films shall be able to conform to moderate contours of the vehicle's interior and exterior surfaces at locations where decals are to be applied.

vi). Overall thickness of processed film shall be between 0.10 mm and 0.20 mm (0.004 and 0.008 in.).

vii). Films shall withstand immersion in either distilled water or SAE No. 20 motor oil for 24 hours at temperatures from 21°C to 32°C (70°F to 90°F) without any appreciable degradation in adhesion, color or general appearance.

viii). Marking films shall withstand effects of detergents and brushes used in vehicle washing procedures for removal of graffiti.

ix). Films shall use a removable grade adhesive that upon removal does not require use of solvents or secondary operations.

x). Square or rectangular graphics shall have rounded corners of suitable radius.

19.22 Paints and Coatings

a). Materials and General Requirements

i). Painting of the car shall serve to protect the vehicle from corrosion.

ii). Paint is prohibited on the interior of the car at customer facing areas, unless otherwise approved by Amtrak on a case-by-case basis.

iii). Paint coatings should also assist in the overall maintenance of the vehicle by providing easy to clean surfaces. The vehicle must be fully and properly coated to achieve its service life with regular maintenance intervals. Interior surfaces shall in general not be painted, with specific approval being required during Design Review.

iv). The surface preparation, primer, paint, and graphics applications shall ensure that the car can operate at least eight years between major exterior finish repairs or replacement.

v). Preparation of the painted surface and application of painting materials for brushing or spraying shall be in accordance with the paint supplier's recommendations. Each coat shall be uniformly applied over all surfaces to be covered, and shall be free from runs, sags, or other application defects.

b). Paint Process Documentation

i). The Contractor shall prepare a paint coating and application document containing procedures for surface cleaning and preparation, priming, surfacing, repairing, and painting for the car body and all equipment that is painted or powder coated.

(1) A detailed paint schedule showing the equipment painted, paint type and manufacturers, recommended thickness, and other pertinent information shall also be included.

(2) The document shall meet Amtrak Specifications 353 and 354.

(3) This document shall be submitted during IDR and FDR and shall be included in the maintenance manuals. **[CDRL 19-06]**

c). Painting Restrictions

i). Any equipment or parts of equipment which would be damaged or suffer impaired operation from painting shall not be painted and shall be corrosion resistant.

ii). The following items shall not be painted:

(1) Wire and cable

(2) Copper tubing, piping, and fittings

(3) Conduit and fittings

(4) Heat transfer surfaces

(5) Grounding pads and straps

(6) Wheels

(7) Axles

(8) Brake rotors

(9) Brake shoes and pads

(10) Air hoses

(11) Pedestal liners

(12) Elastomeric parts

(13) Grease fittings

(14) Linkages

(15) Threaded parts used for adjustments

(16) Electrical equipment

(17) Couplers, drawbars, draft gears, and yokes

(18) Wearing surfaces

(19) Corrosion Protection

(20) Stainless steel carbody

d). Color Accuracy

i). The color differences between any measured production component and the accepted color sample for that component shall be less than ± 1 dE.

e). Corrosion Protection

i). Concealed surfaces capable of rusting or oxidation shall be properly cleaned, then primed with a rust inhibiting paint, and painted with an approved finish coat of paint.

ii). All exposed surfaces shall be suitably finished to prevent corrosion during storage and operation, in accordance with the following requirements:

(1) Areas exposed to dirt shall be designed to minimize retention of dirt and moisture, and sections that may retain moisture or dirt shall be provided with adequate drainage and ventilation and shall be accessible for cleaning. Under-pans or covers, suitable sealed, may be used where applicable to protect underframe sections.

(2) Joints and crevices shall be sealed with a polysulphide or equivalent sealant which is resistant to the operating environment, shall not absorb moisture and shall remain resilient and maintain its sealing properties for the life of the vehicle.

(3) Metal surfaces shall be treated with surface preparation and primer materials specific for the metal with due consideration for the severity of exposure to which the surface is subjected.

(4) Any corrosion protection removed for welding shall be replaced after welding is completed.

(5) Where arc welding is performed on joints between stainless steel and other materials.

19.23 Powder Coating

a). Powder coating shall have a smooth flow and uniform appearance with a particle size of <100 µm, and film thickness of 60 µm - 80 µm. For durability finished thickness will be between 1.5 and 2.5 mm.

b). Where like-anodize is specified. The powder coating shall have a silk gloss (satin) finish resembling anodized aluminum. Gloss level 65-85 R'/60°.

c). The powder coating shall be formulated to minimize environmental impact. VOC content shall be less than 5 g/L. Waste powder shall be recyclable and reusable.

19.24 Durability and Maintenance

a). The coating shall exhibit anti-graffiti properties and excellent weather resistance, achieving over 50% gloss retention after 3 years Florida exposure per ISO 2810.

b). It shall pass 1000 hours xenon arc exposure with over 90% gloss retention per ISO 16474-2.

c). The coating shall show no infiltration or blistering after 1000 hours condensation water exposure and acetic acid salt spray testing per ISO 6270-2 and ISO 9227.

d). It shall demonstrate good hardness and flexibility, passing cross-hatch adhesion, impact, cupping, and bending tests per ISO 2409, 2794, 1520, and 1519. The

coating shall allow mortar residue to be removed after 24 hours per ASTM D3260.

19.25 Insulation

a). Acoustical Insulation

i). To reduce movement, structurally borne sound, and noise generated by the vibration of the roof, floor and side sheets, panels, air conditioning ducts and other metal surfaces, in particular the doors, damping material shall be applied to the inner side of these surfaces (exterior of the HVAC ducts).

ii). Korfund Vibrodamper Compound, Aquaplas DL-10-HV or Amtrak approved equal shall be applied to the interior of the complete structural car shell including the roof, sides, floor, ends, webs of all posts, carlines, floor beams and other structural elements; however, if acoustic requirements can be fulfilled by car shell design (e.g., local stiffness) then a partial application of the compound would be sufficient.

iii). The material shall not contain any asbestos and shall meet the flammability and smoke emission requirements of Chapter 19.19. Application of this damping compound and the surfaces to which it shall be applied shall be in accordance with recommendations of the manufacturer of the compound. The thickness of the damping material shall be such that acoustic requirements are fulfilled.

b). Thermal Insulation

i). The roof, sides, under floor, and ends of the vehicles, including the inside faces of posts and structural members shall be fully insulated. The density, thickness and type insulation shall be determined by U value requirements established by the HVAC calculations and shall be in accordance with the requirements of these Technical Provisions.

ii). General

(1) Insulation materials shall be rigid, nonrigid or spray-on type. Materials shall be non-absorptive of fluids and gases, self-extinguishing, and vermin-proof, and shall have the required properties to meet the noise, vibration and heat loss limits as specified herein.

(2) All materials shall be graded and labeled as standard with the recognized industry associations or societies. Labels shall be permanently affixed to, or imprinted on, the packages or containers of the materials.

iii). Installation

(1) All insulation materials shall be installed in accordance with the Manufacturer's recommendations. Rigid and non-rigid preformed insulation shall be secured with mechanical fasteners or fire-resistant adhesive, or both. Spray-on insulation shall be applied over surfaces free from dirt, grease and other contaminants that might affect the

adherence of the material. Parts subject to corrosion shall be given required protection prior to applying the insulation. The Contractor shall take care to avoid thermal shorts in the insulation as installed. Exposed insulation fibers are not allowed. The design should minimize the use of insulation tape.

iv). Materials

(1) The following materials are acceptable for use on the vehicle:

(a) Rigid insulation

(b) Glass fiber preformed board

(c) Non-rigid Insulation

(d) Spun glass fiber in flexible rolls or mineral wool batts

v). Insulation Performance

(1) Insulation materials shall be certified to conform to the following requirements:

Property	**ASTM Test Method**	**Requirement**
Flame Resistance		
Glass Fiber Board	E162 E662	Flame spread 25 max Ds(4.0) – 100 max
Non-rigid Insulation	E162 E662	Flame spread 25 max Ds(4.0) – 100 max.
Spray-on Insulation	E162 E662	Flame spread 25 max Ds(4.0) – 100 max.
Vapor Barrier		
Rating	C353 Water Method	2.5 perm at 90°F [32°C] and 50% relative humidity
Note: A vapor transmission rate of one grain of water vapor per square foot per hour at a pressure difference of one inch of mercury is defined as one perm.		

(2) The thermal conductivity of insulation materials shall be certified when tested in accordance with ASTM C177-04 or ASTM C518 at 75°F [24°C] mean temperature.

(3) Insulation separated by a vapor barrier shall be used under the floor. The underfloor insulation shall be protected by stainless steel sheathing which shall seal the underside of the vehicle against water, dust and debris.

(4) Floor insulation material shall be compatible with the material used at locations in the vehicle structure and shall not mold, rot, or sustain vermin.

19.26 Flammability and Smoke Emissions

a). General

i). The vehicle and its components shall comply with the requirements of 49 CFR Part 238.103 Appendix B, NFPA 130 Chapter 8, and APTA Recommended Practice PR-PS-RP-005-00. Compliance of the materials with these requirements shall be fully documented with test reports and certificates. For test reports submitted from previously performed tests, the Contractor shall demonstrate that materials included in the test report are identical to the actual materials used on the construction of the vehicles. For high-risk materials, test data from these reports shall be dated no more than five years old from the Contract award data and shall be submitted to Amtrak for approval. For low-risk materials, test date from these reports that are dated between five and 10 years old shall be accompanied by a letter from the manufacturer stating that the materials included in the test report are identical to the actual materials used in the construction of the vehicles. Materials deemed as low risk shall be approved by Amtrak.

ii). There are instances where the Specification calls for use of specific materials, such as Lexan, when it is known that they do not meet all requirements of this Chapter. It is predetermined that use of materials defined by this Specification is acceptable.

iii). A Smoke, Flammability and Toxicity Matrix showing the total weight of each combustible material, where used, supplier's name, flammability and smoke emission test identity, test facility, test requirements, test results, nature and quantity of the products of combustion, and heating value in Btu/lb and Btu/hr shall be submitted by the Contractor during detailed design review. This table shall include all items including items which are/ have been waived from testing or are considered small items with associated waiver numbers listed for approved waivers. **[CDRL 19-07]**

iv). Maximum limits for smoke emission shall be determined using the smoke propagation mode which generates the most smoke.

v). Should the Contractor believe that the quantity of a particular material is such that it would not contribute significantly to a fire, the Contractor may request a waiver from testing for this material. The waiver shall be submitted in writing and shall include the total weight of the material to be used, the location and the distribution of the material in the vehicle, and any previous test reports available. Waivers shall be accompanied by proper justification and will be reviewed on a case-by-case basis. The Contractor shall be responsible for complete conformance with these standards for itself and its subcontractors and suppliers. Amtrak may, at its discretion, require that the current batch of material being provided for this Contract be retested for conformance with these standards.

b). Electrical Fire Safety

i). Electrical equipment shall conform to NFPA Standard 130, Section 8-6, except where more restrictive requirements are imposed by this Specification.

c). Combustible Content

i). The design of the vehicle shall minimize the total combustible material content of the vehicle.

d). Toxicity

i). Those materials and products generally recognized to have highly toxic products of combustion shall not be used.

ii). All materials used in the vehicle construction, except for materials used in small parts (such as knobs, rollers, fasteners, clips, grommets, and small electrical parts) that would not contribute significantly to fire propagation or to smoke or toxic gas generation, shall be tested for toxicity using Boeing Specification Support Standard BSS-7239. Materials shall meet the following maximum toxic gas release limits (ppm) as determined per BSS-7239.

Carbon Monoxide (CO)	3500 ppm
Hydrogen Fluoride (HF)	200 ppm
Nitrogen Dioxide (NO_2)	100 ppm
Hydrogen Chloride (HCL)	500 ppm
Hydrogen Cyanide (HCN)	150 ppm
Sulfur Dioxide (SO_2)	100 ppm

iii). The tests shall be run in the flaming mode after 240 seconds using the NBS Smoke Density Chamber for sample combustion. The gas sampling may be conducted during the smoke density test. The test report shall indicate the maximum concentration (ppm) for each of the above gases at the specified sampling time. The Toxicity test data shall be included in the Smoke, Flammability and Toxicity Matrix.

19.27 Piping

a). General

i). All piping shall be deburred and blown out after cutting or forming. After installation, the piping runs shall be cleaned using an approved method and procedure.

ii). Piping shall be installed free of low spots to provide complete drainage away from control devices and to prevent damage by freezing. All piping shall be adequately clamped (clamps not welded to pipe) to prevent vibration, using an approved elastomeric tape between the clamp and the pipe. Copper tubing shall be sheathed at clamps or sheathed clamps shall be used. Piping through bulkheads or structure shall be positioned to avoid chafing by the

use of clamping and/or grommets. Air and water lines shall be assembled to allow sufficient slope to permit gravity drainage.

iii). All piping shall be installed using a minimum number of fittings. Unions shall be used only where necessary to permit replacement of apparatus. Hoses shall be provided with swivel type fittings to allow replacement without disturbing surrounding piping or apparatus. Steel braided hoses should be considered for connection of all faucets and small water heaters for ease of maintenance. Piping in storage or left open due to the installation shall be capped to prevent contamination.

b). Air Brake Piping and Fittings

i). Air brake tubing and piping shall be of good commercial quality, free of burrs and scale.

ii). Carbody air line which is 0.5 in. nominal and smaller, and in protected locations, shall be of seamless copper tubing, in accordance with Federal Specification WW-T-799F, Type "K", with wrought copper or cast brass sweat type fittings in accordance with ANSI Standards B16.22 and B16.18, or stainless steel. Fittings for stainless steel pipe shall be approved by Amtrak.

iii). All air piping on trucks and carbody air lines larger than 0.5 in. nominal or where subjected to flying debris shall be black pipe conforming to ASTM Standard A53/A53M (schedule 80) with black malleable iron welded fittings, all painted the same as the underframe. Stainless steel pipe and welded stainless steel fittings may also be used where approved by Amtrak. Bends in piping shall utilize large bend radii whenever possible to prevent restriction to the free flow of air. Threaded fittings may be used only where approved on a case-by-case basis. Malleable iron street ells or close nipples shall not be used, except at brake valve exhaust ports.

iv). Hoses shall be allowed where relative motions are expected such as coupler to carbody, truck to carbody, between truck components, vibrating equipment to its mounting base, and other applications as approved by Amtrak.

v). Brake system piping shall be installed in accordance with the recommendations of AAR Standard S-400. Brake piping shall have no low spots (traps) or any 45º or 90º elbows that form "doglegs" in piping runs. The highest point in the Brake Pipe shall be the branch pipe connection to the brake control unit.

vi). Any piping or tubing which could be disconnected during servicing (event recorder air manifold, etc.) shall be permanently labeled to enable the piping to be reconnected correctly when reassembled.

