(j) To measure the bending of the collision and corner posts during the post tests, deflection gauges shall be applied at a minimum of seven locations on each post being tested: top, bottom, middle, load application point, between the load application point and the bottom, between the load application point and the center, and between the center and the top.

    (i) These gauges shall be mounted to measure the deflection of the post in the direction of the applied force.

(k) Deflection gauges shall be mounted on rigid stands separate from the carbody and its fixtures.

(l) The contact surface on the car shall have a smooth, polished, low-friction surface plate mounted perpendicular to the axis of the deflection gauge.

(m) If, during a test, the deflection gauge moves off of this surface plate or contacts the test carshell or the fixtures, the test shall be terminated.

(n) The gauges shall be readjusted, and the test repeated from the beginning.

(o) The deflection gauges shall have electrical outputs compatible with the data logging apparatus used with the strain gauges.

(p) All deflections shall be recorded simultaneously with the strain gauge recordings.

(q) In addition to the above electronic recordings, dial indicators (mechanical) of sufficient stroke shall be employed.

(i) Two shall measure the vertical deflection at the center of both side sills during all tests.

(r) During the compression tests, dial indicators shall be employed to measure the longitudinal deflection at the end sill next to the ram and next to the reaction at the opposite end of the car.

(i) An indicator shall be located next to the lowering jack during the diagonal jacking test.

(ii) A dial indicator shall be mounted at the center of the post during each post tested.

(iii) These dial indicators shall be read and manually recorded at each load step.

(s) All deflection gauges shall have sufficient stroke capacity to measure the maximum deflection expected in the test without the need for resetting any gauge during the test.

(5) Load cells

(a) In order to verify the accuracy of the applied loads and reactions, load cells shall be provided at the appropriate locations for each test. Each load cell shall be calibrated to 1.0% accuracy and certified within one year before commencement of the tests over the full range of 1.5 times the maximum load to which the load cell will be subjected during these tests. The Contractor shall provide records of calibration results prior to commencing these tests. The load cells shall have electrical outputs compatible with the data logging apparatus used with the strain gauges. All loads shall be recorded simultaneously with the strain gauge recordings.

(b) Load cells shall be placed at the end of the ram and at the reaction point for the compression test. A load cell shall be placed at each secondary spring location for the vertical test and at each ram if the load is applied hydraulically. A load cell shall be placed at each jack location for the diagonal jacking test. A load cell shall be placed at the end of the ram for each post test. Load cell readings shall be taken and recorded at each step of load application and removal process.

(6) Load Application

(a) Unless otherwise agreed to by Amtrak, all loads for all tests shall be applied using hydraulic actuators to ensure quick testing schedules of the multiple carshell variants.

(7) Vertical load test

(a) Test description

(i) For structural strength testing, the carbody supported on trucks or simulation thereof, shall be subjected to a vertical load test. The instrumented carshell shall be loaded to simulate ready-to-run weight. A test load, equivalent to the AW3 passenger load, shall be applied to the car in 4 equal steps, resulting in a total of five vertical load increments. The test load shall be distributed in proportion to the distribution of weight in the furnished car. The specimen shall be unloaded in the increments in which it was loaded. Strain gauge, deflection and load cell readings shall be taken at each load increment.

(ii) During the vertical load structural testing, both sets of doors on the vehicle shall be installed and their performance validated during max load. Alternatively, six additional deflection gauges can be used to validate the FEA's predicted worst case door opening deflections and the door may be test separately using these worst case deflections.

(b) Test criteria

(i) The car shall be considered compliant with vertical load testing if all of the following conditions are met:

1. Stresses are in accordance with the requirements of APTA Standard PR-CS-S-034-99.

2. Vertical deflection readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at that point which represents the measured deflection for maximum vertical load.

3. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

4. Maximum stresses calculated from stain readings in any structural element do not exceed the allowable stresses approved prior to starting the test program as part of the stress analysis.

5. Recorded residual vertical deflection between bolsters following removal of the maximum vertical

test loading does not exceed 0.01 in.

6. Recorded residual car transverse width and/or opening diagonal dimensions following removal of the maximum vertical test load do not exceed 0.01 in.

7. Indicated residual strains at strain gauges on principal structural elements following removal of the maximum vertical loading do not exceed the maximum error resulting from the accuracy of the instrumentation.

8. Carbody deflection, as measured during the vertical load tests under a load equal to the passenger load of AW3, is not more than the design camber in the side sill at any point between the carbody bolsters.

9. Door operation is normal, including normally expected cycle times.

10. There are no permanent deformations, fractures, cracks or separations in the car structure. Broken welds resulting from the test are to be inspected jointly by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

11. Vertical deflection readings validate the required camber values

(8) End Sill Compression Load Test

(a) Test Description

(i) For structural strength testing, a compression test load as defined in APTA Standard PR-CS-S-034-99 is to be applied to the end sill assembly in the underframe of the test specimen by means of a ram. This load shall be applied horizontally at the horizontal centerline of the carbody.

(ii) During the compression test, the carshell shall be supported on trucks or simulations thereof to allow free longitudinal movement. The carshell shall be loaded with sufficient dead weight to bring the total body weight of the test specimen to that of an AW0 loaded car. This loading shall be distributed in proportion to the distribution of weight in the finished car.

(iii) The compression test load shall be applied by means of a controlled hydraulic ram, and the force measured by a means independent of those producing the force. The

force shall be measured at the ram and at the reaction at the opposite end of the car. The ram shall be supported at the car end but shall remain free to move longitudinally with respect to the car end. The ram's connection to the structure shall allow vertical rotation for any deflection of the structure throughout the test.

(b) Test criteria

(i) The car shall be compliant with end sill compression testing if all of the following conditions are met:

1. Stresses are in accordance with the requirements of APTA Standard PR-CS-S-034-99.

2. The vertical deflection of each side of the test structure is within ± 10% of the value determined by the analysis.

3. The force measured at the reaction load cell is within 1.0% of the force applied at the ram.

4. Maximum stresses calculated from strain readings in any structural element do not exceed the allowable stresses approved prior to starting the test program as part of the stress analysis.

5. Indicated residual strains at strain gauges on principal structural elements following removal of the maximum vertical loading do not exceed the maximum error resulting from the accuracy of the instrumentation.

6. There are no permanent deformations, fractures, cracks or separations in the car structure. Broken welds are to be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(9) Compression load test at the draft stop

(a) Test description

(i) For structural strength testing, a compression test load of 800,000 lbs. shall be applied to the rear draft stop in the draft gear housing. This load shall be applied at the car transverse centerline and vertically at centerline of shaft. No allowance shall be made for the camber of the carbody.

(ii) A fixture, which simulates the regular draft gear and carrier, shall be installed. During the compression test, the carshell shall be supported on trucks, or a simulation

thereof to allow free longitudinal movement. The carshell shall be loaded with sufficient dead weight to bring the total body weight of the test specimen to that of an AW0 loaded car. This loading shall be distributed in proportion to the distribution of weight in the finished car. The ram's connection to the structure shall allow vertical rotation for any deflection of the structure throughout the test.

(iii) The compression test load shall be applied by means of a controlled hydraulic ram, and the force measured by a means independent of those producing the force. The force shall be measured at the ram and at the reaction at the opposite end of the car. The load shall be applied in increments of 25%, 50%, 75%, 87.5% and 100% of full load. After each load increment is applied, the load shall be reduced to not more than 2% of full load. Strain gauge, deflection and load readings shall be taken at each load increment and at each relaxation of load. The ram may be supported at the car end but shall remain free to rotate at its contact with the car end.

(b) Test criteria

(i) The car shall be compliant with compression testing if all of the following conditions are met:

1. Stresses are in accordance with the requirements of APTA Standard PR-CS-S-034-99.

2. The vertical deflection of each side of the test structure is within ± 10% of the value determined by the analysis.

3. The force measured at the reaction load cell is within 1.0% of the force applied at the ram.

4. Vertical deflection readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

5. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point, which represents the measured deflection, at maximum load.

6. Maximum stresses calculated from strain readings in any structural element do not exceed the allowable stresses approved prior to starting the test program

as part of the stress analysis.

7. Recorded residual vertical deflection between bolsters following removal of the maximum vertical test load does not exceed 0.01 in.

8. The residual horizontal deflection between ends following removal of the maximum load does not exceed 0.04 in.

9. Indicated residual strains at strain gauges on principal structural elements following removal of the maximum vertical loading do not exceed the maximum error resulting from the accuracy of the instrumentation.

10. There are no permanent deformations, fractures, cracks, or separations in the car structure. Broken welds are to be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(10) Diagonal Jacking Test

(a) Test description

(i) For structural strength testing, the carshell shall be loaded to its AW0 weight, with trucks, or equivalent weight, hanging from the body bolsters. The carshell shall be supported symmetrically at the jack pads at the four corners of the car. One of the jacks shall be lowered in five equal increments until it is free of the jacking pad. The selection of the jack to be lowered should be based on its relation to the center of gravity of the carshell so that the diagonally opposite jack remains in contact with the jacking pad and carries some car weight. All gauges shall be recorded at each increment of jack position. The procedure shall be reversed until the load on the jack is returned to its original level.

(ii) The amount of torsional deflection or twist shall be measured.

(b) Test criteria

(i) The car shall be compliant with diagonal jacking testing if all of the following conditions are met:

1. Maximum stresses calculated from strain readings in any structural element do not exceed 80% of the yield strength.

2. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point that represents the measured deflection at maximum load.

3. Indicated residual strains at strain gauges following return to original level do not exceed the maximum error resulting from the accuracy of the instrumentation.

4. There are no permanent deformations, fractures, cracks or separations in the car structure.

5. Broken welds are to be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(11) Diagonal lifting test

(a) Test description

(i) For structural strength testing, the carshell shall be loaded to its AW0 weight, with trucks, or equivalent weight, hanging from the body bolsters. The carshell shall be supported symmetrically at the four most outboard jacking pads of the car. One of the corners shall be lowered in five equal increments until it is free of the support. The selection of the corner to be lowered should be based on its relation to the center of gravity of the carshell so that the diagonally opposite corner remains in contact with the support and carries some car weight. All gauges shall be recorded at each increment of crane position. The procedure shall be reversed until the load is returned to its original level.

(ii) The amount of torsional deflection or twist shall be measured.

(b) Test criteria

(i) The car shall be compliant with diagonal lift testing if all of the following conditions are met:

1. Maximum stresses calculated from strain readings in any structural element do not exceed 80% of the yield strength.

2. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point that represents the measured

deflection at maximum load.

3. Indicated residual strains at strain gauges following return to original level do not exceed the maximum error resulting from the accuracy of the instrumentation.

4. There are no permanent deformations, fractures, cracks or separations in the car structure.

5. Broken welds are to be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(12) Collision post (if included) elastic test

(a) Test description

(i) For structural strength testing, the ability of the carbody structure to resist collision post longitudinal loads shall be tested.

(ii) During the collision post test, the carshell shall be supported on trucks or simulations thereof to allow free longitudinal movement. The post-applied load shall be reacted at the coupler. The carshell shall be loaded with sufficient dead weight to bring the total carbody weight of the test specimen to that of an AW0 loaded carbody. This loading shall be distributed in proportion to the distribution of weight in the finished car.

(iii) The specimen shall be instrumented as required for the car and collision post per the corresponding test plan. Strain gauges and deflection gauges shall be installed at the same places at some locations so that the structural equivalence of the model to the carbody can be determined.

(iv) A longitudinal test load as specified in APTA Standard PR-CS-S-034-99 shall be applied to, and centered on, the collision post. This load shall be distributed over an area not to exceed the width of the collision post by 6 in. in height. If the required load allows an ultimate strength limit, a reduced load can be proposed but shall maximize the lad to the greatest extent practicable and shall be approved by Amtrak.

(v) The test load shall be applied by means of a controlled hydraulic ram, and the force measured by a means independent of that producing the force. A fixture and means of cushioning, such as lead sheets, shall be provided to assure uniform bearing and to prevent crippling

around the area of force application. This fixture and cushion shall not be attached to the post. The test load shall be applied horizontally parallel to the car longitudinal centerline. The load shall be applied in increments of 25%, 50%, 75%, 87.5% and 100% of full load. The load shall be reduced to not more than 2 percent of full load after each step. Strain gauge and deflection readings shall be taken at each load increment and at each relaxation of load. The ram shall be supported at the car end but shall remain free to move longitudinally with respect to the car end.

(b) Test criteria

(i) The car shall be compliant with collision post testing if all of the following conditions are met:

1. Deflection readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point that represents the measured deflection at maximum load.

2. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

3. Maximum stresses calculated from strain readings in any structural element do not exceed the allowable stresses approved prior to starting the test program as part of the stress analysis.

4. Indicated residual strains at strain gauges on principal structural elements following removal of the maximum loading do not exceed the maximum error resulting from the accuracy of the instrumentation.

5. There is no permanent deformation, fractures, cracks or separations in the car structure.

6. Broken welds are to be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(13) Corner post (if included) longitudinal load test

(a) Test description

(i) For structural strength testing, the ability of the carbody structure to resist primary side corner post longitudinal compressive loads to all cars shall be tested.

(ii) During the corner post longitudinal test, the carshell shall be supported on trucks or simulations thereof to allow free longitudinal movement. The post applied load shall be reacted at the coupler. The carshell shall be loaded with sufficient dead weight to bring the total carbody weight of the test specimen to that of an AW0 loaded carbody. This loading shall be distributed in proportion to the distribution of weight in the finished car.

(iii) The specimen shall be instrumented as required for the car and corner post in the corresponding test plan. The strain gauges and deflection gauges shall be installed at the same places at some locations so that the structural equivalence of the model to the carbody can be determined.

(iv) Longitudinal test loads shall be applied to, and centered on, the corner post as specified in APTA Standard PR-CS-S-034-99. The magnitudes of the loads shall be limited to values that approach the yield strength of the past as predicted by the approved FEA but shall maximize the load to the greatest extent practicable and shall be approved by Amtrak. These loads shall be distributed over an area not to exceed the width of the collision post and not to exceed 6 in. in height.

(v) The test load shall be applied by means of a controlled hydraulic ram, and the force measured by a means independent of that producing the force. A fixture and means of cushioning, such as lead sheets, shall be provided to assure uniform bearing and prevent crippling around the area of force application. This fixture and cushion shall not be attached to the post. The test load shall be applied horizontally parallel to the car longitudinal centerline. The load shall be applied in increments of 25%, 50%, 75%, 87.5% and 100% of full load. The load shall be reduced to not more than 2% of full load after each step. Strain gauge and deflection readings shall be taken at each load increment and at each relaxation of load. The ram shall be supported at the car end but shall remain free to move longitudinally with respect to the car end.

(b) Test criteria

(i) The car shall be compliant with corner post longitudinal testing if all of the following conditions are met:

1. Deflection readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

2. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

3. Maximum stresses calculated from strain readings in any structural element do not exceed the allowable stresses approved prior to starting the test program as part of the stress analysis.

4. Indicated residual strains at strain gauges on principal structural elements following removal of the maximum loading do not exceed the maximum error resulting from the accuracy of the instrumentation.

5. There is no permanent deformation, fractures, cracks or separations in the car structure. Broken welds shall be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(14) Corner post transverse load test

(a) Test description

(i) For structural strength testing, the ability of the carbody structure to resist corner post transverse loads shall be tested.

(ii) During the corner post test, the carshell shall be supported on trucks or simulations thereof. Transverse restraint shall be at the lateral stops between the carbody bolsters and truck frame. The carshell shall be loaded with sufficient dead weight to bring the total body weight of the test specimen to that of an AW0 loaded carbody. This loading shall be distributed in proportion to the distribution of weight in the finished car.

(iii) The specimen shall be instrumented as required for the car and corner post in the corresponding test plan. The strain gauges and deflection gauges shall be installed at the same places at some locations so that the structural equivalence of the model to the carbody can be determined.

(iv) Longitudinal test loads as specified in APTA Standard PR-CS-S-034-99 shall be applied to and centered on the corner post. This load shall be distributed over an area not to exceed the width of the corner post and not to exceed 6 in. in height.

(v) The test load shall be applied by means of a controlled hydraulic ram, and the force measured by a means independent of that producing the force. A fixture and means of cushioning, such as lead sheets, shall be provided to assure uniform bearing and prevent crippling around the area of force application. This fixture and cushion shall not be attached to the post. The test load shall be applied horizontally perpendicular to the car longitudinal centerline. The load shall be applied in increments of 25%, 50%, 75%, 87.5% and 100% of full load. The load shall be reduced to not more than 2% of full load after each step. Strain gauge and deflection readings shall be taken at each load increment and at each relaxation of load. The ram shall be supported at the car end but shall remain free to move transversely with respect to the car end.

(b) Test criteria

(i) The car shall be compliant with corner post transverse testing if all of the following conditions are met:

1. Deflection readings plotted against load do not vary by more than ± 5% percent from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

2. Strain readings plotted against load do not vary by more than ± 5% from a straight line (linear) deflection curve, with one end point at the origin (no load) and the other at the point which represents the measured deflection at maximum load.

3. Maximum stresses calculated from strain readings in any structural element do not exceed the allowable stresses approved prior to starting the test program as part of the stress analysis.

4. Indicated residual strains at strain gauges on principal structural elements following removal of the maximum loading do not exceed the maximum error resulting from the accuracy of the instrumentation.

5. There are no locations of permanent deformation, fractures, cracks or separations in the car structure. Broken welds are to be jointly inspected by the Contractor and Amtrak to determine if the failure is the result of weld quality or stress.

(15) Collision post (if included) elastic-plastic test

(a) Test description

(i) Collision posts at the vehicle ends coupled with locomotives shall be tested per the following requirements.

(ii) For structural strength testing, the ability of the connections between the collision posts and the carbody structure to withstand a longitudinal load equal to the ultimate load carrying capacity of the post shall be tested.

(iii) This test shall also verify the structural energy absorption requirement outlined in APTA Standard PR-CS-S-034-99, if used in the design.

(iv) The test specimen shall be a full-scale structural model of the end of a car. The structural model shall include all structural elements required to support the collision posts including the end underframe and roof between the forward end of the end frame and the bolster. All connections shall be identical to those of production cars. The bolster end of the model shall be attached to a rigid fixture so that the stresses in the post and its supporting structure shall be the same as those in a car subjected to the same load.

(v) The specimen shall be instrumented in the same manner in which it was instrumented in the collision post elastic test, except that instruments of greater capacity may be needed for this test. The strain gauges and deflection gauges shall be installed in the same locations so that the structural equivalence of the specimen to the carbody can be determined. Longitudinal test loads shall be applied to and centered on the collision post. This load shall be distributed over an area not to exceed the width of the collision post and not to exceed by 6 in. in height.

(vi) The compression test load shall be applied by means of a controlled hydraulic ram, and the force measured by a means independent of that producing the force. A fixture and means of cushioning, such as lead sheets, shall be provided to assure uniform bearing and prevent crippling around the area of force application. This fixture and cushion shall not be attached to the post. The test load shall be applied horizontally parallel to the car longitudinal centerline.

(vii) The initial load shall be applied in increments of the same magnitude as those used during the collision post elastic load test. The load shall be reduced to not more than 2% of full load after each step. Strain gauge and deflection

readings shall be taken at each load increment and at each relaxation of load.

(viii) The strain gauge readings and deflections measured during this test shall be within 5% of the gauge readings for the same load and location measured during the collision post elastic test. If difference between the two test results, the fixture and/or the model shall be corrected until agreement within 5% between the two tests is obtained.

(ix) After agreement between the two tests is demonstrated, the collision post shall continue to be loaded in stroke increments of 20% of the full depth of the collision post until the load carrying capacity of the collision post is obtained. At each 20% load increment, all load cell(s), strain gauges and deflection gauges shall be recorded. The load need not be relaxed after each step.

(x) The ultimate load carrying capacity of the post shall be defined as the condition where the post cannot support an increased load, or the center of the post has deflected more than its full depth. This deflection shall be measured at the middle of the post from a string connected between the top and bottom of the post.

(b) Test criteria

(i) The collision post shall be compliant with collision post elastic-plastic testing if all of the following conditions are met:

1. All strain gauges and deflection gauges have the same readings within ± 5% for the same loads at the same locations as the collision post elastic load test for 0% to 100% as tested in the elastic test.

2. The connections between the collision post and all other structural members are not completely broken.

3. If required by the design, the collision post and supporting structure have absorbed energy as per APTA Standard PR-CS-S-034-99.

v). Floor Panel Fire Resistance

(1) Amtrak approved sample of materials representing structural flooring and floor panels shall be tested to verify the ability to withstand the requirements of ASTM E119, when exposed for 30 minutes at up to 1400°F on the material underside.

vi). Safety Appliances

(1) Must demonstrate compliance with FRA and APTA requirements.

vii). Emergency Window Egress and Access

(1) Tests shall be conducted to measure the force required to remove each type of emergency window from the carbody. This shall be done both from inside and outside the car. The test shall include a check that car interior furnishings do not interfere with window removal. The force shall not exceed 25 lbf.

viii). Paint Adhesion

(1) A paint adhesion verification test shall be performed using a standard crosscut adhesion test. This test consists of scribing a grid of four horizontal and four vertical 1-inch long lines through the coating with a sharp steel blade. Pressure sensitive tape, Scotch brand No. 335-2, is then pressed firmly over the scribed area and is then pulled away at 90 degree angle to the sample sheet. The coating shall pass the test if no coating is removed from the substrate material. Several test specimens shall be created by preparing the base metal in the same fashion as the carbody, selecting them to represent different conditions on the car. Specimens shall be painted at the same time as the carbody, with the same painting orientation as on the car (side, overhead, etc.).

(2) An alternate paint adhesion test procedure based upon a recognized industry standard such as ISO 2409 or ASTM D3359.may be submitted for review and approval.

ix). Gap Filler

(1) The powered side door high level station platform gap filler shall undergo proof-of-design testing to evaluate and verify that the filler meets all specification requirements for:

(a) Compliance with all applicable ADA requirements;

(b) Functional and operational performance under all design loads, track conditions as specified, and safety factors without deformation or deflection;

(c) Rate of travel for extension and retraction;

(d) Proper operation of all safety provisions and functional interlocks and isolation devices within the unit and with the door system, brakes and indicators;

(e) Maintainability and reliability requirements; and

(f) Manual retraction with power failure

(2) These tests shall include an endurance test in which the filler shall be subjected to no less than 500,000 repeated cycles of deployment and storage.

c). Trucks

i). Wheel Load Equalization

(1) The truck shall be tested in accordance with APTA Standard PR-M-S-014-06, for Class G passenger equipment

(2) To verify the equalization provided by the truck design, one truck on the first car at AW0 load shall have one wheel jacked up (lifted) 2.5 in. and then increasing to 3 in. while taking load readings every 0.5 inches in both the increasing and decreasing direction and suitable instrumentation provided to measure the load carried on the other wheels. The process shall be repeated with one wheel being dropped (lowered). The load changes shall be in accordance with the requirements of APTA Standard PR-M-S-014-06. In the event that suitable equalization is not attained as indicated by the tests, the truck design shall be corrected, the truck retested at the expense of the Contractor, and all trucks installed under the cars shall be modified to be in accordance with the corrected design.

ii). Truck Frame and Bolster Static Load Test

(1) The truck frame and bolster shall be tested to verify that the maximum allowable stresses established by the Contractor and approved by Amtrak under an AW3 load are not exceeded. This is a static load test, repeated twice with a complete release between applications and shall be performed with the suspension elements replaced by solid blocking (with resilient pads if necessary). The truck shall be tested either as individual load bearing components or as an assembly, as the Contractor elects. If the load bearing components of the truck rather than the complete assembly are tested, provision must be made to apply all input loads described herein and for the member under test to react to these input loads in a manner which is identical to the reactions that would occur when included as part of the assembly. Forces shall enter the parts or truck at the normal application points and shall be so combined in each case as to produce the maximum unit stresses at the critical points for which the stress estimates were furnished. The tests shall be witnessed by Amtrak.

(2) No less than 75 strain gauges shall be applied to the truck near the locations of maximum stress points as agreed to by the Contractor and Amtrak, Amtrak having the power of decision in disagreement. The locations of maximum stress points are to be determined by analysis. The critical stress readings of the two applications shall be averaged for comparison with the estimated stresses.

(3) The loads shall be as listed in Chapter 7. The vertical, lateral, longitudinal, and braking loads shall be applied simultaneously. At no point shall the average stress exceed the allowable stress. If it does, Amtrak shall have the right to require that the design be corrected to bring the test stresses with the allowable stresses; the truck shall be retested at the expense of the Contractor, and all trucks installed in the cars shall be modified to be in accordance with the corrected design. Testing will not be required on service qualified components which can be shown to have had satisfactory service experience of comparable severity and duration, as determined by Amtrak.

iii). Truck Frame and Bolster Overload Test

(1) To demonstrate that the truck design has adequate strength to sustain a maximum load in the presence of a combination of minor manufacturing defects, a truck frame and bolster shall be overloaded statically. The suspension elements shall be replaced by solid blocking (with resilient pads if required). The loads shall be as listed in Chapter 7.

(2) No less than 75 strain gauges shall be applied to the truck near the locations of maximum stress points as agreed to by the Contractor and Amtrak, Amtrak having the power of decision in case of disagreement. The location of maximum stress is to be determined by analysis.

(3) Unit stresses at critical locations shall be measured before and after the test at representative points on the truck as agreed to between the Contractor and Amtrak, Amtrak having the power of decision in the event of disagreement. Certain before-test and after-test critical characteristic dimensional checks may be agreed upon to supplement strain gauge readings. Amtrak shall be present for the tests. There shall be no permanent deformation as determined from strain gauge readings. If such deformation appears, the design shall be corrected to bring the stress under the test condition within the elastic limit of the material involved, the truck shall be retested at the expense of the Contractor, and all trucks installed in the cars shall be modified to be in accordance with the corrected design. Testing will not be required on service qualified components which can be shown to have had satisfactory service experience of comparable severity and duration, as determined by Amtrak.

iv). Truck Frame and Bolster Fatigue Load Test

(1) To demonstrate that the truck has adequate fatigue strength under dynamic loading, the truck frame and bolster shall be fatigue tested according to the provisions of APTA Recommended Practice PR-M-RP-009-98. Rev.2. For cast and fabricated truck frame and bolster designs the base fatigue test (Phase 1) shall be 6 Million cycles. The number of quasi-static lateral load reversals (curves),

braking/traction direction reversals and applied twist loads shall correspond to the expected operation and service environment.

(2) The truck frame and bolster shall be tested as a unit, with the suspension elements replaced by solid blocking (with resilient pads if necessary). The loads shall be as listed in Chapter 7. The phasing of loads shall result in maximum combined stresses at the critical locations. The test shall demonstrate that the maximum combined stresses at the critical locations do not exceed those required. Critical locations shall be agreed upon by the Contractor and Amtrak, Amtrak having the power of decision in the event of disagreement.

(3) The frequency of the load cycling shall be as proposed by the Contractor for approval by Amtrak. Prior to the test, the Contractor shall provide documentation and/or drawings for all defects that existed in the truck elements as produced, and the repairs made to the parts containing these defects.

(4) During the fatigue tests, the truck shall be inspected regularly to detect possible crack initiation and progression. If evidence of progressive cracking or failure is found, the cause shall be assessed by Amtrak and the Contractor after which an appropriate correction shall be established and the test repeated.

(5) At the conclusion of the fatigue test, a magnetic particle or dye penetrate inspection shall be made for cracks in the presence of Amtrak. If any crack is found, or pre-existing cracks have propagated, the design shall be corrected, the truck retested at the expense of the Contractor and all trucks installed under the cars shall be modified to be in accordance with the corrected design. Testing will not be required on service qualified components which can be shown to have had satisfactory service experience of comparable severity and duration, as determined by Amtrak.

(6) After completion of the base fatigue test, an extended fatigue test shall be performed. The purpose of the extended fatigue test is to quantify the additional fatigue margin in the truck design.

(7) The extended fatigue test shall be 2 million cycles with loads increased by 20% (Phase 2), then 2 million cycles with loads increased by 40% (Phase 3) or until failure occurs.

(8) At the conclusion of the extended fatigue test, a magnetic particle or dye penetrate inspection shall be made for new cracks and propagation of pre-existing cracks. Note that new cracks, propagation of pre-existing cracks and structural failures do not by default constitute a failure for the extended fatigue test but rather data gathered during the extended fatigue test shall be used as part of the Fatigue Assessment Validation Report.

v). Truck Primary Suspension Tests

(1) A load deflection test shall be performed to demonstrate that the spring rates of the primary suspension system in all axes are within the design limits. This test shall demonstrate that the primary suspension system behaves as predicted and will not result in excessive deflection or a decrease in truck clearance above top of rail to less than the minimums prescribed.

(2) For elastomeric primary suspension elements, the following tests are also required following the guidance in EN 13913: low temperature (stiffness), fatigue resistance, static creep, stiffness under sinusoidal motion and damping.

(3) Hydraulic shock absorber (damper) accelerated life cycle endurance tests shall be performed following the guidance in EN 13802, selection of additional operational environment, physical characteristic and functional requirement tests to be proposed by the Contractor and approved by Amtrak.

(4) If defects are found, the design shall be corrected and shall be retested at the expense of the Contractor, and all trucks modified to be in accordance with the corrected design.

vi). Truck Secondary Suspension Tests

(1) Characterization and type testing of air springs shall be based on EN 13597, with tests and test parameters based on Amtrak's specific application as proposed by the Contractor, subject to Amtrak review and approval.

(2) A load deflection test shall be performed to demonstrate that the spring rates of the secondary suspension system in all axes are within the design limits. This test shall demonstrate that the secondary suspension system behaves as predicted and will not result in excessive deflection.

(3) Hydraulic shock absorber (damper) accelerated life cycle endurance tests shall be performed following the guidance in EN 13802, selection of additional operational environment, physical characteristic and functional requirement tests to be proposed by the Contractor and approved by Amtrak.

(4) If defects are found, the design shall be corrected and shall be retested at the expense of the Contractor, and all trucks modified to be in accordance with the corrected design.

vii). Shunting

(1) A shunting test shall be performed to verify the rail-to-rail resistance over the vehicle complies with the requirements in Section 5.8 using a suitable track signal voltage. Any auxiliary equipment shall be tested for proper operation per the manufacturer's specifications. Any auxiliary equipment activation

and deactivation sequences shall be tested through 1000 cycles or the manufacturer's recommendation, whichever is greater, without defect.

d). Couplers

i). The complete coupler assembly; including draft gear, radial connector, yoke, coupler carrier and uncoupling mechanism, shall be tested to validate conformance to the requirements, including all FRA regulations and applicable APTA standards and recommended practices, (including CEM performance requirements if used), range of motion, vertical loading, draft and buff loads and operations. This shall apply to all coupler types and/or drawbars used on the cars.

e). Brakes

i). General

(1) The design and specifications of the friction brake system shall be verified through a series of tests that simulate the environment in which the brake system will function. These tests shall analyze the brake system's performance, reliability and safety under the extreme conditions found in revenue service, including full-service and emergency brake rate measurements, analysis of component fatigue, heat creation and dissipation calculations, handbrake performance and materials analysis. These tests shall include computer simulations and dynamic testing of brake system components as performed by the brake system supplier, as well as track tests performed by the Contractor using completed cars.

ii). Brake pad/shoe force tests

(1) Tests shall be conducted on the first car to verify the actual force produced at the brake pad by the disc brake assembly, and at the brake shoe by the tread brake unit at both a parking brake if a parking brake is supplied and a non-parking brake location agree with calculated values. Tests shall be conducted with brake cylinder pneumatic pressures in 5 pounds/square inch increments, from 0 pounds per square inch to the maximum used, and from application of the parking brake.

(2) Load cell brake disk caliper and tread brake shoe force measurements shall be taken on each car type to determine brake efficiency. Measurements shall be taken at minimum, full service and emergency brake pipe conditions, operating from 110 psig brake pipe setting and 140 psig main reservoir value. Force shall be measured also with the parking brake applied.

iii). Brake component fatigue tests

(1) A test set-up shall be arranged such that a disc brake assembly, tread brake unit and brake pad and shoe are exposed as nearly as

possible to the same conditions as they will encounter in service. The brake pad and shoe shall be loaded by applying air pressure equivalent to a maximum service brake (friction only) application to the disc brake assembly and the tread brake unit, and the forces developed by brake reaction torque shall be applied through the mounting arrangement. The entire brake assembly shall be subjected to 1,000,000 cycles of applications and releases at the working loads predicted for an AW2 loaded car. The direction of the reaction torque shall be reversed every ten brake applications. This test will not be required for hardware that has had satisfactory service experience of comparable severity and duration, as determined by Amtrak.

iv). Friction brake system endurance tests

(1) The first complete car set of the friction brake pneumatic control system produced, before mounting on a car, shall be subjected to an endurance test of 1,000,000 cycles of normal applications and releases to demonstrate that the control apparatus has the endurance required for rail service. The system will not be considered acceptable until the test has been performed without a component failure of any kind during 1,000,000 consecutive operating cycles. Testing will not be required on service qualified components which can be shown to have had satisfactory service experience of comparable severity and duration, as determined by Amtrak.

v). Brake capacity tests

(1) The first production disc brake assembly, tread brake unit and brake pad and shoe for the car shall be tested using a full scale dynamometer to verify that the friction brake system design can perform the specified friction brake-only operation. A dynamometer test shall be performed to simulate the proposed revenue speed profile, driven by Amtrak defined train schedule service for speeds up to 110 mph. Any elevation grades exceeding 0.2% shall also be taken into account. The complete dynamometer procedure, dynamometer facility and test protocol shall be provided by the Contractor and approved by Amtrak. This procedure is an amendment to the qualification of brake shoe and disc brake materials as specified in Amtrak Specification 973 and Amtrak Specification 80-276. All other attributes of friction brake material performance shall be in accordance with Amtrak Specification 973 and 80-276. The production brake pads and materials shall be used, and temperature limits specified by the brake and wheel supplier shall not be exceeded. For tread brake and brake shoe dynamic testing, a test wheel shall be provided by Amtrak. The test shall be coordinated according to the planned operating pattern.

vi). Handbrake tests

(1) Handbrake performance shall be verified for compliance to the specification as well as APTA PR-M-S-006-98 using new brake shoes/pads.

(2) On the first car, a test of the adequacy of the design of the handbrake shall be made (using first new and then fully worn brake shoes) by measuring with a scale the force needed to move the car with the handbrake applied on level tangent track.

(3) The “handbrake-applied” indicator light shall also be tested.

f). Door System

i). General

(1) The side and end door systems shall be subjected to extensive testing to confirm that the systems and components meet all requirements for:

(a) System integrity

(b) Safety

(c) Functionality and operation

(d) Weather sealing

(e) Opening and closing times and speeds

(f) Trainline controls, indicators and interlocks

(g) Compliance with regulations, recommendations and standards

(h) Reliability

(i) Maintainability

(j) Sustained and compliant performance under all specified operational and environmental conditions

(2) All door system components shall be tested through rigorous multiple-cycle operation that simulates the actual installation, hardware and climatic conditions as specified.

ii). Passenger Rooms and Restrooms Door Endurance Tests

(1) The passenger rooms and restrooms entrance door shall undergo endurance testing to verify the door installation is not subject to premature wear. This shall include:

(2) Simulated door installation: door, track, module structure supporting track, door frame with adjoining partition, door latch assembly, detent, etc.

(3) 24,000 Open-close cycles with every tenth slammed

(4) Every 100 cycles, latch/ unlatch the door

(5) Measurement of change from initial setting at every 1500 cycles

(6) Measurement of force required to open/ close door every 1500 cycles

(7) Mutually agreed upon pass/ fail criteria shall be determined for allowable wear in advance of starting the test.

iii). Side door, Trap door, and Folding step system reliability test

(1) A set of side door panels and operators, fully equipped with all required equipment as designed including trap doors, folding steps, and gap filler devices , shall be installed in a test fixture at the facilities of the door system supplier, and subjected to a repeated open and close cycle test of no less than 500,000 full cycles, so demonstrate the durability of the operators, hangers, switches, motors and all other components of the door system. The test fixture shall simulate the actual door opening, threshold and any pocket in which the doors will be mounted. Power and control to the doors shall be via the actual wire leads that will connect the door operator to the carbody wiring in a production installation. The door operators shall be monitored for proper function and continued operation. Any failure of the door operators to function or perform according to the specifications, test procedure or performance criteria shall be considered a failure. All failures shall be investigated and analyzed as to cause, and the Contractor or door system supplier shall propose corrective action. Once approved by Amtrak, the door operators shall be modified to conform to the corrective action, and the test shall be started over again. The door system test shall be conducted until both operators function continuously without failure for 500,000 cycles.

(2) Once the first car has been completely assembled, and the entire side door system has been installed and the functionality has been verified, the side doors, trap doors, and folding steps shall be operated for 15,000 continuous trouble-free cycles each, split evenly between high level and low level opening/closing of the door, trapdoor, and including gap filler cycling. The system shall be monitored to confirm that each door operates through a complete cycle of fully opening and fully closing and latching for all 15,000 cycles. No adjustments or maintenance will be allowed during the test. Any door or door control failure occurring prior to completion of the test will require that the test be stopped, corrective action be taken to document and resolve the failure and start the test at the beginning for all car doors.

iv). Side door, Trap door, Folding steps, Gap filler safety test

(1) Once installed in a completed car, the side door system, including all side doors, trap doors, folding steps, and gap fillers shall be functionally tested to verify that the door system design conforms to all applicable safety requirements, including:

(a) Trainline and local control, door summary circuit and zero-speed operation

(b) Obstruction detection and recycle operation

(c) Interlocks, isolation and manual locking

(d) Interior, exterior and trainline door status indicators

(e) Manual release (interior and exterior), including the force to activate the manual release, the force to open a door that has been released and the process for resetting the doors to normal operation

(f) Structural integrity of the door panel and glazing

(g) Signage and emergency operation

(2) Under no circumstances shall a door be allowed to create an unsafe condition.

v). End door reliability test

(1) An end door and operator, fully equipped with all required equipment as designed, shall be installed in a test fixture at the facilities of the door system supplier, and subjected to a repeated open and close cycle test of no less than 500,000 full cycles, so demonstrate the durability of the operator, hanger, switches, motor and all other components of the door system. The test fixture shall simulate the actual door opening, threshold and pocket that the door will be mounted in. Power and control to the door shall be via the actual wire leads that will connect the door operator to the carbody wiring in a production installation. The door operator shall be monitored for proper function and continued operation. Any failure of the door operator to function or perform according to the specifications, test procedure or performance criteria shall be considered a failure. All failures shall be investigated and analyzed as to cause, and the Contractor or door system supplier shall propose corrective action. Once approved by Amtrak, the door operator shall be modified to conform to the corrective action, and the test shall be started over again. The end door test shall be conducted until the operator functions continuously without failure for 500,000 cycles.

(2) Once the first car has been completely assembled, and the entire end door system has been installed and the functionality has been verified, the end doors shall be operated for 15,000 continuous

trouble-free cycles each. The system shall be monitored to confirm that each door operates through a complete cycle of fully opening and fully closing for all 15,000 cycles. No adjustments or maintenance will be allowed during the test. Any door or door control failure occurring prior to completion of the test will require that the test be stopped, corrective action be taken to document and resolve the failure and start the test at the beginning for all car doors.

(3) The end door shall also be tested for proper opening, closing and hold-open times, the force required to manually open the door in manual mode, and for proper operation of the obstruction detection system, the normal/manual/open selector switch, and the push button.

(4) A set of end door push buttons shall be subjected to a 100,000-cycle test that simulates the use of the buttons to command an end door to open. The buttons shall perform as intended through the 100,000-cycle test without showing signs of wear, abrasion or degradation of the switch, wiring, connectors or seals.

vi). Side Door On-Board Mobility Lift

(1) The powered mobility lift shall undergo proof-of-design testing to evaluate and verify that the lift meets all specification requirements for:

(2) Compliance with all applicable ADA requirements;

(3) Functional and operational performance under all design loads, track conditions as specified, and safety factors without deformation or deflection;

(4) Rate of travel upward and downward for the lift platform under loaded and unloaded conditions; rate for one full cycle shall not exceed 105 seconds in powered operation and 305 seconds in manual operation;

(5) Full range of vertical movement for the lift to adequately reach the range of station platforms as specified;

(6) Proper operation of all safety provisions and functional interlocks and isolation devices within the unit and with the door system, brakes, car diagnostic system and indicators;

(7) Function of lift after loss of power while in mid-travel, then with restoration of power;

(8) Proper and secure storage of the lift within the car;

(9) Maintainability and reliability requirements; and

(10) Manual operation of lift at rated load.

(11) These tests shall include an endurance test in which the lift shall be subjected to no less than 2,500 repeated cycles of deployment and storage.

g). Interior

i). Luggage Racks/Towers

(1) A complete overhead luggage rack, mounted on simulated carbody structure, shall be tested to verify it meets the 250 lb. load requirement. A complete overhead luggage rack, fully loaded with actual weighted luggage and mounted on simulated carbody structure, shall be tested to verify it meets the 8/4/4g crashworthiness requirements. Similarly, a luggage tower module shall be mounted on simulated carbody structure and tested to verify that it meets the design load requirements as well as the 8/4/4g crashworthiness requirements. Additionally, luggage tower modules shall be tested to verify proper operation of all auxiliary functions in secondary storage configurations (i.e. bike storage, ski storage, etc). All variations of luggage towers including towers utilized in the baggage area shall be tested.

ii). Seats

(1) One sample seat of each seat type identical to a production version shall be tested in a simulated carbody structure by the manufacturer for all criteria specified in APTA Standard PR-CS-S-016-99 and submitted to Amtrak with a detailed test report. This test result must be approved by Amtrak before additional seats can be ordered and assembled into the pilot cars for pre-delivery testing.

iii). Seat Cushion Tests

(1) Seat cushions of each seat type selected twice at random by Amtrak during cushion production shall be tested to verify compliance with Chapter requirements.

(2) Seat cushions including those in booth seats (both foam and upholstery) shall be tested to verify compliance with requirements.

iv). Side and End Wall Liner Tests

(1) A 20lb load distributed over a 0.5 in x 0.5 in surface area applied anywhere on the surface of interior panels shall not cause the panel to deflect more than 1/8 inch. A 50lb load distributed over a 6 in x 6 in surface area applied anywhere on the surface of interior panels shall not cause the panel to damage or crack. Upon removal of the loads, the panel shall return to the original position without signs of damage or permanent deflection.

v). Doors and Hardware

(1) All interior doors and hatches, including food service units, shall be functionally checked to verify:

(2) doors hang vertically; verify correct relationship between carbody plane and door plane

(3) proper open travel

(4) proper fully closed position

(5) smooth movement

(6) smooth latching/ unlatching

(7) smooth locking & unlocking from external side of door

(8) correct latch and/ or lock engagement/ release

(9) non-interference, freedom from sticking or excessive looseness (rattles)

(10) proper switch activation for all door opening/closing lights, i.e., restroom, locker, closet, etc.

(11) proper engagement of the ceiling hatch safety catches

(12) proper function of door lock

(13) proper function of emergency egress capabilities

h). HVAC

i). Heating and Air-Conditioning Tests

(1) One complete Heating, Ventilation and Air Conditioning (HVAC) unit and its complete controls shall be given a qualification and capacity test by the air conditioning manufacturer to verify the performance of the unit. This test shall be successfully completed before commencement of the vehicle climate room test. The test shall be conducted in accordance with ANSI/ASHRAE Standard 37. The testing laboratory shall be approved by Amtrak.

(2) The actual HVAC control system, with actual temperature sensors, shall control all system operations during the test, unless indicated otherwise for specific tests.

(3) Tests shall be conducted at nominal voltage and frequency, except where otherwise specified. Appropriate test log sheets and calculation forms shall be generated and included with the test procedure for approval. They shall become a part of the test report.

(4) The accuracy and tolerances of all instrumentation and tests shall comply with the requirements of the ASHRAE Standard 37 Table 4 and all of the required data shall be continuously recorded. Temperature measurements and measurement techniques shall comply with ASHRAE Standard 41.1. An event recorder shall be provided to monitor operation of relays and contactors.

(5) Note: If more than one type of HVAC unit and/ or controls is provided, then each type shall be fully tested for the following:

(a) Temperature Control Performance

(i) Verify:

1. function after cold-soak of controls
2. integration with HVAC unit
3. demonstration in all possible modes of operation, for all car types identified in the temperature control specification; not merely cars ordered at this time.
4. ramp up and ramp down of all temperature inputs
5. demonstration of all logic functions, input and output, including:

a. control and power circuits

b. operation of all safety circuits

c. all modes of operation, including fault conditions

d. indicators/ display(s), including each condition possible

e. fault displays, including each condition possible

f. Portable Test Unit (PTU), including all modes of operation

(b) HVAC Unit and Controls Performance

(i) Verify:

1. operation of capacity controls
2. operation of pressure controls
3. performance of expansion valves and measurement of superheat

4. performance of duct heater safety circuits and thermostat(s)

(ii) Refrigerant charge test

1. The refrigerant charge, by weight, shall be confirmed at the system design conditions. The Contractor shall include the testing criteria in the test procedure which shall be approved by Amtrak. The criteria shall include the following, at a minimum:

a. Level of superheat at the evaporator outlet;

b. Level of superheat at the compressor suction valve;

c. Compressor suction and discharge pressures;

d. Level of liquid refrigerant sub-cooling at condenser outlet;

e. No air bubbles in liquid line sight glass;

f. Compressor(s) working at full load/capacity.

(c) HVAC Unit Performance

(i) Verify:

1. Design Cooling Capacity Test – Measured airflow with dry evaporator coil and with wet evaporator coil, Determination of cooling capacity at rated conditions, including power requirements

2. Modulation Capability Test

3. Maximum Operating Conditions (MOC) Functional Test

4. Extreme Operating Conditions Functional Test - capacity at 130° F ambient

5. Humidity Control Test

a. humidity control at mild load, high humidity conditions

6. Insulation Efficiency and Liquid Carryover Test

7. Low Temperature Operation – Minimum Cool / Low Ambient Test

8. Heating Capacity Test

9. Abnormal Heating Test with Restricted Airflow

10. Abnormal Heating Test with No Airflow

11. Test of High Limit Temperature Thermostat/Switches

12. Blower Motor / Heater Circuit / Cooling Circuit Interlock Test

    a. Blower Motor, heater interlock with airflow switch test

    b. Blower Motor, cooling circuit interlock with airflow switch test

13. Water Tightness Test

14. Exterior Noise Test

(d) Temperature Control Integration/Operation with HVAC Unit

(i) The temperature control components and software shall be connected with an HVAC unit and either fully functional PTU or necessary temperature and pressure sensing controls to effectively perform full functional testing of all software controls. Controller shall simulate actual operational controls and provide controls and verify correct feedback of HVAC unit response. All points of the approved temperature control schedule referenced in Chapter 10 shall be verified for both the temperature rising and the temperature falling cycles. Demonstration of all HVAC operating modes including the pump-down operation, bump start routine, and staggered compressor starting, when appropriate, shall be included.

(ii) Functional testing shall also include verification of all software control functions, status reporting, and fault recording including lockout conditions and reset.

(iii) Under steady state operation at design conditions, the control voltage shall be varied between the limits allowed by Amtrak Specification 963. The system shall operate steadily without malfunction.

1. All subjects identified above in “temperature control integration/operation” shall be verified on the integrated system of the temperature controls and HVAC unit.

ii). HVAC System Vehicle Level Pre-Test Requirements

(1) Prior to any cooling and heating system test, an air balance test, control scan test and a vehicle heat transfer test shall be

conducted. The purpose of these tests is to demonstrate conformance with interior ventilation, air flow and pressurization requirements, to demonstrate that the HVAC control, and thermostats perform as specified, and to demonstrate that the overall car body heat transmission does not exceed the specified limits.

(2) The pre-tests shall be satisfactorily completed before continuing to further climate room testing.

iii). Air balance test

(1) Prior to any cooling and heating tests, an air balance test and a vehicle pressurization test shall be conducted. Any adjustments to air baffle plates, grilles and diffusers shall be documented during this test.

(2) Each car type shall be tested and the results recorded to verify specification requirements are met for air distribution and balance, including:

(a) Fresh air flow rate

(b) Return air flow rate

(c) Exhaust air flow rate

(d) Car pressurization: car interior, restrooms (negative), electric locker

(e) Pressure differential of restrooms relative to adjacent car interior

(f) Uniformity of supply air flow

(g) Interior car noise levels after balancing with blowers on

(3) Correct air distribution shall be verified with the fresh air and diversion dampers in each of the nominal positions (e.g. For fresh air dampers, closed, partial, full open positions, etc.). Once the required values are established, the system adjustments and settings shall be recorded and diffuser/baffle settings permanently fixed to be used as base settings for the remaining cars of that type.

iv). Temperature control tests

(1) The temperature control components shall be exposed to the specified thermal environments. All points of the approved temperature control schedule referenced in Chapter 10 shall be verified for both the temperature rising and the temperature falling cycles. The temperatures shall be varied as slowly as practical to reflect natural temperature lags as experienced in the actual installation. Demonstration of the pump-down operation, bump

start routine, staggered compressor starting, when appropriate, shall be included.

(2) Under steady state operation at design conditions, the control voltage shall be varied between the limits allowed by Amtrak Specification 963. The system shall operate steadily without malfunction.

v). Heating and air-conditioning system tests

(1) General

(a) The first of each type of car shall be tested in an approved climate room test facility capable of maintaining any test temperatures from -40°F to 130°F and any relative humidity throughout that range between 25% and 95%. Temperature in the facility shall be uniform throughout. There shall be no more than 5°F variation from 24 in. above top of rail to 24 in. above the vehicle roof and from end to end of the vehicle. Fans may be used to circulate air. Passenger load shall be simulated by means of evenly distributed heaters and humidifiers inside the vehicle; solar loads shall be simulated by means of evenly distributed heaters inside or outside the vehicles. Humidity introduced into the vehicle shall be calculated and measured to accurately simulate the passengers' latent heat load. The climate room shall have the equipment available to locally raise the condenser temperature to demonstrate the air conditioning system's pressure modulation capability.

(2) Data requirements

(a) The Contractor shall record sufficient data at intervals of no more than 30 seconds for each air conditioning and heating test to show that the equipment operates satisfactorily and meets design requirements.

(b) The recorded data shall include the following:

(i) Temperatures (°FDB):

1. Return air at both HVAC units;

2. Mixed air at both HVAC units;

3. Fresh air at all air intakes (for both HVAC units);

4. Distributed air throughout the car;

5. Condenser air inlet at both units;

6. Liquid at the filter-drier outlet on both units;

7. Suction at evaporator on both units;

8. Suction at compressor(s) on both units;

9. All temperature sensors and thermostats;

10. Exterior temperature at 24 in. above the rail at both ends of the car;

11. Exterior temperature at 24 in. above the roof at both ends of the vehicle;

12. Interior temperature at 14 seats at 6 in. and 48 in. above the floor;

13. Interior temperature at 4 aisle positions at 6 in. above the floor and 12 in. below the ceiling;

14. Toilet room 6 in. and 48 in. above the floor and 12 in. below the ceiling;

15. Heater guard temperature at all heater locations;

16. Overheat heater compartment at all overheat protection devices;

17. Wet bulb temperatures at a minimum of two ambient locations next to the fresh air intakes.

(ii) Pressures:

1. Compressor(s) discharge on both units;

2. Compressor(s) suction on both units;

3. Liquid leaving condenser/sub-cooler outlet on both units;

4. Suction at evaporator at each evaporator circuit on both units;

5. Evaporator air pressure drop on both units;

6. Condenser air pressure drop on both units;

7. Vehicle pressurization (inches of water gauge).

(iii) Electrical Data:

1. Input Voltage;

2. Blower motor current, power, and speed on both units;

3. Compressor(s) motor current, and power on both

units;

4. Condenser fan motor current, power, speed on both units.

5. Fresh air damper motor current, power, and position on both units,

6. Supply air diversion damper motor current, power, and position an all dampers.

(iv) Relative Humidity Data:

1. Relative Humidity (RH) sensors at 3 aisle positions at 12 in. below the ceiling.

(c) For the heating tests all heater circuits and devices shall be continuously monitored to determine all device input voltages, currents and power draw. For all tests, the status of all temperature control modes shall be "event recorded" in parallel with the temperature, pressure and electrical data in a manner which will allow total system functional status to be followed throughout the testing. Coordinating time marks shall be used on all data recording devices.

(d) The data acquisition system shall have the capability to add channels, if required.

vi). Control scan test

(1) All control switching points for rising and falling temperatures shall be tested, by varying and adjusting the ambient conditions in the climate chamber and the interior loads in the car. All temperatures that affect the control system shall be tested individually. While stabilized within each control mode the interior comfort requirements of Chapter 10, shall be met. Stabilization shall be when the temperature swing at each of the interior car thermocouples, including all spaces such as the toilet room, stay within ± 3ºF per hour. In the event of any control failure, appropriate adjustments shall be made, and the entire scan test shall be repeated until all system controls performs as intended. If any air flow adjustments are made during the scan test, the airflow balance test shall be repeated. Cooling pump-down cycle, bump start routine, staggered compressor startup and cooling lockout shall also be demonstrated during this test. Heating and cooling shall be sufficiently capable of maintaining desired interior temperature near the lockout temperatures for the compressors or condenser fans with maximum solar loads.

vii). Vehicle heat transfer test

(1) The overall carbody heat transmission, value shall be determined during this test. The fresh air intakes and exhaust openings shall be sealed, the vehicle doors shall remain closed and the car ventilation system shall be shut down during this test. The climate room ambient temperature shall be maintained at a constant ambient temperature below 20°F during this test. Portable heaters and fans shall be evenly distributed throughout the car and shall be used to heat the car until the car interior temperature stabilizes. Once the car interior temperature is stabilized, the overall carbody heat transmission, value can be calculated by dividing the total heat applied in the car by the floor heaters (in BTU per hour) by the stabilized temperature difference between the ambient and interior temperature (in °F). The calculated value must be less than or equal to the specified value.

(2) In the event the Heat Transfer test is failed, appropriate changes to the car body insulation system shall be made, and the test shall be repeated.

viii). Cooling system tests

(1) General

(a) The air conditioning tests shall demonstrate the performance in cooling the car and maintaining specified car interior temperatures at various designated ambient conditions. Unless otherwise stated, the applied ambient temperatures shall remain constant, within ± 3ºF, during all tests.

(2) Pull down and steady state operation at design conditions test

(a) Prior to this test, the car shall be "soaked" at 110°F Dry Bulb/76°F Wet Bulb in the climate chamber for at least 6 hours with all doors closed and maximum solar load applied until the interior temperature has stabilized as described above.

(b) After the completing the "soak" period, all electrical circuits, including car lights, shall be energized and the air conditioning system shall be turned ON with all car doors and windows closed. Fresh air dampers shall operate per control logic.

(c) The time required for the system to reduce the interior air temperature to normal ASHRAE conditions shall be recorded, as well as the time for stabilization. Stabilization shall be when the temperature swing at each of the interior car thermocouples, including all spaces such as the toilet room, stay within ± 3ºF per hour. Once stabilized conditions have been reached the test operation shall be continued for 30 minutes with temperatures, pressures, electrical and humidity data recorded at one minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior comfort requirements of Chapter 10 shall be met.

(d) The maximum design passenger load shall be introduced into the car, and the temperature of the ambient air entering the condenser units shall be raised locally to 130°F Dry Bulb, while maintaining 110°F Dry Bulb/76°F Wet Bulb in the climate chamber. Again, once stabilized conditions have been reached inside the car, the test operation shall be continued for 30 minutes with temperatures, pressures, electrical and humidity data recorded at 30 second intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior comfort requirements of Chapter 10 shall be met.

(3) Door cycling test (cooling)

(a) At the same conditions following the pull down and steady state operation at design conditions test, the doors shall be cycled on one side of the car at a rate of 2 minutes open and 15 minutes closed for two hours. The average car temperature shall recover within 2°F of the required interior car temperature within 3 minutes maximum after each door closing.

(4) High ambient temperature test

(a) At the same conditions following the pull down and steady state operation at design conditions test or upon completion of the door cycling test, the climate chamber's ambient temperature shall slowly be raised to 130°F Dry Bulb. After 130°F is reached, the system shall operate continuously for one hour. During the entire test, the system shall not shut down from high pressure, circuit breaker trip, compressor motor overload or failure of any device. Cooling shall be provided at a reduced capacity as described in Chapter 10 during this test. Temperatures, pressures, electrical and humidity data shall be recorded at one-minute intervals during the entire test.

(b) After the one-hour operation, the 480VAC power to the car shall be removed for 2 seconds and then reapplied. The system shall recover from the power interruption and restart with no system or component malfunction.

(5) High pressure cut-out test

(a) Upon completion of the high ambient test, the climate room temperature (or condenser air inlet temperature) shall be further increased until the high-pressure devices on both units are actuated, whereby shutting down the cooling. After actuation, both units must restart as directed by the control system. Temperatures, pressures, electrical and humidity data shall be recorded at one-minute intervals during the entire test.

(6) Condensate carry over test

(a) With the climate chamber temperature at 80°F Dry Bulb/75°F Wet Bulb, operate the air conditioning system continuously for a period of 4 hours in the cooling mode. The interior passenger load and solar load must be adjusted during this test to maintain system operation in cooling mode. Any adjustments to internal loads must hold the interior sensible heat ratio constant at 50%.

(b) At the end of the test, the heater coil, evaporator blower's compartment, supply air discharge plenum, air ducts and diffusers shall be examined for the presence of water.

(c) The test shall be considered successful if, during the test, no condensed water drops, runs, or is blown from the evaporator unit casing and/or its drain pan, and carried in the air stream to the heater coil, evaporator blowers, supply-air discharge plenum, air ducts or diffusers. Overhead heater elements must remain dry.

(7) Low ambient temperature test

(a) Upon completion of the condensate carry over test, the climate chamber shall be adjusted to the lowest ambient air temperature at 40% relative humidity that provides the minimum cooling mode with no reheat according to the Contractor's control schedule. The interior passenger load and solar load must be adjusted during this test to maintain system operation in this cooling mode. Any adjustments to internal loads must hold the interior sensible heat ratio constant at 50%. This HVAC system shall operate for 4 hours under these conditions without damage to the equipment, and the evaporator air flow shall not drop more than 15% from the manufacturer's design point. Temperatures, pressures, electrical and humidity data recorded at one-minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior must conform to the comfort requirements of Chapter 10. While the unit is still running, examine the evaporator coils for evidence of icing, and verify the oil level at each compressor sight glass.

(8) Low ambient temperature test with high internal load

(a) Upon completion of the low ambient temperature test, the interior loads shall be increased to the maximum design passenger load and full solar load and the ambient air temperature shall be lowered to 3 degrees F above cooling system lockout. Operate the system continuously for a period of 4 hours. During the entire test, the system shall operate continuously without damage to the equipment, with temperatures, pressures, electrical and humidity data recorded at one minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior must conform to the comfort requirements of Chapter 10.

ix). Heating system tests

(1) General

(a) The heating tests shall demonstrate the heating system's ability to heat the car interior and maintain specified interior car temperatures at various designated ambient conditions. Unless otherwise stated, the applied ambient temperatures shall remain constant, within ± 3ºF, during all tests. All heating tests shall demonstrate compliance to acceptable touch-safe temperatures on any heaters (125 degrees F).

(2) Layover verification test

(a) This test begins with the car in a stabilized automatic heating condition with an ambient temperature of 60°F. The car is then placed in its layover mode and the ambient temperature reduced to -40°F at a rate of change not to exceed 20°F/hour. This ambient temperature is maintained for a maximum of eight hours. The average interior temperature must remain within the allowed layover temperature range during the eight hour period.

(b) The layover state is continued an additional four hours with reduced applied voltage to its lowest allowable value. Again, the average interior temperature must remain within the allowed layover temperature range during the entire four-hour period.

(c) No areas of the vehicle may drop below 40°F throughout the test and random measurements may be taken during the test to verify compliance, with particular attention to water piping or sensitive equipment.

(3) Steady state heating at design conditions test

(a) Following the layover verification test, the nominal voltage supply is reapplied, and the car is placed in its normal mode, with all car doors closed. Fresh air dampers shall operate per control logic.

(b) The time required for the system to raise the interior air temperature to normal ASHRAE conditions shall be recorded, as well as the time for stabilization. Stabilization shall be when the temperature swing at each of the interior car thermocouples, including all spaces such as the toilet room, stay within ± 3ºF per hour. Once stabilized conditions have been reached, the test operation shall be continued for 30 minutes with temperatures, pressures, electrical and humidity data recorded at one minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior comfort requirements of Chapter 10 shall be met, and no heater guard temperature shall exceed the specified maximum, 125°F during the entire test.

(4) Steady state heating (minimum voltage)

(a) Upon completion of the steady state heating at design conditions test, the applied voltage shall be reduced to its ll wasowest allowable value. Again, the system shall stabilize the interior air temperature to normal ASHRAE conditions. Once stabilized conditions have been reached, the test operation shall be continued for 30 minutes with temperatures, pressures, electrical and humidity data recorded at one minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior comfort requirements of Chapter 10 shall be met, and no heater guard temperature shall exceed the specified maximum of 125°F during the entire test.

(5) Door cycling test (heating)

(a) At the same conditions following the steady state heating (minimum voltage) test, the doors shall be cycled on one side of the car at a rate of 2 minutes open and 15 minutes closed for two hours. The average car temperature shall recover within 2°F of the required interior car temperature within three minutes maximum after each door closing.

(6) Steady state heating tests

(a) Upon completion of the door cycling test, the doors shall be closed, the nominal voltage shall be re-applied and the maximum design passenger load passengers shall be introduced into the car. Again, once stabilized conditions have been reached, the test operation shall be continued for 30 minutes with temperatures, pressures, electrical and humidity data recorded at one minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior comfort requirements of Chapter 10 shall be met and no heater guard temperature shall exceed the specified maximum of 125°F during the entire test.

(b) This test shall be repeated at the applied voltage reduced to its lowest allowable value and at the applied voltage increased to its highest allowable value.

(i) An additional test shall be performed at the maximum voltage to determine the evaluate the temperatures of heaters and heater guards.

(c) Upon completion of the steady state heating test (with design passenger load), the nominal voltage shall be re-applied, and the design solar load shall be introduced into the car. The climate chamber ambient temperature shall be raised and maintained at 42°F. Allow the system to stabilize the interior air temperature to normal ASHRAE conditions. Once stabilized conditions have

been reached, the test operation shall be continued for 30 minutes with temperatures, pressures, electrical and humidity data recorded at one minute intervals in order to evaluate temperature variations and interior humidity requirement as the controls and equipment cycle. The interior comfort requirements of Chapter 10 shall be met, and no heater guard temperature shall exceed the specified maximum of 125°F during the entire test.

(7) Overhead heater safety tests

(a) The overhead heater protection devices shall be tested with restricted and with no airflow. All protection devices and backup protection devices protecting the heaters and housing from overheating shall be tested individually. The tests shall be conducted at nominal voltage supply with an ambient temperature maintained at 40°F, and then repeated at the applied voltage reduced to its lowest allowable value and at the applied voltage increased to its highest allowable value. The overhead heater shall be activated independently of the normal regulating controls. Temperature measurements at the devices and heater power measurements shall be taken throughout each test. After the functioning of the device, temperature measurement records shall be continued until steady temperature fall is observed.

(b) Each test shall be considered satisfactorily completed if the protection device under test has functioned as intended, backup overheat protection devices do not actuate, there is no damage to any equipment or component, and there are no smoke or significant odors detected. When the last level of backup protection device is tested, the test shall be considered satisfactorily completed if the protection device under test functioned as intended, there is no damage to any equipment or component, and there are no smoke or significant odors detected.

(8) Freeze protection tests

(a) The operation of the freeze protection system (including any door threshold, door pocket, water tank, waste system, waste tank, waste lines and water drain valve heaters) shall be demonstrated in the climate chamber. This test begins with the car in a stabilized automatic heating condition with an ambient temperature of 60°F. The car is then placed in its layover mode and the ambient temperature reduced to -40°F at a rate of change not to exceed 20°F/hour, no internal loads and the antifreeze protection circuit energized.

(b) With the HVAC system operating in automatic mode, cycle the doors on one side of the car open and closed at the same rate

as for the door cycling tests. When the doors are closed, spray water at 33°F onto the lower half of at least one pair of doors and the door threshold.

(c) Continue this operation for one hour. The door thresholds must remain free of ice, any door pocket drains must drain freely, and doors must open and close smoothly for the entire test period.

(d) Repeat the test using an application of simulated snow. Snow may be made prior to test and applied by hand to the threshold when doors are open, closed or both. The snow may be hard packed to simulate tracking in on footwear or may be spread out to simulate natural snowfall.

(e) Verify that the freeze protection for the water tanks and water drain valves is working correctly and record the temperature that the systems turned on. Following the Freeze Protection Test, the nominal voltage supply is reapplied, and the car is placed in its normal mode. Verify that the freeze protection systems for the water tanks and water drain valves continue to function as specified.

(f) A final manual test shall be conducted of the Ogontz water valve freeze protection. Following testing above and with the chamber at -40°F and water tanks full, remove all power from the vehicle and verify that the Ogontz valves operate at their intended temperature range and provide dumping of all water on the vehicle. Verify that the water piping, valves, and components are not damaged by visual inspection, and following test by bringing the car and chamber back up to room temperature and resupplying the water system to check for leaks and functionality.

x). HVAC Diagnostic Remote Access Test

(1) The HVAC diagnostics remote access functionality shall be validated.

i). Lighting

i). The function and intensity of all lighting systems and their respective controls shall be tested in the first car to verify compliance with the requirements. All systems shall be designed to function in accordance with APTA PR-E-S-010-98.

ii). Lighting fixture performance

(1) Light level of each fixture shall be measured and compared to the design requirements.

iii). Independent power sources (for emergency lights)

(1) Performance shall be verified in all modes of operation. Charge and discharge time shall be measured.

iv). Marker light certification

(1) The marker lights and fixture shall be tested to verify compliance with FRA 49 CFR Part 221.

v). Lighting intensity-interior

(1) Test shall verify light levels are in accordance with Chapter 13 including APTA PR-E-RP-012-99, APTA SS-PS-004-99, APTA PR-PS-S-002-98, all lighting modes as specified in Chapter 13 and table 13-1, and for all configurations and locations of HPPL signage and LLEPM.

(2) Test shall verify adaptive white light control per Chapter 13.13.c.

vi). Emergency lighting intensity and duration

(1) The test shall verify light levels and duration of each car type are in accordance with APTA Standard PR-E-S-013-99, 49 CFR Part 238.115 and any additional requirements of the specification. Tests shall be conducted in both Normal and Emergency modes and compete operation of independent power sources, including recharge times.

j). Communication/OTIS

i). General

(1) The communication system shall be tested on the first car of each type to verify that it functions in accordance with the requirements of Chapter 12. The diagnostic function of each individual system shall be tested as a separate test or in combination with other functional testing. The PTU shall be used to successfully access all available car subsystems. The capability to modify all password-protected software parameters shall be verified. The interface and functionality of the Central Diagnostics Unit (CDU) and the wireless Local Area Network shall be tested. Testing shall be conducted to ensure that car faults can be downloaded over the network and that the system database can be updated, the CDU and wireless LAN systems shall be fully functionally tested.

ii). PA/IC/OTIS system performance

(1) The performance of the public address and passenger intercom system shall be tested to verify that all aspects of the system perform as intended:

(a) System selector switch function and indication

(b) PA announcements to the car interior only

(c) PA announcements to the car interior and to other cars in the train

(d) PA announcements received from other cars in the train (coupled to legacy equipment)

(e) PA interface with the OCU and the passenger information system

(f) Intercom function between IC stations within the car and between the car and other cars in the train (coupled to legacy equipment)

(g) Communication along analog COMM/MU lines and communication on the DTL

(h) Emergency two-way intercommunications (intercom)

(i) Speaker volume, including interior and exterior speakers, and in both Normal and Night modes

(j) Signal to noise ratio

(k) Fault log tests and communication with the CDU

iii). OTIS system performance

(1) The performance of the automatic announcements, sign, and train map portions of the system shall be verified for specification compliance on each car type. All modes of trainline operation shall be demonstrated, as well as interaction with the PA/IC system.

(2) Proper readability of the interior signs at 45 feet and exterior signs at 115 feet in direct sunlight and complete darkness shall be demonstrated.

(3) The function used to advance the sign reading to the next message shall be demonstrated, using the actual input message to the system. Changes to data files within the OCU shall be demonstrated including editing of files and replacing in-kind.

(4) Simulated power drops and restarts shall be tested to ensure the system returns to proper operation without abnormal behavior.

(5) OTIS shall be tested per the manufacturer's recommendations to ensure it can be properly set-up, adjusted, reprogrammed, and edited to verify normal operation, minor changes to route or display options, or uploading of entirely new route and visual packages.

iv). EMI/EMC

(1) The test plan shall meet the requirements of APTA Standard PR-E-S-010-98, plus any additional requirements of the specification. All modes of operation shall be tested.

v). Wayside equipment tests

(1) Each wayside and Control Center component of the communications system installed under this Contract, including the radio system, CDU, GPS, automatic vehicle location system, the wireless local area network system, and all other communications and interface with the wayside shall be tested to verify that they function in accordance with the requirements. GPS accuracy shall be tested. The ability to modify software data files and change parameters for the wayside communications system equipment shall be successfully demonstrated. The interface and functionality of the car CDU and the wireless local area network shall be fully tested. Testing shall be conducted to ensure that car faults can be downloaded remotely and that the system database can be updated.

(2) Each component of the communications system, including the GPS, automatic vehicle location system and wireless local area network, shall be tested to verify that they function in accordance with the requirements. Wayside simulations shall be performed as approved by Amtrak to fully verify all functions. All equipment which is installed under the Contract on Amtrak wayside or Amtrak control center shall also be tested to verify compliance. The ability to modify software data files and change parameters for the communications system equipment shall be successfully demonstrated.

vi). Wireless LAN

(1) The wireless LAN system shall be shown to demonstrate communication between the cars and wayside equipment, to properly connect to representative user devices, and to properly function through intermittent connectivity or power.

k). Electrical

i). General

(1) All electrical circuit breakers, protection systems, switches, and relays shall be cycled under full load to demonstrate proper functionality. Electrical protection systems, where included, shall be tested to the degree possible to adhere to the manufacturers specifications.

ii). Electrical load/phase balance/power factor

(1) One completed car of each type shall be tested to determine the actual electrical loads, their phase balance and power factor. This

shall be done under at least three different conditions: maximum heating load, maximum cooling electrical load and ventilation. These values shall be used to verify specification compliance.

iii). Trainline tests

(1) Trainline tests shall be conducted at both ends of the first cars of each type. All receptacles for the HEP, inter-car, MU and COMM trainline circuits shall be tested for proper functionality using a trainline test unit. Proper functioning of the PA/IC/OTIS shall be conducted to verify communication into and out of the cars functions properly.

(2) The first cars shall be coupled to a locomotive or other car on the Contractor's test track, and all trainline functions, including coupling and uncoupling and diagnostic messages, shall be tested to verify correct operation.

(3) End of Train functionality for trainlines and 480VAC HEP shall be tested per Sections 15.3.c and 15.5.e.

iv). Network tests

(1) The Contractor shall submit the results of a Network Interface Card (NIC) test of each end device implementing Ethernet communication in order to verify compliance to IEEE standards. The Contractor shall submit the results to Amtrak for review.

(2) The Contractor shall perform a complete network integration test of all train networks, including all subsystems and all on-board networks in order to pre-qualify the proposed network architecture prior to implementation on the cars. This test shall consist of a simulated car with all train switches. The subsystem controllers and end devices shall be the actual units in one car, with at least one of every type of controller represented in the test. Other cars and devices may use simulated traffic generators. The tests shall verify that the protocols, datasets, and messages used on all networks correspond to the Network Interface Control Document, and that the specific signal, message, and dataset documentation are provided for each network. At the time of the integration tests, the Contractor shall also demonstrate the fault tolerance of all networks by simulating all possible faults. Amtrak shall have the option of witnessing the tests. The test procedures and results shall be submitted to Amtrak for review and approval.

(3) Network testing performed by the Contractor shall demonstrate that all networks have capacity 50% above the expected worst-case in-service load.

v). Battery and battery charger tests

(1) Tests of battery capacity and the battery charger shall be made to show compliance with their requirements. The ability to charge the batteries and support other low voltage loads shall be verified. The capacity of the battery to support essential loads for the required time upon loss of HEP output shall also be verified. Proper functioning of the load shed and load drop systems at the specified voltages shall be conducted. The ability to check the battery fluid levels and refilling shall be demonstrated.

(2) Utilizing a heat gun or approved simulated heat source, proper functioning of the over temperature protection of the batteries shall be demonstrated.

vi). Battery capacity

(1) Battery on each car type shall be tested to demonstrate specification compliance.

vii). Battery/battery charger performance

(1) The performance of the battery charger connected to the battery and a simulated carload, shall be tested to verify correct operation. This shall include battery charger self-test, verifying correct voltage control and current control modes of the charger, operation of the temperature sensor, load shed and drive to any external indicators. This shall include: 24-hour charge with DC loads active; discharge to load shed; recharge for 24 hours. Strip chart instrumentation shall monitor battery voltage and carload and battery current over the entire interval. The system shall be tested to verify fault coordination between battery charger, battery and main DC circuit breakers and the ability to support large step loads on car, such as door operators cycling. Proper load shed and load drop at the specified voltages shall be demonstrated. The test shall also verify proper operation of the equipment during:

(a) Loss of input phase (component supplier Proof of Design test)

(b) Reversed phase rotation (component supplier Proof of Design test)

(c) Reversed battery connections (component supplier Proof of Design test)

(d) Fault coordination between battery charger system, battery and main DC circuit breakers (car level Proof of Design test)

viii). Battery tilt and shock

(1) Verify each battery type complies with the 45 degree tilt and 8/4/4g acceleration requirements of 49 CFR Part 238.115.

(2) reserve time of at least eight (8) hours per Section 15.5.f.

l). Food Service

i). The following food service equipment tests shall be performed as required to verify the design:

ii). Structural performance

(1) Verify crashworthiness structural requirements for retaining carts, chillers, and appliances are met. Tables and booth seating shall meet APTA PR-CS-S-016-99.

iii). Refrigeration system performance

(1) A complete car set of Food service refrigeration equipment for each food service car type shall be assembled and connected to operate. Particular concern is that the system might slowly lose capacity over time, with buildup of ice on the evaporators, etc. Room in which the test is conducted shall have a relative humidity of at least 60% at the 70° condition. The following shall be verified:

(a) Pull down capacity at rated conditions with nominal condenser inlet air temperature of 70°F and 110°F

(b) Hot-soak pull down: cases soaked > 95°F rated high ambient

(c) Operation at light load

(d) Operation of condenser environmental controls

(e) Ability to maintain cases to required values, including minimal temperature gradient within case

(f) Ability of thermometer on units to accurately track air temperature

(g) Operation of protective devices, such as pressure switches.

(2) Instrumentation and measurement shall include:

(a) Inlet and outlet air temperature of each galley cart

(b) Inlet and outlet air temperature of evaporator of each freezer and/ or refrigerator box.

(c) For large units, such as stand-up freezer, several locations within the unit are required.

(d) Evaporator surface temperature inlet and & outlet of each coil

(e) Expansion valve bulb temperature of each valve

(f) Chiller conditioned air inlet and outlet air temperature each unit

(g) Condenser air inlet and outlet temperature each unit, also including chillers

(h) Suction and discharge pressures each unit, also including chillers

(i) Compressor current each unit, also including chillers

(j) Activation of chiller thermostat

(k) Activation of chiller defrost cycle

(l) Activation of each box thermostat and solenoid valve

(m) Activation of each freezer defrost function

(n) Activation of environment controls

(3) All food service equipment shall be installed and shall be operated in a test simulating revenue service to verify the proper operation of the appliances, cases, power distribution system (including proper operation of the battery), HVAC, lighting, and the water and waste systems.

iv). Food Service Appliances

(1) Correct operation of all modes of all appliances and any interfaces shall be demonstrated. The effects of interruption of HEP and its restoration shall be demonstrated to verify compliance. Any wireless functions shall also be included. Tests shall also verify EMI/EMC requirements are met.

v). Point of Sale System

(1) Correct operation of all modes of the complete point of sale system and any interfaces shall be demonstrated. The effects of interruption of HEP and its restoration shall be demonstrated to verify compliance. Any wireless functions shall also be included. Tests shall also verify EMI/EMC requirements are met.

m). Water and Waste

i). A set of equipment that simulates the fresh water distribution and waste retention systems on a car shall be assembled and connected to operate. The system shall be piped to simulate actual car piping.

ii). The proper operation of the following shall be verified:

(1) Performance of all system components and controls

(2) System pressures, temperatures and flow rates

(3) Safety controls

(4) Backflow prevention devices

(5) Tank level indications

(6) Vacuum/pressure levels attained and maintained

(7) Valve sealing

(8) Protection mechanisms

(9) Flush valve life cycle

(10) Water fill and capacity

(11) Freedom from backflow

(12) Showers

n). Diagnostics and Test Equipment

i). The Contractor shall demonstrate fully functionality of the diagnostic and test equipment. The Central Diagnostic Unit shall display, record, and upload any failure within the car.

ii). The Contractor shall develop acceptance and qualification tests for all systems identified as diagnostics and test equipment, including but not limited to the central diagnostics unit, the portable test units, the car temperature monitoring, and any bench testers. The tests shall verify all features and components are in compliance with the requirements of this Technical Specification.

(1) Verification that all faults that are configured for all sub-systems to be displayed on the CDU are displayed properly.

(2) Verification that all faults that are configured to be reported to the CDU are so reported.

(3) Verification that fault logs of all systems in the car are accessible from the maintenance screen of the CDU in any of the cars.

(4) Verification that the software version numbers on all non-communications subsystems in the car can be accessed from the CDU of any car.

(5) Verification that all software changes made as a result of the CDU Factory Qualification Test have been implemented on all systems connected to the CDU.

(6) Any faults from each and every system shall be simulated and demonstrated to display properly.

(7) Simulate fault data upload and alarming.

(8) Access to system level fault information and current status parameters through the CDU terminal, the PTUs, and the online portal.

(9) Proper operation of the data recording functionality.

(10) Verification that all PTUs and bench test equipment properly connect, function, and diagnose system-level equipment.

o). Emergency Equipment

i). The performance of the Fire and Smoke Detection System and any Fire Suppression systems shall be verified for specification compliance on each relevant car type. Each type of sensor, alarm, indicator, control and annunciator, as well as all inputs and outputs, shall be demonstrated. All functions and modes of operation shall be demonstrated. The effects of interruption of HEP and its restoration shall be demonstrated to verify spec. compliance. Operation of the complete system from its battery shall be demonstrated from full charge down to fully discharged condition and then recharge. Time the system is supported on battery and the duration of the recharge shall be recorded with a data recorder.

20.6 Installation, Removal, and Maintainability of Equipment

a). This test shall measure the time it takes as well as demonstrate that it is possible to successfully install and remove without interference large components as well maintain frequently serviced pieces of car equipment. These items shall be demonstrated on a fully assembled car, unless otherwise agreed in writing by Amtrak. Items include:

i). Car Exterior: Removal/Installation

(1) Side Loading Doors, gap fillers and operators – each unique location

(2) End Doors – each unique type and location

(3) Gangways and Diaphragms

(4) Undercar and sidewall access door change-out (each type)

(5) Tread brake unit and disc brake unit: worst-case location(s)

(6) Brake valves, including wheel slide dump valves

(7) On-board mobility device lifts

(8) Digital Displays

(9) All other equipment located on the exterior of the Car unless otherwise agreed to by Amtrak.

ii). Removal/ Installation

(1) HVAC unit: - each unique site

(2) Refrigeration condenser tray (if used)

(3) Waste System including complete waste tank assembly

(4) Water heater (each type)

(5) All other equipment installed on the car unless otherwise agreed to by Amtrak

iii). Coach and Premium Accessible Coach Car – Interior: Removal/Installation

(1) Seats (all configurations of each type, i.e., single seats, double seats, left-hand, right-hand, coach, premium coach, etc.)

(2) Interior Doors – each unique type and location

(3) Restroom with associated assemblies – each type and each unique location

(4) Lighting

(5) Digital Displays (all locations)

(6) Water Fill station

(7) All other equipment located in the interior of the coach and premium coach cars unless otherwise agreed to by Amtrak.

iv). Food Service Cars – Interior: Removal/Installation

(1) All Food Service appliances

(2) Booth Seats

(3) Lounge Seats

(4) All other equipment located in the interior of the Food Service cars unless otherwise agreed to by Amtrak.

v). Food Service Preparation Areas – Removal/Installation

(1) Dishwashers (all locations)

(2) Freezers (all types and locations)

(3) Refrigerators (all types and locations)

(4) Chillers (all types and locations)

(5) Each appliance: TurboChef, coffee makers, steam tables, microwaves, griddles, steam table, warming drawers, etc.

(6) Gaylord exhaust fan & motor (for cleaning)

(7) Point of Sale system

(8) All other equipment located in a food service preparation area unless otherwise agreed to by Amtrak.

vi). Sleeper Cars – Interior: Removal/Installation

(1) Sleeper and restroom modules (each type)

(2) Room entrance doors including any en-suite doors – all accommodation types and all unique locations.

(3) Sleeper seats and convertible beds – each unique accommodation type

(4) Upper Berths – each unique accommodation type

(5) Lighting

(6) Digital Displays (all locations)

(7) All other equipment located in the interior of the sleeper and utility cars unless otherwise agreed to by Amtrak.

vii). Car Exterior – Servicing:

(1) Change brake shoes and brake pads, all locations, without the use of a pit

(2) All other equipment that requires servicing in the exterior of the car unless otherwise approved by Amtrak.

viii). Equipment – Servicing:

(1) Clean HVAC unit evaporator drains, each drain on each unit

(2) Clean HVAC unit condenser coil, each unit

(3) Clean refrigeration unit condenser, if supplied

(4) All other equipment that requires servicing in the exterior of the car unless otherwise approved by Amtrak.

ix). Interior - Servicing

(1) HVAC air filters

(2) Air duct cleaning

(3) Removal of diffusers and grilles

(4) Seat cushion removal/ installation – each type

(5) Booth & Lounge seat cushion removal/ installation – each type

(6) Curtain/Shade removal/ installation- each type

(7) Toilet shroud – each type

(8) Toilet bowl assembly - each type

(9) Waste lines – to clear blockage in line – all unique locations

(10) Drains – to clear blockage in line- each type – all unique locations

(11) Trash receptacle container - each type

(12) Sleeper Modules – each type

(13) Restrooms – each type

(14) Shower valves -- each type

(15) All other equipment that requires servicing in the exterior of the car unless otherwise approved by Amtrak.

b). Tests shall also demonstrate that all 49 CFR 238 calendar day inspections and Class I brake inspections shall be capable of being performed without the use of a pit or elevated track.

20.7 Pilot Car Testing

a). Roll Angle (Lean) Tests

i). The first pilot car, in both the AW0 and AW3 load conditions, shall be placed upon a superelevated track up to a maximum of 7 inches in one-inch increments. The test shall be performed in both lean directions to determine compliance with:

ii). Clearance requirements by verifying the Contractor's clearance diagram despite any body roll and lateral shifting of the car body.

iii). Static lean (maximum cant deficiency and maximum cant excess) limits for wheel unloading and carbody roll angle.

iv). Tests shall measure body roll and wheel unloading to verify compliance with 49 CFR Part 213.57 and 213.329. The Contractor shall provide a test report providing all data required by 49CFR Part 213.329 and shall fully support Amtrak's submission to the FRA with additional information as requested by the FRA. This test must be simulated on all cars and performed on each representative car type.

b). Pilot Cars

i). General

(1) Pilot car testing refers to the test of the first car of each type at the Contractor's final assembly facility prior to shipment. To implement pre-delivery testing of the pilot cars, the Contractor shall provide at its assembly facility a test site on which the specified tests can be conducted. In addition, this site shall be equipped with locomotive HEP power simulation with which it shall be possible to test performance.

(2) All tests listed in this Chapter are in addition to the testing required for Production units, road brake tests, and post-delivery testing of pilot cars with other equipment, called out in other sections of this Chapter.

(3) All pilot cars shall be weighed and verified for proper weight distribution by wheel and maximum total weight.

ii). Pilot car testing

(1) After the pilot cars have undergone and passed all applicable proof-of-design and production testing requirements, the cars shall be combined for car-to-car operational, compatibility and coupler tests.

(2) All pilot car testing shall be performed at a dedicated facility that has the capability of testing the cars operations of up to 125mph for uninterrupted 8-10 hours per day.

(3) All trainline functions shall be tested and verified, including:

(a) Door control, door system status and door summary circuits

(b) End of train identification

(c) Locomotive control

(d) PA, IC, and OTIS communications

(e) If equipped, DTL and Wi-Fi data transfer, including wireless and cellular connectivity at all seating or standing locations within the car without interference

(f) HEP, power distribution, and power balancing

(g) Air brake application and release in ECP mode

(4) The pilot cars shall be tested to confirm compliance with track geometry requirements, including curve and crossover negotiation. All car-to-car connections shall be verified as performing in compliance with the track geometry requirements, including:

(a) Carbody clearance

(b) Truck swing

(c) Coupler swing

(d) MU, COMM, DTL, ECP, and HEP cables

(e) Brake pipe and main reservoir air hoses

(f) Gangways, Diaphragms and buffer plates

(5) The clearances between the carbody and the trucks, between the carbody and the couplers, and between cars shall be checked on all pilot cars by methods which place the relevant components in the correct angular relationship corresponding to the worst case conditions to be incurred by operation in the static car envelope. In addition to demonstrating adequate mechanical clearance of the major elements involved, this test shall demonstrate that no interferences or potentially damaging contacts or stress conditions occur between or to any parts of the cars, including stops, wires, cables, or enclosures. Trainline cables shall not droop when under slack conditions such that they can potentially contact the ground, the top of rail, or other obstructions below the car's operating envelope.

(6) The cars, with springs loaded statically to AW0 and AW3 conditions, shall be demonstrated by either testing (measured against a template, plumb line or other approved method) or analysis to confirm that the car conforms to the Contractor's designs and that all the specified clearances and static car envelope requirements have been met, both to wayside and rail. This test shall be performed successfully with each end of each car coupled to another car. Test results must verify compliance with the Contractor's clearance calculations and diagrams for the cars under all operating conditions. Test cars shall be selected so that all variations of car end configuration can be covered.

iii). Pilot car compatibility testing

(1) After the pilot cars have undergone and passed the above, existing Viewliner I or II cars will be coupled to one end of the equipment or in the consist and an Amtrak ALC-42 locomotive will be coupled to the other end of the equipment.

(2) All trainline functions shall be tested and verified, including:

(a) Door control, door system status and door summary circuits

(b) End of train identification

(c) Locomotive control

(d) PA, IC, and OTIS communications

(e) If equipped, DTL and Wi-Fi data transfer

(f) HEP, power distribution, and power balancing

(g) Air brake application and release in Emulation

(3) The compatibility test train shall be tested to confirm compliance with track geometry requirements, including curve and crossover negotiation. All car-to-car connections shall be verified as performing in compliance with the track geometry requirements, including:

(a) Carbody clearance

(b) Truck swing

(c) Coupler swing

(d) MU, COMM, DTL, ECP, and HEP cables

(e) Brake pipe and main reservoir air hoses

(f) Gangways, Diaphragms, buffer plates and curtains

(4) The clearances between the carbody and the trucks, between the carbody and the couplers, and between cars shall be checked on the pilot cars and existing cars and locomotives by methods which place the relevant components in the correct angular relationship corresponding to the worst case conditions to be incurred by operation in the static car envelope. It shall be possible to couple and connect cars and wiring throughout the range of worst case angular relationships based on track curvature. In addition to demonstrating adequate mechanical clearance of the major elements involved, this test shall demonstrate that no interferences or potentially damaging contacts or stress conditions occur between or to any parts of the car, including stops, wires, cables or enclosures. Trainline cables shall not droop when under slack conditions such that they can potentially contact the ground, the top of rail or other obstructions below the car's operating envelope.

(5) If equipped, for any ECP system used, testing shall be performed in both Normal and Emulation modes per APTA PR-M-S-020-17 and PR-M-S-021-17.

iv). Vehicle/Track System Qualification

(1) General

(a) The Pilot cars shall be tested in accordance with the applicable requirements of 49 CFR Part 213.345 for vehicle testing at speeds up to 125 mph on the track and 5" cant deficiency of a qualified test facility to be selected by the Contractor. After the completion of vehicle testing at the selected test facility, the official qualification testing shall be performed on Amtrak's

Northeast Corridor (NEC). Testing shall begin at a speed of no less than 80 mph and test speeds will be incrementally increased as described below. Test results shall be made available on the Pilot Cars immediately after the completion of each test trip and will be reviewed by Amtrak before the decision is made to proceed to the next higher speed increment. The maximum test speed shall be per 49 CFR 213.345 using the Pilot Cars with a minimum of one instrumented car of each car type to be tested. Vehicles with minor variations in their physical properties that do not result in significant changes to their dynamic characteristics are considered to be of the same type for testing purposes.

(b) As track class, signal, propulsion and other required infrastructure becomes available on the route intended for service to support speeds of 125 mph, the equipment shall be tested in accordance with 49 CFR Part 213.345. Should the infrastructure to achieve speeds of 125 mph (test speed to be 5 mph greater) become available at the time of delivery of the vehicle order, the Contractor will be responsible for the conduct of these tests. On all train routes identified by Amtrak where car operation is planned for a speed of 125 mph, the Contractor will be responsible to conduct Pilot Car tests using a car over the identified route segments to enable car operation at the maximum allowable timetable track speed.

(2) Test instrumentation

(a) Test instrumentation shall be provided by the Contractor to record all data necessary to demonstrate compliance with the acceleration limits identified in 49 CFR Part 213.345. Each of the instrumented Pilot cars shall be provided with one truck equipped with two Instrumented Wheelset (IWS) axles. The truck with the worst performance per the simulation shall be equipped with the IWS-equipped truck. Tests shall be conducted in both directions of movement. Friction brakes on the IWS-equipped truck shall be cutout for the duration of testing. The location of the IWS truck is dependent on the worst performing position identified by the MCAT analysis. The consist configuration under test shall be equal to the worst performance in the car simulation.

(b) Each truck on each instrumented car shall be equipped with two lateral accelerometers, mounted on the truck frame at diagonally opposite locations along the vertical line passing through the center of the journal bearing. All instrumented cars shall also be equipped with three carbody lateral and vertical accelerometers. They shall be located on the interior floor, on the car longitudinal centerline, above each carbody bolster and at the middle of the car.

(c) A GPS location system shall be used during testing to accurately report the location of the IWS trucks. This shall be done by a separate GPS system for testing, in which case the GPS antenna shall be located on the roof of the IWS-equipped car. An accurate speed signal shall be provided in the data. This signal may be provided by the locomotive or by separate test instrumentation. The speed signal data and the cab speedometer display shall agree to within 1 percent across the entire speed range.

(3) Data collection and reporting

(a) The Contractor shall provide carborne test equipment capable of recording all data required, analyzing these data for compliance with FRA criteria and reporting results to test train personnel in graphical form. Real time operational safety must be provided. Results will be reviewed on the test train for acceptability by Amtrak before the decision is made to move to the next higher test speed. Reports for a given test trip may be generated as a series of data packages, each covering a distance of approximately 2 to 5 miles.

(b) The reporting software shall be capable of generating the following for each data package:

(c) A time and date stamp.

(d) A graphical depiction of train location and speed by railroad milepost.

(e) A graphical depiction of the various wheel/rail force signals and the truck acceleration and carbody acceleration signals. It shall be possible to directly correlate these signals with the location, speed and time/date data. The location of the worst case data in each data set shall be indicated.

(f) A summary report of the worst case values recorded for the IWS wheel/rail force criteria, and the truck acceleration and carbody acceleration data. Any values which are in excess of those allowed by FRA shall be flagged as exceptions.

(g) Exception reports shall be provided for all events flagged as exceptions. These reports shall include the values recorded plus a close-up time history view of the data signal associated with each exception.

(h) Data packages shall be available within 5 minutes or less after collection of test data. Simultaneous data collection and report generation shall be required. All necessary calibration data, sign conventions, sampling rates, headers, etc. required to process the data shall be included in the report. Data shall be provided to Amtrak in both paper and electronic media which shall include all

software required to format, process and graphically view the test data.

(4) Failure to Satisfy Requirements

(a) Should the car fail to satisfy the vehicle/track interaction requirements, a program for correcting the deficiencies shall be submitted to Amtrak for approval. The Contractor shall submit to Amtrak, within 60 calendar days, a program containing mathematical analysis of the problem and a course of action for its correction. If Amtrak approves the analysis and corrective measures, those corrective measures shall be made effective on the pilot cars within 90 calendar days at the expense of the Contractor, the car shall be retested, and if the measures are successful, they shall be applied to all the cars. If not, the analysis and correction steps shall be repeated, resubmitted and retested until success is attained.

(5) Test reports

(a) The Contractor shall prepare the required final test reports for submission to the FRA by Amtrak. This shall include the track geometry data for the test zones, which accurately reflects the state of the track condition at the time of test. Amtrak reserves the right to require additional vehicle modeling, instrumentation and/or testing if test results show failure to comply with the FRA requirements for operation at any speed below 125 mph, or if additional dynamic behavior which may present a safety issue is observed.

v). Noise and vibration tests

(1) The interior and exterior noise levels and vibration levels of the pilot cars shall be measured to prove compliance with all specification requirements. Interior noise measurements shall be made with all car systems operational while operating on level tangent track in an open area, from standstill to 125 miles/hour and back to zero speed using full service braking. The sound level meter shall conform, as a minimum, to the requirements of ANSI Standard S1.4, Type 2, and set to an A-weighted slow response or with an audio dosimeter of equivalent accuracy and precision.

(2) In conducting interior sound level measurements with a sound level meter, the microphone shall be oriented vertically and positioned to simulate the location of a seated passenger or train Engineer's ear. Measurements with an audio dosimeter shall be conducted in accordance with manufacturer's procedures as to microphone placement and orientation.

(3) Vibration tests shall be made with all car subsystems operating, with the car stationary.

vi). Friction brake performance tests

(1) The friction brake system on one of the pilot cars shall be tested to demonstrate that it meets the requirements. The brake disc, brake pad, brake shoe and wheel temperature shall not exceed the supplier's working range, defined as that within which the material is capable of meeting the specified performance and tolerances. Successful completion of all of the preceding tests and acceptance of the test results by Amtrak will be required for final approval of the friction brake system.

vii). Ride quality tests

(1) To verify conformance to the ride quality requirements, one of the first pilot cars shall be subjected to ride quality road tests. At a minimum, the ride quality tests shall consist of testing of one or more cars on minimally compliant track that conforms with all FRA track standards for the classes of track over which the cares are designed to operate. The car or cars shall also be tested on a major segment of track over which the cars are intended to operate in revenue service, making all local stops while operating at normal scheduled speed, under AW0 and AW1 load conditions. The Contractor shall prepare a ride quality testing plan for submittal to Amtrak for review and approval, specifying the start and end points, speeds, test methodology, measurement parameters and criteria, and method of instrumentation for the ride quality tests. Results from previous ride quality tests that closely simulate Amtrak’s revenue service environment may, at the sole discretion of Amtrak, be accepted in lieu of additional ride quality testing. The results of these tests shall be compared to the results from the modeling performed as specified in Chapter 7.

(2) Instrumentation capable of measuring and charting (for permanent record) the magnitude and frequency of the vertical and lateral shocks expected, up to 5g and 0.5 to 80 Hertz, shall be provided and operated by the Contractor, who shall reduce the raw data for presentation to Amtrak. Sensing units shall be located on the car floor above the intersection of the car longitudinal center line and each truck transverse center line. Weights used in simulating the AW1 load, as well as their loading and unloading, shall be provided by the Contractor.

(3) In the event that the dynamic behavior of the cars is non-compliant in any respect with the requirements, the Contractor shall submit to Amtrak, within 60 calendar days, a program containing mathematical analysis of the problem and a course of action for its correction. If Amtrak approves the analysis and corrective measures, those corrective measures shall be made effective on the pilot cars within 90 calendar days at the expense of the Contractor, the car shall be retested, and if the measures are successful, they shall be applied to all the cars. If not, the analysis

and correction steps shall be repeated, resubmitted and retested until success is attained.

viii). Wheel Spin/Slide Control System Performance

(1) In order to provide a test of the operation of the wheel slide protection system under actual operating conditions, facilities shall be provided for a test of this system during the friction brake performance brake tests. Instrumentation shall be maintained on this train at all times ready to record the following quantities simultaneously:

(a) Individual axle speeds (all cars in the consist)

(b) B.C.P. (after each wheel slide dump valve and car command level)

(c) Time intervals

(d) Tractive effort / braking effort command level

(e) longitudinal acceleration of train

(2) Recording shall be by means of multiple-channel recording digital chart recorders. Personnel assigned to observe the test shall be prepared to run this instrumentation at any time that adverse adhesion conditions may occur. This test shall be continued until recordings have been obtained showing three stops and starts during which slides and slips were successfully corrected. In the event that sufficiently adverse rail conditions to obtain such recordings do not occur during the test, the Contractor shall induce slips and slides with artificial rail wetting equipment (soap or other material to induce slippery conditions that represent leaves on the rails with a 6% - 8% adhesion level) to demonstrate the performance of this system. The slip/slide test can be run in conjunction with the track test.

(3) The test consist size shall be determined based on consist configurations selected by Amtrak and shall include the following sections:

(a) Braking Performance (Friction only and blended for propulsion equipped cars)

(i) baseline (dry): full service braking at 15, 30, 60, 75 110, and 125 mph

(ii) reduced adhesion: full service braking at 15, 30, 60, 75 110, and 125 mph using the lubricant

(iii) very low adhesion: same speeds, with dry rail for 650 feet, 65 feet heavily lubricated rail, followed by dry rail

(b) Propulsion Performance

(i) Baseline (dry): Full Acceleration from zero to 30, 60 mph

(ii) Reduced Adhesion: Full Acceleration from zero to 30, 60 mph

(iii) Very Low Adhesion: from zero - 65 feet heavily lubricated rail, followed by dry rail for 650 feet followed by heavy lubricated rail for 65 feet followed by dry rail. Acceleration till the train reaches steady state acceleration

(4) For all adhesion levels above 5% the system shall regulate brake cylinder pressure, dynamic braking and tractive effort to achieve a minimum slide control efficiency of 80% under continuous full service braking and continuous tractive effort. "Worst-case" conditions shall be simulated by use of a compressed air powered spray device, with a solution of dish-washing soap and water or water-soluble cutting oil and water, as agreed between the Contractor and the Railroad, sprayed in front of the wheels on the leading axle to lower wheel-to-rail adhesion. Slide protection shall be verified by full service brake applications from initial speeds of 15, 30, 40, 60, and 70 mph. Test shall be performed both with and without dynamic braking. A similar set of tests shall be performed under full acceleration.

ix). Water Tightness Tests

(1) Each pilot car shall be tested for watertightness in both the completed shell and assembled car stages prior to pre-shipment.

(2) The entire carbody and all weather sealing around the doors, gangways, windows, any exterior screens, and all other penetrations through the carshell shall be tested during water tightness test similar to AMAA 501.1. A fan or turbine shall be set up that will provide 125 mph air speed longitudinally along the car body. 8” per hour of simulated rain water shall be applied to the area and the fan shall run for no less than 15 min showing no signs of leakage. This shall be repeated again but this time the fan shall be set up so that it will provide 50 mph of air speed at a perpendicular direction with respect to the car body with simulated 8” of rain per hour. This test is to be completed for all side doors, trap doors, folding steps, and windows and shall closely mimic the test conditions spelled out in AMAA 501.1.

(a) During the shell watertightness test, all areas of the sides, ends and roof of each car shall be given a complete test for watertightness. The tests shall be made before installation of sound deadening material, thermal insulation and interior finish.

(3) Each completed car shall be sprayed with water, simulating the conditions at the rated speed of the car, to verify there are no

leaks. Of special interest are the door, window openings, and any roof penetrations, such as those for antennae.

(a) All weather sealing around the doors, gangways, windows, any exterior screens, and all penetrations through the carshell shall be tested during water tightness test similar to AMAA 501.1. A fan or turbine shall be set up that will provide 125 mph air speed longitudinally along the car body. 8” per hour of simulated rain water shall be applied to the area and the fan shall run for no less than 15 min showing no signs of leakage. This shall be repeated again but this time the fan shall be set up so that it will provide 50 mph of air speed at a perpendicular direction with respect to the car body with simulated 8” of rain per hour. This test is to be completed for all side doors, trap doors, folding steps, and windows and shall closely mimic the test conditions spelled out in AMAA 501.1. Door weather sealing shall meet the latest version of EN 14752.

20.8 Production Tests

a). General

i). As a minimum, the tests listed in this Chapter shall be performed on each car (including all pilot cars) prior to the issuance of a release for shipment document by Amtrak. The Contractor's production conformance test shall include all tests and adjustments which can be made prior to delivery in order to keep car acceptance testing and adjustments at Amtrak to a minimum.

ii). Prior to performing each production test for witness by Amtrak, the Contractor shall successfully perform the test internally. Amtrak may request the results of the internal test prior to attending the witness test.

iii). After completion of each car, the Contractor shall demonstrate that each car subsystem is operational.

iv). The following static tests where power is required on the car shall be conducted by applying a supply voltage to the trainline cables to the car and functionally testing all car systems.

v). The test procedure shall include and use a check-off list that shall become a record that all systems have been actuated and have functioned as required. This is particularly required for all protective and safety related devices. All equipment final adjustments shall be made prior to car shipment. After completion of each car, the Contractor shall demonstrate that all discrepancies logged against the car during its construction and test period, by either the Contractor’s own inspection forces or Amtrak inspectors, have been suitably resolved to Amtrak’s satisfaction.

vi). After the installation, connection and cleaning of all piping as specified, the piping shall be pressure tested in accordance with the latest edition of the Code for Pressure Piping, ANSI B31.1. All leaks which appear during

pressure testing shall be repaired, after which the system shall be retested until leak-free.

vii). All air, water, waste system and HVAC pipe work, hoses and fittings shall be properly cleaned, purged checked for leaks with all systems in operation and any faults rectified.

viii). All equipment on each car (including all pilot cars) shall be given tests for proper operation and conformance, at the manufacturer's facility prior to shipment to the Contractor. All equipment shall also be given a functional test (pre-delivery) on the completed car to test for proper operation, by the Contractor prior to issuance of a release for shipment document by Amtrak. The test to be performed by each manufacturer and the Contractor on each car component or subsystem shall be in accordance with the applicable industry standards listed in this Technical Specification and the approved test plan. The following tests in this Chapter list some but not all of these tests to be performed; all Technical Specification requirements must be achieved in any case. The test reports of all tests shall become the property of Amtrak and be included in each vehicle history book as specified. This is in addition to, and is not to replace, the Contractor's and suppliers' QA plans.

ix). The Contractor shall conduct an acceptance test for each car of the cars provided. The test shall verify that each device in the assembly is adjusted correctly and operates properly, both mechanically and electrically. All wiring shall be verified and, as appropriate, tested for insulation resistance and dielectric strength. All cars shall be weighed to verify overall weight and distribution. Leak tests and pressure tests shall be conducted. All modes of operation shall be verified, with every switch and control, staging and input and output exercised, and motor currents measured. At a minimum, acceptance tests shall be conducted on the following systems:

(1) Powered body end, Side doors, Trap doors, and Folding Steps operators and controls

(2) Temperature controls

(3) HVAC system,controls, and remote diagnostics

(4) Air circulation fans & controls

(5) Lighting components

(6) Independent Power Sources (for emergency lights)

(7) Public Address/Intercom System (PA/IC)

(8) Onboard Train Information System (OTIS)

(9) Passenger Emergency Intercom (PEI)

(10) Reservation Display System (if equipped)

(11) Video Surveillance System (if equipped)

(12) Door Lock System

(13) Car and Train Networks

(14) Electronic Display Signs

(15) Electrical panels and electronic equipment

(16) Battery and Battery Charger

(17) Brake Equipment

(18) Wheelslide control system

(19) Food Service Appliances

(20) Water Heaters

(21) Waste System

(22) Fire and Smoke Detection System

(23) On-Board Mobility Lifts

(24) Sleeping Module Amenities

b). Carbody

i). Watertightness tests

(1) General

(a) Each car shall be tested for watertightness in both the completed shell and assembled car stages prior to pre-shipment.

(b) The entire carbody and all weather sealing around the doors, windows, any exterior screens, and all other penetrations through the carshell shall be tested during water tightness test similar to AMAA 501.1. A fan or turbine shall be set up that will provide 50 mph air speed at a perpendicular direction along the car body. 8” per hour of simulated rain water shall be applied to the area and the fan shall run for no less than 15 min showing no signs of leakage. This test is to be completed for all side doors, trap doors, folding steps, and windows and shall closely mimic the test conditions spelled out in AMAA 501.1.

(c) During the shell watertightness test, all areas of the sides, ends and roof of each car shall be given a complete test for watertightness. The tests shall be made before installation of sound deadening material, thermal insulation and interior finish.

(d) The entire carbody shall be watertightness tested in two stages during production:

(i) Stage 1: Bare carshell with windows and doors installed

(ii) Stage 2: Complete assembled car: all doors with gaskets including but not limited to side loading doors, junction boxes, access panels and maintenance doors shall be verified to be free from water ingress as part of stage 2.

(2) Water spray – bare car shell (watertightness test)

(a) Each car shell shall be sprayed with water, simulating the conditions at the rated speed of the car, to verify there are no leaks in the joints. All surfaces shall be sprayed. This shall be done before the application of any sound deadening material or thermal insulation. Openings, such as doors, windows, etc., shall be closed off by suitable means, such as blanking plates, during testing. All spray applications shall run ten minutes before and continuously during the inspection. Test arrangement is subject to Amtrak approval.

(3) Water spray – completed car

(a) Each completed car shall be sprayed with water, simulating the conditions at the rated speed of the car, to verify there are no leaks. Of special interest are the door, gangway, and window openings and any roof penetrations, such as those for antennae.

(b) All weather sealing around the doors, gangways, windows, any exterior screens, and all penetrations through the carshell shall be tested during water tightness test similar to AMAA 501.1. A fan or turbine shall be set up that will provide 50 mph air speed at a perpendicular direction with respect to the carbody along the car body. 8” per hour of simulated rain water shall be applied to the area and the fan shall run for no less than 15 min showing no signs of leakage. This test is to be completed for all side doors, trap doors, folding steps, and windows and shall closely mimic the test conditions spelled out in AMAA 501.1. Door weather sealing shall meet the latest version of EN 14752.

ii). Onboard mobility lift test

(1) Verify all functions, interlocks, safety features and timing

(2) Demonstrate lifting range

(3) Demonstrate manual operation of lift and timing

iii). AEI tag test

(1) A tag reader shall be used to verify that each AEI tag on each car operates correctly and contains the correct data.

c). Truck Tests

i). All trucks

(1) Trucks (including the frame, bolster and any primary structural members) shall have their fabrication techniques qualified by means of a complete radiographic inspection of the entire structure. If determined by the Contractor and agreed to by Amtrak that radiographic methods are not practical for some areas, then the inspection in these areas shall be performed using both ultrasonic and magnetic particle inspection or destructive sectioning methods approved by Amtrak. Castings shall be radiographed in accordance with requirements. Radiographs shall be made in accordance with ASTM Standards E94, E446 or E186 as may be applicable. The radiographic inspection quality level shall be selected by the truck manufacturer to be consistent with the truck design but shall not be of lesser quality than that required by Section 6.12.2 of AWS Standard D1.1. If the first truck fails the radiographic/ultrasonic inspection, then the second shall be inspected, and this process shall continue until a truck passes the inspection. The production variables for the succeeding trucks shall duplicate those for the truck which passes the above inspection.

(2) After qualification of the fabrication and casting techniques as per the above method, 4% of each production lot, randomly chosen by Amtrak, shall be inspected using radiographic, ultrasonic, and magnetic particle inspection methods as proposed by the Contractor and approved by Amtrak.

ii). Truck weight

(1) Each completed truck assembly shall be weighed, and the weight of the truck assembly recorded on a truck weight certificate, prior to installation of the trucks under the carbody. The completed truck shall include all truck-mounted equipment, including handbrake linkage if so equipped, but shall not include secondary suspension components or truck-to-carbody air hoses. The serial number of the truck frame shall be included on the truck weight certificate.

iii). Carbody leveling and floor height

(1) Each completed car shall be leveled and measured to verify correct truck setup adjustments, that the car is level, has the correct floor and gangway buffer plate heights and gangway curtain heights. Measurements shall be taken with the car on calibrated track.

iv). Truck attachment, leveling and coupler height tests

(1) All mechanical, electrical, pneumatic and hydraulic connections between the trucks and the carbody shall be checked. The AW0 car floor height/car level and the end car coupler height shall also be verified.

(2) The height of each corner of the carbody shall be measured from the top of rail on a level section of track to check for proper carbody level with all suspension components at proper design height. Side-to-side differences in height shall not exceed 0.25 in. End-to-end differences in height shall not exceed 0.5 in.

d). Couplers

i). Coupler height and operation of each car shall be verified, including clearance and operation of the uncoupling apparatus. All couplers and drawbars shall be gauged according to applicable FRA, APTA, and manufacturer standards.

e). Brakes

i). Single car brake and pneumatic system operation

(1) The brake system and auxiliary air system of each car shall be tested for leaks. The AAR S-471 Brake Pipe Restriction Test shall be conducted on the Brake Pipe. A functional test that exercises each function of all brake system valves, trainline, and components shall be conducted in accordance with the OEM recommendations. Brake applied indicators and the brake applied/released indicators shall be tested. Tests shall include auxiliary air system functions, such as the governor and regulator for water rising (if equipped). In addition, all requirements of APTA Standard PR-M-S-005-98 shall be met.

(2) For any ECP system used, testing shall be performed in both Normal and Emulation modes per APTA PR-M-S-020-17 and PR-M-S-021-17.

(3) The Contractor shall perform on its test track a complete functional test of the friction brake system prior to shipment of each car. This shall include, as a minimum, a single-car air test, in compliance with FRA requirements, as well as, a test of brake cylinder pressure settings, control and indicator checks, leakage tests, cut-out functionality tests, and handbrake test.

ii). Hand brake operation

(1) The hand brake of each car shall be tested to verify that, when applied, the brake shoe is in contact with the wheel and that the hand brake indicator properly displays the hand brake status.

iii). Wheelslide control system operation

(1) The wheelslide control system shall be tested on each car to verify correct speed sensor air gaps, correct end-for-end wiring of sensors and dump valves, and self-test functions of the controller, with the car on air to exercise the brakes. Speed signal interfaces for the door system shall also be tested. Dynamic testing shall also

be performed to ensure the wheelslide control system is operating as intended. The contractor is responsible for providing the dynamic test procedures for review and approval by Amtrak prior to dynamic testing.

f). Door System Tests

i). General

(1) All doors and their operating systems shall be checked and adjusted on all cars to assure smooth functioning, proper fit, attainment of the specified speed of operation and proper functioning of controls, signals and interlocks. This shall also include all body end, side doors, trap doors, and folding steps. All power operated doors shall be operated a minimum of 1000 consecutive, separate successful cycles in each of the applicable control methods. Initiation of the cycling through the trainline external from the car and initiation from a local control stand or push button shall be tested separately. Proper adjustments for opening and closing shall be checked on every door before and after the above test. Improper adjustment at the end of a test shall require the test to be repeated. Any door or door control failure occurring prior to completion of the test will nullify the test, requiring that it be repeated from the beginning following correction and documentation of the failure. Tests shall include, but not be limited to verification of:

(a) All doors:

(i) door hangs vertically; verify correct relationship between carbody plane and door plane

(ii) seal is attached properly

(iii) proper open travel

(iv) proper fully closed position

(v) seal is aligned properly with door and seals the door all the way around the periphery, with no gaps

(vi) the door moves freely on the door track or hinges

(vii) the door hinges do not have excessive sloppiness at any hinge

(viii) door does not drag on floor or other surface

(ix) proper engagement of hold-open device

(x) door latch engages smoothly at each site and with correct depth of engagement

(xi) lock operates smoothly and without undue effort

(b) Additionally for all passenger and crew doors:

(i) proper location of threshold on the trap/ floor

(ii) proper attachment of threshold to the trap/ floor

(iii) proper engagement of bottom of door with the threshold (vertically and laterally)

(iv) that the mechanical lock is adjusted properly so it can lock the door leaf closed

(v) that the secondary door latch or dog operates properly

(vi) dogs shall remain distinctly open when in that position (not close on their own, even resulting from train motion.

(vii) that the drain for the door threshold is clear

(viii) doors equipped with a door closer close reliably by themselves and engage the latch each time the door closes.

ii). Door safety systems

(1) All doors shall be individually tested to confirm correct operation, including all indicators, audible signals and interlocks, from the cab of a locomotive, from the individual local door pushbuttons, and when obstructions are placed in the door. Tests shall also be performed to confirm correct operation of all interior and exterior manual door opening/passenger emergency facilities, interlock bypass switches and crew door switches.

g). Interior

i). Interior doors and hardware

(1) All interior doors and hatches shall be functionally checked on each car to verify: smooth movement, latching, locking, unlocking from external side of door, correct latch engagement/release, proper operation of detente, non-interference, freedom from sticking or excessive looseness (rattles) and proper switch activation. Force to overcome the detente used on sliding toilet room doors shall be measured.

(2) Proper self-engagement of the ceiling hatch safety catches shall be checked.

(a) Safety catches shall be self-engaging when opening and closing panels.

ii). Seats

(1) Operation of each movable function of each seat and table on each car shall be tested to verify:

(2) Recline, footrest, tray table, workstations, and any deployable ADA tables shall be level when in the fully extended position and shall deploy and retract smoothly without binding.

h). HVAC

i). Air Distribution

(1) Each car shall be measured, and the results recorded to verify correct air distribution, including:

(a) fresh air flow rate

(b) return air flow rate

(c) exhaust air flow rate

(d) car pressurization

(e) uniformity of supply air flow

ii). Temperature Control

(1) Proper thermostatic operation of the air conditioning and heating equipment shall be verified on each car for compliance with the specified values. This shall include, but not be limited to:

(a) integration with HVAC unit- every input/ output verified

(b) demonstration in all possible modes of operation (day/ night, layover, as well as partial and full cool, partial & full heat, etc.)

(c) ramp up and ramp down of all temperature inputs: fresh air, return air and car air

(d) demonstration of all logic functions, input and output, including:

(e) control and power circuits

(f) operation of all safety circuits

(g) fault conditions – representative examples

(h) indicators/ display(s) – representative examples

(i) fault displays - representative examples

(j) Portable Test Unit (PTU), including all modes of operation

(2) The test shall include operation of the controls using car temperature sensors/ thermostats as follows:

(a) use override to warm car to 80° F minimum (est. value). Then, under thermostatic control, verify car cools to setpoint.

(b) use cool override to chill car to 60° F maximum (est. value). Then, under thermostatic control, verify the car heats to setpoint.

(c) verify car temperature gradient meets specified requirements

(d) Verify proper operation of sleeper room controls for validation of temperature ranges

iii). Heater circuit tests

(1) Each heater circuit shall be high potential tested in accordance with IEEE Standard number 16.

iv). Heating tests

(1) General

(a) The heating system, including doorway and protective heaters, shall be functionally tested in all cars. The operation of the thermostatic control system and layover heating shall be demonstrated by test. Controls shall be checked and adjusted for even distribution and proper volume of heat.

(2) Duct heater operation

(a) Duct heat of each car shall be verified for function, uniform temperature distribution and correct current draw.

(3) Duct heater shunt trip operation

(a) Proper operation of each safety interlock of the duct heat control system shall be verified on each car. In addition, operation of the shunt trip feature of the circuit breaker shall be exercised by applying heat directly to the high limit thermostat of each heater assembly.

(4) Floor heat operation

(a) Floor heat of each car shall be verified for function, uniform temperature distribution and correct current draw.

v). Air conditioning unit tests

(1) Each refrigerant compressor shall be given an air pressure test. Each evaporator and condenser coil shall be proof pressure tested and each complete unit shall be vacuum tested, leak checked with an electronic sniffer, and pressure tested to the requirements. All

pressure vessels shall have ASME certificates. Compliance to the random starting timing requirements in Chapter 10 shall be verified. Unit shall be tested for proper sealing against weather. Unit shall pass subcontractor qualification test for shock and vibration.

(2) All cars shall have proper air balancing performed, and smoke testing shall be used to verify ducting is free from leaks. Amtrak may re-evaluate this requirement once repeatability is demonstrated.

vi). Air conditioning system tests

(1) General

(a) The air conditioning system shall be functionally tested in all cars. The thermostatic control system operation shall be demonstrated by test. All controls and dampers shall be checked and adjusted for even distribution and proper circulation of air. Refrigerant charge and compressor oil levels shall be verified. The initial fine mesh liquid line strainer shall be replaced with the proper mesh at the conclusion of testing.

(2) Air conditioning system operation

(a) The air conditioning equipment on each car shall undergo an evacuation and leak test. For package units, this may be done at the supplier plant; however, a "sniff" type leak test shall be done on the car to verify no leaks have occurred as a result of shipping damage. The equipment on each car shall be checked to verify proper control response and function for all operational modes (partial cool, full cool, partial heat, full heat, etc.). In addition, motor currents shall be recorded for:

(i) Blower fan

(ii) Condenser fan(s)

(iii) Compressor

(iv) Exhaust fan(s)

vii). Freeze Protection

(1) Proper operation of all freeze protection equipment shall be verified on each car, verifying that each heater heats and that the current draw is proper. Heaters employing a local thermostat shall have cycling by the thermostat verified.

viii). HVAC Diagnostics Remote Access

(1) The HVAC diagnostics remote access functionality shall be validated.

i). Lighting

i). Lighting operation

(1) Proper function of all interior and exterior lighting fixtures and all their controls shall be verified on each car. This shall include operation in each lighting mode: normal, quiet car, standby, load shed and emergency modes as well as night. Adjustment of all limit switches controlling lighting shall be included. Test shall include verification operation of Independent Power Source functions.

ii). Marker lights

(1) Proper operation of marker lights shall be verified.

j). Communication/OTIS

i). General

(1) The performance, installation, and integration of all components which combine to meet the requirements of Chapter 14 shall be tested to verify proper installation and operation.

ii). PA/IC system performance

(1) The performance of the public address and passenger intercom system shall be tested to verify that all aspects of the system perform as intended:

(a) Control terminal function and indication

(b) PA announcements to each identified zone, including verification of the functionality and control of each speaker (interior and exterior)

(c) PA announcements received from other cars in the train including legacy equipment.

(d) Intercom function between IC stations within the car and between the car and other cars in the train

(e) Communication along analog COMM/MU lines (where equipped) and communication on the Ethernet Train Backbone

(f) Passenger Emergency Intercom functionality

(g) Speaker volume, including interior and exterior speakers, and in both Normal and quiet modes

(h) Attendant Call control and indication

(i) Inductive Audio Loop

(j) Bluetooth LE Broadcast

iii). OTIS system performance

(1) The performance of the automatic announcements, sign, and train map portions of the system shall be verified for specification compliance on each car type. All modes of operation shall be demonstrated, as well as interaction with the PA/IC system, Attendant Call, and diagnostic systems.

(2) Performance and indication of each interior and exterior Display Sign, including that each display sign can appropriately indicate messages specific to each individual sign location.

(3) Simulated power drops and restarts shall be tested to ensure the system returns to proper operation without abnormal behavior.

(4) System shall be loaded with the Amtrak route and display profiles and demonstrated to properly function per the manufacturer's recommended test plan.

iv). Passenger Compartment Control Unit

(1) Each Passenger Compartment Control Unit shall be tested to verify proper operation.

v). Reservation Display System (if equipped)

(1) Proper control and indication of each reservation display system screen, and proper communication between the reservation display system controllers and the diagnostic system.

vi). Door Lock System

(1) Operation and control of all door locks, including keyed overrides, performance on battery backup, and each method of wireless communication.

vii). Data Communication System and Global Positioning System

(1) The Data Communication System functionality including on-board cellular and Wi-Fi connections, shall be shown to demonstrate communication between the car and representative wayside equipment, to properly connect to representative user devices, and to properly function through intermittent connectivity or power.

(2) The Global Positioning System (GPS) capabilities of the communications system shall be verified.

viii). Video Surveillance System (if equipped)

(1) The proper aiming and operation of each video surveillance camera shall be verified. The aiming of each surveillance camera

shall be compared against the approved coverage design, and a screenshot shall be included in the vehicle history book.

(2) The NVR shall be tested for proper operation, including proper recording of all cameras and interface with onboard signals and networks for the purpose of metadata recording.

k). Electrical

i). Electrical apparatus tests

(1) Each component that is separately assembled, housed and wired into a package unit prior to installation shall be tested at its point of manufacture and a certified test report, signed by the responsible Quality Assurance representative of the manufacturer, shall be furnished to the Contractor with a copy to Amtrak. Tests shall be in accordance with IEEE Standard number 16 for control apparatus as appropriate.

ii). Battery tests

(1) Battery and battery charger operation

(a) The overall DC power system of each car shall be tested to verify correct operation. This shall include battery charger self test, verifying correct charge voltage and current of the charger, operation of the temperature sensor, load shed and all external indicators. The test shall include operation in which the battery supports the car loads for a minimum time, (i.e. 30 minutes)

(2) Battery capacity

(a) Verify battery meets 5 hour name-plate rating.

(3) Battery/battery charger performance

(a) The performance of the battery charger connected to the battery and a simulated car load, shall be tested to verify correct operation. The test shall also verify proper operation of the equipment during:

(i) Sustained low input voltage (component supplier Production test)

(ii) Overload or shorted battery charger output (component supplier Production test)

(iii) Battery ground fault (vehicle level Production test)

(iv) Temperature sensor fault (vehicle level Production test)

(v) System overload (component supplier Production test)

(vi) Ability to support large step loads on car, such as door operators cycling (vehicle level Production test)

(b) Each battery shall be given a capacity test at the point of manufacture in accordance with APTA Standard PR-E-RP-007-98 (component supplier Production test).

iii). Car wiring tests

(1) Continuity

(a) On each car, all wiring shall undergo a continuity test in which wire labeling, continuity of conductor and proper connection point are verified.

(2) Power distribution

(a) Power distribution of each car shall be tested including phase rotation, correct voltage of each transformer-derived voltage, polarity of DC at the load and correct feed by the respective bus.

(3) Electrical insulation testing

(a) Electrical insulation tests shall be conducted on all applicable electrical components to verify the state of the insulation to the case, between wiring of different voltage classes, and between the input and output circuit of high voltage line switches and circuit breakers. Semiconductor devices may be protected against the test voltage by means of shorting jumpers if they are not inherently protected by the circuit in which they are used.

(4) Network testing

(a) Every Ethernet cable installed on each car shall be certified to ISO/IEC 11801-1 – Class F after installation, demonstrating channel suitability for IEEE 802.3an-2006 10GBASE-T. The results shall be recorded and submitted as a part of the vehicle history book.

iv). Insulation testing

(1) All wiring on each car shall undergo a Megger and high potential test, in accordance with APTA Standard PR-E-S-001-98.

(2) Insulation resistance tests shall be conducted before high potential tests are conducted.

(3) On items with double insulation, such as grid resistors mounted on an insulated frame, each set of insulation shall be individually tested (i.e., resistors to frame and frame to carbody).

v). Trainline tests

(1) General

(a) The Contractor shall verify the accuracy of the trainline connections by use of a test panel which is connected to the trainline connectors at each end of the car. The test panel shall use the illumination of lights or other appropriate means to confirm that only the proper trainline wires are energized when the various car controls (public address system, doors, etc.) are operated, and that there are no shorted, crossed, incorrect or open circuits. This test shall exercise the controls on all door control panels, PA controls, etc. All spare trainline circuits shall also be tested.

(2) 480V HEP trainline

(a) The 480V trainline wiring shall be tested at each end of the car to verify continuity of each power and control conductor and grounding of control contacts.

(3) 27-Point communication trainline

(a) Through the use of a test fixture, the 27-point communication trainline shall be tested at each end of the car to verify continuity of each conductor, freedom from unintended cross-connections and shorts. Proper operation of any device which interrupts a circuit, such as pressure switches or relays, shall be demonstrated. Operation of end-of-train relays shall be verified. Transmit/receive functions of equipment that is controlled by the trainline, such as side doors, shall be demonstrated by the respective system test.

(4) 27-Point MU trainline

(a) Through the use of a test fixture, the 27-point MU trainline shall be tested at each end of the car to verify continuity of each conductor and check for unintended cross-connections and shorts. Transmit/receive functions of equipment which is controlled by the trainline shall be demonstrated by the cab system test.

(5) Digital Trainline / Ethernet Train Backbone (if equipped)

(a) Through the use of a test fixture, the digital trainline and all switches shall be tested at each end of the car to verify continuity of each cabling run and check for unintended cross-connections and shorts. Transmit/receive functions of equipment which is controlled by the trainline shall be demonstrated.

vi). Convenience outlets

(1) All 120VAC receptacles shall be tested for proper polarity, grounding and the trip action of any associated GFCI devices on

each car. All USB ports shall be tested for proper operation. Operation of DC receptacles shall likewise be verified.

vii). Auxiliary circuits and equipment tests

(1) All auxiliary circuits and equipment shall be tested for proper operation and adjusted or corrected as required.

l). Food Service

i). Doors and hardware

(1) All food service doors, hatches and quarter-turn latches shall be functionally checked on each car to verify: smooth movement, latching, locking, correct latch engagement/release, non-interference, freedom from sticking or excessive looseness (rattles) and proper switch activation. Secure gates and latching mechanism shall be tested for correct operation.

ii). Food service appliance operation

(1) Each appliance shall receive a functional test to verify operation. Coffee makers shall operate through a complete brew cycle.

iii). Other Devices

(1) The unit shall be tested to verify proper operation of all controls, limit switches, timing and safety functions.

iv). Refrigeration/chiller

(1) Refrigeration equipment shall undergo testing to verify:

(a) Freedom from refrigerant leaks (evacuation and "sniff test" if split system)

(b) Operation/calibration of each control device: pressure switches, thermostat, etc. - operation of each device in the defrost function: thermostats, heaters, timer, etc. - correct superheat setting

(c) No-load pull down time for each refrigerated space

(d) Correct thermostat settings for each refrigerated space

(e) Correct tracking of chiller thermometer with chilled space

(f) Correct operation of environmental controls for the condenser (if split system): damper, room exhaust fan, etc.

v). Point of Sale System

(1) Correct operation of all functions

m). Water and Waste

i). Water and waste piping

(1) All car water and waste piping shall be pressure tested for leaks on all cars. Testing may be done in sections if desired. Movement of all valves and freedom from interference shall be checked. All faucets, showers, and drinking water spigots shall be tested for correct temperature adjustment range, water flow rate and freedom from splashing. All sinks, showers, and drinking water alcove shall be tested for proper operation.

ii). Water fill and capacity

(1) Starting with the water tank empty, the water tank shall be filled while measuring the fill time and water pressure of the fill line statically. After the tank has been filled, it shall be drained while measuring the time, using the tank manual drain valve and the volume of water leaving the tank measure to verify the effective water tank capacity, The use of Amtrak SMP #47601 “Water Tank Flush” shall be demonstrated.

iii). Water raising and distribution operation

(1) The water raising system of each car shall be tested, including the correct operation pressure of each regulator in the distribution system.

(2) Freedom from backflow shall be demonstrated to verify that when the water tanks are filled and then air slowly bled off from the main reservoir, no water back-flows from the water tanks into the water-raising system.

(3) (If equipped) Demonstration of the Ozone water treatment system by use of analysis of water samples before and after treatment via the appropriate NSF/ANSI water treatment method.

iv). Water fill stations

(1) Correct operation shall be verified, including chilled water temperature and timing, and operation of the controls.

v). Water heater operation

(1) Correct operation of each water heater shall be verified, including thermostat and hot water delivery temperature. If a mixing valve is used, correct adjustment shall be verified with input supply water at two different temperatures. Polyphase water heaters shall have the correct current value of each phase verified.

vi). Toilet operation

(1) Correct operation shall be verified on each toilet of each car though 1000 cycles in a qualification test. This shall include verification that each control device is calibrated and operates correctly: pressure switches, level controls, switches, water and air pressure regulators, solenoid valves and indicators. Timing of each step of the flush sequence shall be checked. Operation of the collection tank controls, including drain and rinse cycles shall be tested. Freedom from vacuum leaks shall be verified to OEM recommendations.

vii). Waste System

(1) Waste system performance shall be verified by the following:

(a) Performance: flush times, vacuum attained and maintained, etc.