vii). Flexible air lines utilized in toilet systems shall meet or exceed SAE J844.

c). Air Conditioning and Refrigeration System Piping and Fittings

i). Air Conditioning refrigerant lines shall be of annealed seamless copper tubing meeting the requirements of either ASTM B 280 or ASTM B 88 Type K copper tubing and the requirements of ANSI Standard B16.22 shall be used for wrought copper sweat type fittings. This shall also apply to lines within supplier furnished apparatus except that finned tubing in evaporators and condensers need not be type K. Instead of elbows, tubing may be bent by means of a tubing bending tool. All tubing shall be deburred after cutting.

ii). Piping shall be routed to keep the amount of bends to a minimum. All inaccessible runs of tubing shall be without joints. All suction lines and those subject to sweating shall be insulated. If necessary to limit transmitted noise and vibration to the carbody or to protect the refrigerant compressor from external vibrations, vibration isolators shall be used in the piping connections to the refrigerant compressor.

iii). After fabrication, the system shall be cleared of all dirt and foreign matter using an approved procedure. The completed refrigeration system shall be evacuated and charged with refrigerant using an Amtrak-approved procedure.

iv). The discharge of condensate drains lines shall be directly to the roadbed avoiding car structure, electrical cables, and other undercar equipment.

d). Soldering of Piping and Fittings

i). Copper air brake and refrigerant tubing lines shall be continuously purged with an inert gas during joining and shall be joined using silver solder conforming to Federal Specification QQ-B-654A, BCuP-5, or BAg-5.

ii). Condensate drain tubing and car body air brake tubing shall be joined using silver solder. Soldered joints shall be wiped, and the flux cleaned from the tubing and fittings after soldering.

e). Water Piping and Fittings

i). Water piping shall be stainless steel or seamless copper tubing in accordance with ASTM Standard B75- 02 and sized for the service intended. Piping shall be clamped with necessary sound insulation to prevent rattle and be sloped to allow drainage. The use of color coded PEX water lines with crimped fittings may be acceptable but needs further approval by Amtrak.

ii). Fittings shall be sweat type wrought copper or cast brass in accordance with ANSI Standards B16.22 and B16.18 or “Swage-lok” compression type or stainless steel.

iii). All piping, fittings and other wetted surfaces shall be of "lead free" composition.

iv). If copper piping is used, it shall be joined using silver solder conforming to AWS Bag-2 for cast brass fittings and to AWS BCup-3 brazing filler metal for wrought copper fittings, using a continuous purging with an inert gas during

joining. The use of solder with lead content is strictly forbidden. The exterior of brazed joints shall be wiped clean after brazing. Flux shall be cleaned from the piping interior of brazed joints.

v). After installation, the complete water system shall be sanitized using the sanitizing procedure currently used by Amtrak per SMP 47601.

vi). The piping shall be routed and sloped to allow for proper drainage. Low points in piping shall be equipped with Ogontz or equivalent automatic drain valves (specified in respective Chapters), each equipped with a heater, which shall discharge all the water in the vehicle to the tracks whenever the air temperature at the valve falls below 38ºF. This shall be demonstrated during the climate room testing described in Chapter 20.

vii). To ensure complete drainage, venting valves shall be provided to operate in conjunction with the drain valves. At each automatic drain valve, a manual drain valve shall be piped in parallel. Sufficient manual drain valves shall be provided to allow complete draining of the car. Valves shall be labeled in accordance with Amtrak Specification 696. Manual drain valves shall be accessible without use of tools and location is subject to Amtrak approval.

viii). Drains from the water system shall be routed to discharge directly onto the ground, avoiding car structure, electrical cables and all other undercar equipment.

ix). To ensure effective drainage and prevent the accumulation of standing liquid, all drains must either have a recessed cover or, if no cover is required, the drain hole must be positioned as the low point with no interferences “i.e.” weld buildup. Additionally, to prevent liquid pooling all drainage systems must be sloped to the drain, allowing liquid to flow freely.

x). Electrically powered freeze protection, such as heat trace tape secured with conductive aluminum tape, shall be provided for the water fill housings, underfloor and/or equipment area water piping, water system drainpipes, and water tanks. A blanket heater may be used to protect the water tank. All electrically powered freeze protection components shall be readily accessible for routine maintenance and repair. Provisions shall be provided, whether through current detection and/or LED indicators to alert on board personnel as to the function of the freeze protection components.

f). Sewage Piping and Fittings

i). All toilet system piping, the waste tank and all associated fittings, drain piping and serving valves, unless otherwise permitted by Amtrak, shall be manufactured from acid-resistant stainless steel suitable for sewage service.

19.28 Fiberglass-Reinforced Plastic

a). General

i). Fiberglass-Reinforced Plastic (FRP) shall be a glass-fiber-reinforced, laminated material, composed of a gel coated surface, fiberglass

reinforcement and a polyester or other approved thermoset resin. FRP shall withstand, without any physical deformation or structural damage, the environmental conditions in Amtrak Specification 963, be resistant to acids, alkalis and cleaning solutions used by Amtrak.

ii). FRP shall be manufactured by the matched die molding or open molding process. Production techniques shall ensure that the glass fiber reinforcement is distributed throughout the final product in such a manner as to avoid resin-rich or resin-starved sections. A structural analysis shall be provided to confirm that the construction method chosen is adequate for its intended purpose.

iii). FRP parts shall have a greater thickness at attachment points and edges. Exposed sharp edges will not be allowed on any parts. Fasteners used to secure sections of FRP assemblies if used shall not be removed or cutoff to facilitate fit-up during installation to the car.

b). Resin

i). The resin shall be of high-quality, commercial grade, thermosetting, polyester, phenolic or vinylester material selected to meet the requirements of the Contractor and manufacturer molding process requirements.

c). Reinforcement

i). The fiberglass reinforcement shall be mat, fabric woven roving, continuous roving, chopped spun roving, or swirl mat as required to meet the physical properties of this Specification and the molding process requirements. The glass content shall be a minimum of 20% by weight. FRP should be straight without bowing and flexing. Additional supports may be required.

d). Gel Coat

i). The gel coat shall be a high gloss finish resistant to scuffing, fire, weather and cleaning agents. The gel coat shall have a minimum thickness of 0.015 in. If the surface of the FRP panel is to be painted, a primer gel coat shall be used and the part shall be painted in accordance with manufacturer’s specifications. If the FRP panel does not receive paint, then the gel coat shall be pigmented to match the color selected by Amtrak. The reinforced composite component shall be gel-coated on all exposed surfaces. The surfaces shall withstand, without any physical deformation or structural damage, the environmental conditions and resistance to acids, alkalis and cleaning solutions recommended by the Contractor.

e). Additives

i). Additives, fillers, monomers, catalysts, activators, pigments, fire retardants and smoke inhibitors shall be added to the resin mixes to obtain finished products with the required physical characteristics of this Specification.

ii). Mineral filler shall not exceed 28% of finished weight for any preformed matched die molding process.

f). Color Accuracy

i). The color differences between any measured production component and the accepted color sample for that component shall be less than ± 1 dE.

g). Strength Requirements

i). Independent laboratory test certificates shall be provided stating that the reinforced plastic material complies with the requirements of the following standards. Test specimens shall be conditioned in accordance with ASTM D618-08.

Mechanical Property	ASTM Test	Open Moldings	Matched Die Molding
Tensile Strength	D638-08	10,000 lbf/in.^{2}	12,000 lbf/in.^{2}
Compressive Strength	D 695	18,000 lbf/in.^{2}	22,000 lbf/in.^{2}
Flexural Strength	D790	15,000 lbf/in.^{2}	22,000 lbf/in.^{2}
Impact Strength	D 256	6 ft lb per in. of notch	8 ft lb per in. of notch
Hardness	--	45 Barcol	45 Barcol

19.29 Thermoplastic Sheet

a). General

i). Thermoplastic sheet used in the construction of the vehicle shall withstand, without any physical deformation or structural damage, the environmental conditions described in Amtrak Specification 963, and shall be resistant to Amtrak cleaning solutions. Thermoplastic sheet shall be used as extruded or vacuum-formed.

ii). All non-visible thermoplastics should be made up of 100% recycled content, and visible parts a minimum of 50% recycled content.

iii). Only UV stabilized pigments shall be used to create the specified color of the thermoplastic sheet. The color and surface finish of parts manufactured from this material shall be approved prior to the production run of any parts.

iv). Unless otherwise stated in the specification, all visible plastic moldings should have a textured surface of VDI39 with a uniform surface appearance.

b). Quality

i). The finished parts shall be free of waves and quilting on both sides. Degraded polymer in the sheet shall not be allowed, and if present, shall be cause for rejection of the piece. Voids, lumps and contamination shall also be cause for rejection of parts if the defects are larger than 0.010 in., and the population of these defects is greater than one defect in four square feet.

c). Strength Requirements

i). Independent laboratory test certificates shall be provided stating that the thermoplastic sheet complies with the requirements of the following standards. Extruded sheet in the surface finish specified shall be used for testing.

Mechanical Properties	ASTM Method	Value
Specific Gravity	D 792	1.20 to 1.45
Tensile Strength	D638-08	7,000 lbf/in.^{2} minimum
Tensile Modulus	ASTM D638	450,000 psi
Flexural Strength	D790	10,000 lbf/in.^{2} minimum
Flexural Modulus	D790	4.5 x 10^5 lbf/in.^{2}
Hardness Rockwell	D 785	90 to 120 ("R" Scale)
Heat Deflection (annealed)	D 648 @ 264 lbf/in.^{2}	190ºF minimum
Impact Strength (Fabricated Parts)	D 3029 Gardener Dart Drop 0.5" dia. ball at 73°F	320 in. lb minimum

d). Color Accuracy

i). The color differences between any measured production component and the accepted color sample for that component shall be less than ± 1 dE.

19.30 High Pressure Laminates

a). Flat Textured HPL

i). The laminate shall have a decorative melamine surface available in a variety of colors, patterns, and finishes. The backside shall be sanded smooth. The laminate shall have a uniform appearance free of defects and 0.375 in thickness.

ii). The laminate shall utilize sustainable materials with low VOC content, per 40CFR59, Subpart C. It shall be recyclable at end of life.

iii). HPL must meet ASTM E 162-98 for flammability index of less than 35 and BS 476 Part 7 Class 1 for flame spread. It shall meet ASTM E-662-01 with smoke emission of less than 100 in the first 1.5 minutes and less than 200 in the first 4 minutes.

iv). Thickness shall be approximately 0.030 to 0.050 inches to meet strength and fire performance requirements.

v). The laminate shall resist staining, impacts, boiling water, and other common exposures. It shall have wear resistance of 400 cycles minimum per NEMA LD3. Laminate shall be repairable or replaceable if damaged.

b). Pressed HPL

i). Pressed laminate will emulate a slatted wood effect, with a pressed texture design on a wood-grain HPL.

ii). This material should match as closely as possible the color and grain of the real wood laminate specified.

iii). Texture detail to be defined in the design review process.

iv). Pressed HPL will meet all performance criteria listed in Section 19.28a).

19.31 Decorative Laminate Film

a). The decorative laminate film shall be a lightweight, glass fiber reinforced Tedlar-capped material suitable for application to thermoplastic substrates. The film shall be dimensionally stable yet flexible enough for application to flat and moderately curved surfaces.

b). The material shall meet all flammability, smoke, and toxicity requirements of this specification.

c). Multiple layers will be required to meet the Customer Experience Vision requirements as approved in Final Design Review.

d). Film materials must meet low toxicity standards set out in ABD 0031 for the following substances (ppm):

i). HF ≤ 70 *)

ii). HCl ≤ 120 *)

iii). HCN ≤ 10 *)

iv). NOx ≤ 10 *)

v). CO ≤ 300 *)

vi). H2S+SO2 ≤ 10 *)

e). Durability and Maintenance

i). The film shall demonstrate exceptional resistance to staining, solvents, chemicals, and abrasion for ease of cleaning with common cleaners.

ii). In high traffic areas, film must be glass fiber reinforced.

iii). The film shall pass testing for adhesion, abrasion resistance, mar resistance, dimensional stability, graffiti resistance and detergent resistance. It shall demonstrate a tensile peel strength of at least 4.5 lbs/in after 168 hours when applied according to manufacturer specifications. Standard details:

(1) Adhesion of Surface Layer DMS 2291: Pass

(2) Abrasion Resistance DMS 2290: Pass

(3) Tensile Strength ASTM D 882 (psi / N/mm²)

(a) long. d. ≥10.670 / ≥ 75

(b) tran. d. ≥ 9.960 / ≥ 70

19.32 Solid Polymer Surface

a). Solid surfaces will be a non-porous, fully sealed, homogeneous material maintaining the same composition throughout the part.

b). Composition shall be of acrylic polymer, natural minerals (aluminum trihydrate) and pigment, with a satin finish.

c). A thickness of no less than 1/2 inch must be approved by Amtrak on a case-by-case basis.

d). Material shall naturally resist damage from heat, mold, mildew and stains.

e). Material shall be assembled with non-porous, waterproof seams.

i). Location and process for implementing seams must be implemented for approval.

ii). All seaming plans must be submitted for Amtrak acceptance.

f). The material shall meet all flammability, smoke and toxicity requirements of this specification.

g). A minimum of 14% Pre-Consumer Recycled Acrylic should make up the composition of the material.

h). The material must meet GREENGUARD GOLD Certification for low chemical emissions and be ROHS compliant.

i). Solid surface should be repairable in situ for scratches, and the supplier should provide a 10-year commercial warranty for the material.

19.33 Air Filters

a). HVAC and Equipment Ventilation Filters

i). HVAC system air filters shall conform to Amtrak Specification 685 or as approved by Amtrak and shall be selected in accordance with the manufacturer's recommendations for the specific equipment involved. All filters shall have an integral frame. Filters shall be the throw-away type available in standard commercial sizes except reusable filters that may be approved for specific applications where throw-away filters are not available. Filters shall be designed to meet the performance requirements of each installation and shall be approved.

b). High Pressure Air Filters

i). An air filter assembly with a replaceable filter element shall be provided in the air line that connects each subsystem to the main reservoir air supply

system. The main reservoir air filter filtering capability, flow rate capability and overall size shall be appropriate for the application so that the filter replacement interval is greater than one year. Quality of compressed air supplied by the locomotive shall conform to APTA Standard PR-M-S-011-99. It shall be possible to gain access to the filter element for replacement without requiring any pipe fittings to be disconnected or loosened. Glass fiber mat types of filter media shall not be used for high pressure or high-volume applications. Filters shall be provided for each of the following systems and any others operated from the air supply system:

(1) Each air brake control assembly

(2) Waste system

(3) Horn

(4) Low pressure air filters

ii). Replaceable media type filters shall use resin-bound, spun-glass fiber materials. It shall be non-absorptive of fluids and gases.

19.34 Wire and Cable

a). General

i). All wire and cable used shall exhibit the physical and electrical properties for 110ºC rated wire and cable specified in Amtrak Specification 323. High temperature wire, used for heater circuits, shall be as defined as Amtrak Specification 323.

ii). A minimum number of wire types and sizes shall be used in the vehicle. Selection of wire size and insulation shall be based on the current carrying capacity, voltage drop, mechanical strength and temperature and flexibility requirements and in accordance with APTA Recommended Practice PR-E-RP-009-98 and applicable AAR, ICEA, ASTM or MIL Specifications. The Contractor shall submit to Amtrak for review and approval, a procedure for installation of wiring and cable, including the criteria and procedures for the repair of damaged wire or cable. This procedure shall be included in the heavy maintenance manual.

iii). In no case shall wire smaller than the following sizes be used:

(1) Wire on electronic units, cards, and card racks – No. 22

(2) Wire in control compartment – No. 16, No. 18 with Amtrak approval

(3) Wires pulled through conduits and/or wireless – No. 12, No. 14 with Amtrak approval

(4) All other wire – No. 12, No. 16 with Amtrak approval

b). Wiring – General

i). All vehicle wiring shall be in conformance with APTA Recommended Practice PR-E-RP-002-98 and PR-E- RP-009-98, Chapter 3 of the National Fire Protection Association's Publication NFPA No. 70, and the AAR Manual of Standards and Recommended Practices, Section F, Specification S-538, *Wiring Practice and Rolling Stock Standard*, except where otherwise specified, and except that all wire shall be as required in this Specification. Design wire amperage capacity shall comply with the latest revision of the National Electric Code. When more than three current-carrying conductors are applied in a raceway or cable, the amperage capacity shall be derated. Circuit protection shall be in conformance with Chapter 2 of NFPA publication No. 70, Article 240.

ii). Shields used for audio and other wiring requiring EMI/RFI protection shall be grounded at one point only within the vehicle, and not at both ends of the shield.

c). Data Communications Wiring

i). All data communications (Ethernet) wiring shall be able to support EIA/TIA 568 Cat 6a communications for data on rolling stock. It shall be suitable for use in undercar and inter-car applications when installed in flexible (polyimide) or rigid conduit; it shall be suitable for the application and shall maintain long-term electrical integrity for all aspects of the EIA/TIA requirements including impedance, crosstalk, attenuation, and shielding effectiveness. The cable will also meet environmental and safety requirements associated with rolling-stock cables. The cable shall be designed with rolling-stock requirements in mind and will support high-speed data transfer for no less than 20 years in the rail environment. All accelerated life tests performed in the qualification are specified with the intention of this service life. The cable shall be designed so that installation with normal care into new car shells or undercar will not damage its electrical integrity. The cable shall be designed so that installation in raceways with other cables is proper (cable will not be impacted by crushing or cable-to-cable abrasion). The cable shall be able to be terminated with vendor specified connectors that are suitable for use in industrial communication equipment (M12 or similar).

ii). The cable shall have the following characteristics:

(1) Construction

(a) Conductors: Stranded tin-plated copper 4 x (2 x #24AWG) (or .5mm2)

(b) Insulation: Radiation cross-linked data grade polyolefin 125V

(c) Component configuration: Wires are twisted or helically cabled to ensure electrical performance to Cat 6a standards – 100Z characteristic impedance on finished cable

(d) Shielding: Foil and TC braid designed to meet 200mZ/m transfer impedance

(e) Binders/tapes: As required to enhance integrity

(f) Jacket: Radiation cross-linked polyolefin (low smoke, complying with toxicity requirements) 0.8 mm minimum at thinnest point.

(2) Electrical Requirements

(a) Impedance: 100Z+/-5Z

(b) Shielding effectiveness (30 MHz- 100 MHz): 40dB

(c) Voltage rating: 300V

(d) Shall comply with TIA Standard, TIA-568-C.2 for Balanced Twisted-Pair Telecommunications Cabling and Components Standards

(3) Environmental Requirements

(a) Cable jacket will withstand the following tests per AAR RP 585

(b) Tensile and Elongation Section 5.1 and 5.2

(c) Oil Resistance 5.3 and 5.4

(d) Thermal Shock 5.8.4

(e) Penetration 5.9.4

(f) Abrasion 5.9.8.2

(g) Corrosion resistance ASTM D2671-00(2007)e1

(h) Temperature -40°C - 90°C

(4) Mechanical Requirements

(a) Bending radius: 6x OD (fixed)

(b) Car-to-car cables should have a test modeling the installed condition, with periodic measurement of electrical characteristics – 3,000K cycles – with no application-altering failure in electrical performance.

(5) Smoke and Flame

(a) NFPA 130 (UL1685) or equal, i.e., UL 1581 (tray) or IEEE 383 1974

(b) Amtrak Specification 352, Smoke Flame and Toxicity

d). Wire Handling

i). All wiring shall be performed by qualified, experienced wiring personnel using appropriate tools for stripping insulation, cutting, tinning, soldering, harness making, attaching terminals and other wire fabrication tasks. All wiring tools and equipment shall be used as recommended by the tool and equipment manufacturer.

ii). Wire shall be protected from damage during all phases of equipment manufacture. Wire shall not be walked on, dragged across sharp or abrasive objects, kinked, or twisted, or otherwise mishandled. The ends of wire shall not be permitted to lay on wet floors or other damp areas where moisture may be absorbed into the conductors.

iii). When removing insulation, wire strands shall not be nicked or broken in excess of the requirements of FAA Specification No. AC 43.13-1A, Section 449, *Stripping Insulation*. Additionally, the following criteria apply:

Wire Size	**Maximum Number of Nicked Strands***
Wires smaller than No. 10	None
No. 10 through 1/0	7.4 percent
Above 1/0 through 1600/24	4.4 percent
Above 1600/24	graduated scale
*Definitions: A cutoff strand shall count as two nicked strands. A nick is defined as 25% or more of the strand area damaged or cut more than 1/3 of its diameter.	

e). Wire Harness

i). The layout of wiring, for both vehicles and equipment, shall be designed in advance of its installation and in cooperation with the suppliers of the related equipment. Wiring shall be prefabricated into standard harnesses, wrapped, and tied with nylon wire ties or a high strength, waxed lacing cord designed not to invade the wire insulation. Harnesses shall be installed with identical arrangement and location in each vehicle having similar equipment. Separate harnesses shall be provided for major circuit groups or types, or as required for specified circuit separation. All circuits and branches shall be separable by means of terminal boards or approved connectors to isolate portions from others for troubleshooting. All circuits subject to periodic high potential tests shall be so arranged that they can be conveniently isolated for the tests.

ii). Alternative methods for fabricating and installing wiring, which are standard carbuilder practice, may be submitted for consideration by Amtrak at the appropriate design review.

iii). Harnessed wires shall not be installed in conduit or wire ways. Wires from different conduits or other openings shall not be harnessed together with wires running within the box or entering the box through another entrance point. Each harness or group of wires between equipment enclosures shall

contain a minimum of 10% spares, but no fewer than two spares for each wire size at the time of car delivery. All conduits and wire ways shall be arranged to allow ease of replacement of individual wires between equipment enclosures after delivery.

f). Circuit Separation

i). Circuits shall be physically separated to reduce the possibility of unsafe conditions, electrical interference, or equipment damage.

ii). The following major circuit groups shall not be harnessed or bundled together, shall not run in the same conduit, and shall be physically separated and secured in enclosures, wire ducts, junction boxes, or other wire routing devices:

(1) 480VAC HEP trainline

(2) 27-point communications trainline

(3) 27-point MU trainline

(4) I-ETMS/PTC/Cab Signal circuits

(5) AC power circuits

(6) DC control circuits

(7) Communication circuits

(8) Unprotected wiring (e.g., battery or HEP trainline to circuit breaker)

(9) Data communications (Ethernet) wiring even though it might be in the same car to car 27-point communications trainline jumper

iii). Conductors which shall operate at potentials differing by 50 volts or more shall not be cabled together and shall not be placed in the same conduit, raceway, duct, junction box, or enclosure, except that 120VAC and 480VAC may be run in same conduits providing all the wire insulation is rated at 600VAC minimum. Where it is impossible to avoid having wires at different voltages in the same equipment enclosure, the wires shall be physically separated, bundled, and secured separately such that contact between wiring is not possible. All wiring within an enclosure shall be insulated for the highest voltage in the enclosure unless Amtrak approved otherwise.

iv). Wiring connected to transient-generating apparatus shall not be run adjacent to wiring carrying signals to, from, or between semiconductor circuits, logic circuits, vital no-motion circuits, data transmission or communication circuits. In cases in which adequate physical separation is impossible, shielded wire shall be used for all conductors involved.

g). Wire and Cable Runs

i). Wire and cable runs shall be properly placed to be protected from the environment, debris and be arranged to allow for proper heat dissipation per manufacturer's requirements.

ii). All wire and cable shall be free of kinks, insulation damage, insulation abrasions and nicked strands. Wire installation shall not be subject to accumulations of water, oil, or other foreign matter. Flexible Nylon or Sealtite conduit shall not be used on the exterior or underside of the carbody without Amtrak approval.

iii). Cables shall be laid in place with sufficient slack at the bends so that cables will clear the inside bend surface of the strain relief device.

iv). Conduit shall be attached to the carbody employing clamps; welding shall not be used under any circumstances.

v). Concealed wires, such as within conduits, raceways, and wire ducts shall be such that wires may be replaced or added to without the removal of other than an access panel at each end of the wire. It shall not be necessary to disconnect or disassemble conduit to accomplish this task.

vi). Wiring run in loom shall not be carried over a potential chafing hazard.

vii). Wires entering any removable box shall be harnessed and secured to facilitate removal of the box.

viii). All wires and cables shall be fully protected against any contact with any surface other than that designed specifically to support or protect them. This applies to all current carrying wires, cables, or buses on the vehicle.

h). Undercar

i). The 480VAC HEP trainline conductors shall be cleated in place; No. 6 AWG and larger may be cleated in place or installed in rigid conduit.

ii). All undercar wiring smaller than No. 6 AWG shall be run in Rigid Galvanized Steel (RGS) conduits in an approved manner. Conduits shall be of waterproof construction. Permanently retained watertight strain relief bushings, with insulated throat liners of an approved design, shall be used at locations where wires, cords or harnesses enter or exit conduit, junction boxes and equipment enclosures. In addition, strain relief bushings on equipment enclosures shall include a permanently retained O-ring type seal.

iii). In addition to cleating of the 480 VAC trainline and NO 6 AWG and larger cables, they should be enclosed in a stainless-steel wire way as to not be exposed to the elements or debris strikes.

iv). Wires or cables shall not pass through or over the battery compartment and shall not pass overheat generating equipment, even if the wires or cables are in conduit.

v). Rigid galvanized steel conduit shall be run to all rigid-mounted enclosures. One Rigid conduit union shall be used in each run of conduit between rigid-mounted enclosures. The use of running threads is prohibited.

vi). RGS conduit shall be run as near as possible to resiliently mounted equipment, with flexible conduit, not to exceed 18” in length, completing the run. The use of flexible conduit shall be limited as much as possible.

vii). Open undercar wiring shall be protected over the trucks by running the wiring through RGS conduit, with suitable protective bushings applied at the ends.

viii). Conduit routing and the connection to boxes shall minimize exposure to water entering the conduit: for example, conduit should not enter from the top of the enclosure if possible. Drip loops shall be employed as appropriate.

i). Exterior of Roof

i). All wiring to roof-mounted equipment shall be run in rigid galvanized steel conduits within the carshell.

ii). Wires or cables exposed or in conduit shall not pass over or near heat generating equipment.

iii). Conduit routing and the connection to boxes shall minimize exposure to water entering the conduit: for example, conduit should not enter from the top of the enclosure if possible. Drip loops shall be employed as appropriate. Boxes shall be raised above surfaces where water, snow/ ice could accumulate (including from plugged drains), to reduce the possibility of water incursion.

j). Interior

i). Any wiring passing through the floor shall be run in rigid conduit. Wiring, even if enclosed in loom, must not be run through partitions without suitable bushings being provided at such points of passage. Conduit openings from below must extend at least 1 in. above the floor level to ensure water cannot enter the conduit from above, such as from a wet floor.

ii). All 480V wiring above the car floor and within the sides, ends or roof of the car shall be carried in EMT or rigid steel conduits. Short runs, not to exceed 18 in. of flexible conduit may be employed to make final connections to equipment. If used, flexible conduit must meet all Smoke, Flame and Toxicity requirements. All wiring in the walls shall be in EMT or rigid conduit. Wiring in the roof shall be carried in thin-wall aluminum or steel conduit, in metal duct or “Panduit” material meeting the requirements of Amtrak Specification 352. All flexible nonmetallic conduits shall be installed in protected areas only, unless specifically approved by Amtrak. In wire ducts, wire shall be secured at each entrance and exit point, to prevent chafing movement.

k). Cable Cleating and Support

i). Open-run cable shall be supported by using split-block cleats of molded neoprene or silicone rubber, spaced no more than 4 feet apart. Slack shall be allowed in the cable to accommodate both thermal expansion and contraction of cable.

ii). Each cleat shall have a channel-shaped stiffener of at least 10-gage material on the side away from the mounting bracket which shall act to spread the bolt clamping force over the entire length of the cleat. Bolts shall have lock nuts.

iii). Cleats shall be designed to grip each cable individually and firmly, but without causing any damage to cable insulation, including cold flow of the insulation. Cleats shall include spacers in the mounting holes to prevent crushing the cleat by overtightening the mounting bolts. Each cable in the cleat shall have its own cutout sized to the correct wire diameter. The cleat material shall be fire retardant insulating material with a durometer of 50 to 60.

iv). Cleated cables shall be routed and supported such that they cannot, under any combination of forces and car movement, touch each other or any other part of the car, except the cleat cushioning material.

l). Wire Securement and Termination

i). All wiring shall be secured and protected against movement, chafing, and any contact with conductive, sharp, or abrasive objects including the inside surfaces of wire runs.

ii). No wiring shall be secured directly to the vehicle structure, equipment enclosures, or any metallic surface. Wiring securing devices shall be either completely non-metallic or metallic with a resilient, insulating member between the wiring and the metallic portion of the device.

iii). All wiring shall be located and secured such that normal equipment motions, maintenance access, heat sources and the environment do not damage or reduce the life of the wiring.

iv). Junction boxes, with terminal boards, shall be used, as required, for wire terminations. Harness connections to the boxes, as well as internal wiring to terminal boards, shall be as specified. Exterior junction boxes shall be watertight.