(b) Controls

(c) Safety controls

(d) effective capacity of the waste tank

n). Diagnostics and Test Equipment (where equipped)

i). The Contractor shall demonstrate fully functionality of the diagnostic and test equipment. The Central Diagnostic Unit shall display, record, and upload any failure within the car.

ii). The Contractor shall develop acceptance and qualification tests for all systems identified as diagnostics and test equipment, including but not limited to the central diagnostics unit, the portable test units, the car temperature monitoring, and any bench testers. The tests shall verify all features and components are in compliance with the requirements of this Technical Specification.

(1) Verification that all faults that are configured for all sub-systems to be displayed on the CDU are displayed properly.

(2) Verification that all faults that are configured to be reported to the CDU are so reported.

(3) Verification that fault logs of all systems are accessible from the maintenance screen of the CDU in car.

(4) Verification that the software version numbers on all non-communications subsystems in the car can be accessed from the CDU.

(5) Verification that all software changes made as a result of the CDU Factory Qualification Test have been implemented on all systems connected to the CDU.

(6) Any faults from each and every system shall be simulated and demonstrated to display properly.

(7) Simulate fault data upload and alarming.

(8) Access to system level fault information and current status parameters through the CDU terminal, the PTUs, and the online portal.

(9) Proper operation of the data recording functionality.

(10) Verification that all PTUs and bench test equipment properly connect, function, and diagnose system-level equipment. Fire and Smoke Detection

(11) Tested per manufacturers specifications

o). Completed Car

i). Weighing

(1) The Contractor shall weigh each car at the time of shipment. All cars shall be measured empty and dry, with no fresh water, waste or consumables, and with no leftover tools or materials from the production process. All parts shall be properly installed on each car prior to weighing. Each car shall be weighed by measuring the weight on each of the car's wheels. A weighing device which provides a permanent printed record of the weight shall be used, and the weight tickets shall be submitted to Amtrak and copies thereof included in the vehicle history book.

(2) The weighing device shall be maintained within an accuracy of 0.2%. If the weighing device is electronic, it shall be calibrated at intervals of no more than 60 days. If mechanical, it shall be calibrated immediately prior to weighing the first car and annually thereafter.

(3) Any total car weight deviation in excess of the maximum allowable weight specified in Chapter 1, or any car with a weight distribution not in compliance with the provisions of Chapter 1 must be documented on a nonconformance report and explained to the satisfaction of Amtrak prior to shipment. Amtrak may require that the Contractor reduce the weight of any cars exceeding the overall weight or weight distribution limits.

ii). Clearance tests

(1) Each car shall be measured to prove compliance with the Contractor's approved clearance diagram for the as-built car configuration, to verify that the car clearances while in operation will meet the requirements. In addition, the centering of the carbody with respect to the trucks shall be measured and

corrected if necessary. The completely assembled truck shall not exceed the clearance limits specified between the truck and the carbody, and the limits between the truck and the rail.

20.9 Acceptance Tests

a). Car Acceptance Tests

i). The tests specified in this Chapter are to be performed by the Contractor on Amtrak railroad, or as otherwise designated by Amtrak. The tests shall be satisfactorily completed as a condition of acceptance. All tests shall be performed on all cars (including the pilot cars) unless otherwise specified by Amtrak.

ii). After receipt of each car at Amtrak site and before it is operated, it shall be carefully inspected jointly by Amtrak and the Contractor, and any part, device or apparatus which requires adjustments, repair or replacement shall be noted by the Contractor who shall make such adjustment, repair or replacement before acceptance testing is begun. All expenses and costs incurred in any necessary removal of cars from the designated delivery point and their return there for correction of defects shall be borne by the Contractor.

b). Functional Tests

i). A complete, orderly and comprehensive check of each and every vehicle system shall be made to verify its proper operation before commencement of revenue operation. A set of diagnostic test equipment owned by the Contractor of the same design provided to Amtrak shall be used for these tests to the extent possible, but devices bypassed by the use of the DTE's (door open and door close buttons for example) shall also be checked. All aspects of wayside communications shall be tested for proper operation. All software files required for the destination sign system, automatic vehicle location system, GPS and other communications systems shall be loaded and verified for proper operation.

c). Road Brake Test/Stop Distance and Coast-Down

i). The test shall be conducted on a consist to be determined by Amtrak based on configurations selected, ready to run, both with no passenger load, to simulate actual operational performance. Other configurations may be proposed. Selected car brakes shall be disabled so as to provide a total of 80% braking capacity on the passenger cars. The test shall be conducted on flat, tangent track, with the brake application made at the same site for each test run. If necessary, to conduct the test on a slight grade, the entire braking distance shall occur at constant grade; calculations shall be made to correct the stop distance for the effect of the grade. The test shall be conducted in both directions: locomotive leading and trailing. Train brake pads/ shoes shall be worn in before conducting the test.

ii). The full set of tests shall be conducted in the following conditions:

(1) Full Service, Blended Braking

(2) Full Service, Friction Braking Only

(3) Emergency, Friction only

(4) Speeds of 125, 110, 90, 75, 60, 45, 30 and 20 mph

iii). Two stops shall be made from each speed, with sequence controlled to minimize wheel heating. Wheel and disk temperatures shall be measured to verify adequate brake system thermal capacity and to ensure the stop distance is not influenced by beginning the test with hot brake components. Thermal imaging equipment shall not be used for this.

iv). If time and track availability permit, a coast-down test shall also be conducted to determine non-braking frictional losses of the train. The test shall be conducted from the rated speed of the train, with the train allowed to coast down to a near stop.

v). Instrumentation shall include:

(1) Means to determine distance

(2) Train Speed

(3) Brake cylinder pressure of each truck on the locomotive/Multiple Unit

(4) Blended brake current on locomotive/Multiple Unit

(5) Brake cylinder pressure of each truck

(6) Longitudinal acceleration of train

(7) Switch to detect movement out of release position of automatic brake valve from the locomotive

(8) Brake pipe pressure on both ends of the train

vi). At the completion of this test, the brakes shall be reactivated, except those on the instrumented wheelsets.

20.10 Post-Delivery Testing of Pilot Cars with Other Equipment

a). After the Pilot cars have been delivered to Amtrak's facility and have undergone and passed all applicable acceptance inspections and tests, it shall be combined with other rail equipment as designated by Amtrak to verify operational, compatibility and coupler tests with other car and locomotive types that may constitute part of Amtrak's existing rail service. The specific types of rail equipment with which the Pilot Cars shall be tested for compatibility includes:

i). P32, P40, P42, ACS-64, SC-44, ALC-42 and ALC-42E Charger locomotives, as owned by Amtrak.

b). All trainline functions shall be tested and verified, including:

i). End of train identification

ii). Locomotive control

iii). HEP, power distribution, and power balancing

iv). Air brake application and release in ECP and Emulation

v). EMI/EMC requirements

c). The pilot test train shall be tested to confirm compliance with track geometry requirements, including curve and crossover negotiation. All car-to-car connections shall be verified as performing in compliance with the track geometry requirements, including:

i). Carbody clearance

ii). Truck swing

iii). Coupler swing

iv). MU, COMM, DTL/ETB, ECP, and HEP cables

v). Brake pipe and main reservoir air hoses

vi). Gangways, Diaphragms, buffer plates and curtains

vii). ECP brake inter-car cables

d). All equipment shall be tested to be fully functional on Amtrak-supplied wayside HEP power.

20.11 Reliability and Post-Delivery Tests

a). The complete operational car fleet shall be monitored by the Contractor to demonstrate conformance with the reliability requirements.

b). On a monthly basis, the Contractor shall issue a report detailing the performance of the car fleet and its equipment with regard to maintenance actions (which shall be detailed in an appendix by type) and the calculated period and cumulative Mean Distance Between Failures (MDBFs) and Mean Time Between Failures (MTBFs) as appropriate. Any component(s) or system(s) found to be causing and/or related subsystem and/or whole car MDBF/MTBF to fall below the required performance level shall be subject to redesign and modification. During the period such efforts are carried out, failures due to these component failures shall not be counted. However, upon completion, the modified car and/or subsystem shall be monitored for a period of no less than an additional 6 months or the remaining base period, whichever is greater, and the MDBF/MTBF shall be acquired. If the use or failure of the component or system is weather or temperature related, the 6 month period shall include those calendar months during which such use or failure is incurred. It shall be understood that the total test time period shall not be

assumed to be 365 consecutive calendar days in the event that modification is required.

c). Following a satisfactory completion of the test for all subsystems, the Contractor shall issue a final report summarizing the results and with all interim reports appended for completeness. **[CDRL 20-07]**

i). If a satisfactory completion cannot be obtained before the end of the specified warranty period, the Contractor and Amtrak shall resolve any outstanding issues in accordance with the Contract terms and conditions.

20.12 CDRLs

CDRL	Description	Due
CDRL 20-01	Car testing matrix	NTP + 90 days
CDRL 20-02	Master Test Plan	First submittal NTP + 180 days
CDRL 20-03	Test Procedures	Per Figure 20-1
CDRL 20-04	Test Results (Reports)	Within 5 days of test completion
CDRL 20-05	Contractor shall provide a single volume incorporating all required engineering tests associated with the pilot program, all copies of all test procedures, reports and approvals.	30 days after successful completion of testing
CDRL 20-06	All material certification and proof-of-design test procedures and reports in a single binder for each car type.	Prior to shipment of each car type
CDRL 20-07	Reliability and Post-Delivery Test Report	30 days after successful completion of testing

* End of Chapter 20 *

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Amtrak Universal Single Level Fleet Replacement

Technical Specification

21. Tools, Consumables and Spare Parts

Revision 2

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Table of Contents

21.1 Overview 21-1
21.2 Specialized Tools 21-1
21.3 Consumables 21-3
21.4 Spare Parts 21-4
21.5 CDRLs....21-5

21.1 Overview

a). This Chapter details the requirements for the Contractor to identify and provide the specialized tools, spare parts and consumables that will be needed to operate, maintain and repair the cars to be delivered to Amtrak.

b). Most of this Chapter shall be covered in the Technical Support, Spares and Supplies Agreement (TSSSA) SOW; however, in the event that the TSSSA is not executed or upon termination of the TSSSA, the following sections shall be the responsibility of the Contractor.

c). The detailed information identified in the following sections will be provided to Amtrak in a timely fashion during design review or prior to the first batch of cars delivered, but the physical delivery of materials where applicable shall only occur in the absence of or at the conclusion of the TSSSA.

d). Amtrak shall retain all specialized tools, consumables, spare parts and any subsystem mock-ups as detailed in this Chapter.

e). All information required in this Chapter shall also be included in the appropriate operating and maintenance documentation as identified in Chapter 23, including:

i). Operating Manual

ii). Running Maintenance Manual

iii). Heavy Maintenance Manual

iv). Illustrated Parts Catalogue

v). Troubleshooting Guide

21.2 Specialized Tools

a). The Contractor shall provide to Amtrak a complete set of all specialized tools, gauges, meters, diagnostic equipment (including laptop computers), etc. for each of the seven (7) Amtrak shops that will be maintaining the single level fleet that will be necessary to operate, maintain, inspect, test, troubleshoot and repair all car type configurations or subsystems throughout their forty (40) year design life.

b). These tools and equipment shall be delivered to Amtrak at all specified maintenance locations and shall be delivered to Amtrak prior to the Conditional Acceptance of the first car of each type, but no sooner than thirty (30) days prior to the submission of the first car for Conditional Acceptance.

c). All specialized tools shall be included in the base warranty as specified.

d). See Chapter 24 for additional details regarding portable test equipment.

e). Any diagnostic equipment will include spare copies of all software and source code licensed to Amtrak.

i). The license shall allow Amtrak to modify and duplicate this code without limit.

f). Throughout the vehicle design process, the Contractor shall work to minimize the number of special tools required for the maintenance of the vehicles.

g). As part of the design review process, the Contractor shall submit a list of specialized tools and drawings if applicable and diagnostic equipment that will be provided to Amtrak.

i). This list shall identify the item description, manufacturer, part number and purpose, and shall include a cross-reference to the maintenance manuals as to the tasks that require the use of the tools.

ii). This list shall include all specialized tools and diagnostic equipment required to operate, maintain and repair the cars throughout their design life, and shall include:

(1) Specialized tools for inspecting, repairing, removing, installing, maintaining or measuring components and systems on the cars;

(2) Diagnostic equipment to troubleshoot problems, determine component or system status or condition, or interpret diagnostic information;

(3) Portable computer equipment required to view, change or monitor the operating parameters, downloadable recorded data, service history or digital programming for computerized or microprocessor-controlled components or systems; and

(4) All cables, connectors, software, power supplies, carrying cases and peripherals as required for use with the portable computers or Portable Test Unit (PTU).

(5) All diagnostic download and programming software shall be provided in the Microsoft Windows professional level operating system format identified by Amtrak with no use restrictions, so that Amtrak can install the software on additional computers as needed.

h). The Contractor shall provide drawings, schematics, specifications, part numbers and prices for all special tools and maintenance equipment to enable Amtrak to purchase additional quantities.

i). Drawings shall be provided for any component or special not produced by a supplier not owned in whole or part by the Contractor.

i). Drawings shall provide sufficient information to facilitate the manufacture of the required components or special tools should the manufacturer cease to support the component or special tool.

j). During the production of the pilot cars, the Contractor shall demonstrate the usage and validate the successful operation of each proposed special tools.

i). During this validation, Amtrak shall identify any of the proposed special tools that are determined to be unsuited or incapable of performing their intended function.

ii). The Contractor shall redesign such tools until they can successfully serve their intended purpose.

k). The Contractor shall supply complete sets of each type of bench type shop test equipment to each of the seven (7) facilities that will be maintaining this Single Level fleet.

l). Training on the use of the Special Tools shall be included in the delivered Training Program (See Chapter 23).

21.3 Consumables

a). The Contractor shall provide a list of all service consumables needed to support the cars throughout its service design life.

i). Consumables are identified as those items replaced as a function of normal operation, whether the replacement is on a periodic basis or as they wear out.

ii). This list shall be provided as a component of the final design review. **[CDRL 21-01]**

b). This list should include items such as but not limited to:

i). Brake pads and shoes

ii). Filters - Heating, Ventilation and Air Conditioning (HVAC), air, water

iii). Lamps/Light Emitting Diodes (LEDs), marker lamps, indicators lamps

iv). Fuses, Diodes and Resistors

v). Air hoses

vi). All rubber / polymer components

vii). Shock absorbers

viii). Air brake and other pneumatic component overhaul kits

ix). Truck and draft gear elastomers

c). This list shall include the following information as it relates to these parts:

i). Contractor part number

ii). Part description

iii). Original Manufacturer name

iv). Original Manufacturer part number

v). Quantity required by car type

vi). Frequency of replacement

21.4 Spare Parts

a). As a part of final design review, the Contractor shall provide to Amtrak a list of strategic spare parts that Amtrak should acquire and maintain to support the fleet of equipment after the end of the warranty period. **[CDRL 21-02]**

b). This list shall include, but is not limited to the following:

i). Parts that are critical to the safe operation of the equipment;

ii). Parts with a moderate to high failure rate, based on the Contractor's reliability analysis (see Chapter 4);

iii). Parts located on the vehicle exterior or undercar and therefore subject to damage from debris strikes or accidents;

iv). Parts installed in a high-wear environment; and

v). Parts that require troubleshooting and repair off of the car, such as electronic components or LRU assemblies.

c). This list shall include the following information as it relates to these parts:

i). Contractor part number

ii). Part description

iii). Original Manufacturer name

iv). Original Manufacturer part number

v). Quantity required by car type

vi). Shelf life/maximum storage period

vii). Recommended quantity to have on hand

d). The Contractor shall be responsible to provide replacement parts for those failing under the terms of the warranty.

i). Amtrak shall not be responsible for supplying replacement parts to the Contractor for the purposes of fulfilling warranty provisions.

ii). Amtrak shall not be responsible for supplying cores or subcomponents to the Contractor for the purposes of fulfilling warranty provisions.

Technical Specification

22. Shipping Preparation

Revision 2

Table of Contents

22.1 Overview 22-1
22.2 Requirements for Shipping Vehicles 22-1

22.1 Overview

a). This Chapter describes the requirements for preparing completed cars for shipment from the Contractor's final assembly facility to the Contractor's field site, where vehicle acceptance will take place by Amtrak.

b). All vehicles must receive approval for shipment from Amtrak before they can be shipped to the field site. The minimum Car shipment quantity is described in Exhibit V and the Car types must be approved by Amtrak for each batch shipment. The batch shipment will provide Amtrak with enough cars of each type to build a revenue Consist. A shipment list for car types will be provided to the Contractor.

c). The Contractor is responsible for all costs and arrangements associated with the shipment of the completed vehicles to the Contractor's field site.

d). The car clearance for all cars shipped shall be verified with all involved railroads for the delivery routing.

22.2 Requirements for Shipping Vehicles

a). The vehicle must be delivered from the factory with all outstanding issues resolved. Amtrak requires that the field delivery location not serve as an extension of the manufacturing process. It is acknowledged that certain tasks may arise and require completion in the field, including those identified during receiving inspection, vehicle commissioning, conditional acceptance inspection, or through FMIs opened after shipment.

b). All completed vehicles shall be prepared for shipping as follows:

i). All hoses and inter-car cables shall be connected between vehicles.

ii). A Single Car Air Test shall be successfully conducted within 30 days of shipment.

iii). Brake control valve selector plate shall be set to graduated release if being moved in passenger service and a transport control valve shall be installed if required for normal Brake Pipe brake control without HEP electrical power being supplied to the cars (see Chapter 9).

iv). Automated Equipment Identification (AEI) tags shall be properly programmed and installed. The Contractor is responsible for ensuring that the car's technical data is entered into the Umler/EMIS (Equipment Maintenance Information System) system prior to the release of the car (see Chapter 6).

v). New air filters shall be installed in Heating, Ventilation and Air Conditioning (HVAC) system (see Chapter 10).

vi). All required inspections must be complete, including inspections and approvals from the FRA, the FDA and Amtrak.

vii). As part of the shipping process, the following documents must be completed and signed, and be installed in the document holders in each car and in the cab of the locomotive as applicable.

(1) Amtrak MAP 100, Equipment Condition Report

(2) Amtrak MAP 1173, Class 1 Brake/Calendar Day Test

(3) Amtrak MAP 10C, Passenger Car Daily Inspection

viii). The Water and Waste systems, and Food Service Area equipment shall be drained, blown out with compressed air and winterized (see Chapter 17). All water fill ports shall be tagged as out of service.

ix). All doors and windows shall be closed but means shall be provided to access the handbrake during shipment.

x). Shipping labels and warning signs shall be applied as needed (such as do not hump, do not couple to shelf couplers, instructions for operation of parking brake, etc.)

xi). Loose jumper cables shall be included for shipment (see Chapter 15).

xii). The Contractor shall perform other shipping-related tasks as required by Amtrak.

xiii). The Contractor shall comply with the requirements of the Association of American Railroads (AAR) Specification M-1006 and Recommended Practices RP-2001 and RP-2002 regarding railroad shipping information and shall be considered the Point of Contact for additional information.

c). The following shall be set up at the discretion of Amtrak in accordance with the requirements for each shipment of cars:

i). If HEP and main reservoir trainlines are being used for shipment, fresh water may be supplied from the potable water tank for use of the toilet system while in transit. If no water is needed, the tank shall be drained and all water supply lines shall be blown dry and tagged.

ii). All circuit breakers shall be on. The main 480VAC Head End Power (HEP) breaker may be on if power will be needed while the car is in transit, or shall be off if no power will be required. Battery power may be needed for wheel slide protection during shipment.

* End of Chapter 22 *

Amtrak Universal Single Level Fleet Replacement

Technical Specification

23. Training and Documentation

Revision 2

Table of Contents

23.1 Overview 23-1
23.2 General Requirements 23-1
23.3 Mock-Up Training Cars....23-4
23.4 As-Built Drawings 23-4
23.5 Photographs....23-7
23.6 Conformed Specification 23-8
23.7 Manuals....23-8
23.8 Car History Books 23-25
23.9 Training 23-27
23.10 Equipment Summary Report 23-38
23.11 CDRLs....23-41

23.1 Overview

a). This chapter describes the requirements for the development and delivery of project documentation and for the implementation of a post-delivery training program.

b). The Contractor shall be fully responsible for the completeness, accuracy and readability of all documentation, and for ensuring that these documents and the associated parts, components, systems, subsystems, vehicles and the operation thereof meet the specification requirements for the contractually required duration.

c). The Contractor shall develop and provide a training program that accurately and completely reflects the requirements of the manuals. **[CDRL 23-01]**

i). The training program shall familiarize operating, mechanical, supervisory and administrative personnel with all aspects of the operation, inspection, maintenance, repair and supply of parts for the cars.

ii). The training program shall be structured and implemented so that Amtrak and any designated maintenance and/or operations providers have access to all necessary resources to properly and successfully operate, maintain, repair and administer the equipment as required by Amtrak, the Contractor, the FRA and others.

23.2 General Requirements

a). Organization

i). The material in the manuals, troubleshooting guide, and the illustrated parts catalog shall be organized and sequenced with a standard numbering system or alternative numbering system as approved by Amtrak.

(1) Chapter numbers shall be consistent for all documents.

ii). A complete table of contents shall be given at the beginning of each publication, and a complete page-numbered index at the end.

b). Illustrations

i). Sharp, clear drawings shall be used throughout the documents for illustration.

(1) Photographs may be used only where explicitly approved by Amtrak.

c). Language

i). All correspondence, drawings, data, manuals or other written communications pertaining to this Contract shall be in the English language.

d). Dimensions

i). All dimensions shall be shown in standard imperial units of inches and decimals, with a metric equivalent shown in parentheses adjacent to the imperial dimension.

ii). If a component or subassembly uses metric units as the primary system of measurement, then imperial equivalents shall be provided in parentheses.

e). Updates

i). As information becomes available and changes occur, the Contractor shall incorporate the changes and supply the information in updated electronic editable and Portable Document Format (PDF) files in an organized, timely manner based on a regular schedule to be approved by Amtrak.

ii). Each updated information submittal shall be accompanied by a file containing a revised list of effected pages for the manual set being changed.

f). Engineering Change Service Bulletins (ECSBs)

i). Engineering changes that affect any potential safety issue, or may significantly affect car operation in scheduled service, shall be published in the form of an Engineering Change Service Bulletin (ECSB).

ii). ECSBs shall be used in the interim until the official changes in the operator's manual, maintenance manual and illustrated parts catalog have taken place.

iii). The creation of ECSBs shall be included within the Contractor's engineering change procedures and engineering change proposal system.

iv). ECSBs shall be stand-alone documents, provided in both editable document and PDF formats.

v). Each ECSB shall detail the reason, instructions and illustrations to make the change. Associated parts information shall also be included.

vi). A system to control ECSBs shall be developed between the Contractor and Amtrak to control ECSBs, such as using note tools on the existing electronic PDF versions and/or the development of master lists of outstanding ECSBs.

g). Contractor Responsibility

i). The Contractor shall provide documents such as drawings, SolidWorks models, photographs and a family of operating and service manuals which shall provide Amtrak with the information necessary to properly operate and provide all maintenance functions for the vehicles.

ii). These include drawings and manuals to safely and properly conduct:

(1) Operation

(2) Service and inspection

(3) Troubleshooting

(4) Running maintenance

(5) Heavy repair/overhaul (vehicle and system/component level)

(6) Part identification (to the lowest repairable level)

(7) Wreck repairs

(8) Modification of equipment (documenting as-built configuration)

iii). All publications must be reviewed in detail by the Contractor to ensure completeness and accuracy of information and quality prior to any submittal to Amtrak for approval.

h). Rights To Technical Data

i). The Contractor and all of its subcontractors shall grant to Amtrak in connection with this Contract the right to use, duplicate or disclose, in whole or in part and without charge, all technical data required by Amtrak to install, operate, understand, maintain, modify, replace, test, repair or overhaul the cars and their equipment.

(1) This shall not include financial information or information of a contract administrative nature.

ii). Amtrak shall not disclose proprietary information and data being supplied under this Contract except for the limited purpose of obtaining individual part repairs or specialized testing or repair services outside the ability of its shops, and then only on a confidential basis.

iii). Technical data means information of a scientific or engineering nature, regardless of form or characteristics, to be furnished by the Contractor pursuant to this Contract. Examples are:

(1) research and engineering data,

(2) engineering drawings and associated lists,

(3) as-built drawings (regardless of restrictions contained therein),

(4) specifications,

(5) standards,

(6) process sheets,

(7) manuals,

(8) technical reports,

(9) catalog item identifications or related information.

iv). The Contractor shall not patent or copyright any original materials or information created by this procurement which will be submitted to either the Engineer or Amtrak, as per Federal procurement regulations.

23.3 Mock-Up Training Cars

a). As an option, the Contractor shall be responsible to provide instructional full system mock-ups in the design of at least four full training cars (one Coach, one Accessible Sleeper, one Diner and one Café) that are fully functional and can be used for training and troubleshooting for repair personnel and onboard crews, independent of any spares required for car maintenance.

b). The systems shall be kept up to date with all applicable software and hardware during the warranty time frame.

c). Applicable systems shall include at a minimum:

i). Air brake

ii). Waste/water/toilet

iii). HVAC

iv). Door Systems and controllers

v). On-Board Wheeled Mobility Device Lifts and Controller

vi). Trucks

vii). Diagnostic system

viii). Roomette and Sleeping Modules

ix). Food Service equipment including appliances and carts

x). Seats and other seating accommodations

xi). Lighting

xii). Communication System

xiii). Digital Technology Systems

d). The training cars should be provided at a central location for training purposes determined by Amtrak.

23.4 As-Built Drawings

a). General

i). The Contractor shall provide Amtrak with a full set of sub-component, component, system, arrangement and installation drawings, schematics and

specifications for all parts and assemblies as provided on each type of car, from both the Contractor and all of its suppliers.

(1) These drawings shall be in an Amtrak-approved 3-D CAD format utilizing the latest major version of Solid Works (SLDDRW for Mechanical and DWG for Electrical) which includes a SMART searchable index and all material characteristics.

ii). This also includes providing a complete set of all as-built drawings for top assemblies, subassemblies and detail drawings used to manufacture all equipment used therein.

(1) All assemblies and subassemblies are to be fully detailed.

(2) Outline drawings of boxes, components and devices will not be sufficient.

iii). The drawing package shall also include:

(1) Drawings of every special gage, tool, jig or fixture used to correctly install these items or to maintain the cars.

(2) Circuit board level detail, installation and connection drawings.

(3) General arrangement drawings for each car type, color schedules and clearance drawings.

iv). Each assembly, subassembly and arrangement drawing shall include a complete bill of material and parts list describing all items (including weight, original component manufacturer name and part number of the actual supplier of the part) that form a part of the assembly, and the next higher assembly.

v). A drawing template shall be approved by Amtrak prior to submittal of any drawing.

(1) The Contractor's title block must include wording that explicitly grants Amtrak full rights to use the drawing contents.

vi). Electrical schematic drawings shall indicate all wire numbers, references to other drawings of any and all manufacturers to which connections are made, nominal voltages, currents and frequencies, significant resistance values, and the rating of all loads.

vii). Devices shall be labeled in agreement with the identification appearing on the actual device, and their locations on the cars shall be shown.

viii). Pneumatic schematic drawings shall be prepared in a similar fashion.

ix). All dimensions shall be shown in standard imperial units of inches and decimals, with a metric equivalent shown in parentheses adjacent to the imperial dimension.

(1) If a component or subassembly uses metric units as the primary system of measurement, then imperial equivalents shall be provided in parentheses.

b). Drawing Availability

i). Preliminary as-built drawings needed to perform maintenance, repairs, testing or measurements shall be supplied 180 days prior to the delivery of the first completed batch of cars. **[CDRL 23-02]**

ii). A complete set of as-built drawings shall be delivered within 30 days after the delivery of the first batch of cars. **[CDRL 23-03]**

iii). A complete bill of material for each car type, in standard 8.5 in. by 11 in. size, and electronically, covering all major components and hardware, shall also be provided within 30 days after the completion of the last batch of cars of the base order.

iv). Updates to any drawings must be provided to Amtrak once every quarter (3 months) unless otherwise directed by Amtrak until the final delivery of cars.

v). The Contractor shall make available, for the life of the equipment, and without charge, hard copy drawings or electronic files that are required by Amtrak to conduct equipment modifications, conduct overhauls or make extraordinary repairs, such as those arising from accidents, etc. The contractor shall upload all drawings to the Enterprise Product Data Management (EPDM) system, Product Lifecycle Management (PLM) system and/or the latest document control system utilized by Amtrak at the acceptance of the first batch of cars.

vi). All electronic and hard copies of drawings shall be marked with a statement of “Printed Documents are Uncontrolled” to ensure personnel check the latest electronic version for updates to any drawing. The contractor shall also provide a complete set of electronic drawings in Portable Document Format (PDF) within 30 days after the delivery of the first batch of cars. PDFs shall maintain an electronic parent/child relationship to the associated Solid works drawing.

c). Drawing Originals

i). The Contractor shall submit to Amtrak for review and approval, the as-built drawings and 3-D CAD models of all assemblies, sub-assemblies and arrangements in accordance with this chapter. These shall be submitted as follows:

(1) within 30 days after completion of first car of each base type, and

(2) after completion of all modifications

ii). If the Contractor decides not to maintain the drawing originals, they shall be supplied to Amtrak at no cost.

iii). Likewise, if the Contractor terminates operations, all drawings pertaining to this project, CAD files or any other Amtrak approved media shall be provided to Amtrak free of charge.

d). Electronic Delivery

i). Within 30 days of the delivery of the last car of the base order, the Contractor shall provide an electronic file of all the drawings, 3-D CAD models and Finite Element Models (FEMs), the bill of material, as-built specification training materials and operation and maintenance manuals and car history books. **[CDRL 23-04]**

ii). The car number(s) shall be included in the filing system for car-specific data such as the history books.

23.5 Photographs

a). Photographs of Car Assembly

i). For each car type, the Contractor shall take not less than 50 different digital color photographs, large format, showing the progression of vehicle construction. **[CDRL 23-05]**

ii). Special emphasis shall be made to illustrate hidden areas which are later concealed, such as carbody structure, floor pans, ceiling structure, ducting, and electrical lockers.

iii). The views shall be approved by Amtrak.

b). Photographs of Completed Cars

i). For each car type, the Contractor shall take not less than 50 different digital color photographs, large format, showing the interior and exterior of the fully completed and painted vehicle. **[CDRL 23-06]**

ii). Photographs shall include at least the following views of each car type:

(1) Exterior full broadside view,

(2) Exterior 3/4 side view,

(3) Exterior top,

(4) Exterior rear view

(5) Overall interior view

(6) Detail views of the passenger area interior surfaces,

(7) All lockers,

(8) Rest room details,

(9) Galley,

(10) Vestibules,

(11) Open and closed side and body end doors,

(12) Water and waste servicing areas.

(13) High quality exterior views (broadside and 3/4 side view) of each car type against a non-distracting background, suitable for publicity purposes.

iii). The photograph views shall be approved by Amtrak.

c). Digital Format

i). All photographs shall be taken in digital format (jpeg), at high resolution (2400 x 3000 pixels).

ii). All photographic files will be submitted to Amtrak within 30 days following completion and acceptance of the first car of each base type.

23.6 Conformed Specification

a). Within 30 days after completion of each car type, the Contractor shall update and revise this Specification to provide an as-built specification and contract document. **[CDRL 23-07]**

b). The revised document shall require Amtrak review and approval.

c). One reproducible electronic copy in Adobe PDF format of the approved version shall be provided.

d). The conformed specification shall include all changes to the specification made via approved waivers, variances and change orders.

e). Subsequent changes to the specification made prior to the end of the warranty period shall require the conformed specification be revised.

23.7 Manuals

a). General

i). The Contractor shall provide a complete family of operating and maintenance manuals. The following manuals are required:

(1) Operator’s Manual

(2) Service and Inspection Manual

(3) Troubleshooting Guide

(4) Running Maintenance Manual

(5) Heavy Maintenance Manual

(6) Integrated Schematic Manual

(7) Illustrated Parts Catalog

ii). The manuals shall include full descriptions of all systems and components requiring maintenance or servicing.

iii). Description of systems shall be included in the nomenclature of all digital files.

iv). The manuals to be supplied shall contain information required for effectively understanding operation of all car types as well as performing scheduled maintenance including general servicing, lubrication and inspections, system equipment testing, troubleshooting and adjustments, and repair/replacement of components and major subassemblies.

v). The Contractor is responsible for ensuring that subcontractors comply with this Specification and that they also provide the appropriate manuals. Contracts between the Contractor and subcontractors shall include appropriate language to ensure these documents are provided as required.

vi). All manuals shall have at a minimum, the following information on the front cover:

(1) Contractor name

(2) Amtrak name

(3) Type of equipment

(4) Car numbers

(5) Date and level of revision

vii). Contractor manuals shall be provided electronically in an editable Adobe PDF format or other Amtrak approved language.

viii). The front of each volume of any manual type shall include a listing of the Chapter numbers and title for the complete manual.

b). Manual Review and Availability

i). Manual Development Plan

(1) The Contractor shall develop a master plan and schedule for the development and completion of the manuals. **[CDRL 23-08]**

(2) It shall include the Contractor's plan for the development and acquisition of the manual content from suppliers and vendors, the schedule for the major completion points of the manuals, and a

method to track the development of each manual that can be reviewed at the periodic project management meetings.

(3) This manual development plan shall be submitted to Amtrak no more than 180 days after NTP.

ii). First Draft of Manuals

(1) A full set of first draft manuals, including those provided to the Contractor by suppliers, shall be submitted for Amtrak review no less than 90 days prior to the completion of the first car. **[CDRL 23-09]**

(2) If the manuals require revision, as determined by Amtrak, the Contractor shall revise and resubmit the draft manuals until all requirements are met.

(3) The first car shall not be released from the Contractor's facility until Amtrak has approved the first draft of the manuals.

(4) The Contractor shall provide 10 full sets of manuals, in electronic format, to Amtrak prior to Amtrak acceptance of the first batch of cars.

c). Manual Updates

i). A digital copy of all manuals shall be provided and updated for the duration of the warranty period.

ii). Manual information shall be kept up-to-date with the car configuration and operation during the full period of the Contract.

iii). After delivery of the first car, and continuing through the end of the warranty period, should any changes to the car, components or maintenance requirements occur, the Contractor shall revise and update all affected manuals and shall submit hard and electronic copy manual updates to Amtrak.

iv). Upon the completion of the warranty period, the Contractor will issue 10 sets of finalized manuals to Amtrak, reflecting all changes made to the vehicles during production, delivery and operation, and the status of all cars at the time of warranty expiration. **[CDRL 23-10]**

v). Revisions to final draft and approved manuals shall be recorded on a control list in the front of each manual.

vi). The list shall be issued with each revision and shall show the date of each revision and the page reference. Updated lists and revisions shall be maintained in the manuals by the Contractor until the warranty period expires.

d). Work Management System

i). The manuals will be used electronically in Amtrak’s Work Management System (WMS) or successor maintenance tracking database.

ii). The Contractor shall work with Amtrak to ensure that this is implemented successfully. **[CDRL 23-11]**

e). Operator's Manual

i). The Contractor will develop operating manuals for use by train operating personnel, including the Engineer, Conductor and food service Lead Service Attendant (LSAs).

ii). Operator's manuals shall contain all information needed for the operation of each car type, including definitions giving nomenclature, function, location and operation of all indicators, controls, components and subsystems utilized in the operation of the equipment.

(1) This shall include preparing the equipment for operation, securing the equipment from operation and operation of each car type individually.

iii). Normal and rescue locomotive coupling/ uncoupling procedures to both ends of the cars shall be provided, along with coupling to equipment with completely dead batteries, and deadhead movement of equipment in freight train service.

iv). Emergency procedures and safety precautions of a specific nature applicable to the equipment shall be included.

(1) This shall include all passenger evacuation methods.

v). The manual shall give troubleshooting and diagnostic procedures sufficient to isolate faults and problems which are capable of repair by the operator and train crew, arranged in a format to allow ease of use under emergency and time-sensitive situations.

vi). The operator's manual shall be divided into chapters as follows:

(1) Introduction

(2) Communications

(3) Inspecting

(4) Operating

(5) Fault Isolation

(6) On-the-Road Repair

(7) General Description

vii). The fault isolation and on-the-road repair sections of the operator's manual shall include, in summary form, all fault isolation and on-the-road repair procedures. These two sections shall include:

(1) Index

(2) Safety instructions

(3) Instructions for communications during fault isolation

(4) Authorized fault isolation procedures

(5) Authorized on-the-road repairs

(6) Equipment location diagrams

viii). The operator's manual shall accurately portray and clearly illustrate all information required by the operator and train crew to correctly, efficiently and safely carry out their duties on the equipment in all possible configurations.

ix). Illustrations shall include layouts of the equipment, showing major components and controls referenced in the text and their locations on each type of car.

(1) This shall include all electrical, pneumatic, water and waste system cutouts and bypasses.

x). An alphabetical index of subjects and equipment not mentioned in the table of contents shall be provided.

xi). All operating conditions shall be taken into account by the manual's description of unit functions.

xii). A fault isolation section shall be provided to list all possible unit or system malfunctions that are detectable by the train crew without the aid of test equipment.

(1) This shall include fault codes and corrective information supplied by the diagnostic system.

(2) This information shall be presented in tabular format listing each symptom with corresponding potential causes, test, checks and corrective actions.

(3) The goal of these fault isolation tables shall be to allow the train crew to identify operational problems and, where possible, isolate faults from consists to car, car to system and, in some cases, from system to subsystem.

f). Service and Cleaning Manual & Maintenance and Inspection Manual

i). The Service and Cleaning (S&C) manual as well as the Maintenance and Inspection Manual (M&I) shall contain all pertinent information that operating and maintenance personnel will require in order to perform all periodic inspections on the vehicles as required by the Contractor, subcontractors, Amtrak, the FRA and FDA. **[CDRL 23-12]**

(1) All daily inspection items shall be in the S&C manual.

(2) As Amtrak transitions to Continuous Maintenance (CM), all inspections required during a periodic inspection period shall be included, i.e. those occurring every 92 days, every 184 days and annually (every 368 days) and shall be in the M&I manual.

(3) Inspections and servicing activities occurring on an interval that is not used by Amtrak may be included in the tasks shown for the next more frequent interval.

(4) The weight of each car type, and instructions for water system flushing and draining/winterization of the equipment shall be included in both manuals.

ii). The inspection tasks described in these manuals shall include, but are not limited to the following:

(1) Item or system requiring inspection

(2) Frequency or period of inspection

(3) Inspection procedure, including location and description of system being inspected

(4) Pass/fail criteria for inspection

(5) Special tools, conditions or other requirements for inspection to be performed

(6) Source of inspection requirement (Contractor, Amtrak, FRA, FDA, etc.)

(7) Reference for inspection requirement (CFR, maintenance manual, etc.)

iii). For both manuals, a summary table in order of frequency shall be provided for quick reference that lists the item or system, frequency, source and reference for all required inspections.

iv). The M&I manual will also provide complete instructions for all pertinent maintenance activities for the routine operation of the cars that are required every 92 days, or more frequently, including:

(1) Fresh water filling

(2) Waste tank draining

(3) Removal of trash and recyclables

(4) Installation and replacement of consumables

(5) Inspection and replacement of filter elements

(6) Cleaning and lubrication

(7) Replacement of brake shoes and pads

g). Troubleshooting Guide

i). This manual shall contain detailed troubleshooting procedures, including those requiring the use of diagnostic test equipment and those that do not require such equipment, for all major systems, subsystems and components in the following categories:

(1) Carbody

(2) Trucks

(3) Coupler and Draft Gear

(4) Brakes

(5) Door System

(6) Interior

(7) HVAC

(8) Lighting

(9) Communications

(10) Electrical System

(11) Food Service

(12) Water and Waste

(13) Digital Technology

(14) Emergency Equipment

(15) Diagnostics System

(16) Software and Microprocessors

(17) Cyber Security

(18) Onboard lifts

ii). This manual shall provide procedures for the identification, diagnosis and proper correction of car failures and malfunctions.

(1) Procedures shall be organized so that maintenance personnel can isolate faults down from consist to car, from car to system, and from system to subsystem, assembly, subassembly or component.

(2) These procedures shall include determination of the cause and isolation of the fault to replaceable parts, interface wiring or mechanical linkage.

(3) Diagrams of the relationships shall be provided to enhance comprehension.

(4) Troubleshooting procedural format shall include fault codes for each system with built-in diagnostics and fault information and corrective actions displayed by the diagnostic system.

(5) All fault codes are to be included, and diagnosed, in the troubleshooting manual.

(6) When there is more than one probable cause for a system or equipment malfunction, the most likely to have failed shall be considered first; however, consideration shall be given to accessibility and ease of replacement when the likelihood is equally shared by two or more causes.

iii). Each chapter of the troubleshooting procedures shall contain the following sections:

(1) Introduction, including general information, safety precautions, and definition of warnings, cautions, and notes with specific details

(2) Operational and functional system descriptions

(3) Troubleshooting

(4) Use of diagnostic test equipment

(5) Corrective maintenance procedures

iv). When there is more than one probable cause for a system or equipment malfunction, the most likely to have failed shall be considered first; however, consideration shall be given to accessibility and ease of replacement when the likelihood is equally shared by two or more causes. The troubleshooting and corrective maintenance procedures shall contain:

(1) Identification of the system covered

(2) A concise explanation of the troubleshooting format and how to use the procedure

(3) Test equipment and tools required

(4) Safety precautions that must be taken

(5) A reference to the supporting block diagrams

(6) Preliminary tasks that must be performed prior to initiating troubleshooting

v). When applicable, each section shall indicate and list the applicable safety warnings and precautions, test equipment required, special tools required, and any consumables required.

vi). The manual shall include a listing of every type of diagnostic software used on the equipment, including instructions for their use including cable connections.

vii). The manual format shall utilize diagrams and illustrations as required to enhance understanding.

viii). All procedures shall be proven in the field on the first car and shall be revised as necessary.

h). Running Maintenance Manual

i). Definition

(1) Running maintenance is defined as that maintenance that can be performed on the inspection track or does not require taking the equipment out of service.

ii). Contents

(1) The running maintenance manual shall contain an overview of the vehicle operation and a detailed description and analysis of the vehicle and its assemblies/subassemblies.

(2) The manual shall also contain, in a convenient form, all information required for on-car testing, troubleshooting, servicing and replacement of equipment down to the lowest level replaceable item.

(3) The running maintenance manual shall provide technicians with the maintenance procedures that are performed at the running repair level.

iii). Illustrations

(1) Running maintenance manual procedures shall be supported by illustrations. They shall be used to simplify, clarify or shorten the text.

(2) Illustrations shall be located on the same page or facing page of the text they support.

(3) A sequence of illustrations may be used in order to clarify or simplify a complex procedure.

(4) When one of several possible positions is described by text for a device, the position described shall be the same as the one shown by the illustration.

(5) Unless the location and access to the item is obvious, a locator view shall be included, or the assembly diagram provided at the beginning

of the chapter may be referenced to ensure that the equipment orientation is clearly described.

iv). Test Procedures

(1) Functional post-inspection testing and checkout test procedures shall be provided to verify serviceability or to detect failures of a system, subsystem, assembly, subassembly or component.

(a) Pretest setup instructions shall be included.

(2) Test procedures shall be used as a prerequisite for the generation of fault isolation procedures to fault isolate to a system, subsystem, assembly, subassembly or component.

(3) The types of tests that can be performed fall into the following categories:

(a) Operational Test

(i) An operational test procedure shall be provided, it is required to ascertain only that a system or equipment is operable.

(ii) These tests should require no special equipment or facilities other than that installed on the car and shall be comparable to the tests performed by the Operator.

(iii) It is not intended that the operational test of the unit meet the specifications and tolerances ordinarily established for overhaul or major maintenance periods.

(b) Functional Test

(i) A functional test procedure shall be provided, it is required to ascertain that a system or equipment is functioning in all aspects in accordance with minimum acceptable system or unit design specifications.

(ii) These tests may require supplemental support equipment and shall be more specific and detailed than an operational test.

(iii) The test shall contain all necessary information to ensure system or unit operational reliability, without reference to additional documents.

(c) System Test

(i) A system test procedure shall be provided, containing all adjustment specifications and tolerances required to maintain system and unit performance at maximum efficiency and within design specifications.

(ii) The test shall be self-contained and may duplicate other tests.

v). Instructions & Procedures

(1) Instructions shall be provided for the removal, addition, or rearrangement of car types.

(2) The weight and instructions for the lifting and jacking of each car type shall be provided.

i). Heavy Maintenance Manual

i). Definition

(1) Heavy maintenance is defined as the maintenance that may be performed on the shop track or one of the heavy maintenance tracks if the equipment is taken out of service.

(2) Heavy maintenance tasks will generally require more than one 8-hour shift to complete.

ii). Contents

(1) The Heavy Maintenance Manual shall contain a detailed description and analysis of all mechanical, electrical and electronic assemblies/subassemblies so that Contractor overhaul facilities can effectively and safely service, inspect, adjust, troubleshoot, repair, overhaul and test these assemblies.

(2) The Contractor and sub-suppliers shall provide all information needed for comprehensive repair and overhaul work, at least as comprehensive as that used by the suppliers' own service and repair shops, whether the car parts were manufactured by them or purchased from others.

(3) The manual shall provide information for the test, repair and overhaul of each repairable component of the assembly.

(4) No component shall be considered disposable or deemed non-repairable except where agreed to by Amtrak.

iii). Functional Descriptions

(1) The manual shall include descriptions of how each assembly/subassembly operates within the car system. Each shall include:

(a) Block diagrams

(b) Signal flow diagrams

(c) Simplified schematics

(d) Functional wiring and piping diagrams

(e) Completely detailed overhaul procedures

iv). Instructions & Procedures

(1) Procedures shall be provided for installation and removal of equipment in full detail, down to the lowest level of replacement items (assembly, subassembly or component).

(2) Prerequisites and Safety Information

(a) Prerequisite operations, inclusive of access panel or plate openings, removal of other obstructing components, and deactivation of power and other pertinent safety precautions and/or warnings shall be included or appropriately referenced.

(3) Removal Procedures

(a) The procedures shall clearly describe the step-by-step operation in a logical, work flow sequence to safely gain access to, and subsequently remove the item.

(b) Exact quantities of attaching hardware to be removed shall be included in the procedures.

(c) The statement "reverse of removal" may only be used judiciously.

(i) Installation procedures that are basically the same as the removal procedure, but require some additions, such as torque values for bolts, replacement of O-rings and lubrication of a component, can be handled within highlight statements to that effect in the removal procedure. If this is done, the statement "reverse of removal" may still be used.

(ii) If, during the prove-out or validation of a "replace" task, the highlighted data do not enable the maintenance technician to correctly install the subject item, the highlighted information shall be deleted from the removal procedure and a step-by-step installation procedure shall be added to the "replace" task.

(4) Installation Procedures

(a) Installation instructions must be provided for procedures that are complex and require additional step-by-step detail or are significantly different from that of removal procedures.

(i) Exact quantities of hardware shall be identified.

(5) Adjustments

(a) Step-by-step procedures shall be provided for any adjustment or alignment required as a result of replacement of any equipment, or to determine that a system, subsystem, assembly, subassembly or component meets required standards.

(b) Detailed procedures shall be provided to determine the accuracy of, and to correct and adjust instruments, diagnostic equipment and test measuring devices used for precision measurement.

(c) Calibrations are to be performed with an instrument that is certified to a standard of known accuracy to detect and adjust any discrepancy in the accuracy of the instrument being calibrated.

(6) Rewinding Procedures

(a) Rewinding procedures shall be provided in full detail for all rotating and wire-wound apparatus, except as agreed to otherwise by Amtrak.

(7) Disassembly/Assembly Procedures

(a) Procedures shall be provided for the disassembly and assembly of assemblies, subassemblies and components at the heavy repair level of maintenance shall be provided.

(b) Assembly instructions shall include all pertinent assembly criteria, including clearances, backlash dimensions, torque values and similar data.

(c) Final testing, with pass/fail criteria, of the end item shall be provided by reference.

(8) Test and Evaluation Procedures

(a) Test and evaluation procedures equivalent to that performed by the original manufacturer, including the requirements for specialized test equipment.

(b) The Contractor is to procure or fabricate and provide to Amtrak all such specialized test equipment and their drawings.

v). Overhaul

(1) For overhauls, the maintenance action required to restore an item to a completely serviceable and operational condition shall be indicated.

(2) Overhaul is not normally performed in the car and does not necessarily return an item to like-new condition.

vi). Rebuilds

(1) Rebuilds include those services and actions necessary for the restoration of equipment to like-new condition in accordance with original manufacturing standards.

(2) Rebuild is the highest degree of material maintenance applied.

(3) The rebuild operation allows returning to zero those age measurements including, but not limited to, hours and miles, considered in classifying Amtrak's equipment and components.

vii). Special Tools

(1) Complete instructions for use, drawings and parts information for all special tools that are required to be provided to Amtrak by the Contractor.

viii). Component and Assembly Weights

(1) The weights of all components and assemblies that weigh more than 50 lbs. shall be indicated.

(2) In addition, the weights of major component assemblies shall be supplied such as the truck, air conditioning compressor, HVAC module, etc.

ix). Diagnostic Test Equipment

(1) Maintenance, calibration and adjustment, repair and overhaul of all diagnostic test equipment.

j). Integrated Schematic and Wiring Manual

i). The integrated schematic manuals shall include all electrical, hydraulic, pneumatic, mechanical, refrigerant, water and waste water system schematic diagrams as used on each car type, broken down by major system.

ii). The manual shall provide schematic and wiring diagrams including (but not limited to) the following:

(1) Electrical power distribution

(2) Trainline assignments and connections to car-borne equipment

(3) Door control system

(4) Lighting system (interior and exterior, in normal, standby and emergency modes)

(5) Communications system, including PA, intercom and passenger information system

(6) HVAC system, including refrigeration units in the food service car (electrical, refrigerant and air flow schematics)

(7) Brake system (electrical, mechanical and pneumatic)

(8) Main reservoir air distribution system

(9) Fresh water distribution and waste retention systems (electrical, pneumatic and water routing)

(10) Onboard mobility device lift (electrical and hydraulic, if used)

(11) Food service equipment, including all appliances (electrical, water distribution)

iii). All schematic drawings will be provided electronically per Amtrak Standard 700 unless otherwise approved by Amtrak.

iv). The schematics shall include all required information for maintenance, troubleshooting and repairs, including specific identification of wires (size, type and label), circuits, components, junction boxes and termination points, locations of components, voltages and pressures, hoses and pipes (size, type and rating), filters, adjustment points, direction of flow, function, and other information as necessary.

v). The integrated schematic manual shall be supplied in tabloid format, 11 in. tall by 17 in. wide, horizontal format, spiral bound with a protective laminated cardstock front and back cover.

k). Illustrated Parts Catalog (IPC)

i). The Illustrated Parts Catalog (IPC) shall enumerate, illustrate and describe every item used on the cars, along with the diagnostic test equipment and special tools with its related parts, down to the Lowest Level Replaceable Unit (LLRU). **[CDRL 23-13]**

(1) The LLRU is defined as the lowest level of component assembly which consists of a separate individually fabricated part, including all hardware items required to assemble, disassemble, repair or overhaul the component.

ii). Parts Information

(1) Each listing must include the accepted generic modified noun-name description, the original supplier, the original supplier's part number and name, the Contractor's part number, and space reserved for the Amtrak 10 digit internal catalog number.

(2) Identical parts within the equipment, regardless of where used in the car types, shall use only one part number.

(a) Common bulk materials such as weather strip or hose used in several locations, but which is cut to specific application length

for an individual application may use one common part number, but the specific location application must identify the length in the text description.

(3) In the case of hardware such as nuts, bolts, washers, etc., information relative to material, coating if any, all dimensions and types shall be included.

(4) Providing the original supplier and its own part number for all components is of great importance to Amtrak.

(5) If provided to the Contractor, Amtrak part numbers shall be included in the IPC.

(6) An appendix giving the original supplier's contact information responsible for parts ordering shall be included.

(7) Amtrak shall have the right to make direct purchase from the sources listed by the Contractor.

iii). Assembly Break-downs

(1) Complete piece-part breakdowns of all subcontractor assemblies shall be provided, regardless if the Contractor only purchased completed assemblies.

(2) Each component that can be disassembled, including all printed circuit board components and items which may have been purchased by the Contractor as a subassembly, must be broken down in exploded view illustrations to fully indexed parts.

(3) Each part or other item shall be identified as being part of the next higher assembly.

(4) All assemblies shall be listed alphabetically by name with reference to corresponding figure number.

iv). Cross Reference Lists

(1) The IPC shall include two cross-reference lists that sort all listed parts as follows:

(a) Sorted alphanumerically by part number

(b) Sorted alphabetically by part name

(2) These cross-reference lists shall include the part name, manufacturer part number, manufacturer or supplier, Contractor part number, and the page and illustration number where found in the IPC.

v). Illustrations

(1) Illustrations shall be exploded view and located on the same page or facing page of the text they support.

(2) A sequence of illustrations must be used in order to clarify or simplify a complex assembly.

(3) All illustrations shall be properly scaled in order to show each individual part being called out.

(4) When one of several possible positions is described by text for a device, the position described shall be the same as the one shown by the illustration.

(5) Unless the location and access to the item is obvious, a locator view shall be included, or the assembly diagram provided at the beginning of the chapter may be referenced to ensure that the equipment orientation is clearly described.

(6) If the same drawing is used in both the illustrated parts catalog and either the running maintenance or heavy maintenance manual, the reference index in both manuals must identify the same parts.

l). Hardcopy Formats

i). The operator's manual binder shall be lightweight plastic, which can be easily opened for page revisions.

ii). Plastic coated tabs shall be used to segregate sections within each publication.

m). Manual Quantities to be Provided

Name	**Quantity**
Operator’s Manual	250
Service and Inspection Manual	50
Running Maintenance Manual	15 sets
Troubleshooting Manual	15 sets
Heavy Maintenance Manual	15 sets
Illustrated Parts Catalog (IPC)	15 sets
Integrated Schematic Manual	15 sets
Manual quantities are subject to change.	

n). Software

i). The Contractor shall also supply 10 sets of every type of software used on the equipment, from the Contractor and its suppliers, in an agreed-upon format.

ii). This shall include diagnostic tester software, any passenger information and Wi-Fi system software, and databus software.

iii). All such software shall be licensed in Amtrak's name and include master passwords to allow future changing of system parameters by Amtrak when necessary.

o). Inspection, Testing and Maintenance Plan

i). The Contractor shall be responsible for the creation and maintenance of the Inspection, Testing and Maintenance Plan annually in accordance with 49 CFR 238.107.

ii). The Plan shall include all detailed inspection, testing and maintenance requirements for each car.

iii). The list of activities shall be considered an all-encompassing and complete list of every inspection, testing and maintenance requirement throughout the life of the equipment.

iv). Inspection, Testing and Maintenance Plan shall be provided to Amtrak for submittal to the FRA on an annual basis.

v). This plan shall include a detailed description of the following:

(1) Inspection procedure, intervals and criteria;

(2) Test procedures and intervals;

(3) Scheduled preventive maintenance intervals;

(4) Maintenance procedures; and

(5) Special testing equipment or measuring devices required to perform inspections and tests.

23.8 Car History Books

a). General

i). The Contractor shall produce a car history book for each completed car. **[CDRL 23-14]** The car history books shall be a specific record of production, testing, inspection and relevant documentation for each individual vehicle.

ii). The car history book shall contain original documents unless specified otherwise.

iii). All documents for a car shall be marked with all carshell serial numbers, the production sequence numbers or the road numbers for the completed car.

iv). The Contractor shall provide one electronic set and one paper set of originals of the car history book for each car. The electronic set shall be color scanned at high resolution. The printed car history books shall be provided in three-ring binders. Documents shall be copied double-sided where practical.

v). At a minimum, each car history book shall contain the following:

(1) Table of contents

(2) Production control cross-reference sheets, listing:

(a) Carshell serial numbers

(b) Shop order/production sequence numbers

(c) Final car reporting marks and road numbers

(3) Production schedule for each car showing start and end dates for each major stage of manufacturing

(4) List of all production drawings by number and revision status (release date, current revision, and outstanding engineering change requests at time of production)

(5) List of all parts by supplier and part number (bill of material)

(6) List of all serialized components

(7) Truck records (separate set of records for each truck)

(a) Inspection records and component serial numbers

(b) Truck assembly sequence

(c) Truck assembly weight certificate

(d) Wheel/axle pressing graphs

(e) Truck to carbody attachment record

(8) Log of all non-conformances including status

(9) Component test certificates

(10) Test records:

(a) Master test plan

(b) Test procedures

(i) Production tests

(ii) Acceptance tests

(11) Record of measurements and results

(12) Critical dimensional inspection report

(a) Carshell dimensional inspection (prior to production)

(b) Carbody leveling, balancing and centering record

(c) Carbody overall dimension measurement, including compliance with clearance diagram

(d) Coupler height measurement

(e) Scale certificate for each completed car (dry weight)

(13) Records of all required inspections

(14) USPHS Certification forms (originals are to be installed in the appropriate certificate holder in the food service car)

(15) FRA documentation

(a) Record of compliance with FRA regulations

(16) Completed pre-shipment checklist

(17) Shipping approval form

(18) Amtrak acceptance form

(19) Transfer of title of the car from Contractor to Amtrak (with original blue-ink signature of Contractor's representative).

vi). The car history book shall be produced in an electronic format as either as a Microsoft Word, Excel, FileMaker Pro or an Adobe PDF file on a DVD. Procedures, electronic signatures and controls shall be established to ensure the validity of information in this document at all times.

vii). Each car history book shall be fully completed and presented to Amtrak prior to the car being released from the Contractor’s facility.

23.9 Training

a). General

i). The Contractor shall organize and present formal instruction programs for personnel who will operate, maintain, repair and troubleshoot the equipment.

ii). In addition, the Contractor shall provide instruction and training materials for Amtrak personnel who shall train others in the future.

iii). Training shall take place at four locations designated by Amtrak.

iv). All training shall meet the requirements of the FRA contained in 49 CFR Part 243 regarding the training and qualification of safety-related Amtrak employees. This shall include all:

(1) Train operating staff (Engineers and Conductors),

(2) Customer service personnel (On-Board Service and Lead Service Attendants),

(3) Mechanical Department maintenance personnel,

(4) Digital Technology personnel and

(5) Amtrak Police Department.

v). The regulation requires that the training plan:

(1) categorize all 'safety-related railroad employees' (SRREs);

(2) identify all training (subject to FRA regulation) that each category receives; and

(3) provides outlines for each training course, that includes learning objectives, instructional method(s), and assessment approach.

vi). All training shall also be compliant with Section 5 of Railway Passenger Handling Safety Rules from Transport Canada O-0-16.

b). Method of Presentation

i). At the choice of the Contractor, the direct training of the Amtrak employees identified above shall be performed either:

(1) by the Contractor, using a training plan which it has directly submitted to the FRA for review and approval; or

(2) by the Amtrak Safety and Technical Training Department, which shall be fully based upon a Contractor-developed and supplied training plan.

ii). The Contractor's proposal must therefore identify whether the Contractor will either be submitting a stand-alone training plan to the FRA for their approval, or if the Contractor would be requesting that Amtrak adopt the Contractor-supplied training plan.

iii). The training plan in any case must be fully approved by the FRA and ready to be presented to Amtrak personnel prior to the delivery of the first car.

c). Contractor Training Plan to FRA

i). If the Contractor intends to submit a training plan directly to the FRA for its approval, the Contractor must submit a copy of that plan to the Amtrak’s Safety and Technical Training Department no less than 90 days prior to training any Amtrak employee.

ii). Amtrak will not review, comment, or approve the plan, but will rely on FRA's approval.

d). Amtrak Adopts Contractor Training

i). If the Contractor will be relying on Amtrak to adopt its training into Amtrak's own plan, the Contractor must submit fully completed draft training materials

to the Amtrak's Safety and Technical Training department no later than 180 days prior to training any Amtrak employee.

ii). Amtrak will review the materials and provide comments within 30 calendar days.

iii). The Contractor will be expected to incorporate any comments/changes and return the materials to Amtrak within 30 days.

iv). This process will continue until the Amtrak Safety and Technical Training Department determines that the training materials meet the FRA Part 243 requirements.

e). Annual Review

i). Whichever party that performs the training (Contractor or Amtrak) is also required to perform an Annual Review, using operating rule violations, FRA inspections, NTSB incident findings, etc., to determine if the identified training was effective.

ii). If knowledge and/or skills gaps are identified in the Annual Review process, the training plan is to be suitably updated or modified, and the changes reported to the FRA.

f). General Training Requirements

i). The following provides the general requirements for the content and level of details of the training materials that shall be prepared and submitted by the Contractor.

ii). This submittal shall include the hours of classroom and "hands-on" training projected per subset, final course content, the qualifications of the instructors, a listing of training aids to be used and a description of the scope of instruction, on an individual subset level, to fulfill the program requirements.

iii). Course Contents

(1) The Contractor shall provide a program to train and educate personnel in all details of the equipment as required to enable Amtrak to satisfactorily operate, service, and maintain the equipment.

(a) The Contractor shall assume no knowledge of the features of the supplied equipment on the part of Amtrak personnel.

(b) However, the Contractor may assume that maintenance personnel have the basic skills pertinent to their crafts.

(2) The manuals shall be used as the major element of the training program.

(3) The training shall be designed to be delivered by an instructor in the classroom and, when appropriate, in the field or shop when actual equipment is used.

(4) Field instruction may also be provided in locations approved by Amtrak using actual cars or training mock-ups to provide hands-on instruction in the maintenance and operation of the equipment.

(5) The Contractor's program shall include formal and informal instruction, training mock-ups, models, manuals, diagrams and component catalogs.

iv). Training Duration and Classes

(1) Amtrak shall advise the Contractor as to how many individuals of each discipline are to be trained at each location.

(2) The program shall include 5,000 Contractor hours of classroom training at designated sites; 1,500 of which shall be for operations, 1,500 for Train the Trainer, and the remainder for maintenance.

v). Video Recordings

(1) Amtrak shall have the right to video record any classroom training sessions. Amtrak will retain ownership of the video recordings, following a final editing as mutually agreed with the Contractor and will have the right to use video recordings for future training sessions.

vi). Train the Trainer

(1) A primary objective of the program shall be to develop within Amtrak the capability to perform similar training under its own training program subsequent to the Contractor's involvement.

(2) Additional Train the Trainer classes shall be provided which is supplemental to the Contractor hours of classroom training.

vii). Training Materials

(1) All informative material, audio and video training aids and notes shall be supplied beyond that given in the instruction manuals to clearly explain all systems and subsystems that the work force will maintain.

(2) Color copies must be used where it is needed to communicate the training concepts in the document / course.

(3) An editable electronic copy of the training presentation must be provided to Amtrak after the training is approved and delivered by the contractor.

(4) Training materials shall be updated as required during the course of instruction.

(5) All instructional materials will become property of Amtrak.

(6) All materials used in the programs, such as models, manuals, mock-ups, video recordings and drawings, shall be of durable construction and shall become the property of Amtrak.

(7) Training Plan

viii). Virtual Reality Training

(1) The Contractor shall provide Virtual Reality training designed to simulate real-world operational, maintenance and emergency scenarios for the Cars. The VR system shall be used to supplement classroom and simulator-based instruction and must be compatible with Amtrak's Learning Management System (LMS).

(2) The VR system shall provide immersive, interactive 3D environments replicating interiors, equipment bays and control interfaces for each of the car types while including modules for pre-trip inspections, fault diagnostics and troubleshooting, emergency response procedures and component replacement/maintenance.

(3) The Contractor shall deliver a complete VR training curriculum, including instructor guides, student manuals and assessment tools. All content must be reviewed and approved by Amtrak's Training and Development department prior to deployment.

(4) The Contractor shall provide initial setup, calibration and testing of the VR system at designated Amtrak training facilities. A minimum of two (2) Train-the-Trainer sessions shall be conducted for Amtrak instructors.

ix). Before delivery of the first car, the Contractor shall provide Amtrak with a proposed training plan incorporating the following elements:

(1) Description of the training program, including program goals and objectives, sequence of activities, course outlines, evaluation methods, required resources and time required for each part of the program.

(2) Schedule of instruction at each location.

(3) State of the Contractor's experience in organizing and delivering similar training programs and qualifications of the designated instructors.

(4) List of training materials to be provided by the Contractor to support the training program.

(5) Instruction guides for each course to be taught within each program.

(6) Student workbooks for each course, each workbook including a syllabus, objectives, schedule, outlines, figures, lesson summaries and any other appropriate instructional information.

(7) Train the Trainer classes which is supplemental to the Contractor hours of classroom training.

g). User Training

i). The Contractor shall provide a user training program, designed for Amtrak operating, maintenance and training personnel. **[CDRL 23-15]**

(1) This is to acquaint them with the equipment in order to provide sufficient working knowledge to safely operate, inspect, service and maintain it.

(2) The training program shall include formal classroom instruction, as well as practical demonstrations and activities on the actual new vehicles.

(3) The Contractor and/or suppliers shall provide appropriate training aid in the classes as required.

ii). Class audience will be:

(1) Operating personnel

(2) Maintenance personnel

(3) Food service personnel

(4) Supervisors and management

(5) Training department personnel

(6) Amtrak representatives

(7) Amtrak Police Department and Emergency Management personnel

(8) Others as required

h). Training Requirements

i). General

(1) The courses listed below shall be accompanied with training manuals, guides, training aids, student and instructor workbooks, and operator and maintenance manuals.

(2) It is the desire of Amtrak that the content and structure of the manuals be used as direct input into the training course materials where applicable.

ii). Course 1: System Operation Instruction Training Course

(1) This course shall include:

(a) General vehicle familiarization;

(b) Location, function, and operation of pertinent controls, gauges, indicators, and switches;

(c) Subsystem operation, inspection, setup, and shutdown procedures;

(d) Trouble symptoms diagnostic and troubleshooting procedures for isolating and correcting minor faults including, at a minimum, techniques for the following:

(i) Release of brakes;

(ii) Door isolation and cut-out;

(iii) Circuit breaker and/or fuse reset or replacement;

(iv) Water and waste system failure recovery;

(v) On-Board Mobility Lifts (if equipped);

(vi) Any other techniques that would assist operators in quickly bypassing non-critical safety subsystems, allowing trains to safely depart the main line to a convenient service location;

(vii) Towing and rescue, including with completely dead batteries.

(e) Emergency Procedures including, at a minimum, techniques to respond to fire on board or emergency evacuation.

(2) This class shall be conducted four times (twice for operations personnel, twice for maintenance personnel). The first class shall be conducted at the time of the arrival of the first car. Subsequent classes shall be scheduled as approved by Amtrak. This class shall include at least 40 hours of training.

iii). Course 2: Repair and Maintenance Training Course

(1) Course 2 shall include and expand on the information furnished in course 1 and shall include theory of operation for each system, basic schematic and block diagrams to provide fault diagnosis information and training appropriate for in-service maintenance.

(2) Course 2 shall provide the training needed for the following:

(a) Troubleshooting in-service failures as described in course 1

(b) Performing running maintenance including:

(i) General servicing

(ii) Lubricating

(iii) Inspecting

(iv) Adjusting

(3) The training shall include maintenance instructions on the use of the integrated wiring diagrams.

(4) Participation shall include up to 20 electricians, mechanics and foremen. This class shall be conducted twice. The first class shall occur immediately following course 1 and be attended by maintenance personnel. The second class shall be scheduled as approved by Amtrak. This class shall include a minimum of 80 hours.

iv). Course 3: Workshop Training

(1) The workshop training course shall provide the training for in-shop repair and trouble diagnosis of each LRU to the level of the lowest replaceable component.

(a) The training shall contain detailed explanation of flow charts, schematic drawings, with system theory of operation and detailed analyses related to each LRU, so that Amtrak maintenance personnel will be able to effectively service, inspect, maintain, adjust, troubleshoot, repair, replace and overhauled the LRU.

(b) The flow charts, schematic drawings and detailed analyses shall be included in the training manuals.

(2) The training shall include maintenance instructions on the use of the integrated wiring diagrams and shall include reference to the manuals.

(3) The major sections of the workshop training course will address, at a minimum the following subsystems and products, as defined above:

(a) Carbody

(b) Trucks

(c) Coupler and Draft Gear

(d) Brakes

(e) Door System

(f) Interior

(g) Onboard Mobility Device Lifts

(h) HVAC

(i) Lighting

(j) Communications

(k) Electrical System

(l) Food Service

(m) Water and Waste

(n) Emergency Equipment

(o) Digital Technology

(p) Microprocessor-based products

(4) Participation shall include, up to 25 Amtrak Mechanical Maintenance Personnel. This class will be conducted twice. It shall follow the first course 2; others shall be conducted at dates to be scheduled as approved by Amtrak. Each class shall include a minimum of 120 hours.

v). Course 4: Diagnostic Test Equipment (DTE) and Special Tools Course

(1) This course shall provide instruction on the proper use of DTE and special tools during application, operation, usage, adjustment, inspection, maintenance, troubleshooting, repair and storage instructions.

(2) It shall be conducted twice. It shall be conducted upon the delivery of the test equipment and special tools and as agreed upon by Amtrak. It shall be a minimum of 20 hours.

(3) Subjects addressed shall include:

(a) Introduction

(b) General description of the equipment

(c) Description of controls and indicators

(d) Operation of equipment

(e) Operation of safety and emergency equipment

(f) Troubleshooting

(g) Introduction and use of operator and maintenance manuals

(h) Review

vi). Course 5: Material Control Training Course

(1) This course shall provide Amtrak Material Control personnel instruction on the use of the Illustrated Parts Catalog.

(2) Participation shall include, up to 15 Amtrak Material Control Personnel and will be conducted twice. Other classes shall be conducted at dates to be scheduled as approved by Amtrak. Each class shall include a minimum of 16 hours.

vii). Course 6: Amtrak Police and Emergency Management Training Course

(1) This course shall provide Amtrak Police Department and Emergency Management personnel with a detailed understanding of the new equipment as outlined by a Train the Trainer type syllabus.

(2) Emergency equipment and all procedures shall be provided to aid in the training of all internal department personnel as well as outside first response agencies.

viii). Course 7: Specialty Training Courses

(1) The Contractor shall be responsible for arranging specialty training courses utilizing the sub-supplier for training.

(2) Systems such as lifts would be expected to be instructed by the sub-supplier.

i). Training Materials

i). General

(1) Draft copies of the training materials shall be provided for Amtrak review and approval, with sufficient time to allow review and Contractor revision. **[CDRL 23-16]**

(a) Open discussion is encouraged early in the development process between the Suppliers, Contractor and Amtrak.

(2) The Contractor shall provide materials to support each course in the training program, including:

(a) instructor guides,

(b) training aids,

(c) student workbooks

(d) operator manuals

(e) maintenance manuals.

(3) Instructor guides and student workbooks shall be submitted for Amtrak's approval 60 days in advance of the start of the first class for each category of training.

(4) All training materials shall become the property of Amtrak.

(5) Format

(a) The instructor guides and student workbooks shall be submitted as camera-ready copy in a form that allows easy reproduction, such as, loose-leaf bound, black ink on 8.5 in. by 11 in. white paper, printed on both sides and numbered sequentially within units of training.

(b) Any Power Point presentations used in training will be supplied along with camera-ready, paper copy.

(c) Master copies of slides and other audiovisual materials shall also be provided to allow for reproduction as necessary.

(d) An editable electronic copy of the training presentation must be provided.

(e) Color copies must be used where it is needed to communicate the training concepts in the document / course.

ii). Instructor Guides

(1) The Contractor shall provide an instructor guide for each training course. **[CDRL 23-17]**

(2) The guides shall include:

(a) course agendas;

(b) course objectives;

(c) procedures for managing training sessions;

(d) resources and facilities required;

(e) guidelines for preparing for training;

(f) detailed lesson plans, including scripted or outlined presentations and discussion guides;

(g) training aids and job aids;

(h) pre-tests and post-tests;

(i) criteria and methodology for measuring performance in the classroom and in the shop/field;

(j) instructions for using any audiovisual support, training mock-ups, and scale models;

(k) detailed instructions for managing any on-the job training.

iii). Training Aids

(1) The Contractor shall provide training aids, such as training mock-ups, scale models, PowerPoint presentations, video recorded demonstrations, diagnostic testing equipment and any special tools required. **[CDRL 23-18]**

(2) These training aids shall become the property of Amtrak upon the completion of the training program.

(3) Any training mockups shall be separate and distinct from mockups provided during design review unless explicitly approved for training purposes by Amtrak.

(4) If Contractor proposes to provide a full size completed car in lieu of the mockups required in Chapter 3, Contractor must still meet the training aid requirements unless otherwise approved by Amtrak.

iv). Student Workbooks

(1) The Contractor shall provide, for each course, a student workbook **[CDRL 23-19]**, which shall include course agenda, course objectives, schedule of sessions, paper copies of PowerPoint presentations, lecture outlines, lesson summaries and any other information that will facilitate the learning process.

(a) The Contractor shall provide a copy of any course materials in the workbook.

(b) Color copies must be used where it is needed to communicate the training concepts in the document/course.

(2) The training program shall be conducted prior to the start of the new equipment in revenue service.

(3) The Contractor shall develop a training action plan and schedule and submit it to Amtrak within 90 days of Notice to Proceed (NTP), and shall update it periodically, to be submitted with program meeting minutes. **[CDRL 23-01]**

(4) Contractor shall provide paper and electronic (editable and PDF) copies of all training materials at the completion of the training program and shall become the property of Amtrak for unrestricted use for future training purposes.

23.10 Equipment Summary Report

a). In support of Amtrak providing critical information regarding the new rolling stock supplied under this contract to both host railroads and private car owners, the Contractor shall develop and submit for Amtrak review and approval an Equipment Summary Report during Final Design Review. **[CDRL 23-21]**

b). Thirty (30) days prior to the start of Final Design Review, the Contractor shall submit an outline for the Equipment Summary Report for Amtrak review and

approval. **[CDRL 23-20]**

i). The outline shall list all content topics which shall be included in the Equipment Summary Report.

c). The Equipment Summary Report shall compile all information with regarding to operation of equipment including clearance, trainlines and backward compatibility.

d). The Equipment Summary Report shall also include any information require for the modification of a private railcar for operation in consist with the new equipment.

e). At a minimum, the Equipment Summary Report shall include the following:

i). A high-level description of the cars, presenting overall capacities, accommodations, and door locations.

ii). The range of road numbers for each car type.

iii). Any waivers requested from or granted by the Federal Railroad Administration (FRA), or other Federal safety regulations required for the testing or revenue service operation of this equipment.

iv). A detailed description of the equipment, including:

(1) Clearance Outline

(2) Allowable top speed

(3) Braking control, compatibility, and performance

(4) Structural strength and crashworthiness characteristics

(5) Noise and vibration limits

(6) Cybersecurity implementation

(7) Track negotiation (e.g. minimum radius curve (both vertical and horizontal, cant deficiency, super elevation, FRA track classes)

(8) Compliance with Regulatory Agencies and Industry Standards and Recommended Practices.

(9) Trainlines including HEP, discrete and digital.

(10) Coupler, diaphragm and gangway.

v). The Equipment Summary Report shall also include a brief summary of the qualification and routine testing performed on the equipment to validated suitability for service.

(1) The testing summary shall include a description of all track testing performed both on and off Amtrak property.

vi). The Equipment Summary Report shall include a high-level summary of the Quality Control program for the equipment.

vii). The Equipment Summary Report shall summarize the development and submittal of operations and maintenance manuals, plans and training.

(1) This shall cover work to be provided by both the rolling stock and the TSSSA contracts.

viii). The Equipment Summary Report shall include an annotated plan view and elevation for each car type including outline dimensions, interior arrangement and external livery.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

23.11 CDRLs

CDRL	Description	Due
CDRL 23-01	Training Action Plan	90 days after NTP with on-going updates
CDRL 23-02	Preliminary As-Built Drawings	180 days prior to the delivery of the 1st batch of cars
CDRL 23-03	As Built Drawings	30 days after delivery of first batch of cars
CDRL 23-04	Electronic Documentation Delivery	Within 30 days after the last car of the base order is shipped
CDRL 23-05	Photographs-Car Assembly	30 days after completion and acceptance of first of each car type
CDRL 23-06	Photographs-Completed Car	30 days after completion and acceptance of first of each car type
CDRL 23-07	Conformed Specification	30 days after completion of each car type
CDRL 23-08	Master Manual Plan	90 days before completion of first car
CDRL 23-09	First Draft of Manuals	90 days before completion of first car
CDRL 23-10	Manual Updates	After delivery of the first car, and continuing through the end of the warranty period
CDRL 23-11	WMS Implementation	360 days prior to shipment of first batch of cars
CDRL 23-12	Service and Cleaning Manual & Maintenance and Inspection Manual	30 days prior to IDR with on-going updates
CDRL 23-13	Illustrated Parts Catalog	30 days prior to shipment of first batch of cars
CDRL 23-14	Car History Book	30 days prior to shipment of first batch of cars
CDRL 23-15	User Training Program	360 days prior to shipment of first batch of cars
CDRL 23-16	Draft copies of Training Material	360 days prior to shipment of first batch of cars
CDRL 23-17	Instructor Guide	360 days prior to shipment of first batch of cars
CDRL 23-18	Training Aids	360 days prior to shipment of first batch of cars
CDRL 23-19	Student Workbooks	360 days prior to shipment of first batch of cars
CDRL 23-20	Equipment Summary Report Outline	30 days prior to the start of Final Design Review
CDRL 23-21	Equipment Summary Report	Prior to the completion of Final Design Review

Amtrak Universal Single Level Fleet Replacement

Technical Specification

---

24. Diagnostics and Test Equipment

Revision 2

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Table of Contents

24.1 Overview 24-1
24.2 Subsystem Integration 24-2
24.3 Central Diagnostics Unit 24-4
24.4 Car Temperature Monitoring 24-6
24.5 Portable Test Equipment 24-8
24.6 Bench Test Equipment 24-10
24.7 Air Brake Test Rack Adapters 24-11
24.8 CDRLs 24-11

24.1 Overview

a). This chapter defines the hardware and software requirements and describes the basic structure that shall form the diagnostic and fault reporting system used on each car.

b). The system shall supply two levels of diagnostic information.

i). A simplified system using indicator lights, fault status and system status screens shall inform the train crew of failures affecting train operation, and a detailed diagnostic level shall be used by maintenance personnel which shall include detailed fault and system status information. Special consideration may be required in order to outfit each delivery batch with the minimum amount of equipment needed for a functioning diagnostic system.

c). Faults and status information shall be available remotely and shall also be downloadable utilizing standard connectors which shall function as a Portable Test Unit (PTU).

d). Fault information from the individual car systems shall be sent to the central database location on each car for storage and display, which shall allow remote status access through an online portal, downloading of the reported faults via wireless or wayside connection, or hardwire downloading via standard connections.

e). The CDU and HMI screens shall also allow consist-wide control software and database updates to car level systems and the monitoring of certain system level parameters on a real-time basis.

f). The Contractor shall submit a detailed functional description of the Diagnostic System to Amtrak for review and approval. **[CDRL 24-01]**

g). The CDU, HMI and car-level connector for the PTU shall be in Amtrak-approved interior locations, to be finalized during design review.

h). The diagnostic and fault reporting system shall provide sufficient information to enable operations and maintenance personnel to assess the operational readiness and suitability for service of each car and shall provide detailed failure information sufficient to enable maintenance personnel to troubleshoot and isolate failures down to the lowest replaceable unit level and confirm proper operation upon replacement.

i). PTU shall not be required for routine maintenance or routine replacement of components.

j). Tests, resets, or configuration adjustments during any routine maintenance activity shall be able to be accomplished through the Diagnostic System HMI displays.

k). As part of the acceptance testing of the test equipment, the Contractor shall fully demonstrate the function of each type of test equipment being supplied, once delivered and setup in the shop facility.

l). All on-board test equipment and the Central Diagnostics Unit and HMI screen shall be tested as part of the car-level First Article Inspection.

i). This shall include the demonstration of the ability to change password-protected program parameters in all available car systems.

m). Portable test equipment shall be tested on the first batch of cars following delivery.

n). All diagnostic connection ports for the PTUs throughout all cars, regardless of subsystem, shall make use of standard connections.

o). No proprietary cables, connectors, accessories or wiring shall be required to run or copy diagnostic programs, or to copy or upload new software to any piece of equipment on the cars, including at the Central Diagnostics Unit.

p). The CDU shall serve as the source of network time for all microprocessor systems connected via Ethernet, with time synchronized between CDU systems throughout the train network.

q). All carborne equipment clock time shall use the GPS obtained Coordinated Universal Time (UTC).

i). It shall be the responsibility of the Contractor to enforce this requirement for all car systems.

r). The Contractor shall make all modifications to test equipment specified herein which are required because of changes and modifications made to the cars or any of its systems or subsystems to meet the requirements of this Contract.

s). The Contractor shall maintain a master database of all software and its current revision level used for each type of diagnostic and test equipment being supplied for the fleet replacement program, including onboard and shop equipment, until the conclusion of car warranty.

t). All shop support equipment shall be covered in Exhibit G, Technical Support, Spares and Supplies Agreement (TSSSA); however, in the event that the TSSSA is not executed or terminated, the Contractor is responsible for providing all shop support equipment to Amtrak as outlined in this Chapter.

u). Passengers shall not be able to access any security ports at any time on any car. Proper attention must be paid to cabinet keys and locations to secure the car and prevent any potential threats.

24.2 Subsystem Integration

a). Each intelligent subsystem shall include status monitoring, self-diagnostic, fault-detection, recording, and troubleshooting capability including, but not limited to, the following systems:

i). Air Brake/Wheelslide

ii). Truck/Ride Quality

iii). Powered Doors, Trap Doors, & Folding Steps

iv). HVAC

v). Lighting Controllers

vi). OTIS/PA/Train Information

vii). Battery/Chargers/Power Systems

viii). Food Service Equipment (appliances)

ix). Water and Waste (tank levels, etc.)

x). Automatic Vehicle Location System/GPS

xi). Car Temperature Monitoring

xii). Smoke Detectors and Fire Suppression

b). On-board testing shall be either internal, using self-contained diagnostic routines, or external, using a portable tester, or may be a combination of both techniques.

i). Systems which are microprocessor-based shall use both techniques, incorporating an internal self-test routine which can be initiated and monitored through the CDU HMI, without use of a portable tester.

c). The built-in diagnostic test routines shall be used for the testing of all power circuit devices.

d). All power circuit devices shall be testable without the need to remove any connections to the device from the circuit.

e). The on-board test routine shall apply high current or high voltage to the device as appropriate to check calibration and perform failure diagnosis.

i). Provisions shall be supplied to accept a clamp-on current sensor for high current-in circuit calibration checks and jacks for high voltage isolated probes for in-circuit calibration checks.

f). The systems shall constantly monitor their own system health and report problems as a fault to the CDU.

g). Faults shall be stored at the CDU for remote access or later retrieval using the PTU.

h). Each stored fault shall contain car status information at the time of the fault, such as, handle position, speed, temperature, etc., in addition to the actual problem or failure.

i). The CDU shall also be designed to include a real-time data recorder capable of recording no less than 30 days worth of status information from all subsystems.

j). The data recorder shall have both pre-trigger and post trigger recording capabilities and shall be fully configurable from the PTU.

i). It shall record both analog and digital channels selectable by the PTU.

k). Triggers shall utilize the pre-assigned system faults and it shall also be possible to trigger on configurable equations based on one or more analog or digital channels when a selected threshold has been exceeded, or at a specified time interval.

l). Sampling rates shall be selectable and based on the actual sampling capabilities of the subsystem hardware, with 20 Hz being the minimum.

m). All signals, including all subsystem inputs and outputs as well as calculated values shall be transmitted to the CDU to facilitate real-time data recording.

n). Set-up parameters and data shall be stored in non-volatile memory. Recorded data shall be downloadable to the PTU, which shall convert the data into a chart recorder type display format that can be displayed, printed and saved to removable media.

i). The system design shall be approved by Amtrak during design review. **[CDRL 24-02]**

24.3 Central Diagnostics Unit

a). The Contractor shall supply a Central Diagnostics Unit (CDU) and HMI touch screen on each car for use by Amtrak personnel.

b). The HMI touch screen shall display train and car status, event and failure information useful to operations, maintenance, and engineering personnel.

c). Faults downloaded by the PTU shall not be automatically deleted from memory, so that they can be downloaded and included into the maintenance database.

d). Using the CDU and HMI screens, it shall be possible to ascertain the current software version of all software configuration items installed on the train, as approved by Amtrak.

e). From the CDU and HMI screens, it shall be possible to upload new control software to all microprocessors on a train basis (except the systems as deemed safety sensitive during design review, which require update via the subsystems local PTU port).

i). The proposed design shall allow updates to the OTIS content via methods approved by Amtrak.

f). The CDU shall also be capable of providing train-level information over the digital trainlines to the train crew using an HMI touch screen in an approved location.

g). The contractor shall utilize the HMI touch screen devices defined in Chapter 14.

h). The HMI screen shall alert the train crew of major system faults, such as brake problems, HVAC failures, HEP problems, water/waste problems, door problems,

and/or other major failures, as approved by Amtrak.

i). It is intended that this data supplied to the train crew be simplified in nature.

i). Fault information shall be given for all major system failures which require that they be reported to the Amtrak Operations Center (CNOC) or that require a change in operating procedure, as approved by Amtrak.

j). The HMI screen shall also provide train wide subsystem status information to operations and maintenance personnel.

k). The Contractor shall submit for Amtrak review and approval a Fault Management Plan. **[CDRL 24-03]**

i). The Fault Management Plan shall include a fault listing, detailed description of each fault, detailed description of the triggering condition for each fault, conditions required to reset the fault, details of any lockout imposed by the subsystem for the fault, and attributes for each fault.

ii). Attributes shall include whether a fault will be recorded by the subsystem and/or CDU, whether a snapshot will be triggered, the criticality of the fault, if the fault will trigger an alarm for the operator or crew, whether the fault is accessible to crew or maintainers, or if the fault should trigger immediate message to the wayside server.

iii). Additional attributes may be defined by Amtrak during design review. Faults shall be able to be added by use of equation base on subsystem signals and faults for multiple systems similar to the fault trigger requirements listed in section 24.2.k.

l). It is the intent to have maintenance personnel review the faults from the CDU to determine if a problem exists on a car and/or Consist.

i). The Central Diagnostics Unit shall provide the capability to monitor system status, faults and data in real time by maintenance personnel.

ii). The system data to be monitored shall be selectable by use of the PTU or through configuration on the CDU HMI screen. An approved touch screen display shall be provided to view the selected system data in real time.

iii). The CDU shall be designed to be extensible, with the understanding that additions and subtractions of systems on the vehicle will occur throughout the life of the vehicle.

iv). The CDU shall be configurable to add or remove systems using a defined interface. The car builder shall be responsible for developing and providing a CDU system interface document that can be used for future additions or subtractions to the system.

m). The Contractor shall provide a highly available database backed web-based Wayside Server system for installation at an Amtrak datacenter.

n). The CDU shall interface with the wayside and shall be capable of communication

to the server enroute.

o). This system shall enable Amtrak personnel to download faults remotely and view live status information on the cars remotely through an online portal.

p). The system shall allow automatic, scheduled, and manual requests for transfer of status, fault, software configuration and real-time data recorder information.

i). It shall be capable of configuring condition-based alerts and alarms of differing severities to various distribution lists, subject to design review.

q). Cars shall be capable of automatically reporting car number and faults at set locations for car tracking and repair.

i). This system shall also allow uploading and updating OTIS content.

ii). The system shall be utilized through an approved multi-carrier cellular and WiFi communication device which shall be configured and integrated in the vehicle which shall be as transparent to connected systems as practical to allow future technology upgrades or changes with minimal impact to ancillary systems.

iii). Wireless data communications shall be encrypted and protected against intrusion.

iv). The design and capabilities of the wayside server system and design of train to wayside interface shall be submitted to Amtrak for review and approval. **[CDRL 24-04]**

r). The Contractor shall provide an analysis of the potential effects of various possible security attacks on network transmissions and the operation and effectiveness of the measures taken to ensure the security and safety of the networks and equipment.

i). The security analysis shall be guided by IEC/ISO 27000 series standards. This document shall be submitted for Amtrak review and approval. **[CDRL 24-05]**

s). Information on the Amtrak server, communication protocols, and cyber security shall be provided.

t). For enroute communication in areas with limited communication capability, faults and diagnostic information shall be stored for transmission when communication capability returns.

24.4 Car Temperature Monitoring

a). Each food service car shall be outfitted with a remote temperature monitoring system.

i). This system shall operate as a semi-independent portion of the CDU or shall be a separate system.

ii). The temperature monitoring system shall have power provided to it by the car when Head End Power (HEP) is present and have an internal rechargeable and replaceable battery back-up power supply capable of powering the unit and transmitter for at least 12 hours without power from the HEP or car batteries.

iii). The design of the Car Temperature Monitoring system shall be submitted to Amtrak for review and approval. **[CDRL 24-06]**

b). The temperature monitoring system shall include global positioning information, a sensor to monitor whether HEP is being provided to the car, a sensor to detect whether the main water supply tank is empty, two temperature inputs, and a carbody based accelerometer.

i). One temperature input shall measure water temperature in a relatively cold location characteristic of where water would be most likely to freeze on the car.

(1) This may be on the outside of a water pipe as long as the area is well insulated outside the sensor and it is measuring the pipe temperature.

ii). The other temperature input shall be the ambient air temperature inside the car.

c). The power sensor shall include a delay feature that only signals that the HEP power is off when longer than three (3) minutes.

d). An exterior temperature sensor or Global Positioning Information shall be used to determine local ambient air temperatures.

e). The temperature monitoring system shall have a communication system to transmit data from the car via cellular and Wi-Fi communication links.

i). It shall send the car number, location, speed, direction, temperatures, HEP on/off status, and water tank status every thirty (30) minutes.

ii). When the outside temperature is below 32 F, it will transmit every fifteen (15) minutes.

f). While a proprietary database and tracking system may be provided by the Contractor for installation on Amtrak infrastructure, the database and tracking system shall be capable of communicating all information over to the same server utilized by the CDU.

g). The interface control document and a means to adjust the destination for the temperature monitoring system messages shall be provided for Amtrak review and approval.

h). The tracking system shall allow alerts to be sent to different distribution lists of personnel developed by Amtrak, such that when a car is at a facility and in danger of freezing, an urgent alert may be sent by text and/or email to the relevant Mechanical personnel at just that location.

i). It shall be possible to trigger the alert based on the status of any variable sent, or by how long any of the variables has been in a certain state or below a set threshold.

ii). Amtrak shall have the ability to change the criteria and thresholds for alerts, car makeup, and the lists they are sent to, without requiring Contractor or sub-contractor assistance.

24.5 Portable Test Equipment

a). The Contractor shall furnish eight complete sets for each Terminal Depot (including cables, connectors, associated equipment required to interface with the car, instructions, software, chargers, etc.) of all portable test equipment required to perform in-service testing necessary to verify proper operation of all car subsystems prior to the delivery of the first batch of cars. **[CDRL 24-07]**

i). Eight additional sets of all portable test equipment shall be delivered during production delivery. **[CDRL 24-08]**

b). All parts used in the construction of diagnostic test equipment shall be sufficiently rugged for a railroad shop environment and approved by Amtrak during design reviews.

i). Where necessary, it shall include cases and water-resistant seals and switches.

ii). It shall have prior successful experience in similar railroad or transit car workshops and shall use the latest version of Microsoft Windows operating system at time of delivery or approved equal.

c). Each PTU shall be supplied with a carrying case which includes a communications cable and two extra sets of extended-life rechargeable batteries.

d). The PTUs generally shall be of the highest performance level systems available in the commercial marketplace at the time of the first batch of car delivery and shall be approved by Amtrak.

i). All equipment shall be registered by the Purchaser in Amtrak's name, as directed by Amtrak.

e). The Contractor shall provide drawings of the test equipment.

i). Each piece of test equipment, excluding the PTU itself, shall be accompanied with the complete diagrams, schematics and maintenance, parts information and calibration instructions for the device and its intended use and repair.

ii). These shall be supplied as part of the maintenance manuals.

f). All portable testers shall be rugged and suitable for the shop environment.

i). Weight shall not exceed 20 pounds.

ii). There shall be no high voltage connections (greater than 150 volts) required between the car and any portable test device.

iii). It shall not be necessary to remove, dislodge, dismount or disconnect any component in order to use or connect the portable test devices.

g). The function of the portable test devices shall be to produce all of the operating commands and other input signals necessary to fully exercise all functions and components of the particular system under test, and to measure or indicate all of the signals, responses and outputs produced by a system by means of indicators such as lamps, meters, oscilloscopes, gauges, etc.

i). It will be acceptable to require a visual check for system response such as closure of a contactor or a relay, or lighting an indicator, provided that the responding item of equipment does not require the test device engineer to move more than 15 feet to make the required observation.

h). The portable testers will supplement the built-in diagnostic features specified herein for particular subsystems and in those cases shall not duplicate the specified features but shall complement them by providing deeper and more comprehensive diagnostic capability.

i). The portable test device shall not be used to calibrate high-current and high-voltage devices.

i). It shall not be permissible to require connection of external apparatus to the portable test devices without the prior written approval of Amtrak.

i). In such cases, terminals shall be provided to allow connection of the required apparatus to the portable test device.

ii). However, such apparatus shall be considered part of the portable test device and shall be supplied with it on a one-to-one basis.

iii). Portable test equipment shall be supplied for, but not limited to, the following:

(1) Air Brake/Wheelslide

(2) Truck/Ride Quality

(3) Powered Doors, Trap Doors, & Folding Steps

(4) HVAC

(5) Lighting Controllers

(6) OTIS/PA/Train Information

(7) Battery/Chargers/Power Systems

(8) Food Service Equipment (appliances)

(9) Water and Waste (tank levels, etc.)

(10) Automatic Vehicle Location System/GPS

(11) Car Temperature Monitoring

(12) Smoke Detectors and Fire Suppression

24.6 Bench Test Equipment

a). To allow the proper testing, troubleshooting and calibration of car components on a test bench in a specialized workshop environment, the Contractor shall supply 1 (one) complete sets of each type of bench type shop test equipment for each Terminal Depot, to be delivered by the fifth car. **[CDRL 24-09]**

i). Each tester shall be delivered as a completely wired and assembled unit and use shop electrical power and/or compressed air.

ii). Each tester shall have a receptacle for connecting to the device under test.

iii). The connections to the device under test, if not contained in the receptacle, shall be from the front of the tester and shall have provisions to neatly store out of the way when not needed.

iv). The Contractor shall coordinate to ensure compatibility with maintenance facilities.

b). Testers shall be used for the purposes of testing, troubleshooting, and calibrating electric, electronic, mechanical, pneumatic and electro-mechanical components of each car subsystem.

i). They shall contain provisions for the rapid testing, troubleshooting and calibration of each system LRU.

ii). Design of the testers shall be such that all inputs can be varied over the full working range of the device.

c). The bench test equipment shall be automated to the extent possible.

i). If the unit under test is defective, the bench test unit shall allow the technician to troubleshoot the unit to determine which component is defective.

ii). It shall also include a manual mode to allow application of inputs to the unit under test as selected by the technician for troubleshooting.

d). Shop test equipment shall be provided for, but not limited to, the following:

i). Wheelslide control unit

ii). Low voltage power supplies

iii). Brake units and controls

iv). All printed circuit boards

v). Plug-in relays

vi). Lighting Controllers

vii). OTIS/PA

viii). Battery/Chargers/Power Systems

ix). Food Service Equipment

x). Water and Waste

xi). Automatic Vehicle Location System/GPS

xii). HVAC units

xiii). Car wiring

xiv). Microprocessor, EPROM, EEPROM's and other electronic device reprogramming for all car systems, except as approved by Amtrak

xv). All electronic units not identified above

24.7 Air Brake Test Rack Adapters

a). The Contractor shall supply by delivery of the fifth car of two (2) sets of brake rack adapters at each Terminal Depot to allow the mounting of each car's friction brake and pneumatic system valve or control device (and coupler pneumatic control devices, if necessary) to the existing Amtrak brake test racks.

i). Each adapter shall be a complete, unitized assembly for each valve, without the need to assemble loose hoses, fittings, etc. for use.

b). The Contractor shall inspect the Amtrak current air brake test racks and inventory all current brake rack adapters.

c). Complete parts lists, drawings and tabulations giving the proper adapter for each device shall be provided.

d). The air brake system test rack adapters and its details shall be approved by Amtrak. **[CDRL 24-10]**

Table of Figures

Figure 25-1: Hazard Severity Categories 25-8
Figure 25-2: Hazard Frequency Levels 25-9
Figure 25-3: Risk Matrix 25-10

25.1 Overview

a). Safety is of primary importance in the design of these cars.

b). The cars shall present a safe, hazard-free environment to passengers, crew members and the public.

c). Compliance to the specification, as well as all applicable laws, regulations and standards must be achieved.

d). The Contractor shall research NTSB passenger train accident reports and ensure the past mistakes relevant to train design are avoided. Passage from car to car shall be easy and safe.

e). No sharp edges or corners or pinch points shall occur where passengers, crew, or maintenance personnel may come into contact with them.

f). Adequate handholds shall be provided throughout the car. Handhold placement shall consider the needs of semi-ambulatory individuals, and the risks associated with walking in a moving train.

g). Passengers and crew shall not be exposed to tripping hazards, exposed electrical voltage, toxic materials or similar hazards.

h). Location, illumination levels, colors, graphics and surface finishes shall be selected to maximize visibility of door thresholds, controls and other objects with which the passengers and crew must interface.

i). Normal and emergency equipment and controls which the passenger or crew may operate shall be clearly identified, and operating procedures shall be presented in both text and graphic formats.

j). Passenger emergency signs shall also be embossed in Braille raised typeface unless otherwise approved.

k). Power capacitors shall self-discharge.

l). Refer to signage requirements in Chapters 11 and 29.

25.2 General Safety Design Requirements

a). The general safety design requirements and the guidelines listed below shall be incorporated into the design of all car systems affecting safety.

b). Only components with high reliability and predictable failure modes, and which have been proven in conditions similar to the projected service shall be utilized.

c). Whenever possible, all systems are to be designed to prevent single point failures from negating the ability of such systems to perform safely as intended.

d). All systems that passengers or crew members interact with shall be designed with best ergonomic practices, taking into consideration human factor principles.

e). All electronic circuits shall be assumed capable of failing in permissive modes.

f). Software shall be considered capable of failing in an unsafe mode unless it is safety verified while operating in the proposed hardware.

g). All safety circuits not wholly within an enclosure shall be of a double-wire, double-break design.

h). Systems shall be based on closed circuit principles in which energized circuits result in permissive conditions, while interrupted or de-energized circuits result in restrictive conditions.

i). Any component or wire becoming grounded shall not cause a permissive condition. Safety circuits shall be kept free of any combination of grounds that will permit a flow of current equal to, or in excess of 75% of the release value of any safety device in the circuit.

j). Circuit impedance, signal encoding, shielding, layout and isolation shall be selected to reduce the effects of interference to the extent that safety is maintained under all conditions.

k). Commands that result in permissive conditions shall be propagated by no less than two independent signals, both of which must be present before the permissive condition can occur. The lack of either signal shall be interpreted as a restrictive command.

l). Systems controlled by variable level signals shall be arranged such that zero signal level results in the most restrictive condition. At least one enabling signal, however, independent from the variable control signal, shall be present before the control signal can modulate the system to a more permissive level.

m). Wires for safety critical trainline functions shall not be located at the bottom pins of cable connectors mounted in areas where water incursion may occur.

n). The location of pins and wires of safety critical circuits in connectors shall be designed to minimize the possibility of unsafe conditions resulting from shorts to adjacent pins or wires.

o). Circuit breakers shall be guaranteed by the manufacturer to successfully interrupt rated currents. Circuit breakers shall be applied such that the maximum circuit fault currents cannot exceed the manufacturer’s guaranteed operating ranges.

p). Systems that rely on structural integrity for safety shall have sufficient safety factors such that failures are not possible within the life of the car under all possible normal conditions.

q). Systems and devices subject to wear shall not wear to unsafe or permissive states within a period that is no less than three times the specified periodic maintenance interval under the worst-case combination of duty cycle, environment and all other influences. Such systems and devices shall be clearly indicated in the maintenance manuals.

r). Mechanical systems which apply force to achieve safe states shall not depend upon the application of fluid pressure or electrical energy, unless specifically approved.

s). All locks, catches, and similar devices affecting safety shall be passive with no other effort required to achieve the safe state.

t). All systems shall function safely under all combinations of supply voltages, fluid pressures, shock, vibration, dirt accumulation and the railroad environment.

u). All safety related systems, and devices within those systems, shall be clearly identified in all operation and maintenance manuals, procedures, and training materials.

v). Exposure of maintenance personnel to lethal or injurious voltages shall be minimized through compartmentalization, interlocks, lock out, tag out provisions, and similar measures.

w). Exposure of maintenance personnel to occupational injury/illness risks shall be minimized through ergonomic measures.

x). All equipment containing hazardous materials, lethal or injurious voltages, or other risks shall be clearly labeled on both the outside and inside of the equipment.

y). No sequence of operations, or the simultaneous activation of any controls, shall result in unsafe conditions.

z). All systems shall protect against unsafe conditions resulting from human error.

aa). The Amtrak maintenance facilities and storage yards only have ground-level access at track bed height. It is required that the cars have the capability for ground-level access for maintenance access, passenger emergency evacuation and fire/rescue access to the car interior.

bb). Contractor shall identify all safety enhancements to improve situational awareness and overall passenger and crew safety. Additional safety enhancements may be proposed based on emergent technologies (i.e.: alerts for locational awareness or fatigue/attention) or on innovative approaches in vehicle design.

25.3 Safety Certification Program

a). The contractor shall conduct a Safety Program throughout new design, manufacturing, testing, pre-revenue operations, and warranty to ensure that the vehicle achieves a level of safety consistent with the Amtrak network.

b). The Safety Program shall identify potential hazards and initiate actions to eliminate or control them to an acceptable level.

c). It is Amtrak’s intention to conduct a Safety Certification Program. The Contractor and sub-suppliers shall support Amtrak in the Safety Certification process.

25.4 System Safety Program Plan

a). The Contractor shall develop, implement and maintain a comprehensive System Safety Program Plan (SSPP) conforming to the Federal Transit Administration (FTA) Handbook for Transit Safety and Security Certification (FTA-MA-90-5006-02-01), Final Report," November 2002; the latest Amtrak System Safety Program Plan; and any other applicable Federal guidelines or requirements. **[CDRL 25-01]**

b). This SSPP shall assess, analyze and document the safety aspects of all components, systems, managements and materials used on the cars, and the operation, maintenance, repair and performance of those components, materials and systems, from the viewpoint of crews and passengers.

c). The SSPP shall identify all hazards related to the cars and shall impose design requirements and management controls, in addition to those identified in this Technical Specification, to prevent unsafe conditions by eliminating hazards or reducing risk to levels acceptable to Amtrak.

d). The SSPP shall be developed in the earliest phases of the Contract and shall be continuously maintained throughout, as design and construction evolve.

e). The formats for reports, listings, analyses and other required submittals shall be jointly determined between Amtrak and the Contractor.

f). The SSPP shall include a software safety section which applies to any embedded or external software or firmware which controls or monitors safety-critical functions.

g). Software safety requirements shall treat software as an integral part of a hardware/software system.

h). Functions accomplished through the use of software shall be considered safety critical unless an independent redundant hardware means is also provided to accomplish the same function. Refer to Chapters 26, 27 and 28 for more details.

i). Features of the software safety program shall include a description of how the following shall be accomplished: definition, implementation and oversight of the software design and verification process, integrity of the documentation, software hazard analysis, software safety reviews, software hazard monitoring, reporting and tracking, and software integration with hardware at each stage of the design and testing process for components, subsystems, systems, and cars. incorporating software for safety-critical functions. Refer to Chapter 26, 27 and 28 for more details.

j). All systems affecting safety shall undergo a thorough safety review as part of the design review process, with emphasis on credible faults, results, risk, etc. Requirements of 49 CFR 238.105 and other applicable parts of 49 CFR 238 Subpart - B shall be met as part of this review. It shall include, but not be limited to:

   i). Brake control/Anti-Wheel Slide

   ii). Truck

   iii). Smoke/Fire Alarm system

iv). Fire suppression

v). Emergency access & egress

vi). Door system

vii). Windows

viii). Communication (Radios & Public Address Systems)

k). The completed SSPP shall be submitted to Amtrak for review and approval within 60 days of NTP.

25.5 Preliminary Hazard List (PHL)

a). The Contractor shall within 60 days of NTP provide an initial Hazard list.

b). This hazard list shall identify all potential hazards associated with the vehicle including those caused by, mechanical failures, electrical/electronic component failures, software errors or defects, environmental impacts, human error, maintenance, and operational conditions. **[CDRL 25-02]**

25.6 Preliminary Hazard Analysis (PHA)

a). Based on the approved Hazard list the Contractor shall provide a Preliminary Hazard Analysis which defines the potential cause of the hazards, the probability of the hazard, the severity of the hazards, potential or proposed mitigation and the residual probability and severity.

b). The PHA shall be submitted 30 days prior to any Preliminary Design Reviews. **[CDRL 25-03]**

25.7 Hazard Tracking Log (HTL)

a). Based on the approved PHA the contractor shall develop a Hazard Tracking Log.

i). The HTL shall use Amtrak's preferred hazard tracking log methodology, definitions and system of entry.

b). This HTL shall track the status of all supporting documentation for each of the hazards.

c). All hazards in the Hazard Tracking Log must be closed for Safety Certification to be closed.

d). The HTL shall be submitted 30 days prior to any Final Design Reviews and be updated monthly until approved. **[CDRL 25-04]**

25.8 Failure Modes, Effects and Criticality Analysis (FMECA)

a). The Contractor shall provide a comprehensive FMECA(s) for all components on the vehicle.

b). For the purpose of this section, components shall be defined as hardware, electronic/electronic components and software at a minimum it shall be to the level of an assembly (i.e. relay, contactor, actuator, valve, switch etc.) but many be to sub assembly level if required by the authority in order to more clearly define the hazard.

c). The FMECA shall also identify if the failure is annunciated.

d). In the event that the failure is not announced, the analysis shall be extended to include subsequent failures until the subsequent failure is annunciated.

e). The FMECA shall be submitted as part of the IDR and FDR submittals. **[CDRL 25-05]**

f). Information provided in the FMECA shall include:

i). A system overview including schematics.

ii). A complete list of system and subsystem components that will be analyzed.

iii). Identification of the “modes” or ways the components can fail.

iv). Assessment of the effects of the failure on the system.

v). Determination of the severity and probability of failure.

vi). Determination whether the failure is a single-point failure.

vii). Determination of methods to eliminate or control the identified failure.

viii). Identification of single-point failures and hazard-level categorization, which should confirm the adequacy of fail-safe design features.

25.9 Fault Tree Analysis (FTA)

a). The Contractor shall provide a quantifiable Fault Tree Analysis for all Category/Severity one and two hazards.

b). These fault trees analyses shall be fully integrated across sub system such that if events span multiple sub systems the top event vehicle level hazard reflects all sub system events.

c). The FTA shall be submitted prior to FDR. **[CDRL 25-06]**

25.10 Subsystem Hazard Analysis (SSHA)

a). The Contractor shall submit a subsystem hazard analysis for each vehicle subsystem.

b). These subsystems safety analysis shall include subsystem Hazard Tracking log, FMECA, and FTA.

c). The documents shall be submitted as part of the IDR and FDR submittals. **[CDRL**

25-07]

25.11 Operating and Support Hazard Analysis (O&SHA)

a). The Contractor shall submit an Operating and Support Hazard Analysis (O&SHA) to identify and assess hazards introduced during system operation, maintenance, and support activities.

b). The O&SHA shall be submitted prior to FDR. **[CDRL 25-08]**

c). At a minimum, the analysis shall consider:

i). Hazards associated with personnel and procedures during operations, maintenance, and emergencies.

ii). Human interface during the on-car, off-car and facility-level support activities.

iii). Operations and maintenance tasks against human engineering factors, such as task complexity, system criticality, task frequency, new technology, known problems, etc.

iv). The context in which Operators and maintainers work.

25.12 Probability, Severity Risk

a). For the purpose of this Chapter, the Contractor shall utilize the following definition for hazard severity category, hazard frequency levels and acceptable risk.

b). For software failure probability rates used in the safety analysis, it shall be assumed that all software has a Safety Integrity Level (SIL) of zero as defined by EN-50128. For common mode failure of comingled or redundant software a BETA or common mode failure rate of one shall be assigned. Alternatively, if the Contractor can provide independent certification (i.e. TÜV certification) for a higher SIL level this may be used if approved by Amtrak. Refer to Chapters 26 and 27 for additional details.

c). Unless it is shown otherwise through daily test or preventative maintenance inspection the “Time at Risk” for all failures probabilities shall be design life of the vehicle. All time at risks shall be approved by Amtrak.

d). At a minimum, emergency brake application, emergency power removal, door opening, door/propulsion interlock and no motion detection shall be required to meet requirements for of Category I or II hazards for elimination of hazard or reduction of risk to an acceptable level.

e). Emergency brake control shall be fail-safe. No detectable single point failure in the friction brake system, or series of common-mode or common-cause failures added to any combination of undetected failures, can result in the availability of less than 75 percent of emergency braking effort in a train.

Figure 25-1: Hazard Severity Categories

Severity	Value	Meaning
Catastrophic	1	Risk realization expected to result in one or more of the following: death, permanent total disability, loss of passenger/crew occupied volume with equipment damage causing separations in structure, infrastructure damage due to railroad operations/activities that suspends service through the affected area for greater than 24 hours.
Critical	2	Risk realization expected to result in one or more of the following: permanent partial disability, injuries/illness that results in hospitalization, loss of passenger/crew occupied volume with equipment damage that causes openings but no separations in structure, infrastructure damage due to railroad operations/activities that suspends service through the affected area for greater than 2 and up to 24 hours.
Marginal	3	Risk realization expected to result in one or more of the following: injury or illness resulting in one or more lost workday(s), loss of passenger/crew occupied volume with equipment damage that causes no separations/openings in structure, infrastructure damage due to railroad operations/activities that suspends service through the affected area for more than 30 minutes and up to 2 hours.
Negligible	4	Risk realization expected to result in one or more of the following: injury or occupational illness that does not result in a lost workday, equipment damage that does not result in neither loss of passenger/crew occupied volume nor separations/openings in structure, infrastructure damage due to railroad operations/activities that does not suspend service or cause a delay through the affected area for more than a maximum of 30 minutes.

Figure 25-2: Hazard Frequency Levels

Likelihood	Value	Qualitative Meaning	Quantitative Meaning
Frequent	A	Opportunity for risk to be realized expected to occur often.	Probability of occurrence greater than or equal to 10^{-1} (10%) Continuously experienced throughout system life.
Probable	B	Opportunity for risk to be realized expected on a recurring basis.	Probability of occurrence less than 10^{-1} (10%) but greater than or equal to 10^{-2} (1%) Will occur frequently throughout the life of the system.
Occasional	C	Opportunity for risk to be realized expected to occur.	Probability of occurrence less than 10^{-2} (1%) but greater than or equal to 10^{-3} (0.1%) Will occur several times throughout life of the system.
Remote	D	Opportunity for risk to be realized not expected to occur but possible.	Probability of occurrence less than 10^{-3} (0.1%) but greater than or equal to 10^{-6} (0.0001%) Unlikely but can be reasonably expected to occur.
Improbable	E	Opportunity for risk to be realized not expected and almost inconceivable.	Probability of occurrence less than 10^{-6} (0.0001%) Unlikely to occur in the system life, but possible.

Figure 25-3: Risk Matrix

Risk Likelihood	**Risk Severity**			
	Catastrophic 1	Critical 2	Marginal 3	Negligible 4
Frequent – A	**1A** (Red)	**2A** (Red)	**3A** (Orange)	**4A** (Yellow)
Probable – B	**1B** (Red)	**2B** (Red)	**3B** (Orange)	**4B** (Yellow)
Occasional – C	**1C** (Red)	**2C** (Orange)	**3C** (Yellow)	**4C** (Green)
Remote – D	**1D** (Orange)	**2D** (Yellow)	**3D** (Yellow)	**4D** (Green)
Improbable – E	**1E** (Yellow)	**2E** (Yellow)	**3E** (Yellow)	**4E** (Green)

Hazard Risk Index (HRI)		
Red	1A, 2A, 1B, 2B, 1C	CEO/President approval required.
Orange	3A, 3B, 2C, 1D	CSO and Dept E3-Level approval required.
Yellow	4A, 4B, 3C, 2D, 3D, 1E, 2E, 3E	Dept E2-Level and VP Operations Safety approval required.
Green	4C, 4D, 4E	Dept E1-Level approval required

25.13 Hazard Resolution Process

a). The overall goal of a system safety program is to design systems that do not contain hazards. However, the nature of most complex systems makes it impossible or impractical to design them completely hazard-free. As hazard analyses are performed, hazards will be identified that will require resolution. Risk management is a decision-making process consisting of evaluation and control of the severity and probability of a potentially hazardous event.

i). By assigning a Hazard Risk Index (HRI), a determination can be made as to whether hazards should be eliminated, controlled, or accepted. System safety precedence is a methodology that can be used by the Program Manager to define the order to be followed for satisfying system safety requirements and reducing risks. Alternatives for eliminating the specific hazard, or for controlling its associated risk, will have to be evaluated so that an acceptable method for risk reduction can be pursued.

b). It is not possible to remove all potential hazards from the railroad, and therefore a means for determining which hazards are acceptable is required. In general, the more severe the hazard, the more unlikely it should be.

c). For these cars, the following requirements have been established:

i). Hazards with an initial Hazard Risk Index of red or orange should be mitigated such that the Hazard Risk Index is reduced to HRI of yellow or green.

ii). Where it is not possible to reduce the risk to Level yellow or green, specific detailed analysis shall be provided by the Contractor to obtain approval of Amtrak. It should be noted that Amtrak would normally expect the Contractor to introduce design changes to reduce the risk to an acceptable level.

iii). Items with an HRI of red shall not be accepted.

iv). Items with an HRI of orange will only be accepted when it is proven to the satisfaction of Amtrak that the Contractor has exhausted all reasonable alternative approaches.

25.14 Fire Safety

a). Fire safety shall be achieved through adherence to the following requirements:

i). Those materials and products generally recognized to have highly toxic products of combustion shall not be used.

ii). All non-metallic components used on the vehicle shall be smoke, flame, and toxicity tested to NFPA 130, 49 CFR part 238, and BSS 7239.

(1) Maximum smoke developed, maximum flame spread indices, and toxicity emission limits shall be detailed in the specification.

iii). Materials used to fabricate miscellaneous, discontinuous small parts that will not contribute materially to fire growth in end-use configuration may be exempt from smoke, flame, and toxicity testing requirements with waivers approved by Amtrak.

iv). Exempt parts shall be less than 16 in² (100 cm²) in surface area in end-use configuration and may include, but are not limited to, the following:

(1) Knobs

(2) Rollers

(3) Fasteners

(4) Clips

(5) Grommets

(6) Small electrical parts

v). The Contractor shall submit for approval a list of all adhesives to be used on the vehicle, with a description of the physical, chemical, and fire safety properties of each. **[CDRL 25-09]**

(1) This requirement does not apply to adhesives used in extremely small quantities.

vi). The Contractor shall furnish a combustible material matrix including all combustible materials used in the vehicles showing all combustible

properties, weight (density), total surface area, total weight per vehicle, heat value per pound and per vehicle, flame spread, and flashpoint, and documentation references. **[CDRL 25-10]**

vii). All FST Test reports shall be within five years of Notice to Proceed (NTP). Any test reports that are older than five years, the contractor shall submit a letter from the material manufacturer stating the composition of the material has not changed. The material must be approved by Amtrak before use.

viii). All heat sources on the vehicle shall be protected with redundant levels of protection so that circuits are open before unsafe temperatures exist, neither ignition temperatures at the heating elements nor unsafe touch temperatures on the adjacent surfaces.

ix). Battery boxes, electrical cabinets, and the machine rooms shall be equipped with melting thermowire or thermocable to initiate a fire suppression via aerosol system when a fire or high temperature is detected.

x). Smoke Detectors shall be located in each fresh/return air mixing plenum and supply duct. Automatic dampers shall prevent external smoke from entering the vehicle.

xi). Smoke Detectors shall be mounted on the central ceiling panel. The smoke detector used in this location shall be identical to the smoke detectors used in other locations for ease of maintenance and replacement.

(1) All the smoke detectors shall have a strobe light and a sounder and should be rated for proper application on the railroad for shock and vibration.

xii). Smoke Detectors shall be installed in each sleeping accommodation and should be in a location that will be free of dust and debris to prevent false activation.

xiii). On-Board Crew shall be alerted if a smoke detector is activated.

xiv). Fire Suppression and Smoke Detection systems shall report alerts and failures to the diagnostic system.

xv). Protection from smoke and fire originating under the vehicle floor shall be proven through successful completion of a 30-minute floor fire test in accordance with ASTM E-119, NFPA 130, and 49 CFR, part 238.

xvi). Emergency egress shall be provided through vehicle end doors to adjacent cars.

xvii). Two fire extinguishers shall be located in each car.

xviii). The option of compartmentalized fire extinguishing, i.e., fire suppression in individual rooms instead of car wide, with water vaporization shall be considered and evaluated.

(1) For this option, the Fire Equipment Services (FES) shall have manual activation, e.g., at crew rest area, in addition to automatic activation.

xix). Windows intended for emergency escape or emergency access shall be designed for easily removable by a passenger, employee or rescuer and shattering of the glazing must not be required to remove the window.

xx). Trash containers shall be fire containing and prevent the propagation of fire outside of the enclosure.

b). The Contractor shall develop a Fire Safety Analysis complaint with 49 CFR 238.103(c) for the new equipment. The Analysis shall be submitted to Amtrak for Review and approval as part of FDR. **[CDRL 25-11]**

Table of Figures

Figure 26-1 System Assessment Categorization 26-3
Figure 26-2: Business Process Viewpoint 26-14

26.1 Overview

a). Background

i). Amtrak shall be provided with direct access to onboard, and offboard information in near-real-time via machine-to-machine communications with as little human involvement as possible. Data for each car shall be accessible independently as interoperability with the legacy fleet is required.

ii). In the rare event of a railway incident, Amtrak has a statutory obligation to provide information to regulatory authorities in support of their post-incident investigative activities.

iii). Contractor shall provide a secure, robust, and standardized Information Technology platform supporting both API-based access and data streaming, with streaming as the preferred method, to facilitate Amtrak's access to all data generated by and for the rolling stock, its onboard systems, and any and all wayside components under this contract.

iv). These APIs and/or streaming interfaces shall provide standardized integration points between any car and Amtrak's systems for the purpose of onboarding and offboarding information.

v). These APIs and/or streaming interfaces shall facilitate Amtrak design and development of all aspects of the customer experience solutions within its own content management and other programming facilities.

vi). The rolling stock and its systems shall support receiving content updates via these Amtrak systems or intermediary vendor services via APIs and/or streaming in.

vii). The Amtrak system shall be capable of retrieving telemetry, performance, events and other data from the trains or intermediary vendor services through both API-based interfaces and data streaming, supporting push, request/response, near-real-time, and real-time streaming data delivery mechanisms.

viii). More detailed integration requirements are specified in Section 26.6.

b). Required Integrations through API's/Streaming/T2G Amtrak Existing Architecture

i). At a minimum, the following data integrations shall be provided in these APIs:

(1) Journey programming for the On-Train Information System (OTIS) and any outputs from that system.

(2) Journey performance, including GPS track, announcements made, performance of on-board display screens, and errors identified after a completed journey is detected by the OTIS.

(3) Train handling including all events in the cab, by conductor staff, and by passengers.

(4) Train telemetry and events, including access to one-time and streamed process data from all onboard networks both in response to on-demand requests, configurable periodic transmissions from the train, and configurable event-based transmissions.

(5) Video surveillance system real-time and recorded video (if equipped)

(6) Event Recorder and Positive Train Control (PTC) data

(7) All other safety-related information

(8) Equipment faults, events and occurrences

(9) Train performance

(10) Automated measurements and readings

(11) Passenger Emergency Intercom requests and calls

(12) Attendant call requests and responses

(13) Reservation Display System

(14) Electronic Room Accommodation Door Lock System

(15) Data Communication System

(16) Network Intrusion Detection System

(17) HVAC Telemetry Data

c). Data & Information Ownership

i). All Information Technology components including applications, integrations, data and the corresponding infrastructure shall be delivered according to Amtrak Standards.

ii). The Solution Architecture, Designs, and Specifications shall be submitted for review and approval by Amtrak throughout the design reviews, with approval a condition of an acceptable Final Design Review (FDR). **[CDRL 26-01]**

iii). All data collected or generated by the system is the property of Amtrak and can be reused at Amtrak's discretion.

iv). All Information Technology components shall support both Operational and Cybersecurity monitoring in alignment with Amtrak Standards.

26.2 System Continuity, Criticality and Disaster Recovery

a). Amtrak System Assessment Methodology

i). Amtrak assesses and categorizes all systems according to impact on safety and business operations based on the matrix in Figure 26-1.

(1) Contractor shall indicate which *operational continuity* tier they support, as well as any *disaster recovery* (if applicable) and the overall *criticality level* of provided on-board and wayside systems.

(2) Systems that require real-time train movement or passenger safety shall conform to C1 criticality, and systems that support customer experience shall be at a C2 criticality level.

Figure 26-1 System Assessment Categorization

Operational Continuity (Planned & Unplanned Downtime)					Disaster Recovery				
Adjusted Availability Ceiling*	Planned Downtime Acceptable	Acceptable Recovery Time (Hours)	Acceptable Data Loss (Hours)	Reduced Performance Acceptable (AZ Loss)	Recovery Time Objective (Hours)	Recovery Point Objective (Hours)	Reduced Performance Acceptable (Large Scale)		Criticality Level
Up to 99.999%	N	0	0	N	N/A	N/A	N/A		C1
Up to 99.99%	N	1	0	N	4	1	N		C2
Up to 99.9%	Y	4	0	N	24	1	Y		C3
Up to 99.8%	Y	24	1	Y	48	24	Y		C4
Up to 99.7%	Y	Best Effort	24	Y	Best Effort	24	Y		C5

26.3 Engagement

a). Program/Project Management

i). Contractor shall work with Amtrak IT to establish appropriate elements to properly manage effort including:

(1) Schedule and Key Milestones

(2) Primary Deliverables Definition and Success Criteria

(3) Resource Plan with:

(a) Contact List

(b) Working Groups Definition

(c) Roles & Responsibilities

(4) Scope Definition with Backlog/Requirements

(5) Status Reporting Mechanisms including

(a) Status Reporting Definitions

(b) Artifacts

(c) Status Meeting Cadence

(6) Meeting/Workshop Plans for Information Sharing/Discovery

b). Working Team

i). Contractor shall work with Amtrak IT to ensure Resource Plan is comprehensive including representatives from third parties providing Software or Services to the solution.

ii). Third party providers shall be required to participate in working groups unless Contractor can provide expertise, information, and documentation for the solution.

iii). Amtrak reserves the right to request direct access to third parties if deficiencies are identified in the delivery of the solutions.

c). Hosting & Environment Support

i). Amtrak recognizes four primary approaches for the operation of systems or solution:

(1) Installed and Operated in Amtrak environments

(2) Installed and Operated by the Contractor directly within Contractor's environment

(3) Installed in Third Party environments and Operated by Contractor

(4) Installed and Operated in Third Party environments on behalf of Contractor

ii). Each approach has specific requirements for utilization at Amtrak for Delivery and Operations.

iii). Contractor shall be expected to work with Amtrak to understand and align with these requirements where appropriate as agreed upon between parties.

iv). Non-Production Systems

(1) Along with a Production environment aligned to System Criticality as defined in Section 26.2, the Contractor shall support the delivery of appropriate Non-Production environments sufficient to support Delivery and ongoing Operations.

(2) This includes the establishment of Test Labs for testing onboard systems without the need to disrupt train operations.

(3) Non-Production systems shall replicate relevant Production Capabilities and Functions.

(4) Contractor and Amtrak will mutually agree to the level of support and additional compensation related to the delivery of appropriate Non-Production environments sufficient to support Delivery and ongoing Operations.

d). Testing Support

i). Contractor shall support relevant aspects of testing, as agreed upon by all parties, including:

(1) Unit Testing

(2) Integration Testing

(3) End to End (E2E) Testing

(4) Smoke/Business Acceptance Testing

(5) Performance Testing

(6) Cybersecurity Testing including vulnerability scanning and penetration testing (A Full Test will be completed to Qualify Design and subsequent testing will be based on new releases and the systems impacted by the change)

(7) Regression Testing

(8) Continuity Testing (A full test will be completed as part of Factory Testing, and subsequent testing will be defined as part of the Design effort as agreed upon by all parties.)

(9) Continuous uptime testing for electronic equipment, demonstrating the equipment remains functional without user action in the context of Amtrak long distance operations

ii). For systems utilizing third party software or services, Grey Box testing may be required to validate underlying components operate to specification.

iii). Testing process and prerequisites shall be as agreed with Amtrak. Testing shall be aligned to best practices for execution and documentation of results, where appropriate.

e). Delivery Training & Change Management

i). Contractor shall work with Amtrak IT to establish a comprehensive training and change management plan aligned to systems and/or working groups as well as business users impacted by the program.

ii). Contractor shall utilize Train-the-Trainer approach, and the training will be part of the initial training scope with the delivery of the railcars (as per Chapter 22).

(1) Optional approaches of training such as videos, graphics, etc. can be utilized with approval.

iii). Any further training will have to be priced and compensated separately. This plan shall include, but not be limited to:

(1) Communications Structure & Plan

(2) Comprehensive Documentation for relevant Systems for Utilization and Administration

(3) Training Plans & Materials, as agreed upon by all parties.

(4) Additional collateral, such as graphics, images, videos to support Change Management & Training work throughout the program.

26.4 Operational Support

a). Operational Support Shared Responsibilities

i). Per Section 26.3e), the way that the platform is delivered and operated can vary by hosting method.

ii). Contractor shall work with Amtrak IT to define a clear Operating Model for the solutions that:

(1) Work with Amtrak IT to establish Service Level and Operating Level Agreements for systems aligned to best practices, as agreed upon by all parties.

(2) Define clear roles & responsibilities for all aspects of the solution aligned with Section 26.3a).

(3) Establish mutually agreed upon Operational and Support processes that include:

(a) Incident, Problem, and Change Management aligned to best practices such as linking of incident tickets between Contractor and Amtrak.

(b) Notification criteria and methods of escalation

(c) Reporting necessary to support SLA and OLA compliance, as well as failure analysis

(d) Services provided as software as a service (SAAS) remain within Contractor's responsibility

iii). The Contractor shall identify all Contractor or Contractor sub-supplier maintenance or operation support agreements available related to the on-going support of equipment, services, or licenses of on-board and wayside software. **[CDRL 26-02]**

iv). The Contractor shall prepare and submit for Amtrak review and approval a transition to operations plan and schedule that provides a clear path for transitioning support throughout all phases of the procurement, including pre-revenue service, revenue-service, and from Contractor-maintained maintenance and licensing included as a part of the base procurement, to on-going maintenance, support, and software licensing at the conclusion of

any such periods. The plan shall provide any expectations required for Amtrak support of the transition. **[CDRL 26-03]**

b). Operations & Security Monitoring

i). For services offered as SAAS with the focus to ensure continuity and performance of solutions, the contractor shall implement monitoring and logging based on the recommendations in ISO/IEC 27017, NIST 800-82 and NIST 800-53 and as required in Chapter 28 of this specification.