v). Wire and cable dress shall allow for sufficient slack at equipment terminals to provide for movements induced by shock and vibration, equipment shifting, alignment, cover removal and component replacement. Sufficient lengths shall be provided at points of termination for additional re-terminations without applying tension to the wire and without splicing the wire, as follows:

No. 10 AWG and smaller	Three re-terminations
No. 8 AWG and large	Two re-terminations

vi). A drip loop shall be provided on all exposed wires and cables to prevent fluid runoff into connected equipment.

vii). Wire tying devices shall be of such material and construction that they will adequately retain the wires for the life of the wiring and shall be resistant to ozone and ultraviolet light. Wire and cable ties shall be trimmed using the proper tool and located to eliminate any hazard to personnel from sharp edges. Wire tying devices shall be snug but shall not be so tight as to cause indentation and cold flow damage to the insulation. Wire tying devices shall be mechanically fastened to a permanent structure. Adhesive-installed mounting bases shall not be used for ties or for cable support.

viii). Wire tying devices shall not be used:

(1) For any external undercar application

(2) To support wire under its own weight

(3) To support/secure any type of conduit

ix). All wire bundles and cables within an enclosure shall be supported by the use of tape rails, shall be spaced away from the equipment box structure, metal edges, bolt heads and other interference points and shall have electrical clearance from the covers, regardless of the insulation properties of covers. Wire bundles shall be located above or alongside the apparatus rather than at the bottom of the box wherever possible. In all cases, wire shall be a minimum of 1 inch above the bottom of the box. Wire entry into control or junction boxes shall not be permitted through the bottom of the box.

x). Truck wiring shall be designed to ensure sufficient slack, for pivoting, spring action and jacking and shall be provided with clamp supports and abrasion protection. T-splices will not be permitted.

xi). All jumpers, jumper heads and jumper receptacles shall be sealed in an approved manner to prevent the entry of water at any operational speed.

xii). Any wiring needed to calibrate and test vehicle functions shall be a part of the permanent vehicle wiring to enable Amtrak to conveniently maintain the equipment. This wiring shall terminate in approved connectors in the respective control groups and cabinets.

xiii). Amtrak requires wiring and cabling to be accessible for repairs; the Contractor shall submit a complete wiring plan for evaluation at the appropriate design reviews.

m). Marking

i). All terminal boards and terminal posts shall be plainly marked with non-conductive hot stamping type markings so that they shall be easily identified. Devices shall be labeled via silk-screening onto panels, mechanically attached plastic labels (adhesives are not acceptable alternate), or other permanent means approved by Amtrak in design review.

ii). Wires shall be marked with sleeve-type labels with permanent typed-on lettering, such as TE/Raychem TMS or approved equal, or with non-

conductive hot stamping type markings. Both ends of each wire are to be identified. Wires smaller than 6 AWG should be labeled the length of the wire at intervals of 6” and the wire identification should be color coordinated as to voltage type. Wires 16 AWG or smaller may be color coordinated and tagged on each end with the sleeve type labels mentioned here.

n). Cable and Wire Identification

i). The Contractor shall provide a listing of all wire codes and device and connector identification used on its equipment as part of the integrated schematics manual.

ii). The identification system shall be designed to utilize the minimum number of alphanumeric characters to identify devices and interconnecting wiring. Device, terminal and wire identification is intended to provide unique, consistent, clear, concise and recognizable identification of wiring and devices as an aid to maintenance of electrical systems. The wire-designation system shall be one which relates the designation in some way to indicate where it shall go and where it shall come from. Each individual piece of wire shall be given its own distinct identification so that it shall be positively identified at its opposite end without the necessity for "ringing through." As much as possible, naming shall be consistent among all Amtrak equipment. This naming system will be employed on the following:

(1) Electrical Arrangement Drawings

(2) Electrical Schematics

(3) Wiring Diagrams

(4) Labels on hardware

(5) Car Electrical Panels, etc.

(6) Device names: circuit breakers, indicators lights, switches, relays, contactors, pressure switches, etc.

(7) Car Wiring

(8) The above categories on drawings provided by different vendors (for example, air brake schematic and electrical schematics)

iii). By using the nomenclature and appropriate schematic, an electrician shall be able to easily identify any point in a circuit, such as an auxiliary contact, and locate that point on the hardware.

iv). The identical name shall be used for a given component in all references - arrangement and schematic drawings, wiring diagrams, panel and switch plate legends, and maintenance manuals.

v). It shall be the Contractor's responsibility to ensure that:

(1) All equipment suppliers conform to this Specification.

(2) A consistent numbering system is used throughout the vehicles; and

(3) Component device and wire names are not duplicated.

vi). At a minimum, the following major electrical system components shall be identified:

(1) Electrical panels

(2) Contactors and motor starters

(3) Relays and timers

(4) Switches and circuit breakers

(5) Electronic components

(6) Terminal blocks

(7) Connectors

(8) Each wire

(9) All labels shall be permanent and expected to be legible for the life of the vehicle.

(10) Labels shall be easy to read and observable without having to disturb wiring, especially for:

(a) Relay names

(b) Contactor/Motor starter names

(c) Terminal block and terminal identity.

(11) In cases where two or more identical panels are used, the respective panel names "A" and "B" (as appropriate) shall be affixed to the car body or mounting plate, not the panel.

(12) Numbering system shall be consistent between Contractor and component supplier, such as floor heat wire names. It shall be possible for an electrician to connect all external car wiring to a panel without requiring a drawing.

o). Pulling Compound

i). Pulling compound shall be non-conductive, non-hygroscopic, non-odorous, and shall not attract vermin.

p). Solder

i). Wire connections or terminations by soldering shall not be permitted unless explicitly approved by Amtrak prior to application.

q). Tape

i). Use of electrical tape shall be minimized. Electrical tape shall not be used without the prior approval by Amtrak. If used, electrical tape shall be as specified in Section F, S-540 of the AAR Electrical Manual of Standards and Recommended Practices, or equivalent; UL Listed; and a minimum of 0.007 inch thick. Electrical tape shall meet or exceed the voltage rating of wire where the tape is applied.

19.35 Wire and Cable Connections

a). General

i). All wire and cable shall be free of kinks, insulation damage, insulation abrasions and nicked strands. Wire installation shall not be subject to accumulations of water, oil, or other foreign matter.

ii). Cables shall be laid in place with sufficient slack at the bends so that cables will clear the inside bend surface of the strain relief device.

iii). Conduit shall be attached to the carbody employing clamps; welding shall not be used under any circumstances.

iv). Concealed wires, such as within conduits and wire ducts shall be such that wires may be replaced or added to without the removal of other than an access panel at each end of the wire. It shall not be necessary to disconnect or disassemble conduit to accomplish this task.

v). Wiring run in loom shall not be carried over a potential chafing hazard.

vi). Wires entering any removable box shall be harnessed and secured to facilitate removal of the box.

vii). All wires and cables shall be fully protected against any contact with any surface other than that designed specifically to support or protect them. This applies to all current carrying wires, cables or buses on the vehicle.

viii). All equipment enclosures and junction boxes shall be fitted with terminal boards or connectors.

ix). The Contractor shall submit the proposed design and product line for all connections and terminations for approval as part of PDR. **[CDRL 19-08]**

(1) Number 6 and smaller type terminal boards and quick-disconnect terminals, other than those stated herein, will only be permitted with approval.

b). Terminal Boards and Terminal Points

i). All electrical terminal points and terminal boards of wire size AWG 10 or larger shall have brass studs and connections, each of which shall be locked using a single brass nut with brass flat washer and a plated spring-type lock washer. Studs, nuts, and washers may also be made of corrosion-resistant

plated steel, where approved. Each board or connector shall have the necessary number of terminations plus a minimum of 10% spares, but not fewer than one spare unless approved. Binding head screw type terminal boards will be permitted only where approved. All terminal boards shall be in accordance with Federal Specification A-A-59125.

ii). All wires of size range AWG 12 to 14 shall use modular spring lock terminal blocks. The terminal block modules will be mounted on din rails. The supplier shall provide standard 35mm wide DIN-rail in 7.5mm, 15mm and 58mm heights. The DIN-rail shall meet RoHS (Restriction of Hazardous Substances Directive) standards and shall be available perforated or unperforated. Materials will include chromated-steel, copper, and aluminum. The modules shall be color coded for the ability to tell the signal type at a glance. The metal body shall contain a high strength spring steel spring element that will provide a gas-tight connection with the conductor.

iii). Spring connection shall be stainless steel. The terminal blocks shall come with carbody ground modules that are connected directly to carbody ground. The terminal blocks shall come with insertable shorting plugs. The terminal blocks will have snap in positive lock labels. Terminal Blocks shall have a method of labeling for easy identification which is universal across all connection technologies. The modules will have a place to label the terminal number as well as the terminal block name. Each wire shall have a ferrule on its end and be able to be inserted by engaging the spring with a standard 3mm slot size screwdriver. Stranded wire of any size shall have a ferrule on its end.

iv). Terminal Block accessories and bridging systems shall be compatible and interchangeable with all connection technologies (screw, spring and IDC technology) including flexible bridging system, modular testing, standardized labeling system and pluggability features.

v). Threaded studs shall have a minimum of 2-1/2 threads exposed beyond the final nuts. Adequate space shall be provided to permit connecting wire terminals with standard tools. All terminals shall be properly torqued to assure sound connections. Spacers shall not be used.

vi). Jumpers between terminal board points shall be brass or plated steel. Wire jumpers between adjacent terminals of terminal boards will not be permitted.

vii). Terminal blocks will employ closed bottom blocks.

viii). An approved permanent marking strip on each terminal board shall be provided and attached adjacent to the wire junction point to identify the wires attached thereto.

ix). A maximum of two terminals shall be connected to any one binding screw. A maximum of four terminals shall be connected to any one threaded stud, provided that there is no interference between terminal barrels. On terminal boards, the wiring shall be arranged so that no more than two terminals are connected to a stud, from each side of the terminal boards.

c). Wire Terminations

i). Terminals and connections used throughout the vehicle shall be the mechanical, solderless, crimp type made by TE Connectivity/AMP or other approved manufacturer with a comprehensive line of terminals, connector pins and application tools available.

(1) Terminals shall be tested to Military Specification MIL-T-16366F for temperature rise, voltage drop, vibration, current overload, and corrosion.

ii). All wire terminations shall be accessible to remove or replace. Wire terminations shall not be covered by other wires.

iii). All heater wiring terminations shall be Nickel plated and the terminal insulation shall be rated for high-temperature applications.

iv). Terminals and connections shall be attached to the wiring with proper crimping tools and dies as recommended by the manufacturer. Application tooling shall incorporate die or piston stops to prevent over crimping. To prevent under crimping, all application tooling shall incorporate a “full cycle” feature that once started, requires the tool to be brought to the stops before the crimped connection can be removed. The Contractor and its suppliers shall employ a certification process to ensure that all tooling remains within calibration to properly crimp the lugs.

v). Spade (i.e., Fast-On) terminal usage is to be limited and shall only be used with Amtrak approval. Hook-type terminals shall not be used. Corrosive protection shall be provided for all base materials.

vi). Conductors subject to motion relative to the terminal shall be protected by suitable means to prevent breakage of the conductor at or near the terminal. Sufficient slack shall be provided in all wires and cables to prevent breaking or pulling out of bushings and terminals. A maximum of one wire shall be crimped in any one terminal.

d). Power Cable Terminations

i). Power cables shall be terminated with an approved compression terminal. Sufficient cable slack shall be provided to preclude breaking or pull-out from bushings or terminals and to allow two terminal changes. Cable conductors shall be clean prior to installation of terminals. Compression terminals shall be applied using tools and procedures recommended by the terminal manufacturer for that purpose. Swaging tools shall be of a type that ensures complete swaging in every case.

e). Cable Connectors

i). All cable connectors shall conform to SAE AS50151 except for the screw coupling arrangement replaced with the ¼ turn quick disconnect bayonet lock. They shall employ removable crimp contacts of the correct size for the wire being terminated. Except as noted below, the connector contact area

shall be plated with a minimum of 0.000030 in. of gold over a minimum of 0.000050 in. of low stress nickel. For high current applications, the connector contact area shall be plated with a minimum of 0.00010 in. of silver. Adjacent connectors shall either use different inserts or different insert orientations to prevent erroneous connections. The car-side piece of all cable connectors shall be rigidly mounted.

ii). Connectors shall be keyed so as to not be accidentally interchanged between adjacent connectors. Spare contact allocation shall be 10% to 15%, but no less than 4, per connector. Reduced numbers of spare wires in a given connector may be submitted to Amtrak for review and will be approved on a case-by-case basis if 10% of the contact count is less than 4.

iii). Power and control wiring shall be separated in different connectors if they exceed 120VAC. Disconnected plugs will be supported so as to not drop to the ground, floor or other position in which they might be readily damaged. Connectors are to be mounted to provide convenient hand access so as to be easily mated and unmated.

iv). All cable connectors used in exterior locations shall be of the environmental watertight variety and a molded type wherever possible (such as speed sensors). Cable connectors shall be equipped with sealing gaskets on the front mating surface and on the back where the cable enters. Bolts within the connector shall be long enough to ensure that there is sufficient room to terminate the cable wires within the connector body. The cable jacket shall be held by a clamp within the connector body. Unused connector pin positions shall be sealed with either connector contacts or plastic sealing plugs designed for that purpose.

v). Plastic bodied connectors shall not be used on the exterior of the vehicle.

vi). In waterproof interior locations, the use of non-weatherproof connectors will be allowed as approved. All other connector requirements specified in this Chapter which do not directly apply to weatherproofing shall be met.

vii). Alternative connectors such as Harting HAN™ Modular series may be used as approved by Amtrak.

viii). Ethernet connectors shall be M12 style connectors (per IEC 61076-2-101) as manufactured by Harting or approved equal. Ethernet connectors for intercar jumpers shall be housed in an environmentally sealed connector shell suitable for M12 connectors as manufactured by Harting, or approved service-proven equal.

f). Quick-Disconnect Terminals

i). Only Amtrak-approved quick-disconnect terminals may be used. They shall be modular, and they shall provide positive terminal engagement and be shock and vibration proof. All terminals shall be provided with insulation equal to that of the wire. No "push-to-fit" (FAST-ON) type terminals will be permitted unless specifically approved by Amtrak for that unique application.

g). Grounding/ Bonding Connections

i). Grounding and bonding shall be done in accordance with APTA Standard PR-E-S-005-98, unless otherwise approved by Amtrak. All grounding and bonding jumpers and straps shall be sized to handle fault current for which the voltage drop shall not exceed 25V. The bonding method employed shall not produce a dc resistance in excess of 0.0025 ohms, or more than 0.025 ohms at 150 kilohertz for any applied ac voltage. Grounding and bonding jumpers, and brazed shunt straps shall be flexible.

ii). The car body shall be grounded to each truck frame by means of a separate cable which shall be sized to safely ground the car under normal conditions.

iii). The 120VAC, 60 Hz, single-phase service shall be separately and firmly grounded to the car body structure and have a green indicating color band applied to the terminations.

iv). All apparatus operating at 480VAC and not directly grounded to the car body through its mounting shall have grounding straps. This particularly applies to resiliently mounted equipment.

h). Wire Splicing

i). Splicing of conductors shall be avoided and shall be permitted only with Amtrak approval, on a case-by-case basis.

ii). Splicing of conductors in conduit will not be permitted. In the event a splice is approved, it shall be in a junction box and the spliced joint shall be mechanically as strong and have the same conductivity as any other part of the conductor. The splice shall be an insulated permanent crimp splice in accordance with SAE AS7928, Type II, Class I, and shall be installed with the crimping tool and die of the splice manufacturer. All splices shall be insulated with a self-sealing, weathertight, seamless shrink tubing. The outside diameter of the spliced portion of the cable after the insulation is applied shall not exceed the outside diameter of the un-spliced portion by more than 40%. Splices shall be identified in the integrated schematic.