(1) Based on the tenancy configuration and capabilities of the Contractor's SAAS solutions, security alerts shall be forwarded to Amtrak's Cyber Fusion Center.

ii). Contractor will work with Amtrak and report any vulnerabilities as they are related to Amtrak data and systems immediately.

iii). Contractor shall work with Amtrak IT to define data lifecycles and classifications for relevant logged information and establish testing that validates compliance to these best practices where appropriate.

c). Third Party Software & Services

i). Contractor shall disclose relevant use of third-party software and services.

ii). If Contractor identifies issues with third party software or services, Amtrak IT must be notified per the defined notification process in Section **Error! R eference source not found.**.

d). Defect & Vulnerability Management

i). Relevant defects and vulnerabilities must be disclosed, logged, and remediated per the defined Incident and Problem management processes in Section **Error! Reference source not found.**.

ii). Relevant modifications to delivered products must tested to the same test cases as defined in Section 26.3d). with identified defects and vulnerabilities remediated or provided an exception before release.

e). Software Management

i). Contractor shall provide sufficient methods and/or tools for the troubleshooting and administration of relevant software provided. These capabilities should be aligned to best practices and Amtrak tools as mutually agreed upon in Section **Error! Reference source not found.**.

ii). Contractor shall work with Amtrak IT to ensure relevant software is maintained to the latest version as mutually agreed upon in Section **Error! R eference source not found.**.

f). Ongoing Training & Change Management

i). For relevant updates to delivered products, Contractor shall work with Amtrak IT to support required training and change management related to the update aligned to methods and deliverables as defined in Section 26.4e).

ii). Additional training required from software/feature updates will be jointly assessed and priced separately.

g). Technology & Performance Audits/Reviews

i). Contractor shall work with Amtrak to complete regulatory audits and reviews as required by Amtrak or applicable Regulatory bodies and assist in the remediation and response of these audits and review.

26.5 Wayside Requirements for OTIS

a). General Capabilities

i). To the greatest extent possible, Amtrak prefers that these capabilities are delivered through commercial, off-the-shelf systems rather than customized solutions. OTIS shall be an out-of-box COTS package with an established track record in revenue service trains.

ii). Open Standards shall be used (HTML5, JavaScript, etc.).

iii). Programming in OTIS shall have access to all displays, independently addressable and by Amtrak-defined groups.

iv). Access to all Contractor APIs shall be provided to facilitate programmatic access in addition to the use of Contractor supplied user interfaces.

v). All OTIS components shall be capable of being monitored remotely, and problems should be capable of being validated locally as well as alerts and detailed errors send to remote monitoring systems.

vi). OTIS shall be able to log and store events with enough detail to analyze and diagnose root cause of faults.

vii). In the event of loss of the train to ground interface, the OTIS shall be able to continue operation with the pre-loaded mission data. Dynamic updates such as seat assignments and train statuses should automatically re-commence when T2G communication is restored.

viii). Access to On-Board Variables

(1) Amtrak experienced programmers should be able to reference and display train mission variables based on a variety of contexts (for example, in-service at origin station, in-service at a station, in-service between stations, in-service at a terminal station, under daily test, under maintenance).

(2) Through a template system, to be approved by Amtrak, displays shall be capable of being programmed to accept and display on-board variables. The list of on-board variables shall be submitted by

Contractor for approval by Amtrak. The variables shall include at a minimum:

(a) Velocity

(b) GPS Location

(c) Line Map with Current Location, direction of travel, intermediate stops, and destination in a variety of scales

(d) Origin, Current, Next (including full sequence) and Final stops

(e) Date & Time

(f) Restroom status, to facilitate identification of nearest working and unoccupied restroom to that particular sign

(g) Status of PA/IC system, including status of audio broadcast, functioning of hearing loop, PEI call information, and intercom status

(h) Smoke detector status

(i) Relevant maintenance information – including onboard system status - which could be incorporated into a special workshop display templates to facilitate maintenance and operations staff in daily, scheduled, and unscheduled maintenance.

(j) Consist arrangement data such as relative location of Quiet car, Café car, etc.

(3) In addition, the OTIS system shall support external data feeds from ground-based systems in near-real-time to facilitate weather updates, news, and service updates.

(4) To accommodate a long-distance network that has periods of cellular carrier outages, the onboard systems shall be capable of storing data received from ground for replay, contingent upon a configured data validity and expiration.

(5) OTIS shall integrate with wayside systems including all applicable Amtrak enterprise systems and supplier/vendor systems necessary for operation of the OTIS, Video Surveillance System (VSS), and Reservation Display (if equipped) and adjacent systems, as specified in Section 26.6.

(6) The wayside integration of OTIS will allow content and data from Amtrak enterprise data sources on the wayside to be delivered to trains via the Data Communications System (DCS) and stored onboard for displaying interior and exterior train displays and for audio announcements on interior and exterior speakers. The OTIS wayside integration will also support functions of the VSS.

ix). Triggers

(1) Amtrak expects to be able to program the on-board experience in an event-driven fashion. Events shall include at a minimum:

(a) Mission start and end

(b) Geolocation with geofences to trigger events

(c) Time since or time-projected-before a geofence

(d) State of operations (start of movement, cruise, emergency stop, etc.)

(e) Manual operation

x). OTIS Wayside Customer Experience Simulation Lab (Option)

(1) Amtrak must be able to simulate and validate the complete customer experience of the OTIS prior to loading the content programming to railcars, and to diagnose issues identified in the field with communication system operation, including but not limited to content issues.

(2) The Contractor shall deliver a turn-key OTIS simulation lab which shall include the full complement of onboard equipment necessary to fully simulate the on-board communication system operation. In order to reliably simulate the OTIS customer experience on the wayside, the lab shall match the OTIS capability of the train to the greatest extent possible.

(3) All OTIS equipment necessary to simulate all car types shall be supplied as a part of the OTIS simulation lab.

(4) For clarity, this includes minimally the following equipment:

(a) All types of displays, of type and quantity necessary to simulate all car types

(b) PA/IC controllers

(c) PEI units

(d) amplifiers

(e) speakers

(f) inductive audio loop system for audio accessibility

(g) Bluetooth LE Auracast broadcast for audio accessibility, if the trains are equipped with this option

(h) cameras

(i) HMI displays, including Control Terminals

(j) reservation display system components

(k) attendant call system components

(l) data communication system

(m) electronic room accommodation and door lock system components

(n) control units which make up the OTIS system

(o) Video Surveillance System / Network Video Recorders

(5) The OTIS lab shall include ancillary hardware which provides the capability to perform automated, semi-automated, and manual route simulations in the lab.

(6) The OTIS lab shall support mission simulation with playback of telemetry and events from a recorded from actual on-board journeys, and through manually prepared journeys.

(7) The OTIS lab shall:

(a) Integrate with wayside systems including all applicable Amtrak enterprise systems and supplier/vendor systems necessary for simulation of the OTIS, Video Surveillance System (VSS), an Reservation Display System (if equipped) in the lab. To ensure that the lab matches the OTIS capability in the trains, this lab integration shall follow the applicable requirements specified in Section 26.6.

(b) Interface with the same production systems used for the revenue fleet that facilitate the upload of programming and content, such that the same APIs as production are used.

(c) Provide playback of telemetry and event logs to animate the simulation in real-time, accelerated, and slow modes.

(d) Provide simulation of customer experience for samples of all interaction types (all display types, audio).

(8) The simulation shall incorporate the capability to simulate end users interaction with the on- and off-board system during all stages of the train's operation, including:

(a) Train staff operation of the Control Terminal and on-board HMIs including authentication, and operation of system integrations with the Video Surveillance System (if equipped), Public Address System, Intercom System, Attendant Call, and PEI.

(b) Train staff operation of Amtrak electronic devices, and their interaction with the OTIS equipment.

(9) The wayside OTIS simulation lab shall be implemented in a modular and extensible fashion, allowing future modifications and upgrades that occur on the vehicles being simulated in the lab, so that the lab is always maintained to match the OTIS capability in the trains.

(10) The Contractor shall be responsible for delivery, installation, configuration, documentation, training, and setup support of the lab at a location specified by Amtrak. After the lab delivery at the Amtrak designated lab site, Amtrak shall verify the lab operation, configuration, documentation, training, and accept the lab as operational after successful verification.

(11) It is Amtrak's expectation that the Contractor and Amtrak will negotiate an on-going maintenance and support agreement for the lab, that shall do into effect immediately upon acceptance of the lab by Amtrak. Under this agreement, Contractor shall provide technical support, spares, and supplies for the lab under mutually agreed terms and conditions, including support response time SLAs for different types and priorities of support incidents. A support process shall be documented, describing how the lab support incidents will flow between Amtrak and the carbuilder and/or the lab suppliers/vendors. The support process will address how support incidents will be reported by Amtrak users and will be triaged, troubleshooted and resolved by the Contractor.

(12) The detailed system description, functionality, and infrastructure requirements shall be submitted to Amtrak for review and approval. **[CDRL 26-04]**

b). Car Telemetry

i). Data telemetry includes data generated by operator inputs, onboard sensor data, event recorder data and other diagnostic and status information.

ii). Train Control and Monitoring

(1) Amtrak's assumption is that train data will first flow to Contractor's back office systems that analyzes the data and shall trigger maintenance and other actions based on analysis.

(2) In addition, Contractor shall provide a set of services that allow Amtrak to retrieve all data generated by the train using a set of API's/Services that allow Amtrak to pull data in near real-time or to push the data in near-real time to Amtrak.

(3) This does not preclude Contractor from providing a portal for Amtrak personnel to review any data analysis or data visualizations provided to enhance operational awareness of a train's condition.

(4) A data dictionary of the data feed is required. This shall include definition of all data fields, all possible data values, conditions that generate each value and/or the trigger for each field and data value.

iii). Safety/Event Related Information and Video

(1) Today Amtrak collects data in real-time during extraordinary events to understand and assess the impact of those events.

(2) Specifically, Amtrak sets trigger types based on specific input from the operator or sensors to trigger an event. When an event is triggered, the event record data and user defined segment of video data is immediately relayed to Train Operations to provide situational awareness.

(3) A typical example is when emergency braking is activated, the event recorder and video for a limited time before and after the incident are sent via the cellular network to Amtrak's network operations center for immediate review.

(4) The triggers and video lengths should be configurable as well as the type of information needed. A data dictionary of the data feed is required. This should include definition of all data fields, all possible data values, conditions that generate each value and/or the trigger for each field and data value.

(5) Refer to Chapter 14 for additional specific requirements.

iv). Data Definition

(1) Complete data dictionaries and schema shall be provided for all data recorded on the train, along with the format of any data transmitted to the wayside.

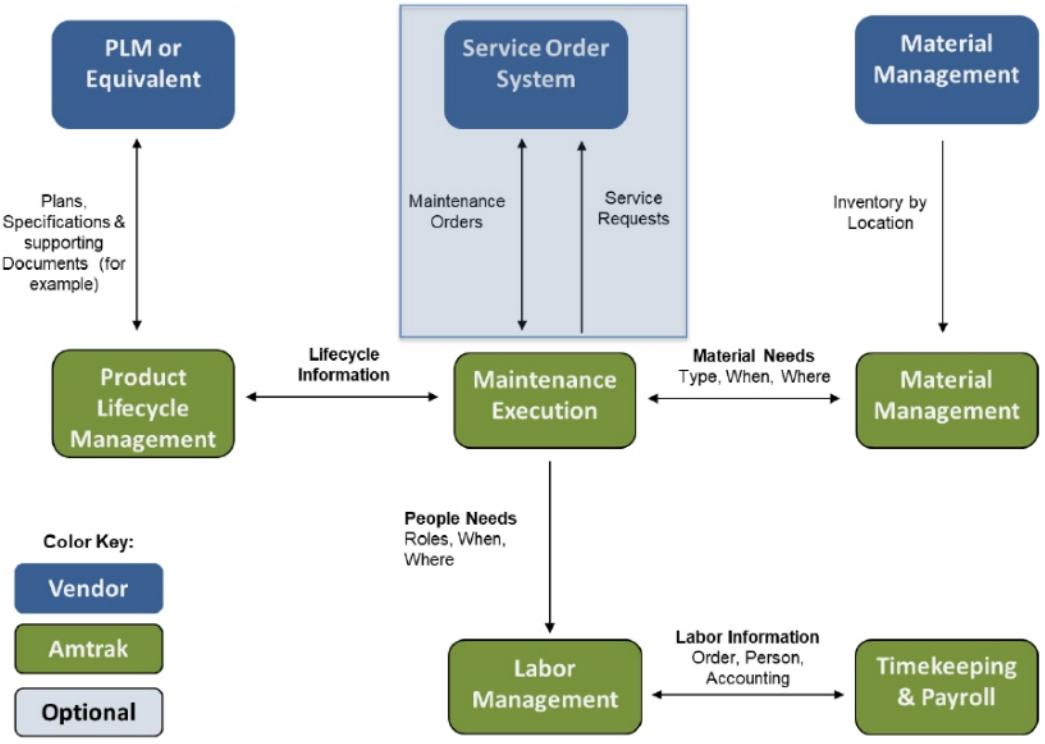
(2) Data dictionary shall provide full access to the complete fidelity of the recorded information.

(3) In addition to user operated PTU, DTE, and other software packages provided by the contractor, utilities to export all binary data into an open, machine-readable format (e.g., CSV, JSON, XML), with full fidelity of the data represented, in a way that can be interpreted by end users (e.g., in engineering units) shall be supplied by the Contractor.

(4) The tool shall provide all means necessary to decrypt and/or decode the data.

(5) The details of the data dictionaries and documentation of the tools shall be submitted along with the utilities for review and approval by Amtrak 90 days prior to delivery of the first vehicle. **[CDRL 26-05]**

(6) Updates of the data dictionaries, documentation of the tools, and the utilities shall be provided prior to the deployment of software which modifies the data formats.



c). System Extensibility and Upgrades

i). Amtrak recognizes that many onboard systems will require technology refresh throughout the life of the rail vehicles.

ii). Display screens, data communication systems, system controllers, cameras, control terminals, passenger compartment equipment, and other customer facing onboard equipment will go through multiple upgrades or refreshes.

iii). The on-board and wayside systems provided as a part of this shall be designed in a flexible and extensible method in order to minimize the impact of these anticipated changes.

Figure 26-2: Business Process Viewpoint

iv). As shown, this is business view of the TSSSA process, with service order creation from Contractor optionally being created in their own systems.

d). Service/Work Order

i). If maintenance orders originate from Contractor, there shall be enough information provided to Amtrak to complete the work without directly referencing Contractor's systems.

ii). If Contractor will not integrate their service order system to Amtrak, work orders shall be created in Amtrak's maintenance execution system.

iii). Work order status shall be provided to Contractor.

iv). Job plans (task lists, tools, materials) should be provided with the maintenance orders.

e). Material Availability

i). Since Contractor shall provide materials to complete maintenance requests, it is assumed Contractor shall ensure materials will be available prior to the execution date(s) of the work order.

f). Back Office

i). Additional interfaces shall be required to integrate billing. These are not included in the diagram since this may differ based on the technologies used by Contractor.

g). Technical considerations

i). The following technologies are in use at Amtrak:

(1) PLM – Siemens Teamcenter

(2) Workorder Management – Maximo & EAMS Braid Mainline Rail

(3) Warehouse & Material Management – SAP

(4) Financial Systems – SAP

(5) Integration/Service Bus – MuleSoft AnyPoint

(6) EDW/Analytical Capabilities - Amazon Redshift/Tableau

(7) EDW/Analytical capabilities are available to support insights into asset condition.

(8) Genetec Security Center (Video Surveillance System, see section 14)

26.6 Train-to-Amtrak Integration Requirements

a). General Integration Requirements

i). To support Amtrak's strategic vision of a unified, modernized, and centrally managed digital ecosystem for Journey Systems across the fleet, all vendor/contractor integrations must follow a standardized, secure, API-driven architecture.

ii). Amtrak supports two primary integration patterns:

(1) Train-to-Vendor/Contractor Systems (Onboard to Offboard):

(a) Communication from railcars to vendor/contractor systems must use secure APIs.

(b) Data exchange onboard or from onboard systems to vendor/Contractor cloud endpoints must adhere to secure communication protocols.

(c) More details in Section

(2) Ground-to-Ground Integrations (Vendor/Contractor Cloud → Amtrak Cloud):

(a) Streaming is the preferred option for continuous, near real-time data exchange between vendor cloud platforms and Amtrak cloud environments.

(b) When streaming is not feasible, REST-based APIs may be used as the fallback method.

(c) Depending on vendor/Contractor solution capabilities, one or both integration patterns may be combined.

(d) For ground-to-ground integrations (Vendor/Contractor Cloud → Amtrak Cloud), streaming is the preferred method for all real-time and event-driven data exchange.

(i) Vendors/Contractors must support a modern, cloud-native streaming platform, such as:

1. Apache Kafka (example), or

2. An equivalent event-streaming technology that provides similar capabilities.

(ii) The streaming solution must provide:

1. Near real-time event delivery

2. Persistent, long-lived connections (no polling)

3. Server-initiated push of event

4. Built-in scalability and reliability

5. Authentication and secure transport

6. Error handling and reconnection support

7. Operational metrics for monitoring

b). Alignment with Amtrak T2G (Train-to-Ground) Architecture

i). Any solution that transmits data from train systems must operate within the existing Amtrak T2G architecture:

(1) The Train-to-Ground (T2G) network uses secure VPN tunnels established over a Private APN.

(2) All traffic originating from onboard systems must be routed through:

(a) Cellular Private APN/Satellite Private Layer-2 or MPLS circuits

(b) T2G VPN tunnels

(c) Amtrak perimeter firewalls

(d) Amtrak secure network zones, including internal and external (public cloud) environments.

(e) No traffic may bypass Amtrak's security perimeter. Direct access from onboard devices to vendor cloud environments is not permitted without first transiting through Amtrak's VPN and firewall layers.

(3) From T2G gateway, data may reach:

(a) Amtrak Internal Cloud (private or on-prem hybrid cloud)

(b) Amtrak-approved External Cloud Platforms

(c) API gateways, streaming gateways, or integration hubs for downstream processing.

ii). Routing is subject to architectural approval and security policy enforcement.

(1) No direction vendor-cloud connections from onboard systems are permitted without routing through the approved T2G path.

c). Architectural, Identity, and Secure Compliance

i). All proposed integrations must comply with:

(1) Amtrak's Enterprise Architectural Principles

(2) Identity and Access Management (IAM) standards

(3) Cybersecurity and Zero Trust requirements

(4) Adherence to approved encryption, authentication, and key management methods

(5) Use of current, supported versions of all technologies and frameworks

d). Certificate-based Authentication Requirements

i). To ensure strong, identity-bound access control across all T2G data flows, Amtrak requires certificate-based authentication for:

(1) Devices onboard the train

(2) Network components participating in T2G communication

(3) API endpoints or streaming endpoints connected to Amtrak systems

(4) Any vendor systems exchanging data with Amtrak over ground-to-ground interfaces.

(5) Certificates must:

(a) Be issued by an Amtrak-approved Certificate Authority (CA)

(b) Use modern cryptographic standards (e.g., TLS 1.2/1.3, 2048-bit or higher keys)

(c) Bind the identity of devices, applications, or services to the certificate.

(d) Support mutual TLS (mTLS) where applicable.

e). Certificate Management Requirements

i). Vendors must support secure and automated lifecycle management for certificates used in T2G and ground-to-ground integrations, including:

(1) Certificate provisioning and secure deployment

(2) Automated renewal mechanisms where possible

(3) Revocation processes (CRL/OCSP) that Amtrak can enforce

(4) Rotation schedules aligned with Amtrak security policy.

(5) Ensuring no certificate is hard-coded or stored in plaintext

(6) Secure key storage (e.g., TPM, HSM, encrypted keystores)

ii). Vendors must integrate with Amtrak's certificate governance standards and participate in periodic reviews to ensure certification health, validity, and rotation compliance.

f). Architectural Design Expectations (MACH Alignment)

i). Solutions must demonstrate measurable business value and adhere to modern architectural practices, including:

(1) Microservices-based decomposition

(2) API-first design

(3) Cloud-native deployment models

(4) Headless, modular components that support rapid feature deployment

(5) Scalability, maintainability, and clear total cost of ownership (TCO) evaluation.

g). Change Management and Interface Stability

i). Vendors must provide advance notification to Amtrak of any software or system modifications that could affect:

(1) Approved API specifications

(2) Streaming interfaces

(3) Data models or schemas

(4) Communication protocols

(5) Security or network requirements

ii). Changes may not be deployed without joint approval and coordinated testing.

26.7 Identity Requirements

a). General Identity Requirements

i). Amtrak has an adopted identity standard for all authentication and authorization scenarios. Amtrak's core identity solution is Microsoft Azure AD and all solutions shall conform to patterns as supported by that platform.

ii). Contractor supplied software and systems requiring authentication of Amtrak users shall incorporate Amtrak's Microsoft Azure AD for identity. This shall include:

(1) Contractor supplied SAAS applications

(2) Contractor's sub-supplier SAAS applications

(3) Software supplied to run in/on Amtrak's environments

(a) Contractor to propose alternate options for On-board OT Equipment that may not have access to Amtrak's Microsoft Azure AD. These options may be considered by Amtrak.

iii). Amtrak requires the IT solution for this solicitation to conform this standard including:

(1) Amtrak Employee or Contractor logins

(2) Non-Amtrak Personnel logins

(3) Machine-to-Machine Communications

iv). Microsoft Azure AD Reference is located at the following URL:

https://docs.microsoft.com/en-us/azure/active-directory/fundamentals/

26.8 CDRLs

CDRL	Description	Due
CDRL 26-01	Provide Solution Architecture, Designs, and Specifications for review and approval by Amtrak throughout the design reviews.	30 days prior to PDR, on-going updates
CDRL 26-02	Identify all Contactor or sub-supplier maintenance and operation support agreements related to the on-going support of equipment, services, or licenses of on-board and wayside software.	30 days prior to PDR, on-going updates
CDRL 26-03	Provide an operations plan and schedule for transitioning support throughout all phases of the procurement.	30 days prior to PDR, on-going updates
CDRL 26-04	Provide detailed system description, functionality, and infrastructure requirements for OTIS wayside customer experience simulation lab.	30 days prior to PDR, on-going updates
CDRL 26-05	Provide details of the data dictionaries and documentation of tools.	90 days prior to delivery of the first car

Amtrak Universal Single Level Fleet Replacement Technical Specification

27. Software and Microprocessor-Based Systems

Revision 2

Table of Contents

27.1 General 27-1
27.2 Software Systems Justification 27-1
27.3 Software Systems Requirements....27-1
27.4 Software 27-2
27.5 Hardware....27-12
27.6 Reliability....27-16
27.7 Safety....27-16
27.8 CDRLs....27-16

Table of Figures

Figure 27-1: Required Software Documentation (Option 1) 27-6
Figure 27-2: Required Software Documentation (Option 2) 27-7

27.1 General

a). This section applies to all software, microprocessor-based systems supplied for this project, including vehicle subsystem controls, test equipment, data analysis, fault analysis and training deliverables.

b). This section shall also apply to the programming of all programmable devices, including microprocessors, microcontrollers, Programmable Logic Devices (PLD), Application-Specific Integrated Circuits (ASIC), or Field Programmable Gate Arrays (FPGA), etc.

27.2 Software Systems Justification

a). Suppliers shall submit a life cycle cost justification for each software application not explicitly required by this specification.

b). This justification shall include, but not be limited to, a comparison between a hardware (e.g. relays, and discreet electronic) and a software-based system.

c). For this calculation, the supplier shall use an "end of life" or obsolescence of the hardware (microprocessor and associated ICs) of 10 years and Military Handbook (MIL-HDBK)-217, Ground Mobile.

d). Based on this analysis, Amtrak will approve or disapprove the use of additional software systems.

27.3 Software Systems Requirements

a). Software System Classification

i). Hardware and software requirements depend on the degree to which the hardware and/or software is custom designed for or applied to this project.

(1) "Commercially available" or "Commercially Off The Shelf" (COTS) hardware or software shall be readily available in the US through retail and wholesale sources and shall be subject to all requirements, except as noted in this section.

(2) "Non-commercially available" hardware or software shall be developed or modified according to the requirements in this section.

(3) Hardware shall be viable for a railway application in terms of robustness and security.

b). Time and Date Processing

i). All software and hardware delivered or developed under this Contract shall be capable of handling dates in the range from 2000 to 2099.

ii). The date data processing shall not experience abnormal ending and/or invalid or incorrect results from the hardware, software, data repository or firmware in operation as part of Amtrak’s business processes.

iii). Each hardware, software, data repository or firmware's date data interface shall support a four-digit year format.

iv). The master real time clock for all subsystems that are connected to the vehicle network shall be provided by the Central Diagnostics Unit (CDU). During Design Review, Contractor shall work with Amtrak to identify vehicle networks that are required especially with respect to cybersecurity.

v). All subsystems shall synchronize to the master clock.

vi). All time displayed to the train crew, maintenance personnel, or passengers shall be adjusted to the local time and shall automatically be adjusted to daylight saving time.

vii). The start and end dates for daylight savings time for all systems shall be adjustable by Amtrak via a configuration of the CDU.

27.4 Software

a). Software Development Process

i). All Non-COTS software shall be in accordance with IEEE Std 62443, Standard for Software Documentation for Rail Equipment and Systems, and the requirements stated within this specification.

ii). The IEEE Std 62443 requirements shall be for a "Type 5" procurement as defined within that standard except as noted below.

b). Backward compatibility

i). Software revisions shall maintain minimum one-version backward compatibility with existing subsystems and communication protocols unless explicitly approved by Amtrak. The Contractor shall provide a compatibility verification report for each release.

c). General Features

i). Software shall perform the following basic functions:

(1) Implement the desired control scheme such that the specified performance is achieved.

(2) Monitor all inputs for unsafe, erroneous, or unknown conditions or combinations of conditions.

(3) Sample all input conditions at rates sufficient to detect and remedy all unsafe or damaging conditions in the shortest possible time.

(a) Sampling rates and program execution times shall be such that the control system is not the limiting factor in response to unsafe or damaging conditions.

(b) All software shall be designed to ensure that the timing requirements for safety related tasks are always met.

(4) Limit all output commands to safe levels for all combinations of input conditions, to avoid equipment damage and hazards to personnel.

(5) Perform system self-diagnostic routines and respond promptly, safely, and predictably to detected faults.

(a) The self-diagnostics shall include tests for program corruption and integrity in read/write memories such as (Electronically Erasable Programmable Read Only Memory) EEPROM and flash Programmable Read Only Memory.

(6) Respond safely and predictably when powering up or recovering from power interruptions.

(a) All power interruptions likely to have corrupted temporary storage shall be detected and cause the system to reinitialize all affected routines and temporary data.

(b) Detection of power interruptions may be by hardware.

(7) Permit thorough interrogation of all input, output, and internal conditions (values calculated or computer by software or logic) by internal, system level, vehicle level and external diagnostic equipment.

ii). Undocumented software features are prohibited.

d). Contractor Activities

i). The Contractor, as system and software integrator, shall be responsible for the overall quality of all software supplied as part of this contract.

(1) If the Contractor also develops software, it shall consider the team that develops software as a supplier.

ii). Quality Control Plan **[CDRL 27-01]**

(1) The Contractor shall develop a car level software quality control plan which defines how it will manage and oversee the software development of its suppliers.

(2) The software quality control plan may be a section within the Contractor's Project Quality Plan.

iii). Software Quality Audits

(1) The Contractor shall conduct periodic software quality audits of all Non-COTS suppliers as well as at each major release/upgrade.

(a) Amtrak reserves the right to attend any audit along with the Contractor.

(2) Amtrak reserves the right to conduct a software quality audit at any time during the Contract especially during software design and development phase.

(3) At a minimum, the suppliers shall plan for an audit to be performed at the Final Design Review (FDR). **[CDRL 27-02]**

(4) The results of all audits shall be submitted to Amtrak for review and acceptance. **[CDRL 27-03]**

(5) Remedial action for all open comments from any audit shall be submitted to Amtrak for review within 90 days of the audit. **[CDRL 27-04]**

(6) The audit shall include:

(a) A software process audit – on each software supplier and its sub suppliers which shall include at a minimum

(i) Project management

(ii) Requirement Tracing

(iii) Configuration Control

(iv) Coding standards

(v) Change process and Defect tracking

(b) Physical audit as defined by IEEE, Std 730 on each SCI – This report shall be submitted with **[CDRL 05-04]**.

iv). Software Testing

(1) The Contractor shall witness all software verification and validation testing (STPr/SD) prior to the release of any software.

(2) Amtrak reserves the right to attend these tests along with the Contractor.

v). Configuration Control

(1) The Contractor shall develop a Software Configuration Control Plan (SCCP) **[CDRL 27-05]** for tracking software changes to individual cars on Amtrak property until the end of the warranty period and all retrofits are complete.

(a) This plan shall be submitted for review and acceptance by Amtrak.

(b) The SCCP shall also control software on non-car equipment such as PTU's, BTE's, and the like, and shall include a

mechanism to ensure continuing compatibility between car software and non-car software.

(c) It shall be consistent with the Contractor's approach to configuration control of hardware and require similar approvals and tests.

(d) These requirements apply to all software subcomponents as well.

(2) The Contractor shall maintain a database of the software version of every software item on each car and in each piece of non-car equipment.

(a) The database shall be kept current by the Contractor at all times and be submitted each time software is updated on any system. **[CDRL 27-06]**

(3) The software version status of every software item on the car shall be provided in the Car History Book. **[CDRL 27-07]**

(4) The software version status of every software item on each piece of non-car equipment shall be provided by the Contractor with the delivery of the equipment. **[CDRL 27-08]**

vi). Delivery of Software

(1) At the end of the warranty period and for each software release thereafter, the Contractor shall provide to Amtrak on Compact Disc Read-Only Memory (CD-ROM), USB Drive, Digital Video Disc (DVD), or an acceptable technology at the time:

(a) All executables **[CDRL 27-09]**

(b) Updated software documentation **[CDRL 27-10]**

(c) Updated user documentation **[CDRL 27-11]**

(d) Software Version Description (SVD) **[CDRL 27-12]**

(2) The requirement for CD-ROM, USB Drive or DVD copies and documentation shall apply to every delivery of software for non-car equipment.

(3) The SVD shall contain a description of problems addressed, known problems yet to be addressed, features added, requirements added or changed, design changes, compatibility between other versions of software, other system and other cars in the train, changes to related software documents and evidence of document review, test plan, and test results.

e). Software Developer Documentation

i). The Contractor shall provide complete software architecture documentation, including component diagrams, interface diagrams, state machine diagrams, network diagrams including protocols used, and API diagrams including how-to-use manuals.

ii). All suppliers who develop software shall submit for Amtrak's review and approval, documentation to ensure a mature software development process that has been fully verified and validated and can be maintained in the future. **[CDRL 27-13]** Amtrak offers two paths listed below:

(1) Submit all the documentation as required by IEEE, Std 62443, for type 5 software.

Figure 27-1: Required Software Documentation (Option 1)

Document Name	Software Type	PDR	IDR	FDR	New Software Releases
Software Project Management Plan (SPMP)	All	Yes	No	No	No
Software Quality Assurance Plan (SQAP)	All	Yes	No	No	No
Software Configuration Management Plan (SCMP)	All	Yes	No	No	No
Software Verification and Validation Plan (SVVP)	All	Yes	No	No	No
Software Verification and Validation Report (SVVR)	All Non-COTS	No	No	No	Yes
Software Requirement Specification (SRS)	All Non-COTS	Yes	Yes	Yes	Yes
Interface Control Document (ICD)	All	Yes	Yes	Yes	Yes
Software Design Description (SDD)	All Non-COTS	No	No	No	Yes
Database Design Description (DBDD)	All	Yes	Yes	Yes	Yes
Software Requirement Traceability Matrix (SRTM)	All Non-COTS	Yes	Yes	Yes	Yes
Software Test Plan (STP)	All Non-COTS	Yes	No	No	No
Software Test Procedure (STPr)	All Non-COTS	No	Yes	Yes	Yes
Software Test Report (STR)	All Non-COTS	No	No	No	Yes
Software Version Description (SVD)	All	No	No	No	Yes
Software User Manual (SUM)	All Non-COTS PTU/BTE	Yes	Yes	Yes	Yes

(2) In order to reduce the amount of submittals, the Contractor may combine the documents by IEEE, Std 1558, for type 5 software as follows:

(a) The SPMP, SQAP, SCMP, SVVP, and STP shall be combined into one document entitled Software Development Plans (SDP). This SDP shall include all the requirements of the individual documents.

(b) The SRS, SDD, DBDD, STPr, STR, and SVVR shall be combined into one document entitled Software Documentation (SD). This SD shall include all the requirements of the individual documents.

(i) It is expected that this document would be developed as a database and would be expanded and updated as the software is developed and tested.

(c) The ICD and DBDD shall be combined into one document entitled Software Interface Document (SID).

(i) This SID shall include all the requirements of the individual documents.

(d) The SVD and SUM, if required, shall be stand-alone documents.

Figure 27-2: Required Software Documentation (Option 2)

Document Name	Software Type	PDR	IDR	FDR	New Software Releases
Software Development Plan	All	Yes	No	No	No
Software Documentation (SD)	All Non-COTS	Yes	Yes	Yes	Yes
Software Interface Document (SID)	All Non-COTS	Yes	Yes	Yes	Yes
Software Version Description (SVD)	All	No	No	No	Yes
Software User Manual (SUM)	All Non-COTS PTU/BTE	Yes	Yes	Yes	Yes

iii). Regardless of which path is chosen, the Contractor or software supplier shall develop the SRS based on the technical specification requirements.

(1) The SRS shall fully link to each technical requirement.

(2) The contractor shall submit an SRTM with the first release of the SRS to Amtrak.

(3) The SRTM shall use the technical section reference identification numbers as defined in the technical specification as the reference to link to the SFD, SRS, SDD, and STPr or SD.

(4) The Contractor shall update and submit an updated version of the SRTM with each document released, strictly following the software life cycle process.

(5) The Contractor and supplier shall not proceed in the software development until the SRS document is reviewed and approved by Amtrak.

(6) The Contractor shall submit software documentation to Amtrak based on the software life cycle.

iv). In order for Amtrak to update, modify, or replace a system on the cars at a later date, the following documents shall be marked "Non-Proprietary": ICD, DBDD, SID and SUM.

v). The Contractor shall perform a demonstration to ensure that the ICD and DBDD or SID is complete and accurate. **[CDRL 27-14]**

f). Operating Systems and Languages

i). Software may be written in a high or low-level language; however, high-level languages such as C/C++ are preferred.

ii). The language, compiler, and its implementation for the selected microprocessor system shall be commercially available in English.

iii). All languages and operating systems shall have an acceptable customer base and be in widespread use.

iv). Use of commercial operating systems such as Windows™ for onboard applications is prohibited, unless approved by Amtrak on a case-by-case basis. Commercially off the shelf available software is categorized as software that can be purchased, leased, or licensed by the general public.

v). Where approved for non-onboard applications such as PTU and BTE, software running on Windows™ shall include a Windows™ format help file to provide context sensitive help to the user of the software.

vi). All compilers shall be approved by Amtrak based on previous service history.

vii). The suppliers shall have a software coding standard for each programming language which shall define header information, comment requirements, module size, etc., similar to NASA C Style Guide SEL-94-003 or MISRA C.

g). Commercial Off-the-Shelf Software

i). Some software supplied under this contract may be commercial-off-the-shelf when approved by Amtrak such as operating systems supplied for PTU and BTE.

ii). For Commercially Available Software, the following shall be supplied:

(1) The original data storage/transfer media functional and usage details **[CDRL 27-15]**

(2) All manuals and instructions to configure and install the software **[CDRL 27-16]**

(3) All licenses required for Amtrak's site use **[CDRL 27-17]**

h). Software Testing

i). Software testing shall be a prerequisite to higher level testing, such as system level and vehicle level tests.

ii). All system or subsystem level features and functions of software systems which implement system or subsystem-level requirements of the Technical Specification that are allocated to software shall be testable.

iii). Field testing shall use the PTU and procedures provided under this Contract.

iv). For features which are only testable off the car with special equipment, all such equipment shall be supplied by the Contractor as test equipment and become the property of Amtrak.

(1) This equipment shall provide the logic, sequencing, and emulation necessary to verify that the software functions as intended.

(2) In lieu of separate equipment, appropriate test functions may be provided within the PTU.

v). Unit and Module Interaction Testing

(1) The supplier shall perform unit and module interaction testing on all software components.

(2) This unit testing shall provide 100% coverage, unless approved by the Engineer.

(3) Automatic test tools, such as Vector Cast or LDRA may be used.

(4) As a minimum, full branch testing, data range and boundary testing, and error trap testing shall be completed.

(5) All unit testing results shall be fully documented in a unit testing report which shall be submitted to Amtrak for review and approval. **[CDRL 27-18]**

vi). Software Type Testing

(1) Type tests of all software systems shall verify the proper operation of all software features, including diagnostics.

(2) The type tests shall demonstrate that the system under test can successfully recognize and report all faults listed in the CDU Fault Management Plan and all other events and parameters reported to the CDU.

(3) The Contractor shall submit the results of the type tests to Amtrak for review and approval. **[CDRL 27-19]**

(4) Where such tests may result in damage to the system hardware, the fault or event may be simulated to avoid damage to the hardware. Any documented exceptions shall be provided in written communication to Amtrak.

(5) Such testing shall be performed any time the software is changed, prior to putting it into service.

vii). Software Validation Test Procedures

(1) Software validation test procedures must be approved by Amtrak prior to the execution of the tests. **[CDRL 27-20]**

viii). Testing of Software Revisions

(1) After the initial version of software is installed on the cars, all software revisions shall be tested by the supplier in the supplier's facilities (laboratory) in accordance with its testing processing and procedures.

(2) After successful completion of such tests, a test version of the software revision shall be placed on a limited number of cars and dynamically tested for a period of time as approved by Amtrak.

(3) Only after results of the dynamic tests on a limited number of cars have been approved by Amtrak shall a new software revision be applied to the fleet or any portion of the fleet.

(4) Application of any software revision to any portion of the fleet at any time shall be in conformity with the approved Configuration Control Plan of this Section 27.c.v.

i). Software Version Numbers

i). Software version numbers shall be included within the firmware code and shall be accessible via laptop Portable Test Unit (PTU), the CDU, and on the system's display.

ii). Every change to software shall be reflected in an update to the version number.

iii). If the software includes data or parameter files which can be modified by the suppliers or by Amtrak, a modification to such files must be reflected in a change to the software version number or a separate data/parameter file version number.

j). Software Security

i). The Contractor, as the systems and software integrator, shall implement disciplined security practices. The disciplined security practices shall be determined by Amtrak unless otherwise agreed upon.

ii). These security practices shall align with industry best practices and ensure the confidentiality, integrity, and availability of the delivered software systems.

iii). To demonstrate its capability, the Contractor shall submit:

(1) The results of a current, independent, BSIMM and/or OWASP SAMM software security assessment **[CDRL 27-21]**.

(2) The assessment shall evaluate the security controls, vulnerabilities, and overall security posture of the software systems implemented by the Contractor, including but not limited to, the following areas:

(a) Authentication and access control

(b) Data protection and encryption

(c) Secure coding practices

(d) Security testing and vulnerability management

(e) Incident response and recovery

(f) Security documentation and training

k). Software Update

i). It shall be possible to update all application software with the exception of approved programmable devices (E.g. ASIC, CPLD, etc.) via the PTU connected to the system directly.

ii). Any partial or interrupted software update shall automatically return the system to the previous version of software and not leave the system in an unconfigured state.

iii). The time required to upload the entire software complement for a given system, including time to replace firmware embedded in FPGAs, CPLDs, etc., shall be no more than fifteen (15) minutes.

iv). The Contractor shall provide detailed instructions/procedure to install and configure the software.

l). Transfer of Software to Replacement Devices

i). In order to ensure the long-term maintainability of programmable devices, Amtrak requires that to Contractor provide:

(1) Master copies of the compiled executable for all programmable devices such as ASICS, CPLD's, FPGA's and Read Only Memory Devices. **[CDRL 27-22]**

(2) Six (6) sets of the necessary equipment and software to transfer the compiled software to new devices and to verify the integrity of the copy. **[CDRL 27-23]**

ii). If the requirements of part i of this subsection are not possible to meet for any programmable device, the Contractor shall provide Amtrak with a sufficient number of replacement preprogrammed devices to supply the fleet for 30 years of service.

m). Software Escrow

i). The Contractor shall maintain in escrow all proprietary source code for all software used on the vehicle and the compilers, linkers, etc. used to develop it. **[CDRL 27-24]**

ii). The source code held in escrow shall be the latest version installed on the vehicles.

iii). The Contractor shall demonstrate that the source code held in escrow compiles to produce the same executive with the same CRC or checksum as installed on the vehicles. **[CDRL 27-25]**

iv). The contractor shall submit a Software Executable Generation Procedure (SEGP) **[CDRL 27-26]** that details the steps required to build the workstation and generate the executable file.

v). Should the compilation process prohibit matching of the CRC or checksum, additional techniques to inspect difference in the generated executive including the use of comparison software and functional testing on the BTE can be employed to prove equivalency.

(1) Such techniques are to be approved by Amtrak.

vi). Full instructions to assist in installation and configuration of the software development workstation, as well as building and verifying the executable software shall be provided. **[CDRL 27-27]**

vii). The Contractor shall provide sufficient documentation of the source code to allow Amtrak to maintain it, troubleshoot it and adjust parameters. **[CDRL 27-28]**

viii). The development software held in escrow, including any operating system used with the licensed development tools, shall be of the same version used to develop the software currently installed on the vehicle.

27.5 Hardware

a). Hardware Platform

i). All car borne and custom computer hardware shall be designed and constructed in accordance with the general electronic design principles of Chapter 15 Electrical System.

ii). Any computers, whether portable or not, and any microprocessor hardware shall be readily available through retail and/or wholesale outlets in the U.S.

iii). The microprocessor-based systems shall be based on an established service-proven family of microprocessors in wide use in the control system industry and the rail industry.

iv). The type and availability of each microprocessor shall be included in the design review package.

v). Any use of commercially available computer boards for on car applications must be specifically approved by Amtrak on a case-by-case basis.

vi). Such approval will be based upon a technical review of the product's suitability for use in a transit rail environment, product documentation and proof that a supply will be available for the expected life of the vehicles.

vii). Hardware Bill of Materials shall be provided to Amtrak for review and approval.

b). Microprocessor Systems Shutdown

i). A special algorithm **[CDRL 27-29]** shall be provided to ensure that:

(1) Computer shutdown and restart occur in a safe and predictable manner.

(2) Spurious faults are not generated during shutdown or restart.

(3) Stored diagnostic data is not lost during shutdown or restart.

(4) Time stamp integrity is maintained on all diagnostic data through any shutdown and restart process, including immediately after restart.

c). Program and Data Storage

i). All onboard microprocessor-based systems shall store software and diagnostic data in non-volatile flash memory, or EEPROMS.

ii). The use of mechanical hard drives or optical disks is prohibited for data storage on all systems, except the network video recorders.

iii). All flash memory and other memory devices with a finite number of read/write cycles shall be implemented in such a way that one sector or memory location is not written to repeatedly, thus shortening the life expectancy of the device.

iv). The life expectancy of such devices as used on the vehicle shall not be less than 30 years.

v). The memory and processor capacity shall be designed to allow program expansion without hardware modification.

vi). Expandability and capacity requirements are as follows:

(1) The memory needs of the installed software, backup copy, if required, during software update and data files shall not utilize more than 50 percent of the installed memory capacity at Type Test.

(a) This requirement applies individually to each type of memory installed, whether it is EEPROM, Flash PROM, or RAM.

(2) Peak processing time demands shall not be greater than 75 percent of the available processor capacity.

d). Electrical Isolation and Pre-Processing

i). All processor system input and output signals shall be isolated. High voltage inputs and outputs shall be isolated external to the microcomputer card rack.

ii). Low voltage (battery and logic voltage level) inputs and outputs shall be isolated from the supply power.

iii). The isolation for the outputs can be external to the microcomputer card rack.

iv). The isolation shall accomplish the following:

(1) Protect and isolate the system from damage due to over-voltage, under-voltage, transients, shorts and open circuits

(2) Perform necessary voltage translations

(3) Remove noise and undesired signals

(4) Pre-processing to limit, discriminate and format those signals that would otherwise require excessive processor time

v). Isolation devices shall consist of optical isolators, transformers, relays, and other circuits appropriate to the application.

e). Batteries and Super Capacitors

i). The use of super capacitors is acceptable for real time clock or other requirements typically performed by a battery, provided the super capacitor can maintain clock or data for a minimum of 90 days.

ii). The use of batteries within control units for maintenance of a real-time clock, or for safe shutdown must be approved by Amtrak.

iii). If approved by Amtrak, all batteries shall be implemented as follows:

(1) Batteries shall be sized to retain data for at least six months without charging and shall be located such that leakage cannot damage any control system components.

(2) Battery life shall be no less than 5 years, regardless of type.

(3) Systems using standby or back-up batteries shall annunciate the need for battery replacement such that the battery continues to perform its function until it can be replaced at the next periodic maintenance.

(4) Batteries shall not be connected by soldering.

iv). Necessary RAM control data shall not depend on battery back-up but shall be stored in non-volatile memory and "shadowed" to RAM for use.

f). Maintenance and Related Tools

i). Portable Test Unit (PTU) and Bench Test Equipment (BTE)

(1) For custom software that is resident in test computers, Amtrak shall be given a license for unlimited use of the software for the approved purposes of this Contract. **[CDRL 27-30]**

(2) Licenses shall not be linked to specific hardware serial numbers.

(3) In addition, PTU and BTE equipment software documentation, compliant with this chapter, shall be furnished. **[CDRL 27-31]**

(4) PTU and BTE software shall be subject to the approved Configuration Control Plan of this Section.

(5) The operating system employed for the PTU shall be the most-advanced, user-friendly system available at the time of system design and development.

(6) While it is anticipated that the system will be Microsoft Windows™ based, advances in technology may preclude this from being the best choice.

(7) Accordingly, identification of the system to be used will be made by Amtrak at the time of design review.

(8) All PTU/PTE and BTE software – shall be package for deployment through Amtrak's Software Management Repository and shall operate without requiring elevated privileges.

(9) All diagnostic software, tools, and utilities intended for use on PTU/PTE devices shall be fully tested and validated on the Amtrak-approved PTU/PTE operating system image prior to delivery.

(10) Validation shall confirm correct operation of all diagnostics, communication, configuration, and firmware-update functions under the Amtrak image's security, network, and access control constraints.

27.6 Reliability

a). If more than two unplanned maintenance releases of any individual software configuration item (SCI) are required during formal type testing through the end of the warranty, Amtrak may require the Contractor to perform a full independent software quality review.

b). This review shall include all aspects of a software audit as listed in this section plus a full independent software verification and validation of the software.

27.7 Safety

a). The use of software in safety-critical or related applications must be approved by Amtrak.

b). If Amtrak approves the use of software in a safety-critical or related application, it shall be developed in compliance with EN-50716:2023, unless approved by Amtrak.

c). In addition to the requirements of this chapter, any software, firmware, processing device or computer providing a safety-critical function shall comply with the requirements of Chapter 25, Safety.

27.8 CDRLs

CDRL	Description	Due
CDRL 27-01	Software Quality Control Plan	NTP + 60 days
CDRL 27-02	Non-COTS Software Supplier Quality Audits	FDR
CDRL 27-03	Non-COTS Software Supplier Quality Audit Results/Reports	Within 30 days of each audit
CDRL 27-04	Non-COTS Software Supplier Quality Audit Remedial Action for Open Comments	Within 90 days of each audit
CDRL 27-05	Software Configuration Control Plan (SCCP)	30 days prior to IDR
CDRL 27-06	Database of Software Versions – Cars & Non-vehicle Equipment	30 days prior to IDR, then ongoing updates
CDRL 27-07	Software Version - Cars	In Car History Book
CDRL 27-08	Software Version - Non-vehicle Equipment	With delivery of equipment
CDRL 27-09	Software – all executables	At the end of warranty period for each software release
CDRL 27-10	Software – Updated software documentation	At the end of warranty period for each software release
CDRL 27-11	Software – Updated user documentation	At the end of warranty period for each software release
CDRL 27-12	Software – Software Version Description (SVD)	At the end of warranty period for each software release
CDRL 27-13	Software Developer Documentation	30 days prior to IDR, then ongoing updates

CDRL	Description	Due
CDRL 27-14	Demonstration to ensure that the ICD and DBDD or SID is complete and accurate	FDR
CDRL 27-15	COTS Software – Original data storage/transfer media functional and usage details	30 days prior to IDR, then ongoing updates
CDRL 27-16	COTS Software – All manuals and instructions to configure and install the software	30 days prior to IDR, then ongoing updates
CDRL 27-17	COTS Software – All licenses required for Amtrak's site use	30 days prior to IDR, then ongoing updates
CDRL 27-18	Test Reports for Software Unit Tests	30 days after performance of tests
CDRL 27-19	Test Reports for Software Type Tests	30 days after performance of tests
CDRL 27-20	Software Validation Test Procedures	30 days prior to IDR, then ongoing updates
CDRL 27-21	Results of a current, independent, BSIMM and/or OWASP SAMM software security assessment of Contractor	360 days prior to shipment of first cars
CDRL 27-22	Transfer of Software to Replacement Devices – Master copies of the compiled executable for all programmable devices	180 days prior to shipment of first cars, then ongoing updates
CDRL 27-23	Transfer of Software to Replacement Devices – Six (6) sets of equipment and software to transfer the compiled software	180 days prior to shipment of first cars then ongoing updates
CDRL 27-24	Escrow of Proprietary Source Code	180 days prior to shipment of first cars, then ongoing updates
CDRL 27-25	Demonstration that source code in Escrow is same as on vehicles.	180 days prior to shipment of first cars, then ongoing updates
CDRL 27-26	Software Executable Generation Procedure (SEGP) to use Escrowed files	30 days prior to FDR, then ongoing updates
CDRL 27-27	Full Instructions for Workstation to use escrowed files	30 days prior to FDR, then ongoing updates
CDRL 27-28	Documentation of Escrowed Source Code to allow for maintenance, troubleshooting and adjustment	30 days prior to FDR, then ongoing updates
CDRL 27-29	Microprocessor System Shutdown Special Procedure	30 days prior to IDR, then ongoing updates
CDRL 27-30	License for unlimited use of software in test computers	360 days prior to shipment of first cars, then ongoing updates

28.5 Software Security Lifecycle....28-27
28.6 CDRLs....28-30

28.1 General

a). Overview

i). The goals of the implementation of these and all cybersecurity requirements are to maintain the safe and reliable operation of assets within the scope of Amtrak's risk posture.

ii). Amtrak's commitment to maintaining the highest standards of cybersecurity is paramount to safeguarding our industrial processes, data integrity, and protecting our people against potential cyber threats. Amtrak developed these cybersecurity requirements to establish a robust cybersecurity framework that aligns with industry best practices and regulatory guidelines, encompassing a range of security measures. By adhering to the requirements herein, Amtrak aims to create a protected and resilient environment that fortifies against potential threats and enhances our overall operational efficiency. All Amtrak vendors, suppliers, contractors, and service providers ("Contractors") shall adhere to the requirements as set out herein (collectively the "Attachment") in the delivery of supplies and/or services that may access, create, use, process, transfer, share and/or store Amtrak Data and Amtrak Operational Technology systems.

iii). Amtrak places a high priority on cybersecurity and recognizes the inherent complexities and evolving challenges associated with safeguarding both IT and OT assets.

iv). The security of Amtrak's train network, which serves as a vital transportation lifeline for millions of passengers each year, is of paramount importance to Amtrak and its customers.

v). To ensure the utmost protection, Amtrak has established a specialized organization of cybersecurity experts dedicated to preserving the security, integrity and resilience of their systems.

vi). Amtrak expects the same dedicated commitment from the Contractor and its Suppliers and sub-suppliers.

vii). By maintaining a dedicated commitment to cybersecurity, Amtrak strives to uphold the trust and confidence of their passengers, partners and stakeholders taking proactive measures to ensure availability, reliability and safety of the train network while safeguarding sensitive information entrusted to Amtrak.

viii). Normative Standards Compliance: The Contractor shall design, integrate, verify, validate, and maintain all IT/OT systems to comply with ISA/IEC 62443 (series), railway-specific cybersecurity standard CLC/TS 50701 or successor IEC 63452, and current TSA Security Directives 1580/82-2022-01 (rail) and 1582-21-01 (passenger rail/transit) in effect at Final Design Review and thereafter through delivery and the TSSSA period. Where referenced standards are updated during performance, the Contractor shall meet the current requirements or provide an Amtrak-approved equivalency mapping. Compliance shall be demonstrated through the deliverables and tests

specified in this Chapter (SBOM/HBOM, access control and crypto evidence, logging and SIEM integration, IDS provisions, vulnerability assessment and penetration testing, corrective action plans), which constitute the acceptance criteria for cybersecurity.

b). Requirements

i). This section defines cybersecurity requirements for all hardware, software, software services and firmware (hereinafter referred to as the “products” for purposes of this section) to be provided under this Contract, whether resident within a microprocessor-controlled system, provided as part of test or interface equipment, provided for the purpose of post-download data analysis and processing, incorporated within training technology and manuals, Bench Test Equipment (BTE) or supplied as a part of a software based service.

ii). These requirements apply to all systems that include processors or other programmable components such as Programmable Logic Devices (PLDs).

iii). All products that consist of programmable components, software or data for this Contract are subject to these same requirements. Contractor shall respectively transmit and enforce these requirements to all subcontractors and require that these subcontractors flow these requirements down to all of their subcontractors and sub-suppliers that handle programmable components, software or data, regardless of the tier.

iv). Thus, where the word “Contractor” is used, it includes all subcontractors and sub-suppliers, at every tier.

c). Failure to meet requirements

i). If the Contractor fails to comply with any of the requirements set forth herein and fails to remedy such non-compliance upon demand from Amtrak, Amtrak may exercise all available legal, contractual and administrative remedies for such non-compliance, up to and including a default termination in accordance with the Termination for Default article in the Contract.

ii). This applies not only to Contractors as defined in the above paragraph, but to manufacturers of all hardware, software, and firmware installed in the railcar.

iii). Further, if the results of any penetration testing, vulnerability assessment or other examination or audit of the Contractor’s cybersecurity protections yields any results that either the Federal Government or one of Amtrak’s jurisdictional partners determines to require further examination and/or audit, Amtrak may share the results of such testing with Federal, state or local authorities for the purpose of protecting national security interests, the safety and security of the riding public, or personal and real property.

d). Minimum Requirements

i). These requirements represent the minimum set of security requirements and additional security requirements may be called out in other chapters of this contract.

ii). In the following text, the terms “cybersecurity” and “security” may be used interchangeably to meet the intention of the specific requirement.

iii). Where security or cybersecurity are referenced, they are inclusive of data privacy considerations where applicable.

e). Security Governance

i). The Contractor shall define, document, and provide to Amtrak for review and approval a listing of Contractor personnel involved in the car’s development, maintenance, and operation who will be accountable for security-related decisions and actions. **[CDRL 28-01]**

ii). The document shall include:

(1) Personnel roles.

(2) Qualifications per person, including:

(a) any security industry certifications

(b) years of experience in IT and/or OT security

(c) years of experience in car security

(d) formal training in IT and/or OT security

(e) previous and current security positions held.

(3) Responsibilities per role for security-related decisions and actions.

(4) Accountabilities per role for security-related decisions and actions.

iii). Zero Trust & Segmentation Principles:

(1) The cybersecurity architecture for onboard, wayside, and cloud components shall align to a Zero Trust model: verify explicitly, enforce least-privilege access, and assume breach. Network access and data flows between security zones shall be denied by default and explicitly allowed by policy.

iv). Data Classification & Handling

(1) The Contractor shall implement Amtrak data classification (e.g., Public, Internal, Confidential, Restricted) and associated handling controls for data at rest, in transit, and in use, including retention and deletion schedules for telemetry and logs. Contractor shall provide a Data Handling Matrix for Amtrak approval.

f). Risk Management Framework

i). The NIST SP 800-37 Framework shall be used as the underlying risk management framework to identify, detect, protect from, respond to and

recover from security risks associated with the cars over their lifecycle, evolving to maintain concurrency with current versions.

ii). If the NIST SP 800-37 Framework becomes obsolete during the term of this contract, Amtrak will determine an appropriate and compatible replacement.

iii). This risk management framework shall be used as the basis for all specified security initiatives within this contract (e.g., assessments and testing, application of controls, risk mitigation, etc.), unless alternate frameworks are approved by Amtrak on a case-by-case basis.

iv). In the case of alternate frameworks being referenced within this contract on a case-by-case basis, NIST SP 800-37 and the named alternate framework shall be leveraged, with the Contractor's ability to combine testing where the requirements of each framework are compatible.

v). Security Compliance Frameworks: "Security Compliance Framework" or "framework" shall imply law, regulation, specification, directive, framework or other as applicable.

vi). In certain scenarios, demonstrating compliance with a specific framework other than NIST SP 800-37 may become necessary, such as requiring compliance to additional regulations, best practices and guidance including, but not limited to: TSA Security Directive 1580/82-2022-01D – Rail Cybersecurity Mitigation Actions and Testing (or current version of TSA Security Directive 1580/82-2022-01), ISA/IEC 62443, CLC/TS 50701, IEC 63452 upon publication, NIST SP 800-82, Rev. 3, NIST SP 800-53, Rev. 5 with the overlay for Operational Technology as specified in NIST SP 800-82, Rev. 3, PCI-DSS, HIPAA, and/or other more granular security compliance frameworks.

vii). Where demonstrating compliance to a specific framework becomes necessary based on the type of data in that environment and/or basis of the framework, the Contractor shall demonstrate compliance to the specific framework in addition to meeting all other security requirements of this contract, unless they conflict with the security compliance framework.

viii). If a conflict arises, the Contractor shall notify Amtrak, discuss the conflict, provide a recommended resolution, and Amtrak shall either approve the recommendation or provide a counter recommendation.

ix). Demonstrating compliance to specialized security compliance frameworks shall be required even if not specifically called out in any other chapter of this contract when the impact of the security compliance framework's basis on Amtrak is evident.

x). Consideration for CLC/TS 50701 and ISA/IEC 62443 Security Compliance Framework:

(1) There are well-known security compliance frameworks for Control Systems such as CLC/TS 50701 and ISA/IEC 62443 that can be applied to rail.

(2) Should the Contractor already align with one of these frameworks, they may submit a mapping of the designated framework against NIST SP 800-37 for Amtrak's review and consideration as an alternative to using NIST SP 800-37 as the primary risk management framework.

g). Supply Chain Security

i). The Contractor shall conduct a thorough assessment of all entities involve in its collective underpinning.

(1) These assessments shall follow the Shared Assessments Standard Information Gathering (SIG) questionnaire and utilize the Agreed Upon Procedures to implement and manage third-party risk assessment and management and ensure compliance with applicable security and privacy laws, regulations, frameworks.

(a) Alternate methods of assessment such as existing audits from an acceptable source or certification to an acceptable alternative will be considered if already existing (i.e. ISO 27001 certification).

(b) Where applicable the SIG Lite form may be considered based on the product being provided.

(2) The Contractor shall disqualify any Supplier and/or sub-supplier that poses an unacceptable level of risk, unless approved by Amtrak.

(3) Unacceptable risk levels shall be determined as moderate or higher, and detailed risk information shall be presented to Amtrak for consideration and approval if the Contractor wishes to proceed with the Supplier or sub-supplier.

(4) Any Supplier or sub-supplier engaged in any portion of this contract from sanctioned countries shall be identified as a critical risk.

(5) The comprehensive third-party security risk management scoring on any Supplier and sub-supplier approved for use in the car's development, maintenance, and operation shall be made available to Amtrak upon their request.

ii). Throughout the procurement and manufacturing process, the integrity and authenticity of car components shall be continuously validated.

(1) The Contractor shall implement measures to ensure that all components used in the cars are obtained from trusted sources and are free from any tampering or unauthorized modifications.

(2) This includes rigorous checks and controls at each stage of the supply chain to maintain the security and reliability of the car's components. Alternatives may be proposed regarding a chain of custody approach to be reviewed and approved by Amtrak.

iii). Software Bill of Materials / Hardware Bill of Materials

(1) The Contractor shall maintain a Software Bill of Materials (SBOM) and Hardware Bill of Materials (HBOM) throughout the design process, with regular updates throughout the warranty period.

(2) The Contractor shall submit the SBOM and HBOM format for Amtrak review and approval prior to the first design review. **[CDRL 28-02]**

(3) SBOM and HBOM shall be submitted at the following intervals:

(a) at each design review

(b) at FAI

(c) prior to the delivery of the first vehicle, and

(d) annually throughout the warranty period

(4) The SBOM shall detail all software components used to provide the required functionality of this technical specification, including all on-board software, and software supplied to support required off-board functionality.

(5) Each SBOM entry shall include:

(a) the system name

(b) the part name

(c) the software configuration item name

(d) the software component's name

(e) the version number and

(f) a cryptographic hash of the software.

(6) The SBOM shall identify any known vulnerabilities associated with each software component, referencing the Common Vulnerabilities and Exposures (CVE) identifiers where applicable.

(7) The SBOM shall be provided in an industry standard format as approved by Amtrak, such as SPDX, SWID, or CycloneDX.

(8) The HBOM shall be a comprehensive list of all hardware components which include microprocessors, programmable logic devices, or other memory and executable code. Each entry shall include the system, the component manufacturer, the component name, model, revision and any unique identifiers.

(9) The HBOM entry shall include supply-chain information including manufacturer location and places of origin for key sub-components.

iv). Country of Origin

(1) The Contractor shall identify the country (or countries) of origin of all products to be provided under this Contract, or any subcontracts, at any tier.

(2) The Contractor shall identify the countries where the development, manufacturing, maintenance, and service for the product are provided or will be provided.

(3) The Contractor must submit a list of the proposed products identifying the country of origin ("List" hereinafter) to Amtrak for approval. **[CDRL 28-03]**

(4) The Contractor shall notify Amtrak of any changes to the List no less than 90 days prior to the date that the change will be implemented.

(a) This is a mandatory requirement for all products that will be used on the project.

(b) The Contractor shall not be entitled to an equitable adjustment to the Contract for any costs incurred based upon any approved changes to this List.

h). Training and Awareness

i). All personnel performing work related to the development, operation, or maintenance of the equipment supplied as a part of this technical specification shall undergo adequate security training.

ii). This training shall cover their specific roles and responsibilities in delivering the equipment and services and effectively mitigating security risks.

iii). The Contractor shall ensure that all personnel are equipped with the necessary knowledge and skills to uphold the highest standards of security throughout the equipment's lifecycle.

iv). Regular refresher training and awareness programs shall be conducted to keep personnel up to date with evolving security practices and requirements.

v). A listing of all security training conducted with a roster of who completed the training shall be provided to Amtrak upon their request.

i). Conflict of Requirements

i). If any security requirement of this contract conflicts with a safety and/or regulatory function of the cars or any other specific contract requirement, the conflict shall be promptly raised to Amtrak.

ii). The Contractor shall provide a detailed explanation of the conflict along with a recommended approach for resolution, which will be subject to Amtrak's review, approval, and/or counter-recommendation.

28.2 Cybersecurity Practices

a). General

i). The Contractor shall adhere to the specified cybersecurity practices detailed below.

ii). In the event that the Contractor knows that it cannot comply with a requirement at the time of its proposal, it shall specify in sufficient detail the justification for non-compliance and its proposed alternative method for meeting the requirement.

iii). The Contractor has the affirmative duty to seek and identify any and all information that would result in actual or potential non-compliance during the course of Contract performance.

iv). The Contractor shall immediately notify Amtrak so that corrective action can be taken.

v). Appropriate security controls shall be implemented for all aspects of the cars that are susceptible to security risks, adhering to a minimum of NIST 800-37.

vi). These controls shall encompass a broad range of security measures and practices to ensure the protection of the cars' assets.

vii). In addition to implementing security controls based on NIST 800-37 or agreed alternative, appropriate security controls shall be implemented for all aspects of the cars that are susceptible to security risks, following industry-specific guidance where available.

viii). This guidance may include TSA Security Directive 1580/82-2022-01D – Rail Cybersecurity Mitigation Actions and Testing (or current version of TSA Security Directive 1580/82-2022-01), ISA/IEC 62443, CLC/TS 50701, IEC 63452 upon publication, NIST SP 800-82, Rev. 3, NIST SP 800-53, Rev. 5 with the overlay for Operational Technology as specified in NIST SP 800-82, Rev. 3,, PCI-DSS, HIPAA, and/or other more granular security compliance frameworks, Cloud Security Alliance for cloud-based assets, CIS for system hardening/benchmarking, OWASP for software security hardening, and other applicable standards and best practices.

ix). By considering and implementing these explicit security controls, the cars' assets shall be optimized for enhanced safeguarding and protection.

b). Software and Services

i). The Contractor shall remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the product not required for routine operations, emergency operations, or troubleshooting.

(1) This will include communication ports and physical input/output ports (e.g., USB docking ports, video ports, UART ports, and serial ports).

(2) Removing or disabling all software components, services, and applications not essential for the operation and maintenance of the device.

(3) Disabling, through software or physical means, all unnecessary communication ports and removable media drives, or providing engineered barriers, and documenting the results.

(4) Ensuring that only explicitly approved and required ports and services are enabled for normal and emergency operation and maintaining an up-to-date inventory of these configurations.

(5) The Contractor shall provide documentation of disabled ports, connectors, and interfaces to Amtrak **[CDRL 28-04]**.

ii). The Contractor shall provide summary documentation of the product's security features and security-focused instructions on maintenance, support, and reconfiguration of the product's default settings. **[CDRL 28-05]**

iii). The Contractor shall disclose the existence of all known methods for bypassing computer authentication contained in the product, often referred to as "backdoors," and provide written documentation that all such backdoors have been permanently deleted from the product. **[CDRL 28-06]**

c). Access Control

i). All access control measures from the current version of TSA Security Directive 1580/82-2022-01 series at time of Final Design Review and through delivery shall be implemented, including those for local and remote access, to secure and prevent unauthorized access to Critical Cyber Systems.

ii). The Contractor shall configure each component of the product to operate using the "Principle of Least Privilege" (POLP), including operating system permissions, file access, device access, device/user accounts, and communications/data transfer.

iii). The software shall deny access by default and allow access by specific permissions.

iv). The Contractor shall provide, for such systems, a mechanism for changing users' roles (e.g., group) or associations. The Contractor shall provide, for such systems, a mechanism for changing users' roles (e.g., group) or associations. The Contractor shall document options for defining access and security permissions, user accounts, and applications with associated roles including which accounts need to be active and those that can be disabled, removed, or modified. The Contractor shall configure these options, as specified by Amtrak. **[CDRL 28-07]**

v). The Contractor shall recommend methods for Amtrak to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware.

vi). If it is not technically feasible to implement the necessary controls to protect the BIOS to reduce the risk of unauthorized changes, the Contractor shall document this as a risk and provide mitigation recommendations when complying with this requirement.

vii). The Contractor shall install physical barriers on any network equipment that is public or crew accessible and hosts one or more Ethernet Ports so as to prevent Physical Access to the subject ports from unauthorized personnel.

viii). The Contractor shall secure any equipment connected to any railcar network in cabinets that use tamper resistant locking hardware.

(1) This requirement excludes any equipment that will require a direct interaction with the operator during the operation of the Railcar (e.g. operator displays, communication system HMI).

ix). The Contractor shall verify and provide documentation for the product, attesting that unauthorized logging devices are not installed (e.g., key loggers, cameras, and microphones), as specified by Amtrak **[CDRL 28-08]**

x). The Contractor shall deliver a product that enables Amtrak to configure its components to limit access to and from specific locations (e.g., security zones, business networks, and demilitarized zones [DMZs]) on the network to which the components are attached, where appropriate, and provide documentation of the product's configuration as delivered.

xi). Secure Remote Access: Contractor shall design and implement necessary access control measures to ensure that remote access to systems is executed in a way that protects against unauthorized access. Contractor shall ensure that configuration documentation for remote access control measures is provided by the trainset manufacturer for systems developed or owned by the trainset manufacturer, and by 3rd party vendors for 3rd party developed or owned systems.

(1) Remote access to onboard systems and devices shall be protected through authentication controls that comply with a minimum of NIST Authentication Assurance Level AAL2 as documented in NIST SP 800-63B.

(2) Mechanisms for secure remote access shall be implemented to ensure that only authorized individuals can access the trainset remotely.

(3) Remote access rules and permissions shall be based on principles of least privilege and separation of duties, where technically feasible.

(4) Logging mechanisms shall be in place to record and monitor remote access activities for audit and forensic purposes

(5) Remote access and related anomalous activity shall be logged and forwarded to the Amtrak enterprise SIEM platform on the wayside.

(6) IP addresses shall not be discoverable on the internet.

(7) Data transmission to and from the trainset systems including all forms of train to ground communications (cellular/wireless, Wi-Fi, T2G) shall be encrypted in compliance with the current FIPS requirements. Such encryption shall not use deprecated algorithms.

(8) Strong authentication methods, such as multi-factor authentication, shall be used to verify the identity of remote users.

(9) All remote access sessions shall be encrypted using industry standard encryption algorithms and secure communication protocols that meet strong cybersecurity and integrity requirements (e.g., FIPS compliant).

d). Authentication / Password Policy and Management

i). The Contractor shall document the levels, methods, and capabilities for authentication and authorization of passwords.

ii). The Contractor shall deliver a product that adheres to standard authentication protocols which conforms to Amtrak Authentication and Authorization standards.

iii). The Contractor shall propose an authentication method (e.g., password based, multi-factor, IP-based, Certificate based authentication) subject to review and approval by Amtrak for the following types of connections:

(1) Wired connections

(a) Local connection: temporary Connection between external equipment and a railcar subsystem (e.g., Portable Test Equipment connected to a subsystem).

(b) Network connections between railcar subsystems and railcar networks.

(c) Network connections between external equipment and railcar networks (e.g., Portable Test Units connected through Ethernet Diagnostic Port).

(2) Wireless connections – remote access

(a) Mechanisms for secure remote access shall be implemented to ensure that only authorized individuals can access the cars remotely.

(b) Strong authentication methods, such as multi-factor authentication, shall be used to verify the identity of remote users.

(c) All remote access sessions shall be encrypted using industry-standard ntra algorithms and secure communication protocols that meet strong security and integrity requirements (e.g., FIPS compliant).

(d) Logging mechanisms shall be in place to record and monitor remote access activities for audit and forensic purposes.

iv). Operator Interface Devices:

(1) Contractor Password or PIN protection shall be the preferred security authentication control to protect onboard devices and touchscreens equipped with human operator interfaces, a.k.a. user interfaces (UI) from unauthorized access.

(2) In cases where password protection may introduce operational safety risks, adequate physical security controls shall be implemented in lieu of the password or PIN protection. e.g. If adding password or PIN protection to a conductor-operated device onboard will result in an impact on safety and timely response from the conductor on operational tasks, then the password protection is not required and physical security measures such as providing a locked door or cabinet protecting access to the device / screen shall be adequate.

(3) Contractor shall provide a means for Amtrak to create a PIN or password for onboard systems.

v). User Accounts: Contractor shall implement appropriate technical and administrative controls to ensure the security and confidentiality of all user accounts. These controls must include, but are not limited to, strong authentication mechanisms, secure storage and transmission of credentials, and regular monitoring for unauthorized access or compromise.

(a) Complex passwords shall be comprised of a combination of uppercase, lowercase, numeric, and special characters.

(b) Passwords shall not be hardcoded.

(c) Passwords shall be modifiable by an administrator.

(d) Passwords shall be encrypted at rest and in transit.

(e) Default passwords on devices, systems, applications shall be changed.

(f) “Hidden” service support accounts shall not be used and must be removed.

(g) Use of shared accounts shall be limited. Principles of least privilege and separation of duties shall be implemented.

(h) The Contractor shall recommend which accounts need to be active and those that can be disabled, removed, or modified. Amtrak will review the Contractor recommendation and provide a final determination in writing. The Contractor shall disable, remove, or modify all the accounts pursuant to the approved recommendation.

(i) Contractor shall ensure that:

(i) Hidden Service Support Accounts are eliminated

(ii) Default passwords are changed to complex passwords in compliance with Amtrak requirements

(iii) Capability to support complex passwords is confirmed and documents; and

(iv) Capability to support individual user accounts is confirmed and documented.

vi). The Contractor shall protect all passwords, including, but not limited to the following methods:

(1) Contractor shall not store passwords in clear text.

(2) Contractor shall not hardcode passwords into software or scripts.

(3) All default passwords shall be changed in all components.

(4) the use of blank/null password shall not be supported unless explicitly agreed upon by Amtrak for specific component types.

e). Logging and Auditing

i). The Contractor shall provide logging capabilities or the ability to support Amtrak's logging system requirements, including transmission to Amtrak's Cyber Fusion center relevant on-board logs associated with cybersecurity.

ii). Logging capabilities provided by the Contractor shall be configurable by Amtrak and support security auditing requirements. As specified by Amtrak, the product shall cover the following events, at a minimum (as appropriate to their function):

(1) Information requests and device responses

(2) Successful and unsuccessful authentication and access attempts

(3) Account changes

(4) Privileged uses

(5) Discovery of malicious software on an IT or OT system

(6) Activity resulting in a denial of service to any IT or OT system; and/or

(7) Any cybersecurity incidents or breaches of onboard systems and defenses, or anomalous events such as unauthorized changes to approved hardware, software, or trainset configuration that result in operational disruption to the IT or OT systems or other aspects of the

Owner/Operator's rail systems or facilities, or an incident that has the potential to impact a large number of passengers, critical infrastructure, or core government functions

(8) Any other activity indicative of a real or potential cybersecurity incident is identified per Security Directive 1582-21-01B - Enhancing Public Transportation and Passenger Railroad Cybersecurity.

iii). The Contractor shall time-stamp audit trails and log files, as specified by Amtrak.

iv). The Contractor shall provide comprehensive security protection of log files.

v). The Contractor shall implement an approach for collecting and storing security log files on the railcar. The Contractor shall also implement an approach for transferring security log files from the railcar to the wayside.

vi). The Contractor shall provide a list of all log management activities that the product is capable of generating and the format of those logs. This list shall identify which of those logs are enabled by default. **[CDRL 28-09]**

f). Cryptography and Encryption

i). Cryptography/Encryption: Encryption shall be used as a security control to maintain confidentiality, verify authenticity or integrity, and provide non-repudiation.

ii). The use of encryption shall consider all relevant aspects, including but not limited to:

(1) Key Management: Procedures and controls for key generation, distribution, storage, and revocation shall be implemented.

(2) Protection of Cryptographic Keys: Measures shall be taken to protect cryptographic keys from unauthorized access, loss, theft, or compromise.

(3) Recovery of Encrypted Information: Procedures shall be implemented to enable the recovery of encrypted information in the event of key loss or compromise. Processes for key recovery shall be established.

(4) Compliance with Industry Standards: Encryption algorithms and protocols employed must adhere to industry standards for strong security and integrity. Compliance with relevant standards, such as FIPS (Federal Information Processing Standards), shall be ensured to maintain the highest level of encryption security.

g). Communication Security & Restrictions

i). Robust security measures shall be implemented to protect data transmitted between the cars' onboard systems and/or external entities. This requirement encompasses various avenues of communication including but not limited to network, wireless, satellite, cellular, and analog.

ii). Security controls shall be implemented to include, but not be limited to, the following:

(1) Network Security

(a) A comprehensive network infrastructure shall be established with the network partitioned using a “zones and conduits” architecture incorporating technologies such as firewalls, intrusion detection/prevention systems, data diodes, and other technology as approved by Amtrak.

(b) Access controls shall be enforced to prevent unauthorized network access.

(c) Encryption algorithms and secure communication protocols, compliant with industry standards for strong security and integrity (e.g., FIPS compliant), shall be employed for all networks utilized within the cars.

(2) Wireless Security

(a) Strong encryption algorithms and secure communication protocols, meeting industry standards for security and integrity (e.g., FIPS compliant), shall be employed for all wireless networks used within the cars.

(b) Wireless access points shall be securely configured, and regular firmware updates shall be performed to mitigate potential vulnerabilities.

(3) Satellite Security

(a) Encryption algorithms and secure communication protocols, compliant with industry standards for strong security and integrity (e.g., FIPS compliant), shall be implemented to safeguard data transmitted over satellite links.

(b) Physical security measures shall be established to protect satellite communication equipment, and regular patching and firmware updates shall be conducted to mitigate potential vulnerabilities.

(4) Cellular Security

(a) Robust encryption algorithms and secure communication protocols, meeting industry standards for security and integrity (e.g., FIPS compliant), shall be implemented to protect data transmitted over cellular communication.

(b) Cellular devices and modules shall be configured with secure settings, including the disabling of unnecessary services and features that may introduce vulnerabilities.

(c) Regular updates of firmware and security patches shall be applied to mitigate potential vulnerabilities.

(d) Access control mechanisms, such as strong authentication and SIM card security measures, shall be employed to prevent unauthorized use of cellular devices and/or SIM cards.

(5) Analog Security

(a) Measures shall be implemented to protect analog communication signals from unauthorized interception, interference, or disruption.

(b) This may involve the use of encryption devices attached to the analog communication line or frequency hopping techniques to change the frequency of the analog signal at regular intervals.

(c) Physical access to analog interfaces and communication equipment shall be controlled to prevent unauthorized tampering or connection of malicious devices.

(d) Physical transmission lines shall be protected against unauthorized tapping, tampering and signal interference.

(e) Analog communication ports and infrastructure (e.g., antennas, transceivers) shall be physically secured from unauthorized access, tampering and sabotage.

(f) Analog communication networks shall be segmented from other networks and isolated from digital networks.

(6) Network Segmentation

(a) A network architecture and segmentation strategy shall be implemented to isolate critical systems and components from less critical ones, preventing unauthorized access, limiting lateral movement within the zone, and mitigating potential attacks.

(b) Secure communication channels shall be established between car components to protect sensitive data and ensure secure interaction between systems.

iii). The Contractor shall provide information on all communications (e.g., protocols) required between network zones whether inbound or outbound and identify each. **[CDRL 28-10]**

iv). The Contractor shall provide a method to restrict communications traffic between different network security zones.

v). The Contractor shall provide documentation on any method or equipment used to restrict communications traffic.

vi). The Contractor shall provide Amtrak with access, including administrative access as needed, to the network components of the product.

vii). The Contractor shall document all remote access entry pathways and ensure that they can be enabled or disabled by Amtrak. **[CDRL 28-11]**

viii). The list of IP addresses assigned to each subsystem on the fleet is subject to approval by Amtrak.

ix). Asset tags, resource ids, and cloud providers of cloud-hosted Amtrak digital assets shall be provided to Amtrak.

x). The Contractor shall provide a method for managing the network components of the product and changing configurations. (e.g., addressing schemes).

xi). The Contractor shall certify that all interfaces which implement administrative management capabilities of onboard devices are managed over encrypted protocols with Amtrak compliant authentication required. **[CDRL 28-12]**

h). Data Protection

i). Robust measures shall be implemented to protect sensitive data, including passenger information, maintenance records, and operational data.

ii). Encryption of data at rest and in transit shall be implemented, meeting industry standards for strong security and integrity (e.g., FIPS compliant).

iii). Backup and recovery capabilities shall be established to ensure data availability and resilience.

iv). Data loss prevention mechanisms shall be in place to safeguard against unauthorized access, disclosure, or alteration of data.

v). Secure data disposal processes shall be implemented to permanently remove sensitive data when it is no longer required.

vi). Compliance with data privacy laws, regulations, frameworks, and directives that are impactful to Amtrak shall be demonstrated.

vii). Databases used for the cars shall undergo regular updates and patching to mitigate potential vulnerabilities.

i). Hardware Security

i). Comprehensive procedures and controls shall be implemented to address all aspects of hardware security.

ii). This includes secure hardware design practices that consider protection against tampering, unauthorized physical access, and theft.

iii). Critical hardware components shall be physically secured and access shall be restricted to authorized personnel only.

iv). A trusted supply chain shall be established to ensure the integrity and authenticity of hardware components.

v). Hardware integrity verification processes shall be implemented to validate the integrity of hardware prior to installation.

vi). Only authorized configurations and firmware/software versions shall be deployed on the car's hardware.

vii). Tamper-evident and/or tamper detection mechanisms shall be employed on critical hardware components to detect unauthorized modifications.

viii). Secure hardware lifecycle management practices, including the secure disposal of hardware, shall be established.

ix). Physical security measures shall be implemented to protect hardware from physical attacks and theft.

j). Bluetooth Security

i). The Contractor shall ensure the security of Bluetooth-enabled devices through the implementation of comprehensive procedures and controls, addressing the following aspects as required by Amtrak:

(1) Encryption: Industry-standard encryption algorithms and secure encryption modes shall be implemented (e.g., FIPS compliant) to protect data exchanged between Bluetooth-enabled devices. The encryption mechanisms shall provide strong security and integrity to safeguard the confidentiality and integrity of the transmitted data.

(2) Secure Authentication: Bluetooth devices shall implement secure authentication mechanisms to ensure that only authorized devices can connect and communicate. Robust authentication methods shall be employed to verify the identity and trustworthiness of connecting devices.

(3) Strong Pairing Methods: Devices shall use strong pairing methods to establish secure connections. These methods should employ cryptographic mechanisms to generate and exchange secure keys during the pairing process, ensuring the confidentiality and integrity of the communication.

(4) Access Control: Bluetooth devices shall employ access control mechanisms to restrict connections to trusted devices only. Unauthorized or untrusted devices shall be prevented from establishing connections with the car's Bluetooth devices to mitigate the risk of unauthorized access.

(5) Updated Bluetooth Versions: Devices shall use the latest Bluetooth version supported by the devices, avoiding the use of older Bluetooth versions that may have known vulnerabilities or weaknesses.

(6) Limited Visibility: Devices shall be configured to limit their visibility and unnecessary Bluetooth services, or profiles, shall be disabled.

(7) Secure Firmware and Software Updates: Bluetooth devices shall have a mechanism to receive and install firmware and software updates. All security patches, bug fixes, and updates provided by the device manufacturers shall be applied.

k). IoT (Internet of Things) Security

i). Robust procedures and controls shall be implemented to address the unique security challenges posed by IoT devices.

ii). These measures include the support for strong authentication mechanisms, such as unique credentials or cryptographic certificates, to ensure that only authorized entities can access and interact with IoT devices.

iii). Each IoT device shall have a unique identifier to maintain its integrity and prevent unauthorized device impersonation and tampering.

iv). Secure provisioning and configuration practices shall be followed, including changing or disabling default passwords.

v). Regular security updates and patches shall be applied to ensure ongoing protection of the devices.

vi). Additional physical security measures shall be implemented for devices deployed in public or vulnerable areas to mitigate the risk of theft or unauthorized removal.

l). Cybersecurity and Vulnerability Assessments

i). Vulnerability Assessments: Vulnerability assessments/scans to identify cybersecurity gaps shall be conducted prior to the delivery of the trainset and/or of Operational Technology to Amtrak.

(1) Amtrak and/or Contractor shall conduct vulnerability scans on all systems with jointly approved technology to ensure that all security controls specified in the design are implemented and effective.

(2) The test procedures shall include a checklist of systems to be tested, the test conditions, test data/parameters etc. This test plan shall be submitted to and approved by Amtrak prior to the scan execution

(3) Parameters and process of the assessment shall be documented and agreed prior to execution.

(4) Contractor shall submit the scan test report, associated findings, and proposed mitigations to Amtrak for review and approval prior to formal acceptance.

ii). Contractor shall document all remediation and mitigation measures employed to manage vulnerabilities for consultation with Amtrak.

(1) Contractor shall allow Amtrak to perform penetration testing. Contractor shall review Amtrak's plan for penetration testing and provide access to the trainset or system as needed to perform the penetration testing and provide other assistance as needed to facilitate such testing.

(2) Amtrak shall be given the opportunity to conduct penetration testing on all systems with jointly approved technology to ensure that all security controls specified in the design are implemented and effective.

(3) The test procedures shall include a checklist of systems to be tested, the test conditions, test data/parameters etc.

(4) Parameters and process of the assessment shall be documented and agreed prior to execution.

(5) Contractor shall provide technical and operational support during the testing process.

(6) The penetration test findings shall be documented in a formal report

(7) Contractor and Amtrak shall develop a plan for remediation measures to address the findings deemed higher than an acceptable risk by Amtrak. The plan must be approved by Amtrak before it can be considered final and implemented for the trainset and/or Operational Technology.

(8) Any residual risks requiring risk acceptance will be managed through the Amtrak GRC process.

(9) Remediation: The remediation measures to address the vulnerabilities and risks identified during the assessment shall be documented and a plan shall be developed for applying the identified measures. The plan must be approved by Amtrak before it can be considered final and implemented for the trainset.

m). Transient Assets

i). Secure Transient Assets: Transient assets such as Portable Test Equipment (PTE), Diagnostic systems, Portable Test Unit (PTU), and portable computers shall be protected from compromise by applying endpoint protection capabilities, where technically feasible:

(1) Applying and maintaining patches for associated asset operating systems and applications

(2) Applying and maintaining access control policies

(3) Applying and maintaining malicious code detection signatures

(4) Applying logging, monitoring, and alerting capability for events

(5) Encrypting data-at-rest where sensitive data is stored

ii). Asset Requirements: In the use or delivery of Transient Assets, Contractor shall:

(1) Install and configure all diagnostics software on the PTUs

(2) Coordinate with Amtrak timely to install and configure all operating system and other software upgrades, updates, maintenance and security patches on an ongoing basis for the life of the trainset to keep the PTUs up to date

(3) Provide timely technical support for the Siemens installed software on the PTUs

(4) Provide appropriate software updates and/or workarounds to mitigate all vulnerabilities associated with the flaw within a pre-negotiated period.

(5) Notify Amtrak of all problems and remediation steps regarding vulnerabilities, regardless of origin of discovery.

(6) Inform Amtrak Management in writing of flaws within applications and operating systems in a timely fashion and provide corrective actions, fixes, or monitoring guidance for vulnerability exploits associated with the flaw

n).

28.3 Physical Security

a). Contractor shall implement physical access controls commensurate with the criticality of each security zone, consistent with the security zoning model approved during Design Review (e.g., IEC 62443 / TS 50701 zone and conduit methodology). Physical controls may include, but are not limited to, disabling unneeded ports, locked cabinets or panels, tamper-resistant enclosures, or alarms on access points.

i). At least one of the following security controls must be implemented to secure onboard systems and devices.

(1) Disable all unneeded communication ports (e.g. USB ports, CD/DVD drives, and other removable media devices) through software or physical disconnection, where possible.

(2) Lockable enclosures for devices e.g. locked cabinets, racks etc.

(3) Devices with security locks and keys e.g. barrel locks for VSS NVRs

ii). Contractor shall ensure the following physical controls are implemented:

(1) Provide physically secure locations (locked cabinets, racks etc.) for cyber-assets requiring protection.

(2) Install physical locks to prevent cabinet/panel access to onboard and wayside devices

(3) Transient assets must be locked in storage when not in use

(4) Electronic access to any system shall not be accessible via lavatories

(5) Control Terminal keypads can be electronically locked

(6) Switches are physically locked behind door/cabinet/panel

(7) Install alarms on any panels containing system or network access points.

28.4 Software and Firmware Vulnerability Mitigation

a). General

i). The Contractor must demonstrate that the software products that will be delivered as a part of this procurement do not constitute a security threat to Amtrak.

b). Secure Software Coding Practices

i). The Contractor and suppliers shall ensure, by integrating robust procedures and controls and specific software security activities into their Software Development Life Cycle(s) (e.g., see Secure Software Development Framework (SSDF) Version 1.1: Recommendations for Mitigating the Risk of Software Vulnerabilities, February, 2022), that security vulnerabilities are identified and removed prior to the delivery of the source code for the Independent Assessment of Software and Firmware Quality (see Section 28.3.5, Independent Assessment of Software and Firmware Quality).

(1) These activities shall be described in the Contractor and Supplier Software Project Management Plans. These activities are subject to audit during Software Quality Assurance Audits.

ii). Code reviews, static analysis, dynamic analysis, software composition analysis, secrets scanning, and other comprehensive application security testing techniques shall be employed to identify and remediate potential security issues.

(1) While application security testing engines may leverage basic rule engine configurations during development to streamline DevOps cycles, application security testing tools shall leverage comprehensive rule engine configurations prior to functional testing and production and resolve all moderate and higher level security findings unless otherwise agreed upon by Amtrak.

iii). Secure configuration management practices shall be implemented to maintain the security of software configurations and settings.

(1) Access to software repositories shall be secured to prevent unauthorized modifications or tampering.

(2) A secure software supply chain shall be established, ensuring that only third-party software that has undergone thorough vetting and testing is used.

(3) Code signing and integrity checks shall be employed to verify the authenticity and integrity of software components.

(4) Prompt response procedures shall be in place to address any identified security issues or vulnerabilities in the car's software, including timely patching and updates.

c). NIST Checklist(s)

i). Where applicable, all software included within this procurement shall be configured in alignment with the NIST National Checklist Program.

ii). This requirement will be applied to all software components where NIST National Checklists are applicable.

(1) If no applicable checklist exists for a given system or component the Contractor may propose alternative checklists/guidelines for Amtrak's review and approval.

iii). The repository for NIST National Checklist can be found at https://nvd.nist.gov/ncp/repository. The Contractor and suppliers shall submit and identification of each system, each system SCI, and applicable NIST checklists (s) for Amtrak Review and approval prior to the first design review. **[CDRL 28-13]**

iv). The Contractor shall provide completed NIST checklists prior to the Final Design Review. **[CDRL 28-14]**

v). If it is agreed that a supplier may utilize another security framework such as IEC62443 or ISO 27001 the contractor may provide a mapping and evidence in lieu of a NIST checklist.

d). Date / Time Dependent Functions

i). For all source code that is subject to the Independent Assessment of Software and Firmware Quality (see Section 28.3.5, Independent Assessment of Software and Firmware Quality), the Contractor and suppliers shall confirm that the subject source code does not include date/time-dependent functions.

e). Independent Assessment of Software Security

i). The results of a current, independent, BSIMM and/or OWASP SAMM software security assessment shall be provided by the contractor. **[CDRL 28-15]**

(1) Also acceptable, upon approval by Amtrak are existing Contractor and vendor certifications such as IEC 62443 SDLA or ISO 27034.

ii). The assessment shall evaluate the security controls, vulnerabilities, and overall security posture of the software systems implemented by the Contractor, including but not limited to, the following areas:

(1) Authentication and access control

(2) Data protection and encryption

(3) Secure coding practices

(4) Security testing and vulnerability management

(5) Incident response and recovery

(6) Security documentation and training

iii). If the results of a current, independent, BSIMM and/or OWASP SAMM software security assessment are unavailable for the Contractor, supplier, or any entity providing software, submit:

(1) The full vulnerability reports from application security scans (SAST, DAST, SCA, secrets scanning, etc.) and manual and/or penetration testing along with a detailed description of software security practices and any technology used for the purpose for Amtrak's evaluation. For any vulnerabilities detected during application security testing, an action plan shall be provided that discusses:

(a) Finding(s) (i.e., verbatim finding text)

(b) Impact Description (i.e., a textual description of the negative consequences to the Project if the practice(s) is not implemented by a process used on the Project)

(c) Project-Specific Action

(d) Responsible Individual

(e) Progress Completion Percentage

(f) Due Date

iv). The independent BSIMM and/or OWASP SAMM appraisal shall include the use of an industry recognized assessor (e.g., Synopsys, etc.).

f). Independent Assessment of Software and Firmware Quality

i). The Contractor shall procure an independent third-party assessment of the application security lifecycle for the following categories of software and firmware:

(1) Software specifically developed or modified for this project; this requirement applies to all software provided on this project.

(2) Software re-used for this project; this requirement applies to software-based subsystems functioning on operationally critical networks only.

ii). The subject security assessment and corresponding requirements specified in this section shall be implemented as per the requirements of NIST SP 800-37.

(1) Also acceptable, upon approval by Amtrak are existing Contractor and vendor certifications such as IEC 62443 SDLA or ISO 27034.

iii). The assessment shall be performed by a qualified, independent organization.

iv). The Contractor shall provide the name of the independent assessment organization for Amtrak review and approval. **[CDRL 28-16]**

v). The Contractor shall ensure that the third-party software security and quality assurance provider shall check software and firmware to ensure that critical application security weaknesses (including SANS' Top 25 Most Dangerous Software Errors and OWASP's Top 10 as applicable) are addressed.

vi). The Contractor shall ensure that the third-party software security and quality assurance provider shall check software and firmware to ensure that the cybersecurity requirements of this contract have been met.

vii). The Contractor shall ensure that the third-party quality assurance provider performs the software security assessment using a range of security assessment testing techniques including Fuzz, Dynamic, and Static testing.

viii). The Contractor shall provide the third party's Software Security Assessment Plan for Amtrak's review and approval prior to performing the assessment. **[CDRL 28-17]**

ix). The Contractor shall ensure that the results of any independent software and firmware quality assurance assessment are sent directly from the third-party provider to Amtrak and the Contractor. **[CDRL 28-18]**

x). The Contractor shall provide a response to the third-party's assessment including plans to correct identified vulnerabilities. The Contractor's response and corrective action plan shall be sent to Amtrak for approval. **[CDRL 28-19]**

xi). This independent assessment of software and firmware quality (including the Contractor's response and Corrective Action Plan) is to be performed at any time of Amtrak's choosing, as follows:

(1) One assessment after delivery of the first set of cars, but before their conditional acceptance;

(2) One assessment prior to completion of conditional acceptance of all base order cars; and

(3) One assessment for each option exercised and additional quantities ordered

xii). The Contractor shall be responsible for implementing corrective actions to address any vulnerabilities that are identified during an independent assessment of software and firmware quality that would prevent the final product from meeting the security requirements defined in this Chapter.

g). Independent Penetration Test

i). To demonstrate compliance with specified functional and cybersecurity requirements relating to this Contract, the Contractor shall procure an independent third-party penetration test and vulnerability assessment.

ii). The Contractor shall provide the name of the independent third-party penetration test provider for Amtrak review and approval. **[CDRL 28-20]**

iii). The subject penetration test and vulnerability assessment and corresponding requirements specified in this section shall be implemented in accordance with NIST SP 800-115.

iv). This shall include tests both onboard the railcar, as well as tests on all services and software which interface with the railcar, and other services and software that are otherwise supplied to meet the Technical Specifications. Tests onboard the railcar shall include all vehicle components, including control systems, communication devices, diagnostic systems, onboard computers, sensors, and all other microprocessor or programmable devices.

v). Testing shall explicitly validate segmentation boundaries between the PTC, OBIS, and TCMS networks and shall assess all potential data exfiltration pathways to offboard or external services. The Contractor shall perform a re-test after delivering remediation to verify fixes, and the results of the re-test shall be delivered directly to Amtrak.

vi). This penetration test/vulnerability assessment shall be performed by a qualified, independent organization with a demonstrated history of performing independent penetration tests in similar passenger rail environments.

vii). The Contractor shall provide the independent third-party's test plan and associated procedures. **[CDRL 28-21]**

viii). The penetration test/vulnerability assessment shall cover all products included in or incidental to this procurement, as described in the other sections of the Technical Specifications.

ix). The Contractor shall ensure that any and all results (including trip reports, draft reports, and final reports) of any independent penetration test/vulnerability assessment are sent directly from the third-party provider to Amtrak and the Contractor. **[CDRL 28-22]**

x). The Contractor shall provide Amtrak with a response to the third-party assessment, including a Corrective Action Plan to correct identified vulnerabilities subject to Amtrak's approval. **[CDRL 28-23]**

xi). This independent penetration test/vulnerability assessment is to be performed at any time of Amtrak's choosing as follows:

(1) One assessment after delivery of the first set of cars, but before their conditional acceptance;

(2) One assessment prior to completion of conditional acceptance of all base order cars; and

(3) One assessment for each option exercised and additional quantities ordered.

xii). The Contractor shall be responsible for implementing corrective actions to address any vulnerabilities that are identified during Independent Penetration Test that would prevent the final product from meeting the security requirements defined in this Chapter.

28.5 Software Security Lifecycle

a). General

i). The onboard microprocessor equipment which includes software must be designed and delivered with consideration to the evolving cybersecurity threats, regulations, and operational requirements of Amtrak.

ii). The objective of the following technical specifications is to ensure that the software and equipment supplied as a part of the technical specification provide are built on a robust, comprehensive and resilient security architecture that provides the necessary tools and safeguards necessary to protect against security incidents, protects sensitive information, and ensures compliance with legal and regulatory obligations throughout the equipment lifecycle.

b). Asset Management

i). Comprehensive procedures and controls shall be implemented for the appropriate and secure handling of assets throughout their lifecycle.

ii). This includes processing, storing, communicating, and removing assets.

iii). For assets that are no longer required and that contain sensitive information (e.g., device with personally identifiable information), specific procedures shall be implemented and followed to ensure the secure destruction of the asset and/or its sensitive contents.

iv). These procedures shall comply with applicable privacy laws, regulations, directives, and best practices to safeguard sensitive information and prevent unauthorized access or disclosure.

v). Proper documentation and records shall be maintained to track the status and disposition of assets throughout their lifecycle.

c). Incident Response and Management

i). The Contractor shall deploy comprehensive mechanisms and capabilities shall be implemented to support the effective management of security incidents and breaches.

ii). These measures include robust detection systems to identify security incidents, efficient reporting mechanisms to promptly notify relevant stakeholders, thorough investigation procedures to determine the nature and scope of incidents, and effective mitigation strategies to contain and remediate security breaches.

d). Operations Security

i). The Contractor shall implement procedures and controls to ensure the secure operation of the cars.

ii). These measures include backup and recovery processes to ensure data and system availability in the event of disruptions or incidents.

iii). Robust malware protection mechanisms shall be deployed to safeguard against malicious software and unauthorized access.

iv). Endpoint security measures, such as secure configurations, regular patching, and secure remote access controls, shall be implemented to protect endpoints from security threats.

v). System monitoring capabilities shall be established to detect and respond to anomalies and potential security incidents.

e). Continuous Monitoring and Intrusion Detection (Onboard)

i). Contractor shall provide necessary support to Amtrak, including any applicable Amtrak cybersecurity vendor, to define specifications, and identify any current trainset constraints, for physical, electrical, and technical provisions to facilitate the installation, integration, configuration, and rail certification of the monitoring capability. Examples include provisioning appropriate physical space, power, cabling, ports, and wayside connectivity in the trainsets needed for the onboard monitoring solution and the wayside integration with the enterprise SIEM platform.

ii). The equipment and its onboard network architecture shall accommodate the installation, integration, and operation of the CylusOne Probe to enable continuous cybersecurity monitoring of all critical onboard networks, including but not limited to the Positive Train Control (PTC) network, the Onboard Information System (OBIS) network, and the Train Control and Monitoring System (TCMS) network. The Contractor shall ensure that all required SPAN ports, network access points, bandwidth capacity, power, cabling, and

mounting provisions are provided to support full CylusOne Probe functionality.

iii). Amtrak's intrusion detection and prevention systems, as well as security event logging, shall be implemented on all on-board networks incorporating communication between Software Configuration Items (SCIs) supplied by different vendors, as well as between all network security zones, to promptly identify and respond to security incidents.

iv). The monitoring infrastructure shall leverage advanced technologies and techniques to detect both known and emerging threats.

v). Regular audits of the monitoring system shall be conducted to ensure its effectiveness throughout the warranty period.

vi). The on-board monitoring, detection, and response systems shall be integrated with Amtrak's Cyber Fusion Center (CFC).

vii). In addition to Contractor-supplied on-board network logging and detection, provisions shall be provided for an on-board IDS solution selected by Amtrak.

(1) Provisions shall include power, space, software connections for Amtrak specified and supplied hardware.

(2) Connectivity shall be provided for each on-board network for passive monitoring of transmissions between devices.

(3) Connectivity to Amtrak's CFC shall be provided through the on-board Data Communication System identified in Chapter 14.

(4) The contractor shall provide the ability for the Amtrak to identify and configure specific network devices, network ports, and network traffic to be spanned and forwarded.

(a) Identification and configuration may be through direct configuration of the on-board equipment, or

(b) through an API provided by onboard network devices to the Amtrak on-board IDS solution.

viii). The Contractor shall submit their agreement of support for an Amtrak on-board IDS solution for Amtrak review and approval **[CDRL 28-24]**

f). Compliance and Issue Reporting

i). Robust mechanisms shall be established to monitor and verifying compliance with security requirements outlined in this contract.

ii). These mechanisms shall also facilitate timely and effective notification and reporting of security incidents, vulnerabilities, and breaches to Amtrak. Cybersecurity regulations in the United States mandate that Amtrak have a reporting obligation within specific timeframes. Regular audits and

assessments shall be conducted to ensure adherence to security requirements and relevant laws, regulations, frameworks, and directives.

iii). Any security incidents or breaches shall be promptly reported to Amtrak, providing comprehensive details and remediation actions.

g). Business Continuity Management (Onboard)

i). Procedures and controls shall be implemented to enable the continuity of operation of the vehicle and its critical assets during adverse conditions.

ii). In situations where existing security controls may not be sufficient to secure information during adverse conditions, alternate controls shall be implemented to maintain an acceptable level of security coverage until optimal conditions are restored.

h). Software Updates and Maintenance

i). Contractor shall provide a patch management process to include policies and procedures for the system after installation. These policies and procedures shall include the patch management process and mitigation strategies for instances when the Vendor informs the user not to apply released patches.

(1) A comprehensive process for software/system updates, patching and maintenance shall be implemented to ensure the integrity and authenticity of updates installed on the vehicle components.

(2) The Contractor shall establish a robust system for verifying the source and integrity of updates before installation, including the use of digital signatures from authorized entities.

(3) This verification process shall guarantee that updates are legitimate and have not been tampered with, maintaining the overall security and reliability of the equipment and software supplied with this contract.

ii). Contractor shall provide support for testing patch releases. This shall include the level of revision on a documented system configuration (i.e., Vendor platform, FAT system, SAT system, current production).

28.6 CDRLs

CDRL	Description	Due
CDRL 28-01	Listing of Contractor personnel involved in the cars' development, maintenance, and operation who will be accountable for security-related decisions and actions	NTP+90
CDRL 28-02	Software Bill of Materials (SBOM) and Hardware Bill of Materials (HBOM) format	30 days prior to PDR
CDRL 28-03	List of the proposed products identifying the country of origin	NTP+90

CDRL 28-04	Documentation of disabled ports, connectors, and interfaces	30 days prior to PDR, on-going updates
CDRL 28-05	Summary documentation of the product's security features and security-focused instructions on maintenance, support, and reconfiguration of the product's default settings	30 days prior to PDR, on-going updates
CDRL 28-06	List of all known methods for bypassing computer authentication contained in the product and provide written documentation that all such backdoors have been permanently deleted from the product	30 days prior to PDR, on-going updates
CDRL 28-07	Document options for defining access and security permissions, user accounts, and applications with associated roles	30 days prior to PDR, on-going updates
CDRL 28-08	Provide documentation for the product, attesting that unauthorized logging devices are not installed	30 days prior to IDR
CDRL 28-09	List of all log management activities that the product is capable of generating and the format of those logs	30 days prior to PDR, on-going updates
CDRL 28-10	Information on all communications (e.g., protocols) required between Amtrak's network security zones whether inbound or outbound and identify each	30 days prior to PDR, on-going updates
CDRL 28-11	List of all remote access entry pathways and ensure that they can be enabled or disabled by Amtrak	30 days prior to PDR, on-going updates
CDRL 28-12	Certification that all interfaces which implement administrative management capabilities of onboard devices are secure	30 days prior to FDR, on-going updates
CDRL 28-13	Preliminary NIST checklist	30 days prior to PDR
CDRL 28-14	Final completed NIST checklists	30 days prior to FDR
CDRL 28-15	The results of a current, independent, BSIMM and/or OWASP SAMM software security assessment shall be provided by the Contractor.	30 days prior to FDR, on-going updates
CDRL 28-16	Name of Independent Assessment Organization	30 days prior to PDR
CDRL 28-17	Software Security Assessment Plan	30 days prior to IDR, on-going updates
CDRL 28-18	Results of any independent software and firmware quality assurance assessment	30 days prior to FDR, on-going updates
CDRL 28-19	Contractor's response to the findings of the software and firmware quality assurance assessment	30 days prior to FDR, on-going updates
CDRL 28-20	Name of Independent Third-Party Penetration Test Provider	30 days prior to PDR

CDRL 28-21	Independent third-party's penetration test plan	30 days prior to FDR, on-going updates
CDRL 28-22	Results of the independent third-party's penetration test plan	30 days after
CDRL 28-23	Contractor's response to the findings of the independent third-party's penetration test plan	60 days after
CDRL 28-24	Design for on-board monitoring and intrusion detection and provisions	30 days prior to PDR, on-going updates

29. Accessibility

Revision 2

Table of Contents

29.1 Overview....29-1
29.2 Regulations....29-1
29.3 Maintenance of Accessible Features....29-1
29.4 Accessibility – Mobility....29-2
29.5 Accessibility – Visual....29-6
29.6 Accessibility – Audio....29-8
29.7 CDRLs....29-9

29.1 Overview

a). This chapter defines the minimum accessibility accommodations for the cars and serves as an index or reference guide to specific chapters in the rest of this specification for more information.

b). This is not intended to be an all-encompassing or exhaustive list of regulations listed in the Law. Please refer to specific standards listed for complete information and requirements.

c). In addition to compliance with the requirements of the ADA and other accessibility requirements in this specification, the Contractor shall comply with the terms of the Application for Equivalent Facilitation (EF) submitted by Amtrak and approved by the USDOT (Exhibits R-1 and R-2). The approved EF was based on a trainset configuration and will need to be revised to reflect the equipment configuration under this procurement. The Contractor with the support of Amtrak shall prepare and submit a revised EF application and shall work with Amtrak, FRA and disability community to obtain an accessibility solution that is accepted by all parties involved.

d). The plan is to create an accessible core that provides access to all amenities for all passengers. This accessible core will enhance mobility between cars and ensure all passengers have access to all train amenities.

29.2 Regulations

a). Regulatory Agencies and the specifications listed below must be referenced for complete understanding of the accessibility requirements by law.

i). ADA

(1) Vehicles must accommodate persons with disabilities in accordance with the requirements of the Americans with Disabilities Act (ADA) of 1990, the ADA Accessibility Guidelines (ADAAG), FTA Circular 4710.1, 36 CFR 1192, and 49 CFR 27, 37 and 38 as amended.

ii). FRA

(1) Vehicles must accommodate persons with disabilities in accordance with the requirements of the FTA Circular 4710.1, 36 CFR 1192, and 49 CFR 27, 37 and 38.

iii). RVAAC

(1) The Contractor shall submit a proposal to incorporate as much of the recommendations presented in the Final Report of the Rail Vehicles Access Advisory Committee (RVAAC) as is feasible.

(2) Within 60 calendar days of NTP, the Contractor shall provide a summary of the recommendations it will incorporate and those it finds to be not feasible. **[CDRL 29-01]**

29.3 Maintenance of Accessible Features

a). Accessible features outlined in this section shall be properly maintained to minimize 'down-time' for replacement and/or repair as outlined in 49 CFR 37.161.

b). From the Contractor's perspective, this means that maintenance requirements shall be clearly outlined and agreed upon, repairs and fixes shall require minimal time to repair/replace, all special tools for repair/replacement of items are made readily available.

c). Damage or maintenance to one accessibility feature shall not require that other features are also unusable.

29.4 Accessibility – Mobility

a). Accessible Path

i). The clear width of an accessible path shall be incorporated according to the recommendations from RVAAC Chapter 4, III in the Café, Diner, Diner/Lounge, Accessible Sleeper, Premium Accessible Coach, and Coach cars.

ii). The floor surface shall be incorporated according to the recommendations from RVAAC Chapter 5, VI to the extent possible.

iii). The floors along the accessible path shall be high contrast flooring to help the visually impaired follow the path through the car.

iv). Thresholds along the accessible path at each passageway between cars shall have tactile feedback built into the floor to alert a visually impaired person of the transition in floor type.

(1) This tactile feedback shall be raised such that the top of the ridge is level with the flooring surface though out the cars.

(2) The indentation shall be lower than the flooring surface to provide ridged tactile feedback for canes.

b). Entrances

i). Boarding and alighting accommodations shall be incorporated according to the recommendations from RVAAC Chapter 3 to the extent possible.

(1) Features to eliminate the gap between the car and the steps when boarding shall be incorporated.

ii). Doors

(1) Doors, steps, and thresholds shall comply with 49 CFR 38.113 and 49 CFR 38.117 within the train. This includes doorways and passageway requirements for clear openings, slip resistant floorings, and clear contrast of all steps.

(2) Lighting for entrances and doors shall comply with 49 CFR 38.119.

(3) Doors shall be incorporated according to the recommendations from RVAAC Chapter 4 to the best extent possible.

(4) Doors and passageways along the accessible path shall be wide enough to accommodate powered wheelchairs.

(5) Specific doors requirements for this fleet can be found in Chapter 12.

iii). Lifts

(1) On-board mobility lifts shall be provided on the standard coach, premium accessible coach, accessible sleeper, diner/lounge, and café cars.

(a) On-board mobility lifts shall comply with 49 CFR 38.113 (d) and 38.125 for boarding the train from any station platform.

(b) The design load for this lift shall be at least 800 lbs.

(c) The controls shall be easily operated by a crew member and emergency operation mode is required.

(d) If the utility car option is exercised, the provision for an on-board mobility lift shall be provided at a minimum. An option shall also be provided for inclusion of the lift in the utility car.

c). Grab Handles

i). All passageways, entryways and doors shall be equipped with appropriate handrails or stanchions. Handrails and stanchions shall comply with 49 CFR 38.115.

ii). Handrails and Stanchions path shall be incorporated according to the recommendations from RVAAC Chapter 4, VI to the extent possible.

iii). Specific handrail requirements for this fleet can be found in Chapters 6 and 11.

d). Inter-car Gangways

i). Between car barriers shall be provided at a minimum according to the recommendations from RVAAC Chapter 3 to the extent possible.

ii). Vertical grab handles shall be provided for ease of access for all passengers.

e). Service Animal Spaces

i). At least one service animal space per seating area shall be incorporated according to the recommendations from RVAAC Chapter 4, IX to the best extent possible.

f). Emergency

i). An evacuation chair shall be provided in the cafe car. The contractor shall provide Stryker Evacuation Chair part number 6254000000.

ii). Egress plans for passengers who have mobility and visual impairments shall be presented by the Contractor for Amtrak alignment and approval during the design review process.

g). Sleeper Cabins

i). Sleeping

(1) Accessible sleeping compartments shall be provided and equipped with all amenities listed in 49 CFR 38.127. This includes sleeping location, restroom, and controls for passenger comfort.

(2) Accessible sleeping areas within the sleeper car shall be incorporated according to the recommendations from RVAAC Chapter 5, III to the extent possible.

(3) Note that all visual and auditory recommendations from RVAAC emphasized in this specification shall be incorporated in both coach and sleeper cabins.

(4) Specific Equity sleeper room requirements for this fleet can be found in Chapter 11.

(5) Securement locations for oxygen, CPAP machines, small coolers for medications, and other medical equipment shall be provided in each sleeper cabin

h). Coach

i). Seating

(1) Accessible seating, transfer seats, wheelchair or mobility aid seating, and storage locations for mobility devices shall be provided in compliance with 49 CFR 38.125 (d) and consistent with the Alternative Design Standards in the Equivalent Facilitation.

(2) Mobility Aid Seating Locations shall be incorporated according to the recommendations from RVAAC Chapter 4, IV to the extent possible including clear space, number of seats and locations, and securement. Additionally, transfer seats shall be incorporated according to the recommendations from RVAAC Chapter 4, V to the extent possible and consistent with the Alternative Design Standards in the Equivalent Facilitation.

(3) Seats shall be reconfigurable to account for a group of passengers using wheeled mobility devices. This shall be incorporated according to the recommendations from RVAAC Appendix B, 2, to the extent possible.

(4) Accessible seating locations shall be provided near but not necessarily adjacent to accessible restrooms. Passengers requiring accessible seating locations shall not be forced to always sit adjacent to restrooms as this provides an inequity for passengers to be subjected to restroom noises and smells.

(5) Accessible seating shall be arranged such that two passengers, one using a wheeled mobility device and the other not using a device, can sit next to each other in at least one location in coach.

(6) Accessible seating shall be arranged such that a wheeled mobility device user can select to sit on either the right or left side of the train based on lateral dominant strength of the passenger to the best extent possible.

(7) Accessible seating shall be arranged such that a wheeled mobility device user can select to sit on either the right or left side of the train based on lateral dominant strength of the passenger.

(8) Specific seating requirements for this fleet can be found in Chapter 11.

ii). Tables

(1) Adjustable height workstation tables shall be provided in all accessible seating locations throughout the cars.

(2) The adjustable height workstation tables shall range from 27” to 34” and should be presented to Amtrak during PDR.

i). Access to Amenities

i). Standards

(1) General outlines and information regarding access to amenities within the train are outlined in 49CFR 38.111. The configuration of the fleet shall dictate which sections under 49 CFR 38.111 will apply.

(2) In general, all controls for passenger comfort shall be provided in an accessible manner according to the recommendations from RVAAC Chapter 5, V to the extent possible. This includes all manner of controls, control locations, buttons, and door opening.

ii). Restrooms

(1) Accessible restrooms shall be provided and equipped with all amenities listed in 49 CFR 38.123. This includes space for maneuvering and turning, height of all amenities from the floor, required grab bars, controls, doorways, and proximity to seating accommodations.

(2) Restroom locations shall follow the quantity and location recommendations from RVAAC Chapter 4, VIII and Chapter 5, I, to the extent possible.

(3) Specific ATR requirements for this fleet can be found in Chapters 11 and 17.

iii). Café

(1) The Café shall be located along the accessible path of the train.

(2) The Café shall have an ADA service counter that is between 32” and 34” tall. The area adjacent to the ADA service counter shall have a 60” minimum turnaround circle for passengers using wheeled mobility devices to turn around and travel back to their seating location.

(3) Accessible seating areas within the Café car shall be incorporated according to the recommendations from RVAAC Chapter 5, IV to the extent possible.

iv). Dining

(1) Accessible dining areas within the dining car shall be incorporated according to the recommendations from RVAAC Chapter 5, II to the extent possible.

v). Miscellaneous

(1) Designs shall incorporate accommodations and provisions for passengers of all sizes including larger passengers to fit in tight spaces such as restroom compartments, aisles, etc.

(2) As provided in the Intercity Trainset (Airo) fleet and a potential outcome if the High Capacity Coach option is exercised, six (6) RVAAC recommended seating locations shall be provided within an accessible path of the Café car with two (2) being provided in each car adjacent to the Café car and two (2) being provided in the Café car.

(3) As an option, the Contractor shall provide provisions for up to four (4) RVAAC accessible seating locations in each car type which shall be modular in design which includes any restraints, adjustable height tables, call systems, outlets, reading lights and any associated wall panels. For the purposes of modularity, the Contractor shall provide incremental option pricing to transition a seating location into an accessible seating location.

29.5 Accessibility – Visual

a). Signage

i). Standards

(1) Symbols, Signs, and Videos shall be incorporated according to the recommendations from RVAAC Chapter 2, IX, X, and XI to the extent possible.

(2) Specific signage requirements for this fleet can be found in Chapter 11.

ii). Accessible Entrance

(1) All locations equipped with accessible entrances onto the train shall be marked and indicated according to 49 CFR 38.113 (e).

b). Braille

i). Where practical and appropriate, signage shall incorporate Grade 2 Braille and/or raised lettering to accommodate visually impaired passengers.

ii). Contractor shall utilize Grade 1 Braille for simplicity and ease of comprehension.

(1) Braille characters shall be raised at a height of 0.6mm to 1.5mm

(2) Dot diameter shall be 1.5mm to 1.6mm

(3) Character spacing shall be 2.5mm to 3.5mm horizontally while 6.0mm to 7.0mm vertically.

(4) Ensure rounded corners to prevent snagging.

iii). Contractor shall incorporate tactile pictograms alongside Braille for enhanced comprehension, where practical.

(1) Pictograms shall be raised and have clear, tactile distinction from Braille characters.

iv). Contractor shall utilize high-contrast colors between Braille dots and the signage background.

v). Contractor shall work with Amtrak and/or local community organizations with proofreading all Braille signage prior to implementation on any vehicle.

vi). All proposed Braille signage shall be submitted during IDR for Interiors **[CDRL 29-02]**

(1) All proposed Braille signage shall be included on all hard mockups for stakeholder review and approval.

c). Lighting

i). In addition to the lighting requirements for entrances listed in 49 CFR 38.119, lighting of other areas in the vehicle shall be considered. Lighting shall be incorporated according to the recommendations from RVAAC Chapter 2, V to the extent possible.

ii). Lighting shall be capable of being adjusted to less than 3000K in coach reading lights.

iii). Specific lighting requirements for these cars can be found in Chapter 13.

d). Warning Alerts and Communications

i). Standards

(1) Visual warning, alerts, and public information shall be announced with a public information system that complies with 49 CFR 38.121.

ii). Route information

(1) Variable Message Signs (VMS) shall be incorporated according to the recommendations from RVAAC Chapter 2, II and VIII to the extent possible.

iii). Emergency Alerting

(1) Visual indication of emergency notification announcements shall be incorporated according to the recommendations from RVAAC Chapter 2, VI to the extent possible.

(2) Specific PIS requirements for this fleet can be found in Chapter 13.

iv). Call Buttons

(1) Visual indication that a call button has been depressed and the alert signal has been sent shall be incorporated according to the recommendations from RVAAC Chapter 2, VII to the extent possible.

29.6 Accessibility – Audio

a). Hearing Assistive Technology

i). Cars shall incorporate the latest innovative technology for hearing assistive technology (inductive hearing loops, Bluetooth, etc.) as of Preliminary Design Review.

ii). Hearing assistive technology shall be incorporated according to the recommendations from RVAAC Chapter 2, IV to the extent possible.

iii). The Contractor shall provide test equipment to Amtrak to verify that the hearing assistive technology is operating as intended during maintenance events.

b). Warning Alerts and Communications

i). Audible warning, alerts, and public information shall be announced with a public information system that complies with 49 CFR 38.121.

(1) Route Information

(a) Audible announcements for Speech to Text shall be incorporated according to the ADA accessible guidelines and to the extent

possible per the recommendations from RVAAC Chapter 2, III and VIII.

(2) Emergency Alerting

(a) Audible indication of emergency notification announcements shall be incorporated according to the recommendations from RVAAC Chapter 2, VI to the extent possible.

ii). Specific PIS requirements for this fleet can be found in Chapter 14.

c). Call Buttons

i). Audible indication that a call button has been depressed and the alert signal has been sent shall be incorporated according to the recommendations from RVAAC Chapter 2, VII to the extent possible.

29.7 CDRLs

CDRL	Description	Due

Amtrak Universal Single Level Fleet Replacement

Technical Specification

---

30. High-Capacity Coach Cars (Option)

Revision 2

Table of Contents

30.1 Overview 30-1
30.2 Specification Changes 30-1

30.1 Overview

a). General

i). The intent of this section is to identify any differing requirements from the previous chapters of this technical specification in relation to the Optional High-Capacity Coach cars.

ii). Passenger capacity shall be increased on the High-Capacity Coach cars to accommodate higher ridership demand.

iii). As stated several times throughout this specification, all car types shall be reconfigurable to accommodate other classes/types of service.

(1) High-Capacity Coach Car

(a) Utilizing the same carshell design to the best extent practical, the High-Capacity Coach car shall have 2 entry doors per side with trap doors and folding steps. The minimum seat pitch requirement is 37”; however, seat pitch may be adjusted to maximize capacity with review and approval by Amtrak.

(b) Amtrak intends to utilize the same 2x2 seat design as the Standard Coach car listed throughout this technical specification.

iv). Amtrak requests that any additional concepts to increase passenger capacity be proposed by the Contractor. Additionally, the Contractor shall propose additional modifications to the base scope of work for concepts that would be advantageous to Amtrak.

30.2 Specification Changes

a). Chapter 1: Scope

i). Paragraph 1.6). is replaced by the following:

(1) Amtrak intends to have a High-Capacity Coach car that may operate with existing Amtrak equipment. Target capacities and requirements for this car type will be outlined in additional section(s) within this chapter.

(2) The High-Capacity coach car shall have 2x2 seating with a minimum seat pitch of 37” unless otherwise approved by Amtrak.

(3) The target capacities are outlined for each car type in Figure 30-1.

Figure 30-1; Target Revenue Capacities

Car Type	High-Capacity Coach
Coach Seats (2x2)	76
Standard Restroom	1
Accessible Restroom 60" turning circle	1
RVAAC Accessible Seating Location*	1*
Number of doors per car side	2
Seat Width	Minimum 20"
Seat Pitch	37"

b). Chapter 6: Carbody

i). Paragraph 6.6.a) is modified by adding the following:

(1) The requirements for the B-End of the car shall apply to the A-end of the car to ensure that the High-Capacity car type has 2 side loading doors per each side to expedite boarding and alighting from the vehicle.

c). Chapter 11: Interior

i). High-Capacity Coach Seating will be identical to Standard Coach Car Seats described in Chapter 11.

ii). Luggage Tower

(1) Each High-Capacity Coach car shall have one (1) luggage tower capable of bicycle storage that shall be of robust tubular brushed stainless steel construction and include shelves.

(2) Bumper guards shall be mechanically attached to the wall panels within the luggage rack/tower to prevent damage to walls or luggage.

(3) The rack/tower shall incorporate suitable brackets for handling garment bags. Golf bags and other larger items shall be able to be stored in this area.

(4) The luggage rack/tower shall be a convertible unit that can be reconfigured to hold two bicycles.

(5) All surfaces shall be smoothly finished to prevent damage to luggage or crew injury.

(6) Each luggage tower shall be equipped with 2 tiers of folding, tubular luggage racks.

(a) The racks shall pivot at the inner walls to allow them to be stowed to accommodate varying sizes of luggage/cargo.

(7) The load bearing surface shall be inclined upward at an angle of 3° to 4°.

(8) The lowest rack keeps baggage off the floor, protecting it from water, dust, etc. on the floor.

(9) Luggage racks and supporting structure shall be made of stainless-steel transversal tubing, with a raised edge for luggage retention.

(10) The racks shall have sufficient strength to support a load of 250 pounds midway between adjacent supports with a deflection not to exceed 1/4 inch and without permanent deformation. This shall be demonstrated at FAI.

(11) Two passive ¼ turn latches shall be provided to stow each of the racks in the raised position. The luggage racks shall be easily moveable with one hand to stow or deploy.

(12) Rack design and shelf dimensions shall provide the flexibility of having:

(a) all luggage racks lowered for luggage handling any rack lowered for luggage handling

(b) all the luggage racks stowed.

(c) enable bicycles to be secured when all luggage racks are stowed.

(13) Rutland Industries, Mini-Mum model # MMW2XMHV or Amtrak approved equivalent for securing bicycles shall be provided along the inner walls folding out as needed to support a bicycle hung on it.

(a) An instruction placard shall be provided on the wall adjacent these racks, giving instructions for proper rack use.

(14) The fully loaded luggage racks and bicycle rack, mounting hardware and associated structure shall meet the strength requirements per APTA SS-C&S-034-98 for equipment support as well as RP-C&S-006-98 for attachment strength.

(15) They shall be simple in design, operation, and maintenance without the need for springs, dampers, etc.

(16) All exposed fasteners in the area shall be countersunk or flush mount types to preclude any damage to passengers' luggage.

(17) All edges and corners shall be rounded with generous radii. Bump strips shall be incorporated along the sides of each of the spaces to avoid scuffing the wall finish or the luggage.

(18) Design of the luggage towers and bicycle racks shall be subject to design review. The final interior equipment, arrangement, dimensions,

and locations shall be developed during design review, with the aid of mockups.

iii). Train-to-Train Transfer Bridge shall be provided for each car.

(1) A dedicated storage location shall be provided on each car.

(2) To be used for disabled trains when the rescue train is parked on an adjacent track.

(3) Crew members place the bridges between the open side doors of the two trains to create a stable walkway.

(4) The bridge shall be designed to be lightweight, slip-resistant, and wide enough to accommodate rapid movement and, in some cases movement of wheeled mobility devices.

d). Chapter 12: Door Systems

i). Paragraph 12.1.b) is modified by adding the following:

(1) The side entrance doors for the High-Capacity car shall be located on the A and B-end of the car.

* End of Chapter 30 *

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part I: General Requirements

31.1 Overview

a). It is Amtrak's intention to develop car types that will be the replacement fleet for the long-distance network.

i). The fleets primarily consist of Sleepers, Diners, Coaches, Café, Lounge and Baggage cars that are coupled together to serve Amtrak's long-distance routes.

ii). These cars shall be interoperable with the Viewliner I and II Legacy Fleet and the Legacy locomotive fleet.

b). The cars shall be designed utilizing Universal or Trans-generational design, addressing the needs of a broad range of passengers.

c). In the event that the business needs change over time, these car types shall be designed to be reconfigurable to include accommodation types that may meet a new direction for Amtrak.

d). All car types are single level with:

i). Entry/exit to the car from train side are from the single vestibule located at the B-end of the car. It is equipped with powered side doors, powered trap doors, powered folding steps, and on-board mobility lifts on defined car types.

ii). A powered collision post door is provided to seal the vestibule from weather when it is oriented at the end of the consist.

iii). Power operated body end doors at both the vestibule and blind ends of the car provide access to the car interior.

iv). Ceiling lighting in the vestibule illuminates not only the vestibule, but also the station platform outside the car, meeting ADA requirements.

v). Ceiling lighting is provided along the passageway, as well as low-location exit path marking.

vi). Hinged ceiling panels shall act as cover for the overhead water distribution piping.

e). Electric/Switch Locker

i). The car electric/switch locker shall be located within the car interior. It shall contain crew temperature and lighting controls as well as circuit breaker panels and electrical equipment.

ii). The car PA system shall be located in close proximity to the electric/switch locker.

f). Emergency Tools

i). The cars shall contain an Emergency Tool Locker recessed into the exposed face unless otherwise approved by Amtrak to meet the configuration of other car types.

g). Car Types

i). These car types are:

(1) Standard Sleeper Car

(2) Accessible Sleeper Car with 32” accessible aisle

(3) Diner Car with 32” accessible aisle

(4) Diner/Lounge Car with 32” accessible aisle

(5) Utility Car with baggage compartment (Option)

ii). Reference Exhibit F for concept diagrams.

h). Accessibility

i). The accessibility areas of the car will conform to ADA requirements as listed in 49 CFR 38, Americans with Disabilities Act (ADA) Accessibility Specification for Transportation Vehicles and 2010 ADA Standard as applicable and to the best extent RVAAC recommendations.

(1) 32” accessible aisles shall be provided in the accessible sleeper, diner, and diner/lounge.

i). Compliance with preliminary design concepts included in the specification and attachments does not relieve the Contractor of all the other requirements within the specification.

31.2 General Requirements

a). This Chapter describes the basic requirements for the interior configuration of the Sleepers, Diner, Diner/Lounge, and Utility (Option) cars.

b). Each car type shall meet or exceed all requirements for ADA accessibility and general seating arrangements that provide comfort and amenities such as electrical outlets, task lighting, and individual work trays or tables.

c). The interior of the car shall be designed and constructed for maximum safety, comfort, convenience, and service to the passenger.

d). The Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

e). All mechanisms described below should be durable, free from jamming, and racking.

f). All operable features intended for passengers use, unless otherwise specified or

approved by Amtrak, shall comply with ADA requirements, including a maximum force of 5 lbf to operate. Operable controls shall be usable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. Forward or side reach operable controls shall be mounted between 34 inches and 48 inches above the finished floor. .

g). The design should meet abuse, load, and crash criteria as described in CFR.

h). Dimensions, position, configuration, comfort, and usability of all items and features will be subject to Amtrak approval during the mockup review.

i). Walls, ceiling panels, and window masks shall be easily cleanable and designed and constructed to form a safe and attractive environment.

j). Visible fasteners shall be minimized.

k). All systems requiring maintenance shall be easily accessible and removable for cleaning and repair.

l). Final interior layouts shall be developed by the Contractor and submitted to Amtrak for review and approval during design review per the Design Review processes outlined in Chapter 3.

m). Whenever possible, common components shall be used in all car types.

n). Strength of all interior fittings and their attachment to the carbody shall meet APTA Standard SS-C&S-006-98 and 49 CFR Section 238.233.

o). All interior or occupied areas shall have Emergency Lighting and LLEPM that leads to the primary exits.

i). These areas include non-seated areas restricted to crew members including the kitchen and baggage areas.

p). The interior clear height from the top of the floor to the ceiling of cars shall be no less than 84” unless otherwise approved by Amtrak.

q). Protection shall be provided to prevent damage along the accessible path especially with respect to seats, armrests, walls, etc. Arm rests shall be designed to absorb wear and tear over the life of the assembly. Details to be reviewed and approved by Amtrak during Design Review.