19.36 Conduit

a). Types

i). Thin-wall EMT type conduit shall conform to UL 797. Flexible metal conduit shall conform to Federal Specification A-A-55810. Flexible polymer conduit shall conform to SAE AS81914.

b). Size and Fill

i). Conduit shall be sized such that the sum of the cross-sectional areas of the conductors and their insulation does not exceed 40% of the cross-sectional area of the conduit for three or more conductors. For two conductors, a limit of 31% shall be used, while for a single conductor, a limit of 53% will be permitted. Where conduit having a length not exceeding 24 in. without bends

of more than 15º is used between enclosures, a maximum fill of 40% will be permitted.

c). Installation

i). General

(1) A run of conduit between junction boxes and/or pulling outlets shall not contain more than the equivalent of four quarter bends, 360° total, including the outlet fittings. Bend radii at the inner surface of the bend shall be no less than eight times the nominal inside diameter of the conduit.

(2) All conduit bends and offsets used shall be made by the use of special forms or tools and shall have the largest radius possible so that wires can be pulled without the use of tackle or power.

(3) Conduit shall be securely clamped with all runs electrically grounded to make a continuous ground. Suitable approved insulation to prevent electrolysis shall be provided where steel and aluminum are in contact.

(4) All conduits shall be arranged to prevent moisture traps and shall drain toward control boxes, except that all open-ended conduits shall be installed in such a manner as to ensure gravity drainage out the end. The conduit arrangement and installation shall be subject to approval. Open ended conduits are prohibited.

d). Conduit Fittings and Junction Boxes

i). General

(1) The conduit fittings and junction boxes for vehicle wiring shall be as manufactured by the Contractor or by a supplier of a comprehensive line of parts.

(a) The Contractor shall submit the proposed product line for approval. **[CDRL 19-09]**

(2) All conduit fittings and junction boxes shall be provided with gasketed covers.

ii). Boxes

(1) All exterior junction boxes shall be fabricated of material appropriate for exterior usage, such as stainless steel, or as approved by Amtrak. All exterior junction boxes shall be weatherproof and shall be connected in such a way that drainage from equipment groups will not pass through the conduit into the junction boxes. Interiors of all junction boxes shall be primed and then protected with a white, insulating epoxy powder coating. If electrical faults within the box can be detected, the interior of the junction boxes may be left unpainted. Equipment areas containing non-insulated electrical devices at more

than 120 volts to ground shall be plainly marked with warning signs worded DANGER – XXX VOLTS. Covers for electrical junction boxes shall be accessible at all times without having to remove other equipment.

iii). Conduit Interface

(1) The open ends of conduit shall be provided with strain relief type fittings with extended rubber bushings, bell-mouth fittings, or insulated throat box connections as approved or an alternate solution may be presented and used subject to approval. All conduit entries into removable equipment boxes shall be secured by means of a bolt-on watertight access panel or an alternative solution may be presented and used subject to approval.

iv). Covers

(1) All junction box covers shall be retained by captive screws. All fasteners used in junction boxes shall be stainless steel. All covers shall be designed to accept or mate with a bulb-type clamp-on seal.

v). Wireways

(1) Wireways shall only be permitted in approved ceiling locations. They will not be permitted in the car body sidewall or under flooring areas. Only conduit will be permitted to run within the car body.

(2) All wireways shall be “Panduit”, meeting Amtrak Specification 352, or rigid steel with a coating to minimize the risk of oxidation and rust formation. The trays shall be adequately supported throughout their entire length in an approved manner. There shall be absolutely no sharp edges. The trays shall be completely de-burred before installation on the vehicles. Grommet clamps shall be provided at all locations where cables or wires enter or leave the wireways. Under no circumstances shall leads be draped over the edge of the wireways, with or without wireway edge protection.

(3) Wireways shall be located to provide access to the harnesses contained within for maintenance action.

(4) Bends in wireways shall be avoided; however, if they are required, approved protection shall be provided to avoid insulation chafing at the bends.

(5) Wireways shall not contain more than 30 current-carrying conductors at any cross-section. The sum of the cross-sectional areas of all conductors contained at any cross-section of a wireway shall not exceed 40% of the interior cross-sectional area of the wireway.

(6) All wire and cable shall be securely fastened within wireways to eliminate movement and resultant chafing.

19.37 Electrical and Electronic Designs

a). General

i). Except as otherwise indicated, electrical equipment and components shall conform to IEEE-16 (2020). Electronic equipment shall conform to EN 50155. Solid state power converters shall conform to IEC 61287-1. All mandatory type and routine tests shall be performed.

b). Reliability Standards

i). A standardized MIL-HDBK-217F reliability part stress prediction shall be performed on all electrical and electronic control systems. This reliability prediction shall be based on the "ground Mobile" environment. Use of alternative reliability database information and prediction methodologies or statistically meaningful filed failure data from comparable operating environments may be permitted with Amtrak approval.

c). Ability to Repair

i). All electrical devices including such items as PC boards, relays, contactors, and filters shall be capable of being repaired by Amtrak in its electronics laboratory. It is recognized that some equipment, due to its complexity, cannot be economically repaired by Amtrak. In preliminary design reviews, the Contractor shall identify all situations where this could be the case, for ruling by Amtrak, whose decision shall be final.

ii). Units shall not be sealed, potted, or constructed to prohibit repair by Amtrak. Units that must be potted or sealed by design other than Lowest Level Replaceable Units (LLRUs) shall have a minimum 10-year warranty.

d). Hardware

i). All hardware associated with electronic and electrical systems, including the case, heat sinks, mounting brackets, etc., shall be protected against moisture, oxidation, and common airborne contaminants.

e). Wiring

i). Wire selection, routing and securement shall be accomplished with the goal of having the wire and cable last the life of the car body. All movement and chafing of wire and cable shall be eliminated. The use of additional wear material(s) to extend life without elimination of the movement, wearing or chafing will not be permitted.

f). Optical Fibers

i). Any application of optical fibers shall be approved by Amtrak. Samples of all fiberoptic cables and termination connectors shall be submitted for approval.

ii). Fiber optic cables shall be installed in accordance with the cable manufacturer's instructions, shall be adequately protected from damage of any kind, and shall be readily accessible for maintenance and inspection. Fiber optic terminations shall be of quick disconnect type, designed to prevent degradation due to the car environment, including vibration and variation in temperature, and shall be capable of inspection and repair without removal from the car.

19.38 Electrical Devices and Hardware

a). General

i). All electrical devices shall be service-proven. Electrical connections shall use either captive screws or captive nuts, with crimp terminals.

b). Suppressors

i). Suppressors shall be incorporated across inductive devices to minimize switching transients. All suppression devices shall be selected on the basis of their ability to absorb the amount of energy available in the connected circuit, for the number of cycles of operation expected in service, without requiring replacement prior to scheduled overhaul. All magnet valves and relay/contactor coils shall have free-wheeling diode or metal-oxide varistor voltage spike suppression, or other suppression means, except where this results in deterioration of performance. Coil suppression devices shall be located physically on or as close as possible to the coil it protects (preferably directly at the coil terminal). Wherever possible, the suppression of transients shall be at the source.

c). Contactors and Relays

i). Contactors shall be defined as those devices, which control one kilowatt or more of electricity through their main contact tips. Unless specified, all contactors shall meet or exceed the requirements of Amtrak Specification 528, section 4.3- 4.5 or Amtrak approved alternative solution.

ii). Relays shall be defined as those devices which switch less than one kilowatt of electricity through their contacts. Unless specified, all relays shall meet or exceed the requirements of Amtrak Specification 528, section 4.3- 4.5 or Amtrak approved alternative solution.

iii). Preference shall be given to solid state relays and contactors where possible.

iv). All contactor and relay coils shall be suppressed with a solid-state device to prevent transients being generated onto the low-voltage network.

v). All devices shall be satisfactorily tested for proper functioning in orientations up to 30° from the mounting plane as fitted in the vehicle. They shall be installed to be fully accessible for inspection, servicing, repair and ease of replacement. There shall be no more than two wires connected to any one terminal. Installation shall be such that, when required, arc spray is directed, by a non-asbestos arc chute, away from ground and adjacent electrical devices.

vi). All devices shall be constructed and utilized in a fail-safe manner; that is, all failures shall be in a direction such that neither the passengers, the crew, nor the equipment is placed at risk.

vii). All magnetic devices shall be a heavy-duty type suitable for railroad service. They shall be constructed such that the main tips or contacts "make" and "break" with a wiping or rolling motion that minimizes build- up of deposits and/or pitting. Contact and/or tip replacement shall not exceed 5% of the total number during any annual inspection period.

viii). Device contacts or tips shall not be placed in parallel to increase the total current load in excess of the rating for an individual contact or tip.

ix). All devices shall be readily identifiable by means of a permanent, durable marking strip giving the device circuit designation. No identifications shall be obscured, or partially obscured, by wire routing. The identification strip shall be mounted adjacent to the mounting of said device.

x). Bifurcated contacts shall be used in low voltage applications whenever necessary due to dry contacts or low current switching requirements.

xi). All time delay relays shall be of the R-C delay or solid-state type. No mechanical or pneumatic time delay devices will be permitted.

xii). Where plug-in relays are approved, the relay shall be positively retained by means of a retaining clip or bar. This device shall be captive, of rugged construction and shall be easily positioned for relay installation and removal without the need for special tools. When the relay is removed, the retainer shall itself be retained so that it cannot come in contact with devices, which may have exposed energized electrical circuits, and it shall not interfere with the operation of any other device when in this position.

d). Switches

i). Switches are defined as those manually operated devices that control less than one kilowatt of electrical power through their contacts. Unless otherwise specified, switches shall meet the requirements of MIL-DTL- 3950. Toggle and push button switches shall be per MIL-DTL-3950, MIL-PRF-8805, MIL-DTL-83731 or equal, as approved by Amtrak. All exterior switches and switches located in “wet” areas shall be IP66 rated or higher. All switches provided shall be of high quality and shall be fully suitable for the rigors of Amtrak’s service environment, including cycle life. The design and selection of all switches shall be subject to review and approval.

ii). Switches shall be provided with a "keying" feature such that after installation, the body of the switch will be constrained from mechanical rotation.

iii). Under no circumstances shall poles of switches be placed in parallel to carry currents in excess of the contact pole rating given by the manufacturer.

iv). There shall be a maximum of two wires connected to each terminal of the device.

v). Switches shall be individually replaceable without disconnecting or removing anything other than the mounting fasteners and electrical connections of the switch to be replaced.

vi). All control switches, which are subject to water splash, which is defined to mean any switches mounted near windows or doors, or mounted on the Engineer's control console, shall be environmentally sealed.

e). Circuit Breakers

i). All circuit breakers provided shall be extremely rugged and fully suitable for the service intended. They shall meet the requirements of Amtrak Specification 498, section 4.4. Design and selection of all circuit breakers not available within Amtrak's material control system shall be subject to review and approval.

ii). The continuous current rating of thermal-magnetic trip circuit breakers shall be selected in accordance with ANSI C37.16 for the load and type of service specified. All thermal-magnetic trip circuit breakers shall conform to the requirements of ANSI C37.13 and ANSI C37.14.

iii). All circuit breakers of the same rating shall be of the same manufacture and model throughout the vehicle. Circuit breaker current rating shall be clearly and permanently marked and shall be completely visible after installation.

iv). The ON, OFF and TRIPPED positions of all circuit breakers shall be permanently marked on the handle or the case of the circuit breaker. The circuit breaker, when tripped, shall assume a distinct position between the ON and OFF positions to permit determination of the fact that it has been tripped by either its overcurrent or shunt trip elements.

v). Circuit breakers shall be individually replaceable without disconnecting or removing anything other than the mounting fasteners and electrical connections of the breaker to be replaced.

vi). Every input power circuit shall be protected by an individual circuit breaker. Separate circuit breakers shall be provided for major assemblies or functions. No circuit breaker shall protect more than one circuit, nor shall any one circuit be protected by more than one circuit breaker. Circuit breaker terminals shall not be used as junction points.

vii). All circuit breakers shall be selectively coordinated as to ensure that the protective device nearest the fault trips before upstream devices.

viii). All circuit breakers shall be sized by current rating and tripping time to protect both the associated equipment and the minimum size wire used for power distribution within the protected circuit without causing nuisance tripping.

ix). Each circuit breaker pole shall be equipped with adequate means of arc extinction to prevent flashover.

x). Circuit breakers shall not be intended for use as on/off switches. All circuits requiring on/off switches shall be so equipped.

f). Fuses

i). Circuit protection functions that can be performed by fuses shall normally be performed by appropriately rated circuit breakers. Fuses shall be used only where specifically called for in the Specification or where the use of circuit breakers is not technically feasible, and only with specific written approval. Fuses may be considered in applications as follows:

(1) To protect solid-state equipment from catastrophic damage.