31.3 Human Factors Study

a). As part of PDR, the Contractor shall submit a Human Factors Study Report for Amtrak review and acceptance **[CDRL 31-01]**.

b). The Human Factors Study shall address all key interaction points in all car types, including but not limited to:

i). seat, bed, and bunk access

ii). tables,

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

iii). screens,

iv). switches,

v). cupboard access,

vi). door locks and handles.

vii). recline

viii). leg room

c). The report shall also address specific human factors for accessible rooms and restrooms, including but not limited:

i). to accessible paths,

ii). aisle and door clearances accessible reach zones,

iii). wheeled mobility device accessible features,

iv). wheeled mobility device and leg clearances,

v). handrail heights and sizes,

vi). transfer positions to seats, beds, toilets, and shower seats.

d). The Human Factors Study Report shall validate the use of all features of the cars by a 95% US male and a 5% US female.

e). Wheeled mobility device animations shall be included to validate accessible paths.

31.4 Universal Design

a). Each car shall be fully compliant at the time of manufacture, with all rules and regulations of 49 CFR 38, Americans with Disabilities Act (ADA) Accessibility Specification for Transportation Vehicles and 2010 ADA Standard as applicable.

i). No part of this specification alters or changes those requirements.

b). Review of the car's accessible features (including all drawings, calculations, and supplier information required to define the proposed installation) shall be conducted with Amtrak as part of the mockup review.

c). Each car with accessible positions shall include RVAAC recommended accessible wheeled mobility device locations, which shall allow passengers using wheeled mobility devices to remain in their wheeled mobility devices while on board the car.

i). The number of dedicated accessible areas for wheeled mobility devices is determined by the car configuration.

ii). A storage area for an unoccupied, folded wheeled mobility device, 48 in. long by 20 in. wide and 40 in. high, in close proximity to the dedicated accessible

area and to accessible seating, shall be provided on each car for each accessible space.

d). ADA-compliant car-to-car access is required along the accessible path.

i). Accessible Sleeper, Standard Sleeper, Diner, Diner/Lounge, and Utility cars shall include end doors and bulkhead doors that have a clear, unobstructed opening of no less than 36 in. wide.

ii). Overlapping gap closer or bridge plates shall be provided between coupled cars to allow wheeled mobility devices to pass from car-to-car without trapping the wheels in gaps.

e). The Accessible Sleeper and Diner/Lounge shall include an accessibility lift on each side of the car's entrance area.

i). Accessibility lifts for boarding are detailed in Chapters 6 and 12.

31.5 Arrangement Flexibility and Modularity

a). The basic car interior shall be standardized to the greatest extent possible and shall be capable of reconfiguration, upgrade, or replacement without disrupting adjacent interior elements of the car.

b). All like components and all associated assemblies (e.g. floor panels, bulkheads, side wall & ceiling panels, etc.) and their spare parts shall be designed and manufactured to be identical/ interchangeable, both as individual parts and as sub-assemblies, throughout the entire car order production.

c). All parts shall mount without modification. Replacement parts shall also be interchangeable.

d). Easy accessibility shall be provided for all items that require periodic maintenance and/or may require replacement.

i). Access doors or panels shall be secured using approved captive fasteners or locks.

ii). It shall be possible to remove these parts without damage to the individual pieces or adjoining components.

e). Likewise, it shall be possible to renew any replaceable room component, whether mounted internal or external to the module, without the need to disassemble (except service panels) or remove the module from the car.

31.6 Signage and Labels

a). The Contractor shall equip each car with adequate signage to provide passengers and crew information about the amenities and safety-related features of the cars.

b). The signage to be provided shall include, but is not limited to, the following:

i). Location of safety equipment

ii). Hazards such as high voltage or heat sources

iii). Operation of emergency exit equipment

iv). Operation of on-board equipment such as doors and door latches/locks

v). Amenities such as trash and recycling containers, potable drinking water, 120VAC outlet, etc.

vi). Toilet room amenities

vii). Room numbers

viii). Capacities for storage locations such as luggage racks and overhead luggage bins

ix). Service-related signs for maintenance and inspection

x). Vehicle road numbers on both ends of the car.

xi). Exterior signage for service points

c). The interior and exterior signage shall conform to the latest revision of Amtrak Specification #697, National On-Board Signage Manual.

i). The artwork, material, location, and specifications for each sign shall be submitted to Amtrak for approval at the design review.

d). Provisions shall be made for all seating and bedroom accommodations to have a safety card stored at each location.

e). A metallic American flag sign shall be installed in each entrance area of each car. The sign shall be light weight and corrosion free.

f). Existing Amtrak signs, in accordance with Amtrak Specification #697, shall be used where possible.

i). Where new sign designs are required, the Contractor shall develop artwork per the Amtrak Onboard Signage Guidelines and submit to Amtrak for review and approval as part of IDR.

ii). The Contractor will provide a signage application drawing for Customer approval identifying all signs and labels used on each car type, including text, as well as the mounting location.

g). Emergency Signage and LLEPM shall be installed in accordance with APTA Standards PR-PS-S-002-98 and SS-PS-004-99.

i). All HPPL signage shall be passive and shall not utilize electric components.

ii). The HPPL material shall be charged and shall maintain charge under all lighting conditions except Emergency.

iii). All HPPL shall have drawings for placement with specific part numbers.

iv). Sleeping accommodations shall not require a light to be on at all times to charge the HPPL as this will be disruptive to passengers. Contractor to propose a solution for Amtrak's approval.

h). Additional signage guidance will be supplied at NTP.

31.7 Interior Noise Levels (Passenger Areas)

a). Under all specific vehicle and operating conditions listed below, the interior noise levels on any car shall not exceed the sound levels below:

i). Vehicle Condition;

(1) Completely assembled car

(2) No passenger load

ii). Operating Conditions:

(1) Operating in any specified mode of acceleration, deceleration, or coasting at any speed up to 125 mph.

(2) On tangent, at-grade, ballast-and-tie track with clean, smooth continuous welded rail,

(3) All auxiliaries operating simultaneously at normal conditions

iii). Measurement Location:

(1) Any and all points at least one foot from the ceiling, floor, end walls, or side walls.

iv). Maximum Sound Levels:

(1) 70 Decibels (Acoustic) (dBA) in seating areas,

(2) 75 dBA in entrance areas (referred to 0.0002 microbar)

b). Compliance with this requirement shall be demonstrated using a Type 2 sound level meter as defined by ANSI Standard S1.4: American National Standard Specification for Sound Level Meters, using the slow meter scale.

31.8 Vibration

a). All car equipment shall be designed to operate without damage or degradation of performance when subjected to vibration and shocks encountered during normal service.

b). All newly designed equipment and auxiliaries mounted anywhere on any car, car body, or trucks within the consist shall not cause vertical or horizontal vibrations anywhere on the car floor, walls, ceiling panels, and seat frames in excess of:

i). 0.10 in. peak-to-peak amplitude,

ii). 0.01 acceleration due to gravity (g) peak acceleration for the frequency range from 5 Hertz (Hz) to 14 Hz, and

iii). 0.045 in. per second peak vibration velocity for the frequency range above 14 Hz.

c). Carbody-mounted components shall be designed to withstand vibrations of not less than 0.2 g at frequencies up to 100 Hz and randomly oriented shock loads of 8 g longitudinal, 4 g vertical and 4 g lateral.

d). Shock and vibration tests shall be conducted in accordance with IEC 61373 (1999) – Railway Application, Rolling Stock Equipment, Shock and Vibration Tests.

31.9 Sanitary Design

a). Cleanability

i). The car interior and all materials shall be designed so that they do not soil, stain, or show dirt easily.

ii). Interior materials shall be easy to clean using few tools and little specialized equipment.

iii). Items such as HVAC grilles shall only require opening to access the ductwork during extensive periodic cleaning.

iv). The number of items that require removal for cleaning shall be kept to a minimum.

(1) Equipment seen by the passengers and crew shall be cleanable in daily service without removal.

(2) Those items that must be removable shall be easy to remove and replace, with all like units being interchangeable.

(3) Removable items shall employ captive fasteners of a type that will not deteriorate or degrade in effectiveness with use over the life of the car.

(4) If screws are used, they shall be easy to line up with the mating hole on the fixed part.

b). Protection from Fluids

i). Great care shall be taken in design, manufacture and installation of the rooms and equipment to ensure that neither routine use, cleaning, and maintenance, nor leaks and overflows will cause fluids to seep or wick under the module's flooring or between the sub-flooring, walls, and car structure.

ii). All floors and pipe connections, etc., shall be sealed internally to prevent liquids from leaking into the car sub-floor and insulation.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(1) This is to avoid sanitation and odor problems and minimize potential for sub-floor corrosion.

(2) Sealing design is subject to Amtrak approval.

c). FDA Requirements

i). Interior design and installation shall meet all applicable requirements of FDA for water, waste, and general sanitation issues.

31.10 Maintenance and Material Performance Expectations

a). Attachment Methods

i). Strength of all interior fittings and their attachment to the carbody shall meet APTA Standard PR-CS-S-006-98 and 49 CFR Part 238.233.

ii). Secondary structure shall be provided to securely anchor car interior items that are subject to significant loads, such as handrails, light fixtures, etc.

iii). In instances where FRP components are used, they shall be stiffened and reinforced appropriately with stainless steel, balsa panels or other materials as approved.

(1) Stiffening and reinforcing will be subject to approval by Amtrak for each application.

iv). All components shall be secured to the car auxiliary structure with machine screws, which engage stainless-steel tapping plates.

v). Floating nut assemblies may be used if they are part of a tapping plate assembly.

vi). Nut-inserts (Riv-nuts, Nut-serts etc.) are not an acceptable alternative to tapping plates. Likewise, spring type mountings are not acceptable.

vii). Where components attach to car interior materials, such as FRP, mounting shall be coordinated so the appropriate provisions are incorporated into the design of those materials.

(1) When the component is mounted on FRP, the tapping plate shall be embedded deeply into the FRP behind the primary FRP wall and completely glassed in using woven glass fabric and resin, so it never loosens for the life of the car.

(2) Mounting holes can be incorporated into the panels to which the components are mounted or drilled in place using a template.

(3) Match drilling using the component as a template is not acceptable.

(4) Components should be mounted from the exposed side of the mounting surface so that the component can be removed for repair or replacement from the front.

(5) Provisions are required to prevent squeaking between the component and mounting.

b). Access Panels

i). Easy access shall be provided for all items that require periodic maintenance, defect repair or replacement.

ii). Panels/ doors covering this equipment shall be hinged, where possible and fastened with approved captive fasteners in a manner that permits these activities.

iii). Safety catches shall be provided for access panels/doors to prevent sudden or accidental deployment.

iv). Window masks shall allow for easy window replacement.

c). Junction Boxes

i). Junction boxes shall be located within electric lockers or hidden behind access panels. See Chapter 15 for additional information.

d). Time to Repair/ Replace

i). All lowest replaceable units (LRUs) shall be replaceable in less than 30 minutes by a single maintenance worker. See Chapter 4 for additional information.

31.11 Safety

a). Fire Safety

i). The builder shall provide a Fire Safety Analysis for Amtrak review and approval, in accordance with APTA RP-PS-005-00. See Chapters 19 and 25.

ii). All interior materials shall meet the flammability and smoke emissions requirements of Amtrak Specification # 352 (which incorporates references to 49 CFR 238.103).

iii). Test reports from an independent lab showing compliance with Amtrak Specification # 352 shall be provided in advance of related FAI's.

b). Injury Prevention

i). The car interior shall be designed to provide a safe, comfortable, and convenient functional environment to the passengers, crew, and maintenance staff.

ii). Interior design shall integrate the car sidewall, transverse wall, window mask, ceiling, and other interior surfaces into a harmonious unit.

iii). Generously rounded edges and corners to guard against personnel injury by passengers, crew, and maintenance staff shall be provided.

iv). The use of visible fasteners shall be kept to a minimum, and where used, be inconspicuous.

c). Pinch Points

i). Gaps smaller than 1.5 inches, and larger than 0.5 inches shall be considered potential pinch points that shall be avoided to the maximum extent possible.

(1) Exceptions can be presented to Amtrak if the gap surface depth is less than 0.5 inches.

ii). The Contractor shall develop and submit a Pinch Point Gap Analysis **[CDRL 11-02]** document that identifies all potential pinch points and justifications.

(1) The analysis shall be submitted for Final Design Review FDR approval.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part II: Interior Components

31.12 Doors and Latches

a). Relevant information for doors and latches as they pertain to interiors is generally described below.

i). Further information for doors and latches can be found in Chapter 12.

b). All interior doors shall be built of robust materials to withstand repeated use without deforming or losing adjustment.

c). Doors, unless otherwise indicated as sliding doors, shall have one continuous piano hinge and shall open outward into the interior of the car unless specified otherwise.

d). All latches and hinges shall be stainless steel piano hinges unless approved by Amtrak during the design review process.

e). Access panel doors shall have stainless-steel piano hinges.

f). Cabinet doors shall be supplied with lanyard or equivalent door limiting mechanism to ensure that no collisions occur between cabinet doors and other components of the car.

i). Doors with lanyards shall be limited to 130 degree opening as a default setting with minimal adjustment. Lanyards shall be removable without the use of special tools.

g). Doors shall close securely without requiring the use of a key and shall remain closed without rattling or becoming loose during operation.

h). As necessary for proper airflow in each car according to the HVAC design, doors shall have a grille located in the lower half of the door panel for air circulation.

i). Electrical locker and utility locker doors shall have a release lever on the inside of the latch.

j). Doors that have passenger safety equipment behind them shall use paddle latches with no locking mechanism. Please refer to Chapter 18 for more information regarding emergency equipment.

k). Doors that cover PA handsets shall only have one latch or lock for access.

31.13 Windows

a). Window size should be maximized with an equal pitch where possible.

b). All seating positions and accessible spaces should have a view out of the window.

c). See requirements of Chapter 6 and Chapter 19.

31.14 Window Masks

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

a). The window masks shall be either Fiberglass Reinforced Plastic (FRP) or thermoformed plastic.

b). The window edge should incorporate openings for heating vents at the window and shall not interfere with minimum accessible clearance requirements.

c). Sidewall heat vents may be separate powder coated aluminum (as appropriate for the mask to window interface), or integral to the window mask.

d). The window masks must not readily collect dust/dirt and shall be easy to clean without removal or special tools.

e). Window masks shall be wrapped in a protective film in accordance with Chapter 19. Paint is prohibited.

f). Panel construction shall allow for removal and recovering of the surface covering at overhaul without damage to the base material.

g). Window masks shall allow for easy window replacement.

31.15 Window Blinds

a). Window blinds shall be provided for all side windows, and if the option is exercised for skylight windows.

b). Blinds should cover the entirety of the window.

c). Blinds shall be replaceable within a 30 min timespan.

d). A single pull-down blind system shall be provided per window, common across all car types, capable of delivering both daytime solar / glare control and full blackout performance, as follows:

i). In daytime mode, the blind shall provide effective sun shading and glare control without creating an overly dark or opaque interior.

ii). ii) In night-time mode, the blind shall achieve full blackout and privacy suitable for sleeper accommodation.

iii). The blind system may utilize engineered fabric solutions (e.g. graduated density, variable weave, perforation, or equivalent) to enable both modes of performance within a single blind system.

e). Side window blinds shall be provided with a handle on the lower edge that is easy to use and accessible. It shall move the blind with no racking or jamming and without exceeding 5 lbf during operation.

f). Blinds shall be stored in a valance so that they can easily be accessed for maintenance.

i). Where luggage racks are provided, the blinds may instead be stored behind the luggage rack.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

g). Operation

i). Side window blinds shall be operated manually by a passenger.

ii). If the skylight window option is exercised, then the skylight window blinds shall be automated so that the conductor can deploy or retract the blinds at the push of a button. Alternatives may be proposed for Amtrak's review and approval.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part III: Storage Areas

31.16 Storage in Seating Areas

a). Each storage location below shall integrate into the seating area in an inconspicuous manner and shall flow seamlessly with the aesthetic of the rest of the car.

b). Each storage location shall be clearly labeled according to Amtrak Specification #697.

c). Each storage location shall be easily opened and accessed by any passenger and the use of paddle latches or push-button latches is desired.

d). Folded Wheeled Mobility Device storage spaces shall be dedicated for at least two devices per car for passengers wishing to transfer to another seat.

e). Storage space for an evacuation chair shall be included. Please refer to Chapter 29.

f). Emergency Equipment listed below shall have appropriate storage locations within the car. Please refer to Chapter 18 for more information regarding emergency equipment.

i). Trauma Kit and Stretcher

ii). Egress Ladder

iii). AED

iv). First Aid Kits

31.17 Trash and Recycling Storage

a). General:

i). Trash and Recycling Receptacles shall be provided on each car type in conspicuous locations to encourage passenger/crew use.

ii). Recycling and trash receptacles shall be provided on both ends of each car type as close as practical to bulkheads and restroom areas.

iii). The recycling and trash receptacles shall be either side-by-side in a row or directly across the aisle from one another.

iv). The recycling and trash receptacles shall meet all FDA and NSF requirements for trash containers and their materials.

v). To the extent possible, these receptacles will be designed to maximize trash capacity or at a minimum accommodate the Amtrak standard trash container, per Amtrak Drawing C-96-7591.

vi). The receptacles shall be boldly labeled with an intuitive icon for type of trash, in accordance with Amtrak Specification # 697.

vii). The inside of each trash receptacle door shall be permanently labeled with the Amtrak AMMPS number of the container required for that space.

viii). Each set of receptacles shall include two separate openings and respective bins:

(1) one for trash

(2) one for recyclables (cans, bottles, and newspapers)

b). Material and Construction:

i). Trash and recycling locker door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). The trash locker container access door shall be secured closed with a square lock.

iii). The trash locker door shall include a recessed grab handle to be used to pull the door open when unlatched.

iv). Visible hardware and fasteners shall be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

v). Recycling and trash receptacle lockers shall be of panel construction with substructure as appropriate to support components.

vi). The locker shall include appropriate brackets and/or guides, etc. to properly index the trash containers with the openings, and as required, to keep them upright.

(1) These devices shall be rounded, etc. to protect staff handling the containers or servicing the end door from injury.

vii). The locker enclosure with walls & door material be fireproof or be lined with fire-resistant material.

viii). The locker shall use as few joints as possible in fabrication; they shall be permanently sealed against moisture and vermin.

ix). The locker shall be structurally sound and conform to requirements set out in 49 CFR 238.233.

c). Cleanability:

i). The inside of the trash locker shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

iii). Easy-to-clean trash guides shall be provided on the sides and back of the locker and on the inside of the locker door. The trash guides shall prevent trash and liquids from getting between the container and locker wall.

iv). Horizontally accessed recycling and trash receptacles shall include a hinged self-closing door flap of a touch-free design that is as large as practical.

(1) This flap shall be as wide as possible.

(2) It shall be possible to open the trash flap by pushing against the vertical surface and further provide for opening without touching the vertical surface.

(3) If possible, the flap should be attached to the locker top surface rather than a door-within-a-door concept.

(4) Spring tension of a stainless-steel spring should prevent the door from swinging/ banging as a result of train motion.

(5) These flaps shall avoid trapping any hands or fingers.

v). Vertically accessed recycling and trash receptacles shall have clear openings without flappers.

(1) Enclosure shall be constructed so as to not ignite, produce lingering char, or allow fire to spread to adjacent interior elements.

d). Required Tash and Recycling Volumes

i). Figure 31-1 defines required trash and recycling capacity volumes in each car section.

Figure 31-1: Trash and Recycling Quantities

Section	Location	Type	Volume
Diner/ Lounge	Entrance Area	Trash and Recycling	7.5 cu ft
	General	Trash and Recycling	20 cu ft
Sleepers	Roomette	Trash Only	0.75 cu ft
	Solo Suite	Trash Only	0.75 cu ft
	Club Bedroom	Trash Only	1 cu ft
	Accessible Bedroom	Trash Only	1 cu ft
	General	Trash and Recycling	20 cu ft
Food Service	Kitchen	Trash and Recycling	44 cu ft
	Servery	Trash and Recycling	24 cu ft

Diner	General	Trash and Recycling	20 cu ft
Utility (option)	General	Trash and Recycling	10 cu ft
	Crew Room	Trash Only	0.75 cu ft
	Crew Common Area	Trash and Recycling	10 cu ft

31.18 Linen Closets

a). General

i). Linen closets shall be located on each car that contains a sleeping compartment and premium coach seating.

(1) In sleeping cars, linens shall be stored in a full height cabinet that is at least 2.5 ft wide and 2 ft deep.

ii). These cabinets shall have adjustable shelving and retaining devices to hold equipment on the shelf.

b). Material and Construction:

i). Linen closet door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). Adjustable shelves with retaining bars shall be provided in these linen closets.

iii). A minimum of 5 shelves per closet shall be the default for the linen closet design and the final number of shelves and installed spacing arrangement shall be determined at the mockup review.

c). Cleanability:

i). The inside of the linen closet shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

31.19 Consumable Supply Closet

a). General:

i). Consumable supplies shall be stored in a full-height cabinet that is at least 2.5 ft wide and 2 ft deep.

ii). One consumable supply cabinet shall be provided per car.

iii). This cabinet shall have adjustable shelving and retaining devices to hold equipment on the shelf.

iv). The cabinet shall have a light that turns on when the door is opened and light switch inside.

v). The cabinet shall have a duplex service outlet.

b). Material and Construction:

i). Consumable Supply locker door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). Adjustable shelves with retaining bars shall be provided in these consumable supply closets. A minimum of 8 shelves per closet shall be the default for the consumable supply closet design and the final number of shelves and installed spacing arrangement shall be determined at the mockup review.

c). Cleanability:

i). The inside of the consumable supply locker shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

31.20 Cleaning Supply Cabinet

a). General

i). Cleaning supplies shall be stored in a full height cabinet that is at least 2.5 ft wide and 2 ft deep.

ii). One cleaning supply cabinet shall be provided per car.

iii). This cabinet shall have adjustable shelving and retaining devices to hold equipment in place and/or on the shelf.

iv). Provisions shall be made for retention of one cordless vacuum with a dedicated outlet, one broom, one dustpan, one mop, and one mop bucket in all car types.

v). The cabinet shall have a light that turns on when the door is opened and light switch inside.

vi). The cabinet shall have a duplex service outlet.

b). Material and Construction:

i). Cleaning Supply Cabinet door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). Adjustable shelves with retaining bars shall be provided in these cleaning supply cabinets.

iii). A minimum of 3 shelves per cabinet shall be the default for the cleaning supply closet design and the final number of shelves and installed spacing arrangement shall be determined at the mockup review.

c). Cleanability:

i). The inside of the cleaning supply cabinet shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

31.21 Lockable Cabinet (Diner Car Only)

a). General:

i). Items shall be stored in a full height lockable cabinet that is at least 2.5 ft wide and 2 ft deep.

(1) This cabinet shall have a hasp installed for additional security.

ii). One lockable cabinet shall be provided per Diner car.

iii). This cabinet shall have adjustable shelving and retaining devices to hold equipment and/or hunting rifles in place and/or on the shelf.

iv). The cabinet shall have a light that turns on when the door is opened and light switch inside.

v). The cabinet shall have a duplex service outlet.

b). Material and Construction:

i). Cabinet door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

ii). Adjustable shelves with retaining bars shall be provided in these cabinets.

iii). A minimum of 3 shelves per cabinet shall be the default for the design and the final number of shelves and installed spacing arrangement shall be determined at the mockup review.

c). Cleanability:

i). The inside of the cabinet shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

31.22 Emergency Equipment

a). General:

i). Emergency Equipment boxes shall be mounted on end of the car.

ii). These boxes shall contain, at a minimum:

(1) a fire extinguisher

(2) crowbar

(3) hammer

(4) snap lights

(5) first aid kit

iii). Emergency equipment boxes shall not be locked and be mounted in an area easily accessible to all passengers in the event of an emergency.

iv). The labels and gages for the fire extinguisher shall be visible and readable from either a seated or standing passenger in an aisle.

v). Further information on these emergency equipment boxes can be found in Chapter 18.

b). Material and Construction:

i). Emergency equipment locker door panels shall have melamine or factory-applied laminate.

(1) Alternatively, panels may be constructed of honeycomb or plymetal wall materials.

c). Cleanability:

i). The inside of the emergency equipment locker shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

31.23 Luggage Storage – General

a). General:

i). Luggage racks shall conform to 49 CFR 238.737.

ii). The Contractor shall factor in:

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(1) Safety

(2) Crashworthiness, abuse, load, and crash criteria

(3) Materials and Workmanship

(4) FDA cleaning clearances

(5) FDA cleaning radii

(6) Sanitary design

iii). All mechanisms should be durable, free from jamming, and racking.

iv). Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

b). Cleanability:

i). The inside of the luggage storage locations shall be easy to clean, with large 0.75 in radius sanitary corners and all joints sealed for good sanitation and to meet FDA requirements.

ii). Visible hardware and fasteners should be minimized to aid cleaning, reduce build-up of contaminants, and provide for pleasing aesthetics.

c). Sleeper Cars: Required Luggage Storage Volumes and Baggage Analysis

i). Baggage storage volumes shall comply with the requirements of this Specification.

ii). Luggage Tower Volume

(1) Each sleeper car shall have luggage towers with sufficient capacity for all potential passenger's suitcases.

(2) Each passenger's suitcase shall be stored on the car they are travelling in.

(3) Luggage tower capacity shall allow for one suitcase for each passenger.

(4) For calculation purposes, assume 50% of the suitcases are large and 50% are medium sized.

(5) Sizes

(a) Large suitcases measure 30" x 20" x 12"

(b) Medium suitcases measure 26" x 18" x 11"

iii). As part of PDR, the Contractor shall develop and provide an analysis of how the proposed car arrangements shall comply with the requirements of this specification. **[CDRL 31-03]**

Figure 31-2: Not Used

d). Key Features

i). Expected features for Luggage Storage areas are summarized in Figure 31-3 and detailed below.

Figure 31-3: Luggage Storage Key Features

Feature	Short Description	Qty
Trim Panels	Wall panel with provisions for mounting lighting, signage, etc.	TBD during design review
Rollstop	Retaining bar for luggage	1 per shelf level
Kick Strips	Stainless steel strips	Each exposed side
Solid Panel	HPL panel	TBD during design review
Upper Shelf	Shorter depth shelf	1
Protective Back Panel	Replaceable wear panel	1 per shelf
Shelves	Full depth shelf	TBD during design review
Bottom Shelf	Floor luggage storage for large bags	1

ii). Trim Panels

(1) Trim panels shall interface with side wall and ceiling with no gaps or dirt traps.

(2) Trim panels are made from HPL composite sandwiches.

iii). Rollstop

(1) Retaining bars or similar details shall be provided on large shelving edges that prevent luggage from falling or rolling out.

iv). Kick Strips

(1) Stainless steel kick strips at 9” high should be used on all exposed edges.

v). Solid Panel

(1) A solid panel with HPL skin and no safety glass should be used when stacks are placed up against bulkheads.

vi). Upper Shelf

(1) Upper shelf can be shallower for smaller bags and aid in passenger reach of luggage.

vii). Protective Back Panel

(1) Replaceable trim panel that protects wall from scuffing shall be provided. Panel should be easy to replace.

viii). Shelves

(1) Shelving with hard wearing finish shall be provided. Shelf should be easily replaceable, easy to clean, with no dirt traps.

ix). Bottom Shelf

(1) The bottom shelf shall be deep enough for large suitcases. It shall have an easy clean surface, no dirt traps, and a soft back corner.

31.24 Luggage Towers

a). General

i). Quantity and location of luggage towers shall be guided by the Baggage Analysis required in Section 31.23.

b). Materials and Construction

i). A luggage tower shall be of robust stainless-steel construction and include shelves.

ii). Bumper guards shall be mechanically attached to the wall panels within the luggage tower to prevent damage to walls or luggage.

iii). The towers shall have sufficient strength to support a load of 250 lbs. midway between adjacent supports with a deflection not to exceed 0.25 in. and without permanent deformation.

iv). The load-bearing surface shall not be less than 24 in. wide and shall be inclined upward from the horizontal toward the center of the car at an angle of approximately three degrees.

c). Aesthetics

i). The towers shall have plain or tinted glass that will be presented to Amtrak for approval during the design review process.

ii). Exact graphics, decals, opacity, etc. shall be determined with Amtrak during the design review process.

d). Modularity

i). Luggage towers should be built as a modular set of parts.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

ii). Various lengths of luggage tower shall be allowed for within the same modular construction.

iii). Luggage towers should be integrated with the side wall and ceiling with no gaps or dirt traps between it and the adjoining body side panels.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part IV: Integrated Electronics and Technology

31.25 Digital Displays

a). General

i). Digital displays shall be provided throughout the cars.

ii). Displays shall be capable of both displaying uniform content across multiple screens and displaying unique information.

(1) This should be adjustable by Amtrak employees who have access to software passwords for such activities.

iii). See Chapters 14 and 26 for additional information and requirements for displays.

b). Materials and Construction

i). All display screens shall be rail rated and/or service proven.

ii). Displays shall be integrated into an access panel for ease of maintenance and replaceability.

iii). Behind each access panel should be provisions for electrical, diagnostics, and communications connections even if the display screen is only powered by the Contractor.

iv). Displays shall be flush mounted unless otherwise agreed with Amtrak during IDR and Mockup Review.

c). Screen Placement

i). General

(1) Screens shall be located to ensure high visibility and legibility for passengers throughout the train.

(2) The intent is to provide consistent access to passenger information without prescribing exact screen sizes, orientations, or positions.

(3) Screen placement shall support dynamic wayfinding, real-time travel updates, and service information including advertising.

(4) Please refer to CMF and suggested layout attachments for further information on screen placement and examples.

ii). Visibility Guidelines by Area

(1) Entrance Areas

(a) Screens should be clearly visible upon entering and exiting the car.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(b) Screens should be positioned to be readable from multiple angles.

(2) Sleeper Cars

(a) At each end of all sleeper car hallways or in transitional spaces screens should be provided for passenger information and way finding. (PIS/OTIS)

(b) Screens must be clearly visible from typical passenger circulation paths.

(3) Food Service Areas

(a) Screens used for digital menus, Food and Beverage Promotions, or service information must be readable from multiple positions including:

(i) While queuing (even when two or more people are in line)

(ii) Directly at the point of purchase

(iii) From seated dining positions

(4) Screen Format

(a) Aspect ratio, orientation, and mounting should be selected to support clear visibility in each context.

(b) All screens shall feature anti-glare treatments and meet accessibility standards for legibility, contrast, and resolution.

(5) Screen Selection and Placement

(a) Amtrak reserves the right to modify screen placement or suggest screen selection changes during the design review process and mock up stages of the design.

31.26 Electrical Locker and Panels

a). The car electric/ switch locker shall be located within the car interior.

b). The car PA unit is located here, recessed into the wall.

c). The locker shall have separate doors for crew operated equipment, and maintenance operated equipment. See Chapter 15.

d). Locker walls shall be of melamine faced aluminum panel construction with substructure as appropriate to support components.

e). Longitudinal walls facing into the entrance area shall be decorated with melamine or other factory-manufactured laminate material.

f). The locker wall & door material shall be fireproof or be lined with fire-blocking material.

g). The substructure shall be robust to support the numerous heavy electrical panels, etc. located within the locker.

h). The door and frame shall be robust due to frequent use and rough treatment.

i). The door lock shall be a coach key style lock with interior release latch.

j). The electrical locker shall be positively pressurized by conditioned air as part of the HVAC system to prevent dust from entering and accumulating in the electrical locker.

k). Air shall only be allowed to vent from the electrical locker through gaps and voids where dust may enter.

l). There shall not be a vent or grille in the door to the electrical locker.

m). The locker shall include a metal pocket or rack to hold the car defect report book, which is approximately 8.5 in. wide by 11 in. tall by 1 in. thick.

n). The inside face of the electrical locker door shall have an identification sign listing the car number, car weight and freshwater capacity, and an 8.5 in. wide by 11 in. tall metal surface for an FDA inspection form and stickers.

o). The surface must be smooth to allow pasting up maintenance forms i.e. extermination.

p). A Central Diagnostic Unit control and display shall be included in the locker.

q). The electric locker door shall be labeled in compliance with Amtrak Specifications # 696 & # 697.

r). When the door is opened, the locker service lights shall be illuminated by magnetic switches.

s). The locker doors shall be hinged to open to not block aisleways/passageways when open.

t). The passage side of the electric locker with the door shall contain all crew and emergency controls in one location to facilitate emergency preparedness and response.

u). At a minimum the following components shall be located on the passage side of the electric locker:

i). B-end emergency fan switch

ii). B-end body end door cutout switch

iii). B-end conductors emergency brake valve (Note: exhaust of valve must not direct onto electrical equipment in the locker, so as to avoid blowing water onto it when valve is activated)

iv). PA unit (see Chapter 14)

v). Fire extinguisher enclosure (see Chapter 18)

vi). Smoke Detector main display panel and controls, behind a transparent door, accessed with a coach key (see Chapter 25)

vii). Waste system status (see Chapter 17)

viii). System status indicator panel (See Chapter 10)

ix). All other crew operated emergency controls

v). At the top of the room adjacent to the hallway, each room shall be equipped with an electrical junction box, containing a series of terminal blocks to allow the interconnection of room module wiring with that of the car.

w). Overhead wire ducts shall carry inter-module wiring as well as the feeds from the switch locker.

x). The cover of the box shall make a dust-tight seal to the room interior and shall be secured with captive screws.

y). The electrical equipment and switch locker shall be located as appropriate near the end of each car.

z). A small switch locker shall be incorporated into the electrical locker, containing just the essential lighting and other control switches needed by the train crew for car setup for consist operation.

Figure 31-4: Not Used

31.27 Outlets

a). General

i). Convenience outlets utilizing duplex receptacles as described in Chapter 15 shall be located throughout the interior.

ii). A “120 Volts” label, in accordance with Amtrak Spec. # 697, shall be installed at each outlet location, 0.5 inch from the outlet.

b). Passenger Convenience Outlets

i). Seat Outlets

(1) A duplex receptacle shall be provided for each seat, including those at tables, in all car types. See the following sections for additional information:

(a) 31.37: Roomette

(b) 31.38: Solo Suite

(c) 31.39: Club Bedroom

(d) 31.40: Accessible Bedroom

ii). Table Outlets

(1) A duplex receptacle shall be installed on each side of each table, located such that the table or seat does not interfere with access to the outlet.

iii). Mirror Outlets

(1) A duplex receptacle shall be installed adjacent to each mirror. See the following sections for additional information:

(a) 31.35: Standard Toilet Room (STR)

(b) 11.46: Accessible Toilet Room (ATR)

(c) 31.37: Roomette

(d) 31.38: Solo Suite

(e) 31.39: Club Bedroom

(f) 31.40: Accessible Bedroom

(g) 31.41: Sleeper Cabin Communal Restrooms

(h) 31.42: Sleeper Cabin Communal Showers

31.28 Video Surveillance (Option)

a). An onboard digital video surveillance system shall be provided.

b). The video surveillance system shall monitor, and record data acquired from multiple onboard camera sources that shall be arranged to maximize the coverage of the vehicle and its operations.

c). The onboard camera system shall have day and night capabilities with performance down to at least 0.1 lux and provide high quality color video.

d). The system shall operate continuously off the low voltage power supply system and be backed up by car battery as a vital load.

e). A minimum of four (4) interior cameras shall be placed throughout each car to facilitate recognition of passengers and/or luggage onboard the rail vehicle.

f). One camera shall be mounted in each entrance area with wide angled coverage of the entrance areas, and doorways.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

g). No less than two cameras shall be mounted in the passenger seating area. Cameras mounted in the passenger seating area shall be facing in opposing directions with overlapping viewing zones to maximize coverage.

h). Failure of a single camera shall not affect system functionality.

i). The cameras shall have adjustable resolution of at least 1080p with frame rates adjustable up to thirty (30) frames per second to avoid latency and/or frame loss.

j). The cameras shall provide the latest MPEG-4 video compression commercially available, H.264 or greater.

k). Each camera shall deliver compressed video in real time to the data storage device. All video cameras provided shall have a proven history of reliable operation on rail vehicles.

l). The surveillance system shall commence recording data when the car is powered on, and continue recording until the car is powered off, unless otherwise directed by the Conductor.

m). All communications equipment shall meet the requirements in Chapter 14, Communications. See also Chapter 26.

Part V: Interior Structures

31.29 Bulkhead Walls

a). General

i). Bulkhead walls at the end of each passenger seating area shall be constructed of melamine or HPL- faced aluminum panels for durability and to be pleasing to the passenger.

ii). Any fiberglass material shall be covered with a high gloss gel coat. All seams will be sealed, using appropriate sealing materials.

iii). Fasteners shall not protrude from the wall panels but countersunk to be flush with the wall panels.

iv). Bulkheads dividing the car shall be constructed for durability. All joints shall be sealed, using appropriate sealing materials.

v). Fasteners shall not extend from the wall panels but instead countersunk to be flush with the wall panels.

vi). The bulkhead shall meet the structural strength required in APTA PR-CS-S-006-98.

vii). Panels shall be machined smooth and free of sharp edges and burrs. Like panels shall be identical.

viii). Edges and corners shall have generous radii. Finished surfaces shall be decorative laminate, Schneller G20002T or high-pressure laminate.

ix). Amtrak shall reserve the right to choose material it deems appropriate for the application.

x). Provision for textile wainscot panels or sections shall be included.

xi). Panels shall include stainless-steel kick panels equal in height to the sidewall heater grills.

xii). Kick panels shall wrap the edges of the passage/ aisle side edge of the panel.

xiii). Bulkheads shall be designed so that decorative surfaces can be changed at overhaul without damaging the substrate.

xiv). Alternate panel construction will be considered where appropriate.

xv). To keep the number of fasteners low, service panels shall be kept as small as possible while still allowing access to the necessary items requiring access.

xvi). The gaskets shall be protected from crushing through the use of metal-to-metal stops incorporated around the mounting fastener holes. Bulkheads with Doors

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(1) For bulkheads at end door or partitions, bulkheads should have a flush integrated screen and provision for Amtrak 3D branding.

b). Doors should be made from safety glass, have a minimal frame and an accessible touch button to open the door. Please refer to the attached CMF document (Exhibit F) for exact color, material, and finishes desired in bulkhead walls. Please also refer to chapter 19.

31.30 Ceilings

a). Ceiling panels shall be designed and constructed and installed to allow easy individual removal for maintenance and repair of any components included in the ceiling design, such as air ducts.

b). Ceiling panels shall be constructed of material that meets flame, smoke, toxicity, and structural standards, subject to Amtrak's approval.

c). The ceilings shall be made of a wear resistant and easy to clean material, preferably coated metal sheets or HPL panels.

d). Hallway and central ceiling panels shall be lightweight phenolic composite sandwich design or honeycomb construction.

e). Panels shall have a dense phenolic composite edge machined smooth and free of sharp edges and burrs or may employ imbedded aluminum trim.

f). Alternatively, as appropriate, honeycomb aluminum panels may be used. Finished surfaces shall be decorative laminate, Schneller G20002T or Amtrak approved equivalent.

g). Corners and edges shall be rounded.

h). Panels should be self- trimming.

i). Where trim extrusions are necessary between panels, their size should be minimized.

j). The number of visible fasteners should be minimized.

k). Piano hinged ceiling panels shall be designed, constructed, and installed to allow easy individual opening and closing to provide access for maintenance and repair of any components located above the ceiling, such as:

i). body end door operators and tracks,

ii). HVAC air ducts,

iii). lighting fixtures,

iv). PA speakers,

v). water piping,

vi). wiring, etc.

l). These panels shall be hinged along one edge in such a way that they may be hung open or easily removed from the hinge.

m). Ceiling panel size shall allow a single person to open/ close the panels safely, unaided.

n). The panels shall be secured closed with a quarter turn Southco or equal quarter turn draw-tight vice-action latches with indicators for the locked position. When in the locked/closed position the latch arm shall not move freely. The latch will be determined during the design review process. Self-adjusting compression latches are prohibited.

o). The driver required for the latch will be determined during the design phase.

p). Each panel shall include a passive self-engaging safety catch to prevent accidental panel openings.

q). These safety devices shall be stainless steel and be configured so as not to rattle in service. The safety latch shall be self-engaging when opening and closing the panel.

r). Panels shall be sealed against air leaks around their entire perimeter, with the seal on the stationary side of the joint.

s). Any components that penetrate the ceiling shall form an air-tight joint to the ceiling to avoid dirt streaking.

t). The seal on these items shall be on the component, rather than the ceiling panel.

u). The method of securing the ceiling panel to the car structure shall ensure that panels cannot drop at all due to any car motion from coupling/ uncoupling as well as under all operating conditions at all authorized speeds on any FRA class of track.

v). Hinged panels, which provide access of overhead equipment such as door operators, water heater, galley exhaust hood blower, etc., shall be equipped with a limit switch so that when the panel is opened, the associated service lights shall be illuminated.

w). Where the car ceiling panels form the bottom of the HVAC duct, they shall be hinged along one side to allow them to be easily opened for periodic duct cleaning.

31.31 Flooring

a). Floor Covering

i). The car floor shall be equipped with a combination of carpeting and anti-slip flooring to provide an aesthetically pleasing and safe environment for the passenger.

ii). Safety and installation shall be foremost in the design.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

iii). Carpeting is used not only for aesthetics, but also as a sound absorbent.

iv). All floor coverings shall be new.

v). The integration of the base floor material, carpeting, and shower/ restroom inserts shall be the subject of design review.

vi). Care shall be taken to ensure smooth transitions between flooring, carpeting, and transitions in doorways, restroom entrances, seat tracks, etc., to avoid tripping hazards.

vii). Generally, clamping thresholds should be used at these joints and longitudinal carpet-retaining tracks used to secure carpeting.

viii). Carpet-retaining track locations shall be coordinated with those of LLEPM tracks to ensure a smooth transition.

ix). Joints in the floor beneath the floor covering shall be smooth with no transmit bumps, ridges, and other irregularities through to the finished surface of the covering.

x). The builder shall provide an adhesive system suitable for railcar applications and be unaffected by the inherent flexing of vehicle interior color panels and temperature swings during train operation.

xi). The adhesive shall not degrade the flammability, smoke emissions, and toxicity characteristics of the carpet, composite flooring, or car substrate.

xii). The composite flooring, floor coverings, and their adhesive systems shall be able to withstand a wide variety of periodic and specialized stain removal cleaning typical for a passenger rail vehicle without any stretching, puckering, rippling, fraying, pulling up, or other adverse effect to the surface appearance or function.

xiii). Cleaning may occur daily and at least every 90 days using a carpet cleaning machine, hot water, and caustic or acid chemicals.

xiv). Daily specialized spot cleaning will take place using chemical cleaners, scrubbing with brushes, and application of gum remover.

xv). The base floor and floor coverings shall be installed in accordance with the best practices of the industry and OEM instructions.

xvi). Floor coverings, their trim, and the installation of these materials shall result in a smooth and flat floor covering for the life of the floor covering. Coverings shall be removable at end-of-life with no damage to the underlying floor panels.

xvii). Floor covering seams should be kept to a minimum and the plan for seam location shall be approved by Amtrak during the design review process.

(1) High-wear carpet locations especially center aisles shall be designed to be fully replaced in under 30 minutes.

xviii). The carpet vendor shall provide detailed recommended cleaning instructions for the builder to include in the maintenance manual sets.

xix). To the extent possible, floor coverings for each site shall have the same dimensions among all cars, or among like cars at a minimum, so materials can be cut to size outside of the car and be installed with minimal on-car trimming.

b). Walkoff carpets shall be installed in all entrance areas to each car to prevent damage to the interior flooring of each car. Walkoff carpets shall be designed for high-traffic environments and must function under all conditions including temperature fluctuations, vibration and continuous passenger loading.

i). The walkoff carpet system shall be easily replaceable and shall trap water and soil at the entryway to improve cleanliness and safety while providing a stable, firm and slip-resistant walking surface consistent with all accessibility requirements for floor surfaces.

c). Please refer to Figure 31-5 below for general outline of where each flooring type will be utilized and to Exhibit F for exact color, material, and finishes desired in bulkhead walls:

Figure 31-5: Floor Covering Table

Location		**Flooring Type**
Diner	Aisle by Galley	Anti-Slip Rubber Flooring 1
	Seated Area	High Traffic Carpet 2
	Galley	Anti-Slip Rubber Flooring 2
Diner/Lounge	Entrance Area	Anti-Slip Rubber Flooring 1
	Seated Area	High Traffic Carpet 2
Sleeping Car	Entrance Area	Anti-Slip Rubber Flooring 1
	Aisle/Hallway	High Traffic Carpet 2
	Inside Bedrooms	Low Traffic Carpet 3
	Bedroom Restrooms	Anti-Slip Rubber Flooring 2
Communal Restrooms	ATR, STR & Shower	Anti-Slip Rubber Flooring 2
Utility Car Areas (Option)	Aisle/Hallway	High Traffic Carpet 2
	Entrance Area	Anti-Slip Rubber Flooring 1
	Common Area	Anti-Slip Rubber Flooring 1
	Checked Bag Storage	Anti-Slip Rubber Flooring 2

d). Carpeting and Securement

i). Carpet

(1) Heavy-duty commercial carpet shall be provided as indicated including seating areas and sleeper cabins.

(2) Carpet shall be designed for modular replacement.

(3) All areas of common design shall use template cut carpets. Linear carpets such as those used for aisles shall likewise be of identical sizes within car types.

(4) Roomette and Solo Suite carpets shall be replaceable in 15 minutes each. Bedroom carpets shall be replaceable in 20 minutes.

(5) Sleeping cars, Diner/Lounge car, Dining car, and Utility car aisle carpets shall be replaceable in 30 minutes.

(6) All carpet shall be designed per Amtrak specification and shall be designed to provide maximum passenger comfort and safety as dictated by ergonomic requirements.

(7) The carpet shall be compliant with all applicable APTA and ADA guidelines.

ii). Carpet Securement

(1) Generally, the aisle and hall carpet shall be mechanically secured to the floor using longitudinal carpet-retaining tracks along both sides of the center aisle and along the outside edges of the car in the sleeper car hallway.

(2) A cove shall be provided where the carpet meets the longitudinal wall for ease of cleaning.

(3) Clamping thresholds shall be used at transitions to rubber or composite flooring and metal moldings, as required, such as at bulkheads.

(4) The carpet-retaining tracks along the aisle may be incorporated in the tracks for LLEPM.

(5) The spacing between the carpet-retaining tracks, moldings, etc. shall be identical on all cars so that carpeting does not need to be trimmed to fit a specific car.

(6) If carpet must be glued into place at certain locations, these require Amtrak approval.

e). Anti-Slip, Skid Resistant Flooring

i). Skid-resistant, waterproof composite floor covering, that has been tested and proven to meet ADA requirements, shall be used where indicated including passageways, restrooms, food service areas and other utility areas where carpet is not installed.

ii). The floor design must comply with 36 CFR Part 1192 Appendix I. and to the best extent, RVAAC VI Floor Surfaces recommendations.

iii). The floor covering shall have an integral cove of 4 in. radius, where specified, for easy cleaning, and shall extend from 2 in. to 6 in. up the wall, depending upon application.

iv). Transition strips shall be provided between composite flooring and carpeted areas.

v). Transitions between flooring types shall produce level changes in flooring surfaces less than 0.25 in.

vi). The trim strip between the wall lining and the floor covering shall be sealed to prevent harborage, accumulation of debris, or incursion of water and cleaning fluids.

vii). Floors in entrance areas and end passageways shall have a 3 in. wide high-contrast visibility strip directly adjacent to door openings to delineate the door opening for visually impaired passengers.

viii). The high-contrast strip at the side entry doors shall be made of high-performance photo-luminescent material so that it is integrated into the LLEPM system for exit pathway marking.

ix). The LLEPM material and application shall comply with APTA Standard PR-PS-S-004-99 and shall be embedded in the floor system.

x). All flooring shall be installed using an adhesive system that is approved by the flooring manufacturer and Amtrak.

31.32 Hallways

a). General

i). Hallway information shall be used in any corridor or aisle through a train car with enclosed compartments on either side.

ii). All hallways shall be designed and constructed to form a safe and attractive environment. Visible fasteners shall be minimized.

iii). Modularity shall be optimized during the design process and the outer walls of the modules shall be developed as a common component where possible.

iv). All mounted items in the area shall be secured to the module structure through the use of fully embedded tapping plates when pullout strength or expected weight is greater than 20 lbs.

v). These are expected to last the life of the car without coming loose.

vi). Consistent features shall be maintained across hallways to the extent possible.

b). Requirements for integrated systems in all hallways are listed below.

i). HVAC

(1) Supply Air Diffusers

(a) Conditioned air is delivered to the hallway via 2 supply air diffusers with adjustable air flow control and located on the windowsill of the outside window.

(2) Exhaust Grille

(a) Exhaust air is removed from the room via the exhaust air grille which is located at the upper portion of the module.

(3) Air Circulation Fans

(a) Air circulation fans with controls shall be provided at the head of each sleeping berth.

(b) The purpose is to stir car air and decrease the potential for temperature differential between upper and lower areas of the car.

(c) The air circulation fans shall have manual adjustment of the airflow direction.

ii). Communications

(1) Speaker

(a) PA speaker shall be located on the central ceiling panel.

(b) The speaker used in this location shall be identical to PA speakers used in other locations in the cars for ease of maintenance and replacement.

(2) Passenger Emergency Intercom

(a) A PEI shall be located in every car in addition to specified locations called out later in this section.

(b) The intention of this button is to notify the conductor and flag the entire train that there is an onboard emergency.

(3) All communications equipment shall meet the requirements in Chapter 14.

iii). Electrical System

(1) Electrical equipment information is shared in detail for each hallway area.

(2) All electrical equipment in the entrance area shall meet the requirements in Chapter 15.

iv). Lighting System

(1) Lighting general information is shared in detail for each area. Detailed lighting information can be found in Chapter 13.

(2) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

v). Emergency Equipment

(1) Chapter 18 details emergency equipment requirements. Generally, the following items shall be included.

(a) Smoke Detector

(i) Smoke Detectors shall be mounted on the central ceiling panel.

(ii) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

vi). CMF

(1) Please refer to the CMF document Exhibit F for color, material, and finishes desired in this sleeper cabin area. Please also refer to Chapter 19.

(a) Wall Panels

(i) Wall panels shall be wrapped in a protective film in accordance with Chapter 19. Paint is prohibited.

(ii) Sidewall Panels along the carshell wall shall be made from molded thermoplastic or melamine resin composite with an easy to clean surface finish.

(iii) Partition Walls shall be created from a composite structure such as aluminum honeycomb, melamine resin, or HPL skinned honeycomb panels.

(iv) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(b) Ceilings

(i) Ceiling panels shall be wrapped in a protective film in accordance with Chapter 19. Paint is prohibited.

(ii) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels. Please refer to Section 31.30 for details on this ceiling type.

(iii) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(iv) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

(c) Flooring

(i) Flooring within the hallway shall be made from high traffic carpet flooring.

c). Key Features

i). A comprehensive list of expected features in hallways is provided in Figure 31-6 and described in detail below.

ii). In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design. All mechanisms described below should be durable, free from jamming, and racking. The design should meet abuse load and crash criteria. Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

Figure 31-6: Key Features – Hallways

Feature	Short Description	Qty
Handholds	49 CFR 238.115 compliant handrails	Depends on car type
Trash Bin	Trash bin with push flaps and access door	At least 2
Panel Work	HPL panels and Tedlar style sidewall liners	All
Passenger Information Screens	Digital display monitor (PIS/OTIS)	2
Control Panel Doors	Access panels with seamless features to panel work	All Access panels
Kick Strips	9” high stainless steel strips	All exposed wall panels
Trim panels	Wall panel with provisions for mounting signage etc.	TBD during design review

iii). Handholds

(1) General

(a) Compliant handholds should be supplied.

(b) Grab bar positioning will be subject to mockup testing and Amtrak approval.

(c) Grab bars shall meet the requirements in 49 CFR 38.115.

(2) Horizontal Handrails

(a) Horizontal handrails shall be provided along the full length of a hallway along the window side of the aisle, if applicable.

(3) Vertical Grab Bars

(a) Vertical grab bars shall be provided between every cabin or compartment.

iv). Trash Bin

(1) Trash bins shall be provided with stainless steel push flaps.

(2) Please refer to Section 31.17 for more information on trash and recycling requirements.

v). Panel Work

(1) Hallways should be designed to have well fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(2) There should be no protruding equipment, snag point, or dirt traps.

(3) All equipment storage cabinets should be accessible using a crew key with discreet locks.

vi). Passenger Information Screen (PIS/OTIS)

(1) Display screens should be supplied on both ends of the hallways.

vii). Control Panel Door

(1) All equipment storage cabinets should be accessible using a crew key with discreet locks.

(2) These doors should use the same front panel as the other hallway wall paneling.

viii). Kick Strip

(1) Stainless steel kick strips at 9” high should be used in all hallways.

ix). Trim Panels

(1) Allowance for an area on the panel should provide suitable space to apply wayfinding signage.

(2) Trim panels differ from panel work in that trim panels are locations for wayfinding and accent lighting features to be mounted.

d). Lighting Requirements

i). General

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups. Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

ii). Lighting Types and Locations

(1) Wash Lights

(a) Wall Panel Wash Light

(i) Indirect strip lights wash light onto the ceiling from the top of the compartments along the hallway.

(2) LED Panel Spotlights (White Lights)

(a) Small circular LED light panels shall act as spotlights along aisles.

(b) The frame for the spotlights shall be color matched to the ceiling.

31.33 Entrance Areas

a). General

i). Entrances for the cars shall have entrance doors on both sides of the car at the B-end.

ii). Entrance areas shall include a 60” turning circle.

iii). All entrance areas shall be designed and constructed to form a safe and attractive environment.

iv). Visible fasteners shall be minimized.

v). Modularity shall be optimized during the design process and the outer walls of the modules shall be developed as a common component where possible.

vi). All mounted items in the area shall be secured to the module structure through the use of fully embedded tapping plates when pullout strength or expected weight is greater than 20 lbs.

(1) These are expected to last the life of the car without coming loose.

vii). Consistent features shall be maintained across entrance areas to the extent possible.

b). Integrated Systems

i). HVAC

(1) Supply Air Diffusers

(a) Conditioned air is delivered to the entry area via 2 supply air diffusers with adjustable air flow control and located on the windowsill of the outside window.

(2) Exhaust Grille

(a) Exhaust air is removed from the entry area via the exhaust air grille which is located at the upper portion of the module.

(3) Air Circulation Fans

(a) Air circulation fans with controls shall be provided.

(b) The purpose is to stir air and decrease the potential for temperature differential between upper and lower areas.

(c) The air circulation fans shall have manual adjustment of the airflow direction.

ii). Communications

(1) Speaker

(a) PA speaker shall be located on the central ceiling panel.

(b) The speaker used in this location shall be identical to PA speakers used in other locations in the cars for ease of maintenance and replacement.

(2) Passenger Emergency Intercom

(a) A PEI shall be located in every car in addition to specified locations called out later in this section.

(b) The intention of this button is to notify the conductor and flag the entire train that there is an onboard emergency.

(3) All communications equipment shall meet the requirements in Chapter 14.

iii). Electrical System

(1) All electrical equipment in the entrance area shall meet the requirements in Chapter 15.

(2) Junction Box

(a) The junction box shall be located where practical and shall be presented during the design phase. It shall be easily accessible by the maintenance group.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

iv). Lighting System

(1) Lighting general information is shared in detail for each area. Detailed lighting information can be found in Chapter 13.

(2) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

v). Emergency Equipment

(1) Chapter 25 details emergency equipment requirements.

(2) Smoke Detector

(a) Smoke Detectors shall be mounted on the central ceiling panel.

(b) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

c). Security

i). Many items within the entrance area will need to be secured.

d). Please refer to the attached CMF document (Exhibit F) for exact color, material, and finishes desired in this entrance area. Please also refer to Chapter 19.

i). The following items are identified with specific locking preferences:

(1) Crew access panels

ii). Any other locking or security items will be discussed with Amtrak during design reviews.

iii). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic or melamine resin composite with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb, melamine resin, or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iv). Ceilings

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

v). Flooring

(1) Flooring within the entrance area shall be made from high traffic anti-skid flooring. Please refer to Section 31.31 for details on this flooring type.

e). Key Features

i). A comprehensive list of expected features in entrance areas is provided in Figure 31-7 and detailed below.

ii). In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design. All mechanisms described below should be durable, free from jamming, and racking. The design should meet abuse load and crash criteria. Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

Figure 31-7: Key Features – Entrance Areas

Feature	Short Description	Qty
Handholds	49 CFR 38.115 compliant handrails	4
Door Threshold	Anti-slip, color contrast, texturized flooring at door	2
Trash Bin	Trash bin with push flaps and access door	2
Step Stool Storage	Storage location for step stool used during boarding and alighting process	1
Panel Work	HPL panels and Tedlar style sidewall liners split horizontally into two types (See Exhibit F)	All panels
Passenger Information Screens	Digital display monitor (PIS/OTIS)	2
Control Panel Doors	Access panels with seamless features to panel work	All access panels
Kick Strips	9” stainless steel strips	All exposed panel work
Wheeled Mobility Device Lift	Wheeled mobility device lift for boarding	1
Crew Door Control Panel	Exposed crew controls and buttons for doors and lifts	1
Electrical Control Panel	Maintenance storage location behind access panel	1
PEI	Emergency Alert system with intercom	1

iii). Handholds

(1) Compliant handholds should be supplied on both sides of each door, at key access points along aisles.

(2) Grab bar positioning will be subject to mockup testing and Amtrak approval.

(3) Grab bar shall meet the requirements in 49 CFR 38.115. Handhold grab bars shall be made from stainless steel.

iv). Door Threshold

(1) Door threshold should have a slip-free surface and a contrasting floor color to the main entrance area flooring to mark the threshold.

v). Trash Bin

(1) Trash bins shall be provided with stainless steel push flaps.

(2) Please refer to Section 31.17 for more information on trash and recycling requirements.

vi). Panel Work

(1) Entrance areas should be designed to have well fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(2) There should be no protruding equipment, snag point, or dirt traps.

(3) All equipment storage cabinets should be accessible using a crew key with discreet locks.

vii). Hand Sanitizer Dispenser

(1) An infrared hand sanitizer dispenser shall be installed in each car in the entry vestibule.

(2) The dispenser shall provide a touchless and hygienic solution for dispensing hand sanitizer in public places.

(3) Infrared Sensor

(a) The dispensers shall utilize advanced infrared sensor technology for touchless operation.

(b) The IR sensor shall have an adjustable sensor range to optimize detection distance.

(4) The dispenser shall accommodate a minimum of 1000 ml of hand sanitizer.

(5) The sanitizer reservoir shall be easily refillable without the use of tools.

(6) The dispensers shall be powered via hardwired connection.

(7) The dispensing volume shall be adjustable between 1.5 ml and 3.5 ml per application.

(8) The dispensers shall be constructed using durable and easy-to-clean materials suitable for high-traffic areas and compliant with all requirements of this specification.

(9) The dispenser shall have an LED indicator for low sanitizer levels.

(10) The dispensers shall be wall-mounted and shall allow for easy removal and replacement.

(11) Dispensers shall come filled with an unscented, hand sanitizer with a minimum alcohol content of 60%.

viii). Passenger Information Screen (PIS/OTIS)

(1) Display screens should be supplied on both sides of the interior vestibule door.

ix). Control Panel Door

(1) All equipment storage cabinets should be accessible using a crew key with discreet locks.

(2) These doors should use the same front panel as the other entrance area wall paneling.

x). Kick Strip

(1) Stainless steel kick strips at 9” high should be used in all entrance areas.

xi). Wheeled Mobility Device Lift

(1) A wheeled mobility device lift shall be mounted on doors on both sides of the car, where any passenger with disabilities may board.

(2) The wheeled mobility device lift mounting shall not impede on passenger ingress or egress through the doorway.

(3) Please refer to Chapter 12 for more information.

(4) Crew door controls shall be exposed for ease of access and located on a panel near the entry and exit doors of the car. Please refer to Chapter 12 for more information.

(5) Electrical control panels shall be located behind access panel doors that are operated using a square lock, or as otherwise approved by Amtrak.

xii). PEI

(1) Intercom and alert button shall be integrated into the sidewall for emergency notification and communication. Please refer to Chapter 14 for more information.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

f). Lighting

i). General

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups. Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

ii). Lighting Types and Locations

(1) LED Panel Spotlights (White Lights)

(a) Small circular LED light panels shall act as spotlights above the doors, and along aisles.

(b) The frame for the spotlights shall be color matched to the ceiling.

(2) Compartment Light

(a) Step Lights

(i) Step lights should illuminate interior threshold during boarding.

(3) Wall Panel Wash Light

(a) Indirect strip lights wash light onto the ceiling from the top of the entrance area monuments.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part VII: Restrooms

31.34 Restrooms - General

a). General

i). Restrooms shall comply with water and waste system equipment requirements detailed in Chapter 15.

ii). The highest levels of winterization protection in the design of the toilet room shall be provided.

iii). Accessibility requirements for labeling in the restroom from Chapter 26 shall be followed. Please also reference signage from Section 31.6.

iv). All parts of the toilet room and associated water and waste piping shall have complete maintenance access provided to all components.

v). All toilet room fixtures, dispensers and appliances shall be constructed in accordance with the requirements of the US Public Health Service and 21 CFR Part 1250 requirements and ATR shall meet the ADA requirements of 49 CFR Part 38.123.

vi). Complete details of the toilet room, including maintainability analysis and winterization details, shall be presented for Amtrak approval during design review, and they shall be included in the interior mock-ups.

b). Floor Pan

i). The floor pan of the toilet room modules shall be FRP with 1.5 in. minimum radii corners to eliminate the accumulation of debris and aid in cleaning.

(1) A stainless-steel overflow pan shall be provided under the toilet and water connections.

(2) A waterproof rubber flooring covering which reduces noise and resists accumulation of odors shall be provided.

(3) The purpose is to prevent fluids from wicking beneath the toilet room flooring, both for hygiene and to prevent degradation of the subflooring materials.

(4) This pan shall be watertight and have raised edges of at least 4 in. in height. The pan’s exposed edges shall be folded for safety and to provide stiffness.

(5) The floor pan shall be installed over the subfloor of the car, and the perimeter of the pan shall be fully sealed to prevent moisture from seeping under the pan.

(6) Attachment points to secure the floor pan to the subfloor shall be in the sides, rather than the bottom surface, and be watertight. The floor pan joint at the door opening shall be waterproof to the subfloor.

(7) Floor penetrations shall be avoided, when possible, but where required, sealed to make the joint waterproof and with an appropriate material to prevent flame propagation from underfloor flame sources.

c). Floor Covering

i). A seam-free, skid-resistant rubber floor covering, solid surface material, or approved coating shall be used in the toilet room floor area.

ii). Color and pattern selection shall be approved by Amtrak.

(1) The floor covering shall be coved a minimum 4 in. up the sidewalls to form the inside scuff/kick plate.

(2) The edges shall be sealed to form a watertight seal.

d). Drainage

i). A provision shall be provided for a floor drain in the toilet room pan that shall be reviewed with Amtrak during Design Review.

(1) The floor shall be properly may be sloped toward the drain, preferably located near the toilet and an intumescent device shall be utilized to seal the drain in case of a fire, or alternate approved design.

e). Attachment Strength of Fittings

(1) The fittings in toilet rooms shall meet the attachment strength requirements defined in 49 CFR Part 238.233.

f). CMF

i). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic or thermoset material with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall be inspired by the CMF document (Exhibit F) and meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

ii). Ceiling

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

iii). Flooring

(1) Flooring within the restroom area shall be made from rubber flooring with a friction, no-slip texture.

(2) Flooring will be durable to withstand spills, leaks, and all methods of cleaning. Flooring shall also not become frequently damaged or worn.

(3) Flooring shall have enough give to prevent fatigue from standing.