(2) Where current or voltage levels prohibit circuit breakers.

ii). Fuses shall be permanently identified adjacent to the fuse, including functional name, fuse type and rating. The rating of each fuse shall be permanently and clearly marked directly on each fuse.

iii). Fuses shall be readily accessible. All fuses mounted in exterior equipment boxes shall be accessible without going under the vehicle.

iv). Fuse holders shall contain fuse retention devices at both ends.

v). Unless explicitly noted otherwise in this Specification, all fuse compartments shall have a spare fuse of identical size and rating for each "in-circuit" fuse and shall be mounted next to the respective "in-circuit" fuse with the fuse holder clearly marked SPARE FUSE. The spare fuse holder shall not be enclosed and shall not consist of any loose parts.

vi). The use of current limit-type fuses is prohibited.

g). Bus Bars

i). Bus bars are to be fabricated from OFE (Oxygen Free Electronic) or ETP (Electrolytic Tough Pitch) copper (CDA 101). The bus bar conductivity shall be 100% IACS. All bus bar joints and bolted connection points shall be silver or tin plated.

ii). Current densities, other than at joints, shall not exceed 1000 amperes per square inch, and in any case shall not exceed a value which would cause a bus bar temperature rise greater than 30°C. Current densities in joints shall not exceed 150 amperes per square inch.

iii). Bus bars shall be properly brazed together at joints unless bolted connections are found to be necessary for maintenance purposes and are approved. The overlap at bus bar joints shall be no less than 10 times the thickness of the bus material. Bus bar connection bolts shall be torqued to obtain a uniform bus bar connection pressure of 200psi. Bolting hardware shall be plated steel with Belleville washers to maintain connection pressure.

iv). Except for connection areas, bus bars shall be safety insulated, using a high-dielectric, powder coating or other approved means. Tape will not be acceptable. Bus bars that are behind insulating panels will be exempt from this requirement.

h). Capacitors and Resistors

i). Dry tantalum capacitors shall be used in place of aluminum electrolytes, except for high values which are not commercially practical or available, in which case long life grade aluminum electrolytic or dry polypropylene film capacitors shall be used.

ii). Dry tantalum capacitors shall be in hermetically sealed metal cases, except for surface mounted types when hermetically sealed metal cases are not available.

iii). Commutating capacitors shall be a paper or plastic film type, shall incorporate a non-toxic impregnant, and shall be chosen to give a service life of at least 20 years. Filter capacitors shall have high ripple current rating for long life.

iv). Capacitors shall be derated 20% for voltage based on the nominal supply voltage and maximum case temperature. If filter capacitors are exposed to low ripple voltages, lesser values of derating may be accepted if it can be shown that reduced operating temperatures can be achieved due to lower dissipation; however, the sum of the dc and ac ripple voltages shall always be less than the capacitor's voltage rating at a maximum case temperature of 85°C.

v). All resistors shall be operated at less than 50% of their rated maximum power dissipation. Other power resistor applications may be submitted for approval of lower derating, on a case-by-case basis.

vi). Use of trim potentiometers or adjustable resistors shall not be permitted without Amtrak approval. Generally, the need for adjustments shall be avoided by use of the appropriate circuitry, and stable precision components.

vii). Transformers and Inductors

viii). Transformers and inductors shall be rated at 20% over the maximum specified current level.

i). Switch, Circuit Breaker and Fuse Panels

i). All switch, circuit breaker and fuse panels shall conform to Amtrak Specification 498, with dead front, mounted in the specified equipment enclosures and switch/ electric lockers.

ii). Each switch and circuit breaker panel shall carry the necessary apparatus, arranged to be easily accessible to connections and designed to prevent operating or maintenance personnel from coming in contact with live parts when operating the switches or circuit breakers. All live portions of the protected circuitry shall be completely concealed so that no danger of electrocution or shock exists from the touching of the panel, or any appurtenances or devices mounted thereto.

iii). All switches, breakers, fuses, and indicating lights shall be provided with a nameplate of raised or recessed lettering on the dead front, clearly identifying the circuit which each device controls and its circuit designation. The dead front panel shall conform to NFPA No. 70, Article 408. A wiring gutter shall be provided along the top, sides, and bottom, for the routing of high voltage leads to their designated circuit breakers.

iv). The panel shall be secured by approved, captive fasteners and shall be configured for easy removal so that maintenance and repair action is not impeded.

v). Power distribution to circuit breakers and switches shall be from a bus bar or bus circuit.

vi). Distributing power by successive or "daisy-chained" connections between device terminals will not be permitted.

vii). Battery Backup Circuits

(1) Any device provided that requires a backup battery must be designed with a five-year battery life unless specifically approved by Amtrak.

(2) A “low battery replacement” indicator or an equivalent fault message in the equipment diagnostics shall be provided to enable timely battery replacement prior to a loss of backup functionality.

19.39 Semiconductor Standards

a). General

i). Semiconductors shall be selected to withstand all continuous and transient voltage and power demands present in the circuit application without damage or reduction in life.

ii). All circuit designs shall provide for the presence of high current switching equipment on the vehicle and the resultant induced voltages and currents in electrical equipment.

b). Rating

i). Discrete semi-conductors shall have the following minimum voltage breakdown rating, dependent on the use:

(1) Transistors and thyristors operated from the nominal battery supply, or those connected to trainlines, shall have minimum breakdown ratings of four times the maximum circuit rating. Suppression devices shall be provided as necessary to protect the devices and limit the circuit voltage.

(2) Diodes operated from the nominal battery supply, used as suppression devices, or those connected to trainlines shall have a minimum Peak Inverse-Voltage rating (PIV) of 1000V. Diodes with less than 1,000 V PIV rating may be used if adequate circuit transient protection is also provided.

(3) All discrete semiconductors operated from inverters or other isolating devices shall have minimum breakdown ratings of two times the maximum circuit voltage (except where specifically detailed otherwise). Suppression shall be provided, as necessary, to protect the devices and limit the circuit voltage to the values specified by the semiconductor manufacturer.

ii). Semiconductors shall be placed in a clean and ventilated environment which shall favor easy replacement.

iii). All semiconductor junction temperatures shall be limited to 150ºC (or to the maximum rated temperature for the device, whichever is less) or less at maximum ambient temperature and at maximum rated output power.

iv). All semiconductors shall be operated at less than 50% of the maximum continuous current rating or maximum continuous power rating, whichever is more restrictive.

v). Integrated circuits operated from the battery supply through inverters or other isolating devices shall be operated within the voltage and current ratings specified by the manufacturer, derated to less than 50% of the maximum stress level at the maximum operating temperature of the device as specified by the manufacturer.

vi). Where the supplies to integrated circuits are regulated and surge protected, the voltage rating shall be 15% below the manufacturer's recommended maximum. In addition, the maximum power shall be limited to 50% of the manufacturer's specified maximum at the maximum operating temperature.

vii). All gallium arsenide and similar optical semi-conductors shall be rated for operation over the temperature range of -40°C to +85ºC.

viii). All semiconductors shall be rated “industrial or automotive grade” for reliable operation over the temperature range of -40ºC to +85ºC, except for discrete power semiconductors (>=1 Watt) which shall be rated for temperature range of -55ºC to +125ºC. Exceptions shall not be taken without proper identification and written authorization from Amtrak prior to first article tests.

ix). All suppliers of semiconductors shall be selected according to a recognized standard such as ISO-9002 Section 4.6 or better. Exceptions shall not be taken to the above provisions without proper identification and written authorization from Amtrak prior to the first article inspection.

c). Availability and JEDEC Registration

i). To the highest extent practicable, thyristors, transistors and diodes shall be JEDEC registered and numbered.

ii). All semiconductors shall be available from at least two manufacturers and available from U.S. distributors. Single source devices, such as high voltage power devices, microprocessors, ASICs, and related support chips may be used only if approved. Such devices shall be essential to the proposed equipment, shall meet the service-proven requirements and shall be supplied by veteran manufacturers likely to support the device.

iii). Environmental Stress Screening All printed circuit boards or assembled card racks shall undergo Environmental Stress Screening (ESS) in accordance with Section 5.10 of IEEE Std 16-2020. ESS alternatives based upon EN 61163-1 guidance will be considered as approved by Amtrak. All ESS records must be maintained for review by Amtrak inspectors.

19.40 Printed Circuit Board Standards

a). General

i). Printed circuit boards shall be designed to IEEE Std 16-2020, Section 4.10 except as noted otherwise below.

ii). Printed circuit boards incorporating vital functions shall be designed to IPC-2220 Design Standards Series, Printed Boards, Class 3.

iii). Printed circuit boards incorporating components whose power dissipation is in excess of 2 watts, or boards mounted adjacent to such components shall utilize circuit board material per NEMA Standard LI 1, Type FR-5.

iv). Printed circuit boards shall have a minimum thickness of 0.0625 in base material. All conductor material shall be copper and shall be firmly attached to the board and shall be resistant to blistering and peeling when heated with a soldering iron.

v). All printed circuit boards shall be designed for ease of testing per ANSI/IPC-D-275, “Testability Design Check List.”

vi). Traces shall be made as wide as practical, with the minimum width being based on a 10ºC temperature rise.

vii). Components with pins shall be mounted only on one side. Connections shall be made to the other side or internal layers via plated through holes. Surface mounted components may be mounted on both sides if part of an approved existing design.

viii). All circuit boards shall be inherently stiff or shall be reinforced to prevent damage due to vibration or handling. Unless otherwise approved circuit boards larger than 100 $in.^2$ shall be centrally stiffened.

ix). All equipment shall be designed using stable, high tolerance components to eliminate the need for adjustments. Compensation for manufacturing tolerances may be made through parallel precision resistors. All replacement printed circuit boards shall be directly interchangeable without any additional adjustments.

x). All printed circuit boards shall be of the "plug-in" type, with positive support against vibration, except where otherwise approved otherwise.

xi). No more than one PC board shall be stacked on each PC card.

xii). Printed circuit board connectors shall be heavy duty, high reliability, and proven in prior successful rail service. All printed circuit boards shall plug into keyed sockets. Contact fingers and edge connectors shall have 0.000050 in. thick gold plating.

b). Marking

i). All circuit boards shall be labeled with a part number, serial number, and descriptive nomenclature.

ii). All components shall be labeled on the board with component drawing references and such other information as may be required to repair and troubleshoot the board. The component and wiring sides of the board shall each be marked to indicate capacitor and diode polarity, and at least two leads or one lead and a graphic symbol indicating orientation of all transistors and thyristors.

iii). Integrated circuits and other multi-terminal devices shall have an index mark on the component side of the board, visible with the component inserted, to indicate proper keying and insertion; the first pin on all integrated circuits packages shall be identified on the wiring side of the board.

iv). For boards whose component density is greater than 2.25 components per square inch, the Contractor may submit an alternate marking plan for possible approval. Such a plan should include board marking, augmented by layout drawings.

c). Component Mounting

i). Components shall be fastened to the board in such a manner as to withstand repeated exposure to shock and vibration. Large components shall be supported in addition to the solder connections. Power resistors shall be mounted on standoffs so that the resistor bodies do not contact the board, spaced far enough away from the board so that resistor-produced heat will not discolor or damage the board or adjacent wires or components.

d). IC and Device Sockets

i). IC and device sockets are prohibited except for components that must be removed for reprogramming or initial calibration procedures or devices that are available only for mounting in sockets. All socket applications shall be subject to approval by Amtrak. All other components shall be soldered in place.

ii). Where approved, IC and device sockets shall comply with MIL-DTL-83502E and MIL-DTL-83734H, as is applicable for the device, and shall be made of the following materials:

(1) The bodies shall be molded from diallyl phthalate, PTFE Teflon, or approved equal.

(2) The contacts shall be fabricated from beryllium copper and shall be plated with a minimum of 0.000030-inch (0.000762-mm) of gold over a minimum of 0.000050-inch (0.00127-mm) of low-stress nickel in the area of contact with IC pins.

e). Conformal Coating

i). Both sides of the assembled printed circuit boards shall be coated with a clear insulating and protective coating compliant with IEEE Std 16-2020.

ii). All IC sockets, connectors and test points shall be masked when the coating is applied.

f). Keying

i). All printed-circuit boards shall be "keyed" to prevent insertion into the wrong socket. Further, circuit boards in safety related control systems, such as friction brakes, cab signal, PTC, and systems which can cause damage or unsafe train operation if the vehicle is operated with a card removed, shall be connected through a safety circuit or checked through an auto test to disable the vehicle if a circuit board is removed.

g). Circuit Board Connectors

i). Printed circuit board connectors shall be heavy duty, high reliability, two-part type with a history of successful service in rail applications and shall be approved by Amtrak prior to commencing design.

ii). Connectors which comply with MIL-DTL-55302G or DIN 41612 (EN 60603) Level 1 or 2, and which have plated contacts as described below, are considered to comply with the requirements of this Chapter.

iii). The connector contact area shall be plated with a minimum of 0.000050 in. of gold over a minimum of 0.000050 in. of low stress nickel.

iv). Card edge connectors are prohibited.

v). All connectors within one panel assembly shall be keyed to prevent damage or malfunction due to incorrect insertion.

h). Testing

i). Sufficient clearance shall be provided between components to allow testing, removal and replacement without difficulty due to lack of space.

ii). Test points shall be provided in appropriate locations on modules and printed circuit boards. A negative return test point shall also be provided. The test points shall either accept and hold a standard 0.080 in. diameter tip plug or shall be a turret lug similar to Cambion No. 160-1026-01-05, or approved equal, with sufficient clearance to permit it to accept a standard oscilloscope probe clip and shall be identified by appropriate markings.

iii). When test points are not suitable, as for complex circuits or micro-processor-based control system, self- diagnostic routines and/or special test equipment may be used to identify the failed Lowest Replaceable Unit.

i). Plated-Through Holes

i). In addition to the general guidelines of the Institute of Printed Circuits (IPC), the following requirements shall be met:

(1) Plating Holes – Copper plate shall be a minimum of 0.001 in. minimum average thickness, and 0.003 in. maximum average thickness. Solder plates shall be 0.0003 in. minimum average thickness and 0.0015 in. maximum average thickness.

(2) Plated Hole Defects – No more than three voids per hole will be acceptable. Total area of the voids shall not exceed 10% of the total wall area. The largest void dimension shall not exceed 25% of the core diameter or the board thickness, whichever is smaller. There shall be no pits, voids, or cracks at the junction of the whole wall and terminal area to a depth of 1-1/2 times the total copper thickness on the surface.

j). Enclosures

i). All circuit boards that are rack mounted shall plug into racks containing the mating half of the circuit board connector. The circuit board rack shall mount in an enclosure conforming to requirements in this document. The rack, circuit board and circuit board hardware shall be designed as an integrated system.

ii). The rack and enclosure shall provide environmental and EMI shielding necessary to meet the requirements of this Specification.

iii). Printed circuit boards shall be positively retained by means of keeper bars or other approved method. The enclosure or rack cover shall not be used to retain the circuit boards.

iv). Each circuit board shall be fitted with an ejector or hand grip to assist in board removal. The rack and the edge of each board, or the card ejector, shall be labeled with corresponding numbers to identify board location within the enclosure.

k). Extenders

i). Printed circuit board extenders (six sets of each type) shall be provided by the Contractor for test purposes. At least two extenders of each type shall be available for use and evaluation throughout the design conformance and acceptance test programs. The interfaces between extender and enclosure and PC board shall be positive and secure and shall prevent malfunction and loss of securement during testing. Mechanical locking means shall be considered for large PC boards.

19.41 Auxiliary AC Motors

a). Motors shall limit starting current to within industry recommended practices and be equipped with NEMA C-frame type sealed bearings that shall not require re-lubrication for the life of the bearing. Bearings shall be sized to provide a minimum life of 6 years. Any motor mounted with the shaft vertical shall have bearings suitable for this type of application. Any motor which is exposed to weather shall be a type specifically designed for the environment. Any motor with a vertical shaft and subject to the weather shall include a moisture seal on the shaft to prevent water from entering the bearings.

19.42 Recyclable Materials

a). Expendable items that are recyclable shall be identified with the appropriate symbols, as defined by the Society of the Plastics Industry, permanently imbedded in the material.

20.11 Reliability and Post-Delivery Tests 20-103
20.12 CDRLs 20-104

20.1 Overview

a). This Chapter addresses the requirements for the testing of the design and production of the cars and its components. It is based upon the traditional descriptions of testing an individual passenger car.

b). The cars may have varying components and features depending upon Amtrak.

i). Based upon this, the Contractor shall review each part of this Chapter and prepare a matrix of its adaptation for the specific applicability for testing to the cars being constructed.

ii). This car testing matrix shall be presented to Amtrak for approval. **[CDRL 20-01]**

iii). The overall testing program shall be mutually agreed upon by the Contractor and Amtrak.

c). In the following text, the words consist and car may need to be used interchangeably to meet the intention of the specific test.

d). References to first car or pilot train shall refer to the first delivered equipment of a particular type.

e). As part of the production of the cars and its components under this Contract, the Contractor shall be responsible for a comprehensive series of tests to be performed to verify both the suitability of design and workmanship of each car.

f). The Contractor is also responsible to fulfill all requirements called for by the Federal Railroad Administration (FRA) for testing new passenger equipment, and for operation at 125 mph per the applicable requirements of 49 CFR Parts 238 and 213.345 for Tier I equipment, for submission by Amtrak to the FRA.

g). The tests and any required adjustments to be performed are grouped into four classifications:

i). Material Certification,

ii). Proof of Design,

iii). Production, and

iv). Acceptance.

h). Whenever test requirements overlap, the more comprehensive shall govern.

i). The Contractor shall perform all tests under Amtrak observation, and the FRA may also observe such tests.

j). All contractual tests shall be conducted in accordance with Amtrak approved test procedures.

k). Testing activity scheduled and/or conducted before test procedure approval will be

at the Contractor's risk.

l). Material Certification Tests consist of all tests required to certify that the materials used in the manufacture of the rail cars meet the performance and behavior requirements of the manufacturer's specifications, all applicable industry standards, and Federal requirements.

m). A full listing of the material certification tests shall be included in the Master Test Plan, and the certifications and test results shall be submitted to Amtrak for review and approval.

n). All material samples used for certification testing shall be scrapped upon the conclusion of testing and shall not be used in the manufacture of the cars.

o). Proof of Design Tests are those tests conducted on the systems and components to validate the design of the cars, to confirm that the systems and components function as intended and in accordance with specifications and Federal requirements, and to ensure that no unintended or undesirable consequences are encountered during production or operation of the cars.

p). Proof-of-design tests shall be conducted on all major systems and components prior to release of the first cars of each type, and as necessary during production in the event of a design change or component substitution.

q). Production Tests consists of all components, systems and car tests to be performed on each production car to ensure that each car meets all functional, operational and workmanship requirements and standards, and that any production errors or nonconforming materials or components are revealed and corrected prior to the vehicle being released from the Contractor's facility.

i). These tests comprise component-level testing at the supplier's facility, and system-level testing at the Contractor's facility during and at the completion of production to demonstrate conformance with Technical Specification and baseline configuration requirements prior to delivery.

r). Acceptance Tests consist of production car tests to be performed on each car by the Contractor after delivery of each car to the Contractor's field site or Amtrak's facilities to demonstrate conformance with the Technical Specifications, to ensure that no system functionality was lost during shipment and transit of the vehicle, and as a condition for Acceptance.

s). Tests related to contract options are included in this Chapter. If a contract option is not exercised, then the relevant tests will not be applicable.

20.2 General Requirements

a). The Contractor is required to perform all tests as specified herein.

b). The Contractor and its subcontractors may, at their option, perform additional testing as they deem necessary as part of the quality assurance program.

c). Unless indicated otherwise, all costs associated with any of the tests performed

are to be borne by the Contractor.

d). In the event of a failure to meet the Technical Specification requirements in any test, necessary corrections shall be made by the Contractor at its expense, and the failed test shall be rerun in its entirety at the Contractor's expense.

e). If further corrections or modifications affecting the item under test are instituted, the Contractor shall perform a complete retest at its expense to demonstrate compliance with the Technical Specification requirements.

f). Notwithstanding the preceding provision, Amtrak shall not charge the Contractor a fee for the use of Amtrak-owned facilities, tracks or utilities located on the Northeast Corridor, or for the use of Amtrak personnel, the first time a particular inspection or test is performed on a particular car.

g). Amtrak shall have the right to charge Contractor for, and Contractor shall pay, all such expenses in connection with any re-inspection or retesting of a particular car required as a result of a car not having successfully passed the applicable test.

h). Acceptance of the Fleet or any car thereof by Amtrak shall not occur until after all tests, and retests if applicable, are successfully completed in accordance with the requirements stated in the Contract.

i). The Contractor shall give at least ten days' notice to Amtrak prior to the start of any test referred to herein.

j). In the case of pre-revenue service tests per 49 CFR Part 238.111 (b) (2), 45 calendar days' notice shall be given to Amtrak in order to assure timely notification of the FRA. Additionally, CFR Part 238.110 is intended to complement 238.111, as proposed to be revised in the NPRM, and shall be included in the testing requirements.

k). If the Contract, or any subcontracts, Applicable Laws of any public authority having jurisdiction over Amtrak operations, require the Locomotives or other Equipment or Supplies to be inspected, tested or approved, Contractor shall give the COTR thirty (30) days (sixty (60) days for international travel) notice of its readiness and of the date arranged for any such testing so Amtrak may observe such inspection, testing or approval.

l). The Contractor shall perform and bear all costs of performing such inspections, tests and approvals unless otherwise provided in the Contract.

m). If after Contractor begins delivery of the cars or other Equipment or Supplies, Amtrak determines that any such item requires additional inspection, testing, or approval (in addition to inspections and tests provided under the Contract), Contractor shall, upon written authorization from Amtrak, order such additional inspection, testing or approval and Contractor shall give notice as provided hereunder.

n). These additional inspections or tests shall be conducted at the initial expense of Amtrak, and Amtrak shall grant a non-compensable extension of time equal to any delay caused by such tests.

o). Notwithstanding the preceding sentence, if such additional test or inspection reveals a defect or failure of the cars or Supplies to comply with the requirements of the Contract; or with any Applicable Laws, ordinances, rules, regulations or orders or if the original test or any retest or additional testing is improperly conducted by a Contractor Party, Contractor shall bear all costs of correction and retesting thereof, and no extension of the Contract Time shall be granted.

p). Required certificates of inspection, testing or approval shall be secured by Contractor and promptly delivered to Amtrak.

q). Neither the observations nor representations of Amtrak in its administration of the Contract, nor Amtrak's inspections, tests or approvals shall relieve Contractor from its obligations to perform the Work in accordance with the Contract.

r). Except as otherwise provided herein or agreed to by the Parties; tests shall be performed at plants of Contractor or its Subcontractors.

s). Contractor shall have a valid Amtrak Temporary Permit to Enter prior to performing any work on the Railroad or Amtrak's premises.

t). For onsite track testing, Amtrak shall identify suitable track meeting the length, alignment and other characteristics identified by the Contractor to permit performance of the required qualification track tests.

u). Except as provided herein, Amtrak may, at its sole discretion, allow the Contractor to furnish test reports which indicate that equipment furnished under this Contract is identical to equipment which has been previously tested for the same application and accept this as showing conformance with the requirements of this Technical Specification. Amtrak has the discretion to reject any test reports from similar or identical equipment that the Contractor may propose in lieu of actual testing, for any reason at all, including but not limited to differences in the equipment, differences in the operating environment, insufficient time or mileage in service, or anything else whatsoever.

20.3 Test Plans, Procedures and Reports

a). The Contractor shall prepare and provide to Amtrak as specified the following test documentation. See Chapter 22 for additional details regarding submittal of documents to Amtrak.

i). Master Test Plan

(1) No later than 180 days after NTP, the Contractor shall submit to Amtrak for review and acceptance a Master Test Plan **[CDRL 20-02]** covering all tests listed in or otherwise required by this Technical Specification.

(2) The Master Test Plan shall be updated monthly and presented as an attachment to the program meeting minutes.

(3) The Master Test Plan shall include a testing matrix identifying, all tests as required to be performed by the Contractor and suppliers, including but not limited to:

(a) Material certification tests;

(b) Proof-of-design tests, including all required carshell, truck and suspension and ride quality tests;

(c) Production tests; and

(d) Acceptance tests.

(4) It shall include a detailed schedule showing the sequence in which the test will be performed, and the time and place of each test to be performed.

(5) The plan shall be updated periodically, showing the status of each test procedure, test and associated report summarized in a spreadsheet format.

ii). Test Procedures

(1) The Contractor shall prepare a detailed test procedure for all tests required by this Specification and for all other tests to be conducted by the Contractor or its suppliers in connection with its own quality assurance program. **[CDRL 20-03]**

(2) Tests procedures shall be submitted for approval in advance of the anticipated test dates as follows:

Figure 20-1: Test Procedure Submittal Due Dates

Test Type	**Procedure Due Date**
Supplier Qualification, Proof of Design and Production	No less than 60 days prior to start of testing
Contractor Qualification, Proof of Design Tests	No less than 60 days prior to start of testing
Contractor Production Tests	No less than 45 days prior to start of testing

(3) All required testing shall be conducted in accordance with Amtrak-approved master test plan and approved test procedures.

(4) The test procedures shall include the following information:

Title/Approval Page: Includes the name of the test, test number, revision level, date, author,

	signature of engineer responsible for system, signature of personnel who reviewed and approved the test, etc.
Revision History:	Provides the history of changes made to the document, including description, not merely date.
Table of Contents:	
1.0 Purpose	Identifies what the test is to accomplish.
2.0 Application	Identifies which car types/equipment is tested with this procedure.
3.0 References	Identifies any documents used as guidance for the test, such as APTA, FRA, ASTM, etc.
4.0 Definitions	Provides definitions of terms used in the test.
5.0 Prerequisites	Provides requirements of car condition before the test can be conducted, such as which tests must be successfully conducted before this test.
6.0 Equipment	Identifies test equipment and any other special requirements; lists instrument model numbers, calibration dates and serial numbers.
7.0 Initial Conditions	Identifies positions and/or state of all devices, controls and equipment.
8.0 Procedure	This is the actual test sequence. The test procedure shall identify pass/fail (or in some cases, intentional overload) criteria for each step in the procedure. Test data may be recorded within this section, or in a separate data section. The test procedure shall identify the conditions required for the performance of the test, including a sheet where test conditions can be recorded, such as voltage, current, resistance, time, etc. Each test performed shall be signed and dated by the technician performing the test.

9.0 Data Sheets	This is a form in which data is recorded, if it is not recorded within the body of the test. If data is recorded by instruments, such as strip chart format, etc., those results shall be attached here.

(5) Each car and system shall be tested in exact accordance with Amtrak-approved revision of the test procedure.

(6) All test and inspection instruments shall be properly calibrated.

(7) Should a system or component fail a test, the component or system shall be repaired or replaced, and the test repeated from the beginning.

(a) The test shall not be restarted at the point at which the failure occurred.

(b) Amtrak may, at its sole discretion, determine portions of the failed test which need not be repeated. Unless Amtrak gives written approval to re-test only the portion impacted by the failure of a component.

(8) Each test shall be a separately controlled document and identified by its own number, title and revision.

(9) All revisions shall be submitted to Amtrak for approval.

(10) A history of test revisions and changes shall be maintained and recorded within the test document.

(11) All tests must be written in an instructional form describing the full activity of each test step and written in duplex-numerical form (similar numbering system as seen in this specification).

(12) All special tools and/or equipment to be used must be specified within the test document.

(13) A data collection form shall be used with each procedure and shall be fully identified.

(14) Each individual test shall be accompanied by a separate sheet where the test results are documented.

(15) Each step of the test requiring a specified result or measurement shall be included and identified by the duplex-numeric step number referenced in the test document.

(16) Areas shall be provided for recording actual values produced during the test where needed.

(17) In addition, acceptance criteria and associated tolerances shall also be shown in parenthesis near the space available for recording the actual value.

(18) The test number, revision and page number shall be shown on the header of each page or all test procedures.

(19) Areas shall also be allocated for the date, car number, component serial numbers (as applicable), test equipment serial numbers, verification of test equipment calibration, test status (accepted/rejected) and signature areas for the test technician, Contractor Quality Assurance (QA) representative and Amtrak representative.

iii). Testing Notification

(1) In the case of pre-revenue service tests per 49 CFR Part 238.111(b)(2), the Contractor shall provide no less than 45 calendar days' notice to Amtrak in order to assure timely notification of the FRA.

(2) For other tests, each detailed test procedure shall be submitted to Amtrak for review far enough in advance of the planned test date to allow Amtrak at least 60 days for Qualification and Proof of Design tests and 45 days for production tests to initially review and comment on, or approve the procedure, and still have sufficient time to allow the Contractor to modify a rejected procedure and resubmit to Amtrak, to have approval a minimum of ten (10) working days prior to any testing covered by the procedure.

(3) Amtrak shall witness all tests.

(a) Under no circumstances will Amtrak accept the results of a test performed without approved procedures.

(b) Amtrak requires the Contractor to do internal pre-testing to validate performance prior to the Amtrak-witnessed testing and may require it for tests requiring Amtrak personnel to travel to a Contractor site. In the event the witnessed tests fails, the unwitnessed test results may not be used as a substitute.

iv). Test Documentation

(1) The Contractor shall be responsible to provide Amtrak with written test reports for all tests performed on the cars and their components, including supplier test reports.

(2) Upon the completion of each test, the Contractor shall submit a written report of each test, including copies of all test data, to Amtrak for approval. **[CDRL 20-04]**

(3) In every case, the report shall include a description of the test, all raw data collected in the test, and a summary of the results in a form that can be directly compared to the Technical Specification without further calculations.

(4) The test report shall include a record of the testing dates, tracing numbers for any calibrated instruments used during testing and an overall conclusion of the test findings.

(5) A test shall not be considered as completed until Amtrak (and the FRA, as required) has approved its final written test report.

(6) Should the test procedure or reports be inadequate and not meet the requirements of the Technical Specification of the FRA, Amtrak reserves the right to require revisions including those requiring more testing tasks or data to satisfy itself that the test program or report is adequate and does meet FRA and Specification requirements.

(7) The approval of Amtrak does not in any way relieve the Contractor of responsibility for the adequacy of the test program within the scope of this technical specification.

(8) Upon the completion of all required engineering tests associated with the pilot program, all copies of all test procedures, reports and approvals shall be copied and presented to Amtrak in a single volume and a single pdf document with links to each test that is easily searchable. **[CDRL 20-05]**

(9) All material certification and proof-of-design test procedures and reports shall be supplied by the Contractor in a separate binder and submitted to Amtrak for review and approval prior to acceptance of the first car of each type and a single pdf document with links to each test that is easily searchable. **[CDRL 20-06]**

(10) The master test plan shall be included in this binder and a single pdf document with links to each test that is easily searchable.

(11) Reports on all certification and proof of design tests plus the acceptance tests for the first car of each type shall be submitted and approved by Amtrak prior to acceptance of the first car of each type and a single pdf document with links to each test that is easily searchable.

(12) For production tests, which are performed on all cars or all components, a separate volume shall be submitted to Amtrak containing all approved tests applicable to individual cars and a single pdf document with links to each test that is easily searchable.

(13) In the event a test is revised, the Contractor shall supply a copy of the test reflecting approved changes and the upgraded revision

status to replace the existing test within this volume and a single pdf document with links to each test that is easily searchable.

(14) The test reports required by this specification that are performed on all cars or all components shall be included in the vehicle history books. At the front of the test diction of the vehicle history book there shall be a test log and a single pdf document with links to each test that is easily searchable.

(15) This test log shall be maintained by the Contractor during the equipment assembly.

(16) The test log shall have a place for a technician signature and date and will be signed when each test procedure has been completed.

(17) The test log shall be submitted to Amtrak for review before each car shall be released for shipment to the delivery site.

(18) All Contractor and Amtrak in process inspection sheets and test data records for that car shall be contained in this test log.

20.4 Material Certification Tests

a). All materials used in the production of the vehicles shall be tested to verify conformance with all applicable standards, regulations and specifications, and to ensure that the material performs as specified. At a minimum, the following materials shall undergo material certification testing:

i). All exterior glazing shall be certified to conform to 49 CFR Part 223 requirements.

ii). All interior materials shall be certified to meet smoke, flame and toxicity requirements.

iii). All subfloor panels shall be certified to meet strength and impact resistance requirements.

iv). All materials used in production of the carshell shall be certified to meet material strength, composition and performance characteristics.

v). All components used in the manufacture of truck, suspension and coupler assemblies shall be certified to meet all applicable strength, composition and performance requirements.

vi). All insulation materials shall be certified to meet applicable insulation performance standards.

vii). All materials used in food preparation areas of the Food service car, potable water systems and trash storage shall be certified to meet all applicable Public Health Service sanitation requirements.

viii). All interior and exterior emergency signage materials shall be certified to meet FRA emergency exit signage requirements.

ix). All emergency power sources shall be certified to meet FRA emergency exit pathway.

x). All emergency equipment shall be certified to conform to all applicable FRA regulations and other requirements as necessary.

xi). All exterior graphics components, including paint, decals and hardware, shall be certified to meet all applicable performance requirements including environmental and air quality requirements, durability in accordance with environmental and climatic conditions, and application in a railroad environment.

xii). All electrical devices producing magnetic fields shall not pose a hazard to any person with a pacemaker or other cardiac device within any area of the carbody interior, including passenger and maintenance areas. The magnetic field generated by the electrical devices shall be such that the magnetic field at any location where a passenger, driver or maintainer can be shall not exceed 1 mT (ref.."EN 45502-2-1, paragraph 27.6 " equivalent to ISO 14117, paragraph 4.6) when measured using the method defined by EN 50500 or IEC 62597. All car level EMC tests shall include applicable magnetic field interference testing for medical devices.

20.5 Proof of Design Tests

a). General

i). The Contractor shall develop a series of tests to evaluate the design of the carshell and each car system, subsystem and major component to verify that:

(1) the performance requirements of the carshell structure, systems and components have been met

(2) the system and all component parts function as intended and within all specified parameters

(3) no unintended or unanticipated functions, problems or non-conformances are discovered during production or operation of the cars.

ii). These tests shall validate the design of all systems and components as supplied by the Contractor and subcontractors and prove that these designs are fully compliant with all applicable specifications, regulations and performance requirements.

iii). Proof-of-design tests shall be conducted on systems and components at the facilities of the Contractor or suppliers, or at other facilities as designated by the Contractor.

iv). The carshell and its primary structure shall undergo extensive proof-of-design testing to validate the structural strength, dimensional accuracy and performance of the carshell.

v). Proof-of-design tests shall also be conducted on completed cars at the Contractor's facility, to ensure that the individual systems and components have been integrated to function as intended within the completed car, without unanticipated or undesirable effect or degradation of performance of other systems or components.

b). Carbody

i). Weight and Balance

(1) Each completed car shall be weighed on a certified scale at AW0 condition ready to run [i.e. water, food service equipment, supplies, etc.] to determine compliance with the maximum weight and weight distribution requirement of the specification.

ii). Clearance

(1) Each completed car type shall be measured at AW0 and AW2 load to verify compliance with the clearance diagram. This shall include all exterior fittings, hardware, safety appliances, (including FRA top-of-rail clearance requirements) etc. Width measurements shall be taken from the centerline of calibrated track, not the carbody.

iii). Car Curving

(1) The first train containing each car type shall be tested to verify compliance (including having sufficient clearance between truck and carbody/equipment) to successfully negotiate the specified minimum curving radius in both directions of curving.

(2) This must take into account suspension motion (including worst case broken or collapsed springs), wheel wear, and the actions of maximum buff and draft with all connections made between cars.

(3) Each possible combination of vehicle configurations including locomotives, car types, procured cars with gangways, diaphragms, and legacy cars shall be tested to confirm interoperability.

(a) Couplers, trainlines and brake hoses compatibility shall be performed to confirm proper integration of the system at worst case curves, switcher, vertical curves, etc. including proper receptacles/plugs junctions and length compatibility.

iv). Structural

(1) General

(a) Unless otherwise indicated, all references to APTA, FRA and other standards indicate applicability of the current versions of the standards, as of the date of the NTP.

(b) The test plans shall be coordinated with the final design of the carbody shell compliant with 49 CFR Part 238 requirements and

shall test structural element strength and/or crash energy management performance, as based upon the design.

(c) Specific details of the structural test plan shall be submitted to Amtrak for approval.

(d) The first representative carbody of each car type shall be tested by the Contractor to confirm that the FEA is sufficiently accurate to ensure that the carbody structure complies with this Specification.

(e) If there are no major structural differences between the carbody types and the test results are comparable with the FEA, the Contractor may choose to present data showing the similarities and differences between different carshell types to propose that the testing of certain carshell types can validate the performance of multiple types. In those cases, the worst case carshell must be the one subject to testing. Selection of carshells for testing is subject to approval by Amtrak and to review and objections from the FRA

(f) The tests shall be performed at an Amtrak approved facility.

(g) To be acceptable, the test facility must have documentation showing calibration of all instrumentation, have qualified personnel with experience in conducting similar tests, and have the necessary equipment, instrumentation and control equipment to conduct the test.

(h) The tests shall not begin until the carbody stress and any energy absorption analyses have been submitted and approved by Amtrak.

(i) The test carshell shall be completely inspected and any non-conformances corrected. All inspection, test, rework, repair and corrective action reports shall be available for review. Particular attention shall be given to recording flatness and straightness.

(j) The test carshell shall be structurally complete, including all structural parts and fiberglass ends (if part of the design), but excluding such items as exterior and interior trim, windows, doors, seats, lights, interior lining, or other parts that would obscure any structural member from view, or that would interfere with the performance of the test.

(k) The test shell shall have no paint, primer, sound damping coating, or insulation.

(l) The weight of underfloor and above floor compartment-mounted equipment and heavy roof-mounted equipment shall be simulated by equivalent weights at their respective locations.

(m) All structural tests shall be conducted on the same carshell or carshells.

(n) The carshell shall be weighed and the weight recorded prior to installation of any test equipment.

(o) For the tests, the car shall be supported on the trucks or equivalent supports to allow longitudinal movement.

(p) All gauges and instruments shall be in current calibration and remain so for the duration of the test.

(q) The methods of calibration and time periods for recalibration shall be in accordance with the test laboratory's national standard or ISO standards.

(r) The laboratory shall have on file a current certification of calibration traceable to the laboratory's national standard or ISO standards.

(s) The Contractor may conduct preliminary tests per the approved test procedures, but all critical dimensions and flatness shall be verified after the Contractor tests and before the official test begins. All data from preliminary tests shall be recorded per the approved test procedures and available to Amtrak upon request.

(t) The test of record is to be witnessed by Amtrak.

(u) A copy of all recorded data shall be given to Amtrak at the conclusion of each test.

(v) A data acquisition system shall be provided to permanently record all gauge outputs at each load step. The data acquisition system and complete sensor set up shall be qualified by a handheld, high precision fixed shunt resistor across sensors chosen by the Amtrak test representative.

(w) At the end of each load step, a printout of all strain gauge readings in proper engineering units (micro-strains) and a plot of load vs. gauge reading for critical gauge locations shall be given to Amtrak or its representative for review. Loads shall be reported in pounds for each individual application and totaled.

(x) The Contractor shall obtain approval of Amtrak or its representative after every load step before proceeding with the next step.

(y) All vertical and compression loads shall be complete removed, residual stresses measured, and sensors (including vertical load sensors) zeroed at the end of each individual test.

(z) The Contractor shall not break down the test fixtures until Amtrak or its representative has reviewed and accepted all data for the applicable test.

(aa) The Contractor shall prepare a color photographic record of the test.

(bb) This record shall include photographs of the car in the test fixture configuration for each test, installation of sensor configuration for each test, repairs or modifications, deviations from the drawings, and any areas found to be non-compliant.

(cc) The entire procedure shall be video recorded by the Contractor. The camera shall rove to view and record key areas.

(dd) All video taken during this test shall become the property of Amtrak. Video camera locations must be approved by Amtrak.

(ee) Amtrak reserves the right to test a second car of each type during the construction period.

(ff) Should such a test be ordered, it shall be at the expense of Amtrak unless such tests prove the design is non-compliant in any structural area, in which case, the Contractor shall be responsible for the test expense and for all of Amtrak's costs, and the cost of modifications necessary for the car and all other cars to be made compliant with the Specification.

(gg) The Contractor (at its expense) shall also perform a complete set of structural tests to qualify the modified car.

(2) Test procedures

(a) A procedure shall be prepared for each test.

(b) The procedure shall include a description of the test, its purpose, how and with what equipment the specimen is to be loaded and the load increments, the type and location of strain gauges, the location of deflection gauges, a complete description of all fixtures, instruments and gauges and a detailed description of the data acquisition system.

(c) Annotated copies of catalog cuts may be used to provide parts of the description.

(d) An explanation of the accuracy of the instrumentation shall be provided.

(e) Photographs (where available), drawings and sketches shall be included to clarify the text.

(f) The test procedure shall provide a step-by-step instruction describing how the load is to be applied, the load at each step,

when data is to be recorded, a space for the signature of the test supervisor and a space for recording the authorization to proceed obtained from Amtrak or its representative.

(g) Test procedures shall be submitted not less than 60 days in advance of the proposed test date; approvals of the test procedure and stress analysis are prerequisites for the start of testing.

(h) The test procedure shall include a copy of the current calibration certification for each instrument and gauge to be used for the test.

(i) Typical logging sheets, printouts, plotting forms and examples of any other data sheets for the test or in the final report shall also be submitted as part of the test procedure.

(j) Tables shall be included to give the maximum allowable reading for each gauge and loading condition.

(k) Other tables shall be included to provide the requirements for all other test criteria.

(l) Each test procedure shall contain a table of predicted strain (or stress) its magnitude of the allowable, and deflection at selected gauge locations.

(m) This table shall list the strain or deflection gauge number, the location of the gauge, the predicted strain (or stress) or deflection from the stress analysis, spaces to enter the actual gauge readings, and a space to enter the calculated percent difference, defined as:

$$\% \text{ difference} = \frac{\text{Actual} - \text{Predicted}}{\text{Actual}} \times 100$$

(3) Strain gauges

(a) For structural strength testing, a minimum of 200 strain gauges (as typical for an 85 ft long car) shall be applied to the car structure for each of the compression, vertical load and diagonal jacking tests.

(b) 75% of the strain gauges shall be 3 gauge combinations, such as rosette gauges.

(c) Some gauges may be used for more than one test if their location on the structure is appropriate for other tests as accepted by Amtrak, but readings from at least 200 strain gauges in locations of interest shall be obtained for each test.

(d) The location of the strain gauges shall be based on the Contractor's experience, the stress analysis and Amtrak's recommendations.

(e) There shall be no less than three locations where there are a sufficient number of gauges to encircle the carbody, providing cross sections through the vehicle for evaluation.

(f) One location shall be outboard of the bolster, one shall be at the quarter-point between the truck centers, and one shall be at the center of the car.

(g) Gauges shall be placed, for example, on all four sides of the side sill and body sills, on the side framing, along the cant rail, on the cross members, and at the center line of the car.

(h) For structural post tests (if used), there shall be a minimum of 100 strain gauges applied to the post and car structure in the vicinity of the post.

(i) Some of the gauges may be for more than one test if their location on the structure is appropriate for other tests, but readings from at least 100 strain gauges in locations where the stress may be critical shall be obtained for each test.

(j) Drawings and sketches showing the location of each strain gauge shall be prepared by the Contractor and submitted for approval as part of the test procedure.

(i) These drawings shall dimension the location and orientation of each gauge, showing their distances from edges, connections and bends.

(ii) Their locations on the upper or lower, inner or outer surface shall be noted on these drawings.

(k) The gauges shall be calibrated and applied in accordance with the manufacturer's instructions for the material being measured and be compensated for temperature.

(4) Deflection gauges

(a) For structural strength testing, vertical deflection of the carbody shall be measured along both side sills at each load step during all tests.

(b) At least 11 gauges per side shall be used.

(c) Gauges shall be located at the end sills, at the bolsters, and at the mid-point between the bolsters.

(d) The remaining gauges shall be evenly spaced between the five locations.

(e) Measurements shall be taken to the nearest 0.01 in., and the deflections shall be considered as the average of the readings recorded on both sides of the car.

(f) To measure the longitudinal deflection of the car during compression testing, additional deflection gauges shall be applied at the end sill, near the ram, and at the opposite end sill, near the reaction.

(g) For the diagonal jacking and lifting tests, an additional deflection gauge shall be applied at the jack or crane that is lowered or raised to measure the vertical movement at the lifting locations.

(h) During the vertical load test, the change in carbody width due to bending shall be measured and recorded at the belt rail in the center of the car.

(i) Two additional deflection gauges shall be applied in one of the side door openings closest to the center of the car to measure the change in the diagonal dimensions of the opening during the tests.