31.35 Standard Toilet Room (STR)

a). General

i). The STR shall have the ability to be used in two orientations.

ii). A modular design that allows different door positions should provide flexibility for the layout of the interior architecture.

iii). The orientation should always prioritize seats and passenger accommodation numbers where possible, while providing options for better aisle access in other instances.

iv). To the extent possible equipment, parts, and features in the STR shall be identical to equipment, parts, and features in the restrooms for sleeper cabins.

v). The intent of this clause is to minimize spares and maintenance techniques.

b). Key Features

i). A comprehensive list of expected features in the Standard Toilet room is provided in Figure 31-8, and described in detail below.

ii). Detailed functional requirements for each feature are listed below. In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

Figure 31-8: Key Features – Standard Toilet Room

Feature	Short Description	Qty
Restroom Door	Sliding door for entrance into STR	1
Toilet	Assembly including toilet bowl, shroud, and overflow pan	1
Toilet Seat	Assembly including lid and seat for toilet	1
Toilet Flush	Push button flush and automatic flush mechanisms	1
Toilet Paper Dispenser	Protective location for dispensing toilet paper	1
Toilet Seat Cover Dispenser	Protective location for dispensing seat covers	1
Sanitary Waste	Storage location for used feminine hygiene products	1
Sharps Bin	Storage location for used needles and other medical waste	1
Sink	Solid surface sink counter and basin	1
Hand Dryer	Automatic hand dryer and paper towel dispenser	1
Vanity Mirror	Mirror for passengers to look while washing hands	1
Trash	Storage for restroom related trash	1
Grab Handles	49 CFR 38.115 compliant handrails	1
Baby Changing Table	Fold out table for infant diaper care	1
Crew Storage	Locker with square key for dedicated crew storage	1
Coat Hooks	Coat hooks that hold up to 50lbs	2
PEI- Intercom only	Speaker for emergency conversations	1
Emergency Call Button	Buttons in accessible locations that activate PEI	2
Exhaust	Adjustable exhaust grille	1

iii). Restroom Door

(1) The door should open and provide adequate space for a 95th percentile male. Airline style bi-fold and swing doors are an unacceptable solution.

(2) The door should be sealed to prevent leaking water escaping into the internal space of the car.

(3) The door should lock from the inside, with an indicator on the outside showing the door lock status.

(4) The clear width door opening shall be a minimum of 24”.

(5) The door shall be of lightweight construction, consistent with durability and be secured with stainless-steel hinges.

(6) The door shall be free from resonance and rattles when in the closed position when the train is in motion at any permissible speed.

(7) The door frame and attachment of the keeper shall be sufficiently rigid so that it does not flex when the door closes, even if it is slammed; the intention is that this interface does not deteriorate over the life of the car.

(8) Likewise, interior door construction shall incorporate interior stiffening in the area where the lock/ latch is attached to the door, so that the fasteners securing it to the leaf have a solid surface on which to clamp.

(9) The door latch, with a handle on both sides of the door, shall engage automatically when the door moves towards a closed position, but the lock requires definite action to engage.

(10) The door shall remain in the fully closed position at any permissible train speed.

(11) The lock shall be operable, in an emergency, from the outside with a standard Amtrak coach key.

(12) An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

iv). Toilet

(1) An elongated toilet, complete with toilet bowel assembly, shroud, and overflow pan shall be provided in the restroom.

(2) Toilet bowl Assembly

(a) A toilet stand with shroud assembly shall be located in the toilet room. Each restroom shall be equipped with a toilet bowl assembly, encased in the toilet shroud.

(3) Toilet Shroud

(a) The shape of the toilet shroud housing shall locate the toilet seat ergonomically for ease of use and comfort.

(b) Sufficient foot room shall be provided.

(c) When seated, the user's legs shall not contact the shroud.

(d) The toilet shroud shall be constructed of FRP with gel coat color to match the restroom shell or of stainless steel, with brushed finish or approved alternate.

(4) Toilet Overflow Pan

(a) The toilet bowl assembly shall be mounted on a stainless-steel overflow pan, which shall contain flooding should the toilet outlet become blocked or system leak.

(b) The overflow pan shall be watertight with raised edges of ~2 inches height, have the attachment points exterior to the pan, have all exposed edges folded for safety and to provide stiffness, and be equipped with an overflow tube.

v). Toilet Seat

(1) A standard toilet seat and toilet lid shall be provided.

(2) Toilet seat and seat lid should have soft close mechanisms.

(3) A white toilet seat with lid, meeting Amtrak Specification #352, shall be provided.

(4) The toilet seat and cover shall be constructed of reinforced fiberglass or approved alternate.

(5) The lid and seat shall be stable in the up position regardless of train motion, including braking, to prevent it from slamming down suddenly against the shroud.

vi). Toilet Flush Mechanism

(1) A two-button push flush shall be located on the back wall of the restroom above the toilet.

(2) This shall provide standard and eco-flush features for the passenger.

(3) The flush mechanism shall also incorporate an automatic flushing feature when the passenger is done using the toilet.

vii). Toilet Paper Dispenser

(1) A toilet paper dispenser shall be provided adjacent to the toilet.

(2) This dispenser shall protect the toilet paper from getting wet.

viii). Toilet Seat Cover Dispenser

(1) A dispenser for paper toilet seat covers should be located by the toilet.

ix). Sanitary Waste Disposal

(1) A sanitary waste bin shall be provided to the right of the toilet complete with modesty flap. The minimum volume for this bin shall be 7 gallons.

x). Sharps Bin

(1) Provision for a sharps bin should be provided within the room.

(2) The size, position, and method of removal of sharps should be agreed and instructed by Amtrak.

xi). Sink

(1) General

(a) A solid surface sink with hot and cold water faucet shall be provided for passengers.

(b) The sink countertop shall be made from solid surface material and shall include a marine edge, 6” backsplash, and ¾” radius for cleanability.

(c) Note that all sink countertops shall be sloped toward the basin and drain.

(2) Sink Basin

(a) The sink basin shall have minimum internal dimensions of 18" width x 10" length x 5" depth.

(b) The sink shall have a 1/2 to 1 gallon capacity and be equipped with an overflow.

(c) The sink shall be drained through a nominal 1-1/4” diameter drain.

(3) Faucet

(a) The faucet shall be mounted behind the sink.

(b) The faucet shall use IR sensor to control water dispensing.

(c) Water flow from the faucet shall be aligned directly over the drain to not splash the user and/or countertop.

(d) Faucet shall be hardwired for power with a battery backup.

(4) Soap Dispenser

(a) An automatic liquid soap dispenser which will accept a Celeste Industries liquid soap refill shall be installed and shall be located adjacent to the mirror.

(b) Power for the soap dispenser shall be hardwired with a battery backup.

(5) 120V Outlet

(a) A duplex 120VAC GFCI receptacle shall be located on a panel adjacent to the sink, preferably located to keep it dry from splashes from the sink.

xii). Hand Dryer

(1) A high velocity motion-activated hand dryer and a paper towel holder shall be mounted on the wall of near the sink in an easily accessible location.

xiii). Vanity Mirror

(1) A large 41.5” x 23” mirror shall be positioned in front of the sink. The mirror can be split into two sections as necessary.

xiv). Trash

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(1) A trash bin shall be provided under the sink with push flap cover.

(2) The minimum volume of trash for this receptacle shall be 2 cu ft.

(3) The trash flap for this receptacle shall be a minimum of 10” x10”.

xv). Grab Handles

(1) Stainless-steel grab bars shall be provided on one side of the restroom to allow passengers to steady themselves against train motion.

(2) Bars shall be directly secured to car secondary structure or module structure.

(3) These bars shall be anti-slip grab bars in accordance with Subpart F of 49 CFR Part 38.123 (a) (3) shall be provided for passengers to utilize while using the facility.

xvi). Baby Changing Table

(1) A baby-changing table should be provided.

(2) The changing table should be easy to deploy and stow with an intuitive handle. The table shall include a strap to ensure passengers with limited reach can operate the table.

(3) The mechanism should be durable, free from jamming and racking.

(4) The design should meet abuse loads.

(5) It should have a soft opening mechanism.

xvii). Crew Storage

(1) A crew storage cabinet shall be provided at high elevations in the restroom for storage of restroom and cleaning supplies.

xviii). Coat Hooks

(1) Two coat hooks shall be provided on the partition wall. Coat hooks shall be capable of supporting up to 50lbs each.

(2) These hooks are identical to the towel hooks provided in the sleeper cabin.

xix). Emergency Call Button

(1) Two waterproof Emergency Call Buttons shall interface with the Passenger Emergency Intercom (PEI) in the toilet room.

(2) The Emergency Call Buttons are providing better access for passengers if they are not able to reach the PEI unit.

(a) The Emergency Call buttons shall have illuminated and audible indications when actuated.

(b) One Emergency Call button shall be located within easy reach while seated on the toilet and not easily confused with the flush button or other controls.

(c) A second button located within 12 inches from the floor or otherwise reachable for someone who has fallen.

(d) Placement of the buttons is subject to approval during design review.

(3) The PEI in the toilet room shall interface with the Emergency Call Buttons.

(a) The PEI and Emergency Call button arrangement, including the interfaces used between them, must maintain the same safety level and a standalone PEI.

(b) The PEI and Emergency Call Buttons must remain functional under any toilet module degraded mode condition.

(c) See Chapter 14 for additional details.

xx). Exhaust

(1) An exhaust grille shall be provided in the ceiling.

(2) Negative pressure in the restroom shall be provided by the HVAC system.

c). Additional Equipment Requirements

i). HVAC

(1) Supply Air Diffusers

(a) Conditioned air is delivered to the room via 2 supply air diffusers with adjustable air flow control and located on the windowsill of the outside window.

(b) Air vents should take less than 3 lbf to operate and adjust.

(2) Exhaust Grille

(a) Exhaust air is removed from the room via the exhaust air grille which is located at the upper portion of the module.

ii). Outlet

(1) Outlet to be provided within crew storage cabinet for maintenance and cleaning access.

iii). Lighting

(1) General

(a) Lighting general information is shared in the points below.

(b) Detailed lighting information can be found in Chapter 13.

(c) All lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(d) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting Types and Locations

(a) Main Ceiling Light (White Light)

(i) A large rectangular LED panel in the ceiling provides the main source of light for the room.

(b) Compartment Light

(i) Floor Lights

1. Lights shall be provided as indirect lighting that spills out across the floor under the sink counter.

(ii) Sink Lights

1. A wash light should be used to light the sink area indirectly.

2. This light shall only be activated when the door to the restroom is locked.

(iii) Mirror Light

1. A LED light shall illuminate the mirror around the border.

2. This light shall only be activated when the door to the restroom is locked.

iv). Communications

(1) Speaker

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(a) PA speaker shall be located on the central ceiling panel.

(b) The speaker used in this location shall be identical to PA speakers used in other locations in the cars for ease of maintenance and replacement.

(2) All communications equipment shall meet the requirements in Chapter 14.

v). Emergency Equipment

(1) Smoke Detector

(a) Smoke Detectors shall be mounted on the central ceiling panel.

(b) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

vi). Security

(1) Many items within the restroom area will need to be secured.

(2) The following items are identified with specific locking preferences:

(a) Restroom Door Locking Mechanism

(3) Any other locking or security items will be discussed with Amtrak during design reviews.

d). CMF

i). Please refer to the attached CMF document (Exhibit F) for exact color, material, and finishes desired in this restroom area. Please also refer to Chapter 19.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part VIII: Sleeper Cabins

31.36 Accessible Sleeper and Standard Sleeper Cabin General Requirements

a). All sleeper cabins shall be designed and constructed to form a safe and attractive environment.

b). Visible fasteners shall be minimized.

c). Modularity shall be optimized during the design process and the outer walls of the modules shall be developed as a common component where possible.

d). All mounted items in the room shall be secured to the module structure through the use of fully embedded tapping plates when pullout strength or expected weight is greater than 20 lbs.

i). These are expected to last the life of the car without coming loose.

e). Space shall be incorporated, and mounting brackets be provided within the room walls to mount components required to provide functions of the adjustable features in the room, functions of the sink and functions of the toilet, but are preferably not visible.

f). Consistent features shall be maintained across sleeper cabins to the extent possible.

g). The Contractor shall provide a matrix table of interior features for each sleeper cabin and identify which items are repeatable for maintenance and maintainability management.

h). Accessibility requirements for labeling in the restrooms in sleepers from Chapter 26 shall be followed.

i). Please also reference signage from Section 31.6.

j). Noise Cancelling or Sound Proofing

i). Noise cancelling or sound proofing features shall be implemented into the construction of all wall panels for each sleeper cabin.

ii). The noise reduction can come from acoustic dampening panels, foams, or other technology.

iii). The noises from adjoining compartments, hallways, and machinery shall be dampened to at least 65 dBA.

k). Communications Equipment required in each Sleeper Cabin

i). Speaker

(1) PA speaker shall be located on the central ceiling panel.

(2) The PA speaker shall have an associated mute button.

(3) The speaker used in this location shall be identical to PA speakers used in other locations in the cars for ease of maintenance and replacement.

ii). All communications equipment shall meet the requirements in Chapter 14.

l). Emergency Equipment required in each Sleeper Cabin

i). Smoke Detector

(1) Smoke Detectors shall be mounted on the central ceiling panel.

(2) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

m). The accessible sleeper must have a 32” wide accessible path throughout. Where the aisle turns 90°, it should be 44” wide. There must be 60” turning space in vestibules and transition areas.

n). To ensure both accessibility and operational efficiency, the standard sleeper cabin should prioritize the maximization of aisle width while maintaining adequate accommodation sizes for passenger comfort. The minimum allowable aisle width is set at 24 inches, and the contractor shall confirm that this dimension does not impede the removal or maintenance of any installed components.

o). Accessible Sleeper and Standard Sleeper Minimum Accommodations

31.37 Roomette

a). General

i). The roomette provides comfortable daytime seating and night sleeping accommodations for up to two passengers.

ii). In the roomette, two seats face each other and share a window view.

iii). These seats adjust to create a sleeping area for one passenger and an upper berth can be adjusted in position to create a second sleeping space for another passenger.

b). Key Features

i). A comprehensive list of expected features in the Roomette sleeper cabin is provided in Figure 31-17 and described in detail in the subsequent sections referenced in the table.

ii). Detailed functional requirements for each feature are listed below.

c). Attendant Room (Accessible Sleeper and Standard Sleeper)

i). This is essentially a roomette, assigned permanently to the car attendant.

ii). In addition, it also incorporates an attendant call, smoke-fire detection/annunciator, and PEI panel used to identify the site of a passenger requesting service or emergency.

Figure 31-17: Key Features – Roomette

Feature	Short Description	Qty	Reference
General Items			
Standard Sleeper Cabin Door	24” sliding door that includes window, blind and door lock mechanism. Manual Operation	1	
Side Window	Lower window includes emergency egress features, upper window above deployed bunk	1	
Side Window Blinds	A single blind system that provides sunshade and blackout performance	1	
Outlets	Duplex outlets with USB	See Figure	
Master Light Switch	Light switch that can turn on or off all lights in a sleeper room (analog)	2	
Master Thermostat Control	Mechanical Interface control of temperature settings (digital)	1	
Floor Heat	Heating mechanism for room	1	
Standard Grab Bar	49 CFR38.115 compliant handrails	As Needed	
Communications			
Attendant Call Button	LED Button to page Crew	1	
Seating Area / Lower Sleeping Berth			
Sleeper Cabin Seats	Standard Sleeper Cabin Seat includes fold-down features to convert into bed	2	
Sleeper Cabin Armrest	Standard Sleeper Cabin Armrest built into sidewall	1 per seat	
Sleeper Cabin Headboard	Standard Sleeper Cabin includes a firmly cushioned panel behind the seat that serves as a headboard in the berth configuration.	2	
Cup Holder	Cupholders built into side wall	2	
Single Leaf Fold Out Table	Table built into side wall	1	
Upper Sleeping Berth			
Upper Berth	High level sleeping location with retaining straps	1	
Upper Berth Grab Bar	Grab bars/handholds in suitable positions to access upper berth.	As Required	
Upper Berth Steps	two built-in steps to allow access to the upper berth module	1	
Personal Care			
Fold Out Sink	Includes sink basin, faucet, sink open indicator light, and 120 V outlet.	1	
Vanity Cabinet	Small storage cabinet with a mirror on the front.	1	
Vanity Mirror	Mirror with LED light or backlight	1	
Hand soap Dispenser	Location for hand soap installed near vanity	1	
Lotion Bottle	Location for lotion bottle stored near vanity	1	
Towel Ring	Install near sink.	1	
Towel Hook	Two on the partition wall.	2	

Trash			
Seating Area Trash Bin	Tip out small storage for sleeper room trash	1	
Storage			
Cabinet	Storage location for personal items with a door	1	
Open Wardrobe	Open storage location with restraining strap	1	
Coat Hooks	Installed on partition wall	2	
Carryon Luggage Storage	Storage cubby for carryon sized luggage	1	
Under-Seat Storage	Open space for carryon sized luggage	1 per seat	
Storage Cubies	Small open cubbies for storing smaller items at each bed location	min 2	
Upper Room Storage	Storage for a carry-on bag in an area above the aisle or on top of the restroom, accessible from inside the room with a retention bar.	1	

d). Functional Elements

i). Seat to Lower Berth Conversion

(1) A simple unlatch mechanism is required to convert the seats into a lower bed/berth.

(2) This should be positioned in a place that is easy for people to use and designed in a way that people can understand its purpose.

(3) The latch should be free for jamming and free from any finger trap hazards.

(4) Conversion of seats to lower berth shall result in an entirely flat sleeping surface.

(5) The mattress surface should be integral to the back of the seat.

(6) A single seam between the bed surface is acceptable with a single thin topper to finish the bed surface.

(7) There shall be no movement in the lower berth structure under full loading conditions when the lower berth is deployed.

(8) Lower Berth Dimensions: Minimum width 27" x Minimum length 77”

(9) Conversion between seat and berth configuration shall require no more than 10 lbf.

ii). Deploying Upper Berth

(1) The upper berth should be stored horizontally at the maximum height in the room.

(2) When stored, the upper berth should not block any part of the window or window removal in the event of an emergency.

(3) Leading edges should be soft in form to minimize impact to any potential head strike.

(4) The berth's stored height should be maximized so head clearance is at a maximum in both seated and standing positions.

(5) A simple and easy to use handle, latch, and lock mechanism should be within easy reach from a standing position.

(6) Successful locking should be visually indicated, and safety measures should be put in place to prevent accidental deployment and prevent misuse.

(7) The upper berth deployment should lower slowly and in a controlled manner.

(8) Considerations should be made for assisted movement or counterbalances to assist people moving the upper berth down and back up into the stowed position.

(9) Mitigation should be made to avoid finger traps across any mechanism, rails, or support structures.

(10) Upper Berth Dimensions: Minimum width 27" x Minimum length 77”

(11) Deploying or storing the upper berth shall require no more than 10 lbf.

e). Lighting

i). General

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(a) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting controls shall be analog switches.

ii). Lighting Types and Locations

(1) Wall Wash Lights

(a) Wall wash lights for the aisle partition wall and the back walls behind the seats shall be provided along the length of each wall.

(2) LED Panel Spotlights (White Lights)

(a) Two small circular LED light panels shall act as spotlights above the steps to the upper berth.

(b) The frame for the spotlights shall be color matched to the ceiling.

(3) Compartment Lights

(a) Step Light

(i) Step shall have a strip of indirect lighting so that the entire lower step is illuminated.

(b) Under Seat Lights

(i) Under seat lights shall be provided as indirect lighting that spills out across the floor under each seat.

(4) Reading Lights (White Lights)

(a) Upper Reading Lights

(i) Upper reading lights shall be embedded into the ceiling panel above the upper berth.

(ii) These should be two mini panel lights with one light at each end of the bed. Reading light switches should be located next to the reading light.

(b) Lower Reading Lights

(i) Lower reading lights shall be provided at each seated position.

(ii) The light itself shall be adjustable so that the passenger can adjust the direction to position the light over their reading material.

(c) Reading Light Switches

(i) Reading light switches should be located next to the reading light.

31.38 SoloSuite

a). General

i). The SoloSuite is a unique, single passenger compartment that provides enhanced comforts over the roomette.

ii). The SoloSuite includes a seat that converts to a sleeping berth and a working table on the opposing side.

iii). A padded footrest lies under the opposing side that is offset to allow the nesting feature to work with the opposite SoloSuite compartment.

iv). When the seat is converted to 'bed mode', the footrest forms the foot end of the bed.

v). A mirror image SoloSuite is installed adjacent to the SoloSuite compartment.

vi). An additional feature of the SoloSuite compartments shall be the ability to combine two of the SoloSuites for face-to-face discussions but can then be closed for privacy and sleeping privately.

vii). The dividing panels shall be easily opened and stored when the two compartments are twinned but can easily be closed and locked when privacy is desired.

viii). The partition panel shall be attached in a way that prevents one passenger from being able to remove it without the opposing passenger’s permission.

b). Key Features

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

i). A comprehensive list of expected features in the SoloSuite is provided in Figure 31-18 and described in detail in the subsequent sections referenced in the table.

ii). Detailed functional requirements for each feature are listed below.

Figure 31-18: Key Features – SoloSuite

Feature	Short Description	Qty	Reference
General Items			
Standard Sleeper Cabin Door	24” sliding door that includes window, blind and door lock mechanism. (Manual Operation)	1	
Side Window	lower window includes emergency egress features, upper window to match other bedrooms	1	
Side Window Blinds	A single blind system that provides sunshade and blackout performance	2	
Outlets	Duplex outlet with USB.	See Figure xxx	
Master Light Switch	Light switch that can turn on or off all lights in a sleeper room	1	
Master Thermostat Control	Mechanical Interface control of temperature settings (digital)	1	
Floor Heat	Heating mechanism for room	1	
Standard Grab Bar	49 CFR38.115 compliant handrails	As needed	
Communications			
Attendant Call Button	LED Button to page Crew	1	
Seating Area / Lower Sleeping Berth			
Sleeper Cabin Seat	Includes fold down features to convert into bed.	1	
Cabin Arm Rest	Built on both sides of the seat with one built into the side wall	2	
SoloSuite Room Divider	Retractable dividing partition that is lockable between SoloSuites	1	
SoloSuite Central Console	Footbox and central table module	1	
Standard Sleeper Cabin Headboard	Standard Sleeper Cabin includes a firmly cushioned panel behind the seat that serves as a headboard in the berth configuration	1	
SoloSuite Ottoman	Foot rest that converts into portion of bed	1	
SoloSuite Ottoman Table	Table above the ottoman for working	1	
Cup Holder	Cupholders built into side wall	1	
Bottle Holder	Small storage location in carshell side wall	1	
Single Leaf Fold Out Table	Table built into side wall	1	
Personal Care			
Fold Out Sink	Includes sink basin, faucet, soap dispenser, 120 V outlet, sink open indicator light	1	
Sink Vanity Cabinet	Small storage cabinet above the sink, with a mirror on the inside	1	
Sink Vanity Mirror	Mirror with light	1	
Hand soap Dispenser	Location for hand soap installed near vanity	1	
Lotion Bottle	Location for lotion bottle stored near vanity	1	

Towel Ring	Install near sink.	1	
Towel Hook	Installed on partition wall	1	
Trash			
Seating Area Trash Bin	Flip out storage for sleeper room trash	1	
Storage			
Open Wardrobe	Open storage location with restraining strap	1	
Coat Hooks	Installed on partition wall	2	
Carryon Luggage Storage	Storage cubby for carryon sized luggage under Ottoman	1	
Storage Cubies	Small open cubbies for storing smaller items at each bed location	1	
Baggage rack above seat	Storage rack for a carry-on bag to be provided above each seat	1	

c). Functional Elements

i). Seat to Berth Conversion

(1) A simple unlatch mechanism is required to convert the seat into a bed/berth.

(2) This should be positioned in a place that is easy for people to use and designed in a way that people can understand its purpose.

(3) The latch should be free for jamming and free from any finger trap hazards.

(4) Conversion of seat to berth shall result in an entirely flat sleeping surface.

(5) The mattress surface should be integral to the back of the seat.

(6) A single seam between the bed surface is acceptable with a single thin topper will finish the bed surface.

(7) There shall be no movement in the berth structure under full loading conditions when the berth is deployed.

(8) A folding ottoman pad should complete the seat surface between bed and ottoman.

(9) The pad should be independently operated.

(10) Care should be taken in the design and activation to avoid accidental entrapment or mitigate injury through misuse.

(11) The folding ottoman pad and ottoman table leaf should create a space large enough for a passenger to stand and deploy and stow the bed while in the room with the door closed.

(12) Lower Berth Dimensions:

(a) There should be a minimum of 82'' between the two opposite corners account for the tapering bed shape.

(b) There should be a minimum of 22'' between the inside surface of the footbox and any sidewall structure.

(c) There should be a minimum of 77'' bed length.

(d) There should be a minimum of 34'' bed width.

(e) Dimensions and usability will be subject to Amtrak approval at the mockup review.

(13) Conversion between seat and berth configuration shall require 10 (ten) pounds force or less.

ii). Opening Room Divider

(1) As the divider is deployed it must be done with a smooth and gliding motion, with little or no noise.

(2) The deployment of the divider shall be easy to use and be able to be operated safely by passengers independently. Divider operation shall take less than 10 lbf to open/close and the latch/lock shall take less than 5 lbf to operate.

(3) There should be no finger traps or hazards.

(4) When the divider is in its closed position it must provide good sound insulation to the adjoining room and noise levels from the adjoining rooms shall be less than or equal to 65 dBA.

(5) When closed, the divider must be free from rattle and movement and be securely locked in place along all edges.

(6) There should be no light spill from the adjoining room.

(7) The divider shall be installed so that damage from pushing the divider off track and into an opposing SoloSuite is prevented.

d). SoloSuite Room Divider

i). General

(1) The divider must store away neatly into a pocket, wall, or ceiling and not protrude into the room.

(2) When stored the divider must be free from rattle and movement and be securely retained in its stowed position.

(3) The divider must be designed to prevent noise attenuation from one solo suite room to another as if the divider was a solid wall when closed.

(4) The stored divider must not prevent the use of any other of the rooms' features or obscure the window.

ii). Room Divider Dimensions

(1) The room opening created when moving the divider should allow seated passengers to see each other from a seated position.

(2) The opening should be as large as possible so joining rooms feel like a single space.

(3) The opening should be maximized and be a minimum of 35" x 35".

iii). Room Divider Locking Mechanism

(1) The divider must be securely locked in place with a visual indicator on both sides of the room to show that it is locked.

(2) A solution must be found to prevent one passenger opening the divider without the others' permission, such as a double latch.

e). SoloSuite Central Console

i). A central console partition shall be provided to provide a location for footboxes for the facing SoloSuite pairs.

f). Ottoman – SoloSuite

i). A fixed ottoman should be provided inside the SoloSuite foot-box.

ii). A foldable portion of the ottoman should fold up to complete the bed surface and down to provide some standing space when the main part of the bed is deployed.

iii). Cushions for the ottoman shall be supplied and match the comfort and quality of the seat cushions.

iv). The area below the ottoman cushion shall also function as an area for trash storage. Please refer to the flip out trash bin for more information.

g). Ottoman Table

i). The ottoman table should be large enough for face-to-face dining when the seat is tracked forward.

ii). This workstation table shall be 8.5" x 37.5" and include a fold out component to extend the table by 7.5" wide for a total extended measurement of 16" x 37.5".

iii). The folding leaf shall create extra knee and turnover space for sleeping passengers.

iv). The leaf must not interfere with divider mechanism when folded back.

v). The leaf should be easy to deploy and stow with an intuitive handle.

vi). This table shall conform to APTA PR-CS-S-018-13.

h). Lighting

i). General

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(a) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

ii). Lighting Types and Locations

(1) Lighting controls shall be analog switches.

(2) Wash Lights

(a) Wall Wash Lights

(i) Wall wash lights for the partition wall behind the seat shall be provided along the length of each wall.

(b) Ceiling Wash Lights

(i) Central wash lights shall light the ceiling area, illuminating a central ceiling well.

(3) LED Panel Spotlights (White Lights)

(a) Two small circular LED light panels shall act as spotlights above the entry door.

(b) The frame for the spotlights shall be color matched to the ceiling.

(4) Compartment Light

(a) Footbox Lights

(i) The ottoman footbox shall be lit with indirect lighting and shall allow the entire footbox to act as indirect lighting for the room.

(b) Under Ottoman Light

(i) Under Ottoman lights shall be provided as indirect lighting that spills out across the floor under the ottoman area.

(5) Reading Lights (White Lights)

(a) Lower Reading Lights

(i) Lower reading lights shall be provided at each seated position.

(ii) The light itself shall be adjustable so that the passenger can adjust the direction to position the light over their reading material.

(b) Reading Light Switches

(i) Reading light switches should be located next to the reading light.

i). Security

i). Many items within the sleeper cabin area will need to be secured. Unique items for this sleeper cabin type are defined below.

(1) Divider Locking Mechanism

(a) The divider shall be able to be locked by the passenger occupying one of the SoloSuite compartments.

(b) The divider locking mechanism shall be tamper proof from the adjoining SoloSuite side and shall provide the passenger with confidence that their privacy and personal space will be maintained when they have locked their side of the divider.

(c) The divider lock shall have a clear indication of the locked or unlock status of the mechanism.

31.39 Club Bedroom

a). General

i). The Club Bedroom provides comfortable daytime seating and night sleeping accommodations for up to four passengers.

ii). In the Club Bedroom, two double seats face each other and share a window view.

iii). These seats adjust to create a sleeping area for two passengers to share a sleeping space, and an upper berth can be adjusted in position to create a second sleeping space for two additional passengers.

iv). In addition to the seating and sleeping provisions, this accommodation includes a small restroom with a toilet and shower and a separate sink and vanity area.

b). Key Features

i). A comprehensive list of expected features in this type of sleeper cabin is provided in Figure 31-19 and described in detail in the subsequent sections referenced in the table.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

ii). Detailed functional requirements for each feature are listed below.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Figure 31-19: Key Features – Club Bedroom

Feature	Short Description	Qty	Reference
General Items			
Standard Sleeper Cabin Door	24” sliding door that includes window, blind and door lock mechanism. Manual operation.	1	
Standard Sleeper Cabin Restroom Door	door between bedroom and restroom	1	
Side Window	lower window includes emergency egress features, upper window above deployed bunk	1	
Side Window Blinds	A single blind system that provides sunshade and blackout performance	1	
Outlets	Duplex outlets with USB.	See Figure 31-10	
Master Light Switch	Light switch that can turn on or off all lights in a sleeper room (analog)	2	
Master Thermostat Control	Mechanical Interface control of temperature settings (digital)	1	
Floor Heat	Heating mechanism for room	1	
Standard Grab Bars	49 CFR 38.115 compliant handrails	As needed	
Restroom Grab bars	49 CFR 38.123 compliant handrails	As needed	
Communications			
Attendant Call Button	LED Button to page Crew	1	
Seating Area / Lower Sleeping Berth			
Sleeper Cabin Seat	Seat bench suitable for 2 passengers to sit side by side, includes fold down features to convert into bed	2	
Standard Sleeper Cabin Arm Rest	Built into sidewall	1 per side	
Standard Sleeper Cabin Headboard	Includes a firmly cushioned panel behind the seat that serves as a headboard in the berth configuration	2	
Cup Holder	Cupholders built into side wall	2	
Single Leaf Fold Out Table	Table built into side wall	1	
Upper Sleeping Berth			
Upper Berth	High level sleeping location with retaining straps	1	
Upper Berth Grab Bar	Grab bars/handholds in suitable positions to access upper berth. 49 CFR 38.115 compliant handrails	as needed	
Upper Berth Steps	Three built-in steps to allow access to the upper berth module	1	
Personal Care - Vanity Unit			
Solid Surface Sink	Includes sink basin, faucet, soap dispenser, 120 V outlet, towel ring, and lotion bottle	1	
Sink Vanity Cabinet	Small storage cabinet above the sink, with a mirror on the front.	1	
Sink Vanity Mirror	Mirror with boarder LED light or backlight	1	
Handsoap Dispenser	Location for handsoap installed adjacent to the over-sink mirror.	1	
Towel Ring	Install near sink.	1	
Hand Dryer	Automatic hand dryer installed in vanity Cabinet	1	
Towel Hook	Install near vanity	2	

Personal Care - On-suite Restroom			
Rain Shower	Shower head mounted on the ceiling	1	
Adjustable Shower Head	Handheld shower head	1	
Shower Control	Adjustment for water pressure and temperature in the shower	1	
Shower Drain	Drain location for shower	1	
Shower Exhaust	Adjustable exhaust grille	1	
Soap Dish	Storage location for personal soap items in shower	1	
Soap Dispensing Bottles	Refillable soap, conditioner, and lotion bottles mounted on wall	3	
Towel Hook	Installed on partition wall inside restroom	1	
Standard Towel Storage	Elevated towel rack above toilet	1	
Toilet	Assembly including toilet bowl, shroud, and overflow pan	1	
Toilet Seat	Assembly including lid and seat for toilet	1	
Toilet Flush Mechanism	Push button flush and automatic flush mechanisms	1	
Toilet Paper Dispenser	Protective location for dispensing toilet paper	1	
Shower Seat Cover	Additional cover for toilet that converts toilet area into shower seat	1	
Trash			
Trash	Trash bin for restroom and bedroom	1	
Storage			
Open Wardrobe	Open storage location with restraining strap	1	
Coat Hooks	Installed on partition wall and open wardrobe	2	
Under-Seat Storage	Open space for carryon sized luggage	1 per seat	
Storage Cubies	Small open cubbies for storing smaller items at each bed location	4	
Upper Room Storage	Storage for a carry-on bag in an area above the aisle or on top of the restroom, accessible from inside the room with a retention bar.	1	

c). Functional Elements

i). Seat to Lower Berth Conversion

(1) A simple unlatch mechanism is required to convert the seats into a lower bed/berth.

(2) This should be positioned in a place that is easy for people to use and designed in a way that people can understand its purpose.

(3) The latch should be free for jamming and free from any finger trap hazards.

(4) Conversion of seats to lower berth shall result in an entirely flat sleeping surface.

(5) The mattress surface should be integral to the back of the seat.

(6) A single seam between the bed surface is acceptable with a single thin topper will finish the bed surface.

(7) There shall be no movement in the lower berth structure under full loading conditions when the lower berth is deployed.

(8) Lower Berth Dimensions: Minimum width 48" x Minimum length 77”

(9) Conversion between seat and berth configuration shall require 10 (ten) pounds force or less.

ii). Deploying Upper Berth

(1) The upper berth should be stored horizontally at the maximum height in the room.

(2) When stowed, the upper berth should not block any part of the window or window removal in the event of an emergency.

(3) Leading edges should be soft in form to minimize impact to any potential head strike.

(4) The berth's stored height should be maximized so head clearance is at a maximum in both seated and standing positions.

(5) A simple and easy to use handle, latch, and lock mechanism should be within easy reach from a standing position.

(6) Successful locking should be visually indicated, and safety measures should be put in place to prevent accidental deployment and prevent misuse.

(7) The upper berth deployment should be free from jamming and racking and should lower slowly and in a controlled manner.

(8) Considerations should be made for assisted movement or counterbalances to assist people moving the upper berth down and back up into the stored position.

(9) Mitigation should be made to avoid finger traps across any mechanism, rails, or support structures.

(10) Upper Berth Dimensions: Minimum width 48" x Minimum length 77”

(11) Deployment or stowage of the berth shall require 10 (ten) pounds of force or less.

d). Lighting

i). General

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(a) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting controls shall be analog switches.

ii). Lighting Types and Locations

(1) Wash Lights

(a) Wall Wash lights

(i) Wall wash lights for the aisle partition wall and the back walls behind the seats shall be provided along the length of each wall.

(2) LED Panel Spotlights (White Lights)

(a) Two small circular LED light panels shall act as spotlights above the steps to the upper berth and above the open wardrobe.

(b) The frame for the spotlights shall be color matched to the ceiling.

(3) Compartment Light

(a) Step Lights

(i) Step shall have a strip of indirect lighting so that the entire lower step is illuminated.

(b) Under Seat Light

(i) Under seat lights shall be provided as indirect lighting that spills out across the floor under each seat.

(c) Sink Light

(i) A wash light should be used to light the sink area across the width of the vanity unit.

(d) Mirror Light

(i) A LED light shall illuminate the mirror around the border.

(4) Reading Lights (White Lights)

(a) Upper Reading Lights

(i) Upper reading lights shall be embedded into the ceiling panel above the upper berth.

(ii) These should be four mini panel lights with two lights at each end of the bed.

(iii) Reading light switches should be located next to the reading light.

(b) Lower Reading Lights

(i) Lower reading lights shall be provided at each seated position.

(ii) The light itself shall be adjustable so that the passenger can adjust the direction to position the light over their reading material.

(iii) Reading light switches should be located next to the reading light.

(5) Restroom Lighting

(a) Back Wall Wash Light

(i) A back wall wash light shall be mounted to the towel shelf and provide both up and down wall wash lighting.

(b) Spotlight

(i) A LED spotlight shall be located on the ceiling above the toilet and adjacent to the rain shower.

(ii) This shall only activate when the door to the restroom is locked. This shall be a white light.

e). Security

i). Unique items for this sleeper cabin type are defined below.

(1) Restroom Door Locking Mechanism

(a) This locking mechanism shall indicate to other passengers sharing the room that the restroom is occupied.

(b) Additionally, the locking of this door shall activate certain lighting fixtures as explained above.

31.40 Accessible Bedroom

a). General

i). The Accessible Bedroom is a fully accessible room for one passenger who uses a wheeled mobility device and two additional passengers.

ii). The room has three separate sleeping spaces divided into a double lower berth and one upper berth.

iii). To the extent possible without jeopardizing capacity, the accessible space is based on the RVACC recommendations to accommodate larger mobility devices.

iv). The ability to turn around in the room is facilitated by a clear 60” diameter turning circle in day conditions and a 60” diameter turning circle or other ADA compliant maneuver during nighttime conditions.

v). The room has an ensuite restroom that is also fully accessible with a lockable door separating it from the living space and a separate 60” diameter turning circle

vi). Access shall be provided in and out of the room and to the bathroom and shower when the beds are fully deployed.

vii). The Accessible Bedroom should be designed for a 32” side aisle.

viii). All features shall be reached by a person sitting in a wheeled mobility device unless otherwise listed in this section.

ix). Dimensions shall be taken from the Americans with Disabilities Act Accessibility Standards and DOT regulations.

x). The Contractor shall propose a layout that accommodates the listed items below and captures the same level of amenities and finish as the Club Bedroom.

xi). The Contractor shall share conceptual drawings prior to PDR and a detailed layout at the PDR stage for Amtrak approval.

b). Key Features

i). A comprehensive list of expected features in the Accessible Bedroom is provided in Figure 31-20 and described in detail in the subsequent sections referenced in the table.

ii). Detailed functional requirements for each feature are listed below.

Figure 31-20: Key Features – Accessible Bedroom

Feature	Short Description	Qty	Reference
General Items			
Accessible Sleeper Cabin Door	39” sliding door that includes window, blind and door lock mechanism. Automatically operated.	1	
Accessible Sleeper Cabin Door Controls	ADA accessible controls for operating sleeper cabin door	1	
Accessible Sleeper Cabin Restroom Door	36” Sliding two panel automatic door for accessible sleeper restroom	1	
Accessible Sleeper Cabin Restroom Door Controls	ADA accessible controls for operating sleeper cabin restroom door	1	

Side Windows	lower window includes emergency egress features, upper window above deployed bunk	1	
Side Window Blinds	A single blind system that provides sunshade and blackout performance	1	
Outlets	Duplex outlets with USB.	See Figure 31-10	
Master Light Switch	Light switch that can turn on or off all lights in a sleeper room (analog)	2	
Master Thermostat Control	Mechanical Interface control of temperature settings (digital)	1	
Floor Heat	Heating mechanism for room	1	
Standard Grab Bars	49 CFR 38.115 compliant handrails	As needed	
Restroom Grab Bars	49 CFR 38.123 compliant handrails	As needed	
Communications			
Attendant Call Button	LED Button to page Crew	1	
Emergency Call Button	Buttons in accessible locations that activate PEI	2	
PEI - Intercom only	Speaker for emergency conversations	1	
Seating Area / Lower Sleeping Berth			
Sleeper Cabin Seat	Two seat bench Includes fold down features to convert into bed	1	
Tip Up Seat	Wall mounted seat that can fold away when not in use as an RVACC accessible space	1	
Sleeper Cabin Armrest	Built into sidewall - one by sleeper cabin seat and one by tip up seat	2	
Center Armrest	Center armrest between the two seats	1	
Standard Sleeper Cabin Headboard	A firmly cushioned panel behind seat that serves as headboard in berth configuration.	2	
Cup Holder	Cupholders built into side wall and center armrest	2	
Single Leaf Fold Out Table	Table built into side wall.	1	
RVACC accessible space	RVACC accessible space is provided in tip up seat location	1	
Upper Sleeping Berth			
Upper Berth	Includes retaining straps,	1	
Upper Berth Grab Bar	49 CFR 38.115 compliant handrails	As needed	
Upper Berth Ladder	Rigid ladder structure for accessing upper berth in accessible sleeper room	1	
Personal Care - OnSuite Restroom			
Accessible Solid Surface Sink	Solid surface sink counter and basin	1	
Accessible Sink Vanity Cabinet	Storage cabinet in sink area	1	
Sink Vanity Mirror	Mirror with LED light or backlight	1	
Hand soap Dispenser	Base for hand soap installed adjacent to the over-sink mirror.	1	
Towel Ring	Install near sink.	1	
Hand Dryer	Automatic hand dryer and paper towel dispenser	1	
Shower Curtain	Opaque shower curtain that is adjustable	1	

Shower Seat	fold down shower seat platform with access to shower controls and handset	1	
Rain Shower	Shower head mounted on the ceiling	1	
Adjustable Shower Head	Handheld shower head	1	
Accessible Shower Control	Adjustment for water pressure and temperature in the shower within accessible reach range	1	
Shower Drainage	Drain location for shower	1	
Shower Exhaust	Adjustable exhaust grille	1	
Soap Dish	Storage location for personal soap items in shower	1	
Soap Dispensing Bottles	Refillable soap, conditioner, and lotion bottles mounted on wall	3	
Towel Hooks	Installed inside restroom	3	
Standard Towel Storage	Elevated towel rack and storage for towels in vanity unit	1	
Toilet	Assembly including toilet bowl, shroud, and overflow pan	1	
Toilet Seat	Assembly including lid and seat for toilet	1	
Toilet Flush Mechanism	Push button flush and automatic flush mechanisms	1	
Toilet Paper Dispenser	Protective location for dispensing toilet paper	1	
Toilet Seat Cover Dispenser	Protective location for dispensing seat covers	1	
Baby Changing Table	Fold out table for infant diaper care	1	
Trash			
Seating Area Trash	Flip out storage for sleeper room trash	1	
Restroom Trash	Storage for restroom related trash	1	
Sanitary Waste	Storage location for used feminine hygiene products	1	
Sharps Bin	Storage location for used needles and other medical waste	1	
Storage			
Open Wardrobe	Open storage location with restraining strap as accessible height	1	
Coat Hooks	Installed on partition wall, a maximum of 48” from the floor.	3	
Carryon Luggage Storage	Storage cubby for carryon sized luggage at low and accessible position	1	
Under Seat Storage	Open space for carryon sized luggage	1 per seat	
Upper Room Storage	Storage for a carry on bag in an area above seats, accessible from inside the room with a retention bar.	1	
Storage Cubies	Small open cubbies for storing smaller items at each bed location	2	

c). Functional Elements

i). Seat to Lower Berth Conversion

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(1) A simple unlatch mechanism is required to convert the seats into a lower bed/berth.

(2) This should be positioned in a place that is easy for people to use and designed in a way that people can understand its purpose.

(3) The latch should be free for jamming and free from any finger trap hazards.

(4) The position of the latch shall be ADA reach compliant.

(5) Controls and operating mechanisms shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist.

(6) There should be an assisted mechanism making it easy for ADA passengers of any ability to deploy and store the bed self-sufficiently and safely.

(7) Conversion of seats to lower berth shall result in an entirely flat sleeping surface.

(8) The mattress surface should be integral to the back of the seat.

(9) A single seam between the bed surface is acceptable with a single thin topper will finish the bed surface.

(10) There shall be no movement in the lower berth structure under full loading conditions when the lower berth is deployed.

(11) A supplemental cushion shall be permanently mounted at seat level on the partition wall side of the seat below the seat shelf and shall function to expand the length of the bed.

(12) Design of the bed should allow people to sleep in both directions.

(13) Any furnishings set above the bed surface must not present a hazard or head strike when using the bed.

(14) Lower Berth Dimensions: Minimum width 48" x Minimum length 75”

(15) Conversion between seat and berth configuration shall require no more than 10 lbf.

ii). Deploying Upper Berth

(1) The upper berth should be stored horizontally at a suitable height in the room to allow easy deployment of the upper bunk.

(2) When stowed, the upper berth should not block any part of the window or window removal in the event of an emergency.

(3) Leading edges should be soft in form to minimize impact to any potential head strike.

(4) The berth's stored height should be optimized so head clearance is at a maximum in both seated and standing positions.

(5) A simple and easy to use handle, latch, and lock mechanism should be within easy reach from a standing position.

(6) Successful locking should be visually indicated, and safety measures should be put in place to prevent accidental deployment and prevent misuse.

(7) The upper berth deployment should be free from jamming and racking and should lower slowly and in a controlled manner.

(8) Considerations should be made for assisted movement or counterbalances to assist people moving the upper berth down and back up into the stowed position.

(9) Mitigation should be made to avoid finger traps across any mechanism, rails, or support structures.

(10) Upper Berth Dimensions: Minimum width 27” x Minimum length 77”.

(11) Deployment or storage of the berth shall require no more than 10 lbf.

d). Accessibility Features

i). 39” Room Door

(1) Access to the room will be subject to review and mockup user testing. Room doors should be accessed by an automatic sliding door.

(2) The door shall also be able to operate in a manual mode in the event of power loss or malfunction so that the room is not put out of service due to door operation failure.

ii). Handrail Locations

(1) Horizontal Handrails:

(a) ADA compliant horizontal handrails positioned to assist transfer through the sleeper room shall be provided.

(b) The handrail should be positioned to maximize the space between the room features while providing maximum access and support for passengers.

(i) Adjacent to aisle side seat

(ii) Adjacent to window side seat

(iii) On the cabinet near the door threshold

(iv) Adjacent to bed along partition wall and above mattress

(v) Along the underside of the window

(vi) Shower handrail along 3 walls of restroom

(2) Vertical Handrails

(a) ADA compliant vertical handrails positioned to assist transfer through the sleeper room shall be provided.

(b) The handrail should be positioned to maximize the space between the room features while providing maximum access and support for passengers.

(i) Either side of restroom door

(ii) Adjacent to toilet

(iii) Inside restroom adjacent to door

iii). Control Buttons and Locks

(1) Room Door

(a) The controls for the room door must be ADA compliant in position, size, and configuration.

(i) Door Open/Close

(ii) Door Lock

(b) The buttons should be easy and intuitive to use.

(c) An accessible manual lock should be included with an indicator to show lock condition.

(d) The buttons should have visual and haptic feedback.

(e) Dimensions, position, and usability will be subject to Amtrak approval during mockup review:

(i) Note this review will include the disability community input.

(2) Restroom and Shower Room Doors

(a) The controls for the restroom and for the shower door shall have the same features as the room door.

(i) Door Open/Close

(ii) Door Lock

iv). 60” Turning Circle

(1) A clear 60” turning circle should be provided inside the room when the seats are in an upright position.

(2) Turning circle shall be clear when fold out table and tip up seats are deployed.

(3) Alternatively, an ADA T maneuver space shall be available when the bed is deployed.

v). Adjustable Features with Clearances

(1) Tip up seat

(2) Fold out table

(a) Fold out tables should be positioned so when deployed should be clear of an RVAAC accessible space and an ADA accessible space.

vi). Accessible Spaces for Wheeled Mobility Devices

(1) A clear accessible space of 59” x 32”.

(a) This shall be provided inside the room when the seats are in an upright position.

(2) An RVACC accessible space of 59” x 32” shall be provided in each of the following locations:

(a) Beside the bed for storing a wheeled mobility device.

(b) In front of the restroom sink.

(c) Next to the toilet seat for storing a wheeled mobility device.

(d) Next to the shower seat for storing a wheeled mobility device.

e). Lighting

i). General

(1) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(a) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Unlike other sleeper cabins, the points below are not accompanied by a diagram to show approximate lighting locations and types.

(3) Instead, the Contractor shall propose lighting locations at the PDR stage for Amtrak approval.

(4) Lighting controls shall be analog switches.

ii). Lighting Types and Locations

(1) Wall Wash Lights

(a) Wall wash lights for the aisle partition and the back walls behind the seats shall be provided along the length of each wall.

(2) LED Panel Spotlights (White Lights)

(a) Two small circular LED light panels shall act as spotlights near the entrance door.

(b) The frame for the spotlights shall be color matched to the ceiling.

(3) Compartment Lights

(a) Under Seat lights shall be provided as indirect lighting that spills out across the floor under the seat.

(4) Reading Light (White Lights)

(a) Lower reading lights shall be provided at each seated position.

(b) The light itself shall be adjustable so that the passenger can adjust the direction to position the light over their reading material.

(c) Reading light switches should be located next to the reading light.

(d) A corner lamp shall wash indirect light both up and down.

(e) The switch for this light shall be located next to the lamp.

(5) Restroom Lighting

(a) A LED spotlight shall be located on the ceiling above the toilet and adjacent to the rain shower.

(i) This shall only activate when the door to the restroom is locked.

(ii) This light shall be a white only light.

(6) Floor Lights

(a) Lights shall be provided as indirect lighting that spills out across the floor under the sink counter.

(7) Sink Wash Light

(a) A wash light should be used to light the sink area indirectly.

(b) This light shall only be activated when the door to the restroom is locked.

(8) Mirror Light

(a) A rounded LED light shall illuminate the mirror around the boarder.

(b) This light shall only be activated when the door to the restroom is locked.

31.41 Sleeper Cabin Communal Restrooms

a). The restrooms for sleeper cabin passengers shall be identical in every way to the STR restrooms in coach. See Section 31.36 and Chapter 11.

31.42 Sleeper Cabin Communal Showers

a). General

i). To the extent possible equipment, parts, and features in the shower shall be identical to equipment, parts, and features in the showers for sleeper cabins.

(1) The intent of this clause is to minimize spares and maintenance techniques.

ii). The general requirements for a restroom included in Section 31.35 apply to this section as well.

iii). Modular Design

(1) The shower shall have the ability to be used in other orientations provided that the same amenities are provided within a similar footprint.

(2) A modular design that allows different door positions should provide flexibility for the layout of the interior architecture.

(3) The orientation should always prioritize passenger accommodation numbers where possible, while providing options for better aisle access in other instances.

b). Key Features

i). A comprehensive list of expected features in the sleeper cabin showers is provided in Figure 31-21 and described in detail below.

Figure 31-21: Key Features – Sleeper Cabin Shower

Feature	Short Description	Qty	Reference
General Items			
Standard Cabin Room Door	Sliding door into Shower room	1	
Restroom Grab Bars	49 CFR 38.115 compliant handrails	2	
Communications			
Emergency Call Button	Buttons in accessible locations that activate PEI	2	
PEI - Intercom only	Speaker for emergency conversations	1	
Personal Care - Changing Area			
Changing Area	Dry location within shower room of a suitable size for getting dressed	1	
Changing Area Bench	Seating platform in changing area for getting dressed	1	
Changing Area Mirror	full length mirror	1	
Solid Surface Sink	Includes sink basin, faucet	1	
Sink Vanity Cabinet	Storage cabinet above the sink, with a mirror on the front.	1	
Sink Vanity Mirror	Mirror with boarder LED light or backlight	1	
Sink Outlet	120V GFCI outlet near sink	1	
Handsoap Dispenser	Location for handsoap installed adjacent to the over-sink mirror.	1	
Towel Ring	Install near shower door	1	
Under Sink Cover	Access cover panel for sink piping	1	
High-Capacity Bath Towel Storage	Storage cabinet with door	1	
High-Capacity Towel Bin	Open bin for used towels	1	
Towel Hooks	Inside the shower for hanging wash cloths or wash bags	2	
Hand Dryer	Automatic hand dryer and paper towel dispenser	1	
Personal Care - Shower Area			
Shower Door	Safety glass door for entrance into shower (Bifold doors are prohibited)	1	
Fixed Glass Shower Panel	Safety glass panel	1	
Shower Seat	Fixed Seating platform in shower	1	
Rain Shower	Shower head mounted on the ceiling	1	
Adjustable Shower Head	Handheld shower head	1	
Shower Control	Adjustment for water pressure and temperature in the shower	1	
Shower Drain	Drain location for shower	1	
Shower Exhaust	Adjustable exhaust grille	1	
Soap Dish	Storage location for personal soap items in shower	1	
Soap Dispensing Bottles	Refillable soap, conditioner, and lotion bottles mounted on wall	3	
Trash			
Sleeper Cabin Trash	Storage for shower room trash	1	
Storage			
Restroom Crew Storage	Locker with square key for dedicated crew storage	1	
Coat Hooks	Installed on the partition wall	2	

c). Fixed Glass Shower Panel

i). Applicability: Sleeper Cabin Showers

ii). A fixed glazed panel made from safety glass should be used to keep the shower space open and bright.

iii). The lower portion can be solid to provide structure for the cantilever benches.

d). Shower Door

i). Applicability: Sleeper Cabin Showers

ii). The shower door shall be made from safety glass.

iii). Sleeper Cabin Showers:

(1) The door should be sealed to prevent shower water escaping into the changing space of the room, even when water is sprayed directly onto the back surface of the door.

e). Towel Storage – High-Capacity Bath Towels

i). A cupboard for storing a minimum of 15 clean Amtrak bath towels shall be provided.

f). Towel Storage – High-Capacity Hand Towels

i). Space should be provided on the vanity unit to stack hand towels and wash cloths.

g). High-Capacity Towel Bin

i). The space under the sink should be maximized for storing used towels with a minimum volume of 30 Gal.

ii). The bin should be lined, prevent water ingress and buildup of mold.

h). Changing Area

i). The standing changing area in front of the changing bench should be a minimum of 24” x 30”.

i). Changing Area Bench

i). A cantilevered bench should be provided in the changing area with space kept free under the seat for a bag.

ii). The bench should have a minimum depth of 11.5” running the full width of the changing area.

j). Changing Area Mirror

i). A mirror constructed from safety glass shall be located above the changing bench.

ii). The mirror on the front of the vanity unit should extend higher as a separate panel suitable for people to see their reflection while standing.

iii). The mirror area should be suitably lit, and two concepts shall be presented at PDR, lighted perimeter and backlighted mirror.

(1) Amtrak shall give guidance at the PDR and Mockup review for final mirror configuration.

k). Additional Equipment Requirements

i). HVAC

(1) Supply Air Diffusers

(a) Conditioned air is delivered to the room via two (2) supply air diffusers with adjustable air flow control and located on the windowsill of the outside window.

(2) Exhaust Grille

(a) Exhaust air is removed from the room via the exhaust air grille which is located at the upper portion of the module.

ii). Electrical

(1) Detailed electrical requirements can be found in Chapter 15.

(2) Outlets

(a) Outlet to be provided near the crew storage and the sink.

iii). Lighting

(1) General

(a) General lighting information is described below. Detailed lighting information can be found in Chapter 13.

(b) All lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(c) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting Types and Locations

(a) Wall Wash Light

(i) Changing Area Wall

1. Indirect light on the back wall shall be provided.

2. This shall be activated only when the door is locked from the inside.

(b) Main Ceiling Light (White Light)

(i) A large rectangular LED panel in the ceiling provides the main source of light for the room.

(c) Spotlight (White Lights)

(i) Small circular LED light panels act as spotlights to provide the master lighting conditions for this room - frame to be color matched.

(ii) At least one in the changing area and at least one in the shower enclosure.

(iii) Position, number, and style to be approved by Amtrak during the design review process.

(d) Compartment Light

(i) Floor Light

1. Lights shall be provided as indirect lighting that spills out across the floor under the sink counter.

(ii) Sink Light

1. A wash light should be used to light the sink area indirectly. This light shall only be activated when the door to the restroom is locked.

(iii) Mirror

1. A rounded LED light shall illuminate the mirror around the boarder.

2. This light shall only be activated when the door to the restroom is locked.

iv). Communications

(1) Speaker

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(a) PA speaker shall be located on the central ceiling panel.

(b) The speaker used in this location shall be identical to PA speakers used in other locations in the cars for ease of maintenance and replacement.

(c) All communications equipment shall meet the requirements in Chapter 14.

v). Emergency Equipment

(1) Smoke Detector

(a) Smoke Detectors shall be mounted on the central ceiling panel.

(b) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

(2) Security

(a) Many items within the coach area will need to be secured.

(b) The following items are identified with specific locking preferences.

(c) Any other locking or security items will be discussed with Amtrak during design reviews.

(i) Shower Door Locking Mechanism

31.43 Sleeper Cabin CMF

a). Please refer to Chapter 19 and Exhibit F for more information.

b). Wall Panels

i). Sidewall Panels along the carshell wall shall be made from molded thermoplastic with an easy to clean surface finish.

ii). Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

iii). The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iv). Noise cancelling or sound proofing features shall be implemented into the construction of all wall panels for each sleeper cabin.

v). The noise reduction can come from acoustic dampening panels, foams, or other technology.

vi). The noises from adjoining compartments, hallways, and machinery shall be dampened to at least 65 dBA.

c). Ceilings

i). Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

ii). The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iii). The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

d). Flooring

i). Flooring within the sleeper cabin shall be made from carpet.

ii). Flooring will be durable to withstand spills, leaks, and all methods of cleaning. Flooring shall also not become frequently damaged or worn.

iii). Flooring shall have enough give to prevent fatigue from standing.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Part IX: Sleeper Cabin Key Features

31.44 Sleeper Cabin Key Features – General

a). Available space shall be optimized for passenger comfort and utility where possible. This includes integrating storage pockets, bottle holders, and other methods to maximize passenger spaces.

b). Cabin Door – Standard Sleeper Cabin

i). Applicability: Roomette, SoloSuite, Club Bedroom and Shower Room

ii). Sliding Door

(1) A sliding door shall be provided for access to the room.

(2) The door shall not rattle and shall allow smooth sliding operation.

(3) Measures should be made to prevent any delamination of finish and surface finish protected by runners or guides.

(4) The door should be free from jamming.

(5) Door shall be manually operated.

(6) Clear Opening dimension of the door shall be maximized and shall not be less than 24” wide.

iii). Sliding Door Window

(1) Windows shall be included in the cabin doors to provide natural light and enhance the spaciousness of the room.

(2) Windows shall be made of safety glass, each ¼” thick.

(3) They shall have a minimum width of 21” and shall be long enough that the lower portion of the window is not more than 18” from the floor.

(4) The door window shall be removable from either side using a pry-out rubber zip strip as an emergency escape route should the door be jammed closed.

iv). Sliding Door Window Blind

(1) An integrated blackout blind for the window in the door shall be provided.

(2) The blind shall be manually operated by the passenger.

(3) Blinds shall be able to be replaced within a 30 min timespan.

v). Sliding Door Lock

(1) Electronic Lock

(a) An electronic door locking mechanism shall be implemented into the door.

(b) This locking mechanism shall default to the unlocked position with loss of power as a safety feature.

(2) Manual Lock

(a) Additionally, an accessible, stainless-steel, manual lock shall be mounted to the inside of the sliding door with an indicator to show lock condition.

(b) The lock shall engage with a stainless-steel mechanism in the partition wall of the sleeper cabin.

vi). Sliding Door Handle

(1) Stainless-steel door handles shall be provided in the sliding door.

(2) They shall be positioned to slide door easily from a standing position for a 5th percentile female and a 95th percentile male.

(3) The door handle shall be recessed into the door.

c). Accessible Cabin Door

i). Applicability: Accessible Bedroom

ii). The Accessible Sleeper Cabin Door shall meet all requirements of the Standard Sleeper Cabin Door, except for the following:

(1) Door Operating Mode: Automatic with manual back up

(2) Clear Opening shall not be less than 39” wide.

d). Accessible Cabin Door Controls

i). Applicability: Accessible Bedroom

ii). The controls for the room door must be ADA compliant in position, size, and configuration.

(1) Door Open/Close

(2) Door Lock

iii). The buttons should be easy and intuitive to use.

iv). An accessible manual lock should be included with an indicator to show lock condition.

v). The buttons should have visual and haptic feedback.

vi). Dimensions, position, and usability will be subject to Amtrak approval during mockup review.

(1) Note this review will include the disability community input.

e). Cabin Restroom Door – Standard Sleeper

i). Applicability: Club Bedroom

ii). The door should be sealed to prevent shower water escaping into the internal living space of the room, even when water is sprayed directly onto the back surface of the door.

iii). To keep the room carpet dry, a “water deflector” shall be provided on the inside of the door at the bottom to direct any water running down the door into the floor drain, rather than onto the threshold.

iv). The door should lock from the inside, with an indicator on the outside showing the door lock status.

(1) Sleeper Cabin Shower: An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

v). The clear width door opening shall be a minimum of 24”.

vi). The door shall be of lightweight construction, consistent with durability and consistent appearance with the shower module and be secured with stainless-steel hinges.

vii). The door shall be free from resonance and rattles when in the closed position when the train is in motion at any permissible speed.

viii). The door frame and attachment of the keeper shall be sufficiently rigid so that it does not flex when the door closes, even if it is slammed; the intention is that this interface does not deteriorate over the life of the car.

ix). Likewise, interior door construction shall incorporate interior stiffening in the area where the lock/ latch is attached to the door, so that the fasteners securing it to the leaf have a solid surface on which to clamp.

x). The door latch, with a handle on both sides of the door, shall engage automatically when the door moves towards a closed position, but the lock requires definite action to engage.

xi). The door shall remain in the fully closed position at any permissible train speed.

xii). The lock shall be operable, in an emergency, from the outside with a standard Amtrak coach key.

xiii). An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

xiv). A grille in the door shall provide a path for ventilation air to enter the room, and flush odors before being exhausted to the car's exterior.

f). Accessible Restroom / Shower Room Door – Accessible Sleeper Cabin

i). Applicability: Accessible Bedroom

ii). The Accessible Sleeper Cabin Restroom Door shall be an automatic sliding door; this can be achieved with two leaves.

iii). The door shall operate in manual mode as well so that the event of power loss does not prevent the use of the restroom.

iv). The door shall be positioned to create space for a T-maneuver when the door is open and the bed is deployed.

v). The clear width door opening shall be a minimum of 36".

vi). The door should be sealed to prevent shower water escaping into the internal living space of the room, even when water is sprayed directly onto the back surface of the door.

vii). To keep the room carpet dry, a "water deflector" shall be provided on the inside of the door at the bottom to direct any water running down the door into the floor drain, rather than onto the threshold.

viii). The door should lock from the inside, with an indicator on the outside showing the door lock status.

(1) Sleeper Cabin Shower: An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

ix). The door shall be of lightweight construction, consistent with durability and consistent appearance with the shower module and be secured with stainless-steel hinges.

x). The door shall be free from resonance and rattles when in the closed position when the train is in motion at any permissible speed.

xi). The door frame and attachment of the keeper shall be sufficiently rigid so that it does not flex when the door closes, even if it is slammed; the intention is that this interface does not deteriorate over the life of the car.

xii). Likewise, interior door construction shall incorporate interior stiffening in the area where the lock/ latch is attached to the door, so that the fasteners securing it to the leaf have a solid surface on which to clamp.

xiii). The door latch, with a handle on both sides of the door, shall engage automatically when the door moves towards a closed position, but the lock requires definite action to engage.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

xiv). The door shall remain in the fully closed position at any permissible train speed.

xv). The lock shall be operable, in an emergency, from the outside with a standard Amtrak coach key.

xvi). An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

xvii). A grille in the door shall provide a path for ventilation air to enter the room, and flush odors before being exhausted to the car's exterior.

g). Accessible Restroom/ Shower Room Door Controls – Accessible Sleeper Cabin

i). Applicability: Accessible Bedroom

ii). The controls for the restroom door must be ADA compliant in position, size, and configuration.

(1) Door Open/Close

(2) Door Lock

iii). The buttons should be easy and intuitive to use.

iv). An accessible manual lock should be included with an indicator to show lock condition.

v). The buttons should have visual and haptic feedback.

vi). Dimensions, position, and usability will be subject to Amtrak approval.

(1) Note this review will include the disability community input.

h). Side Window

i). Applicability: All sleeper cabins

ii). Each window shall be an emergency exit window and rescue access window complying with 49 CFR 238.113 and 238.114.

iii). Windows in all sleeper cabins shall be of the same size, except for the windows in the SoloSuite.

iv). SoloSuite windows shall be smaller than those in the other sleeper cabins as the SoloSuite has a smaller length along the carshell wall.

v). Sleeper Bedrooms shall include a side window that functions as an emergency exit and rescue access window. When deployed, the bunk shall not obstruct any portion of this window or prevent its operation or removal in an emergency.

vi). A secondary window of the same width shall be provided above the deployed upper bunk, to provide light and views for passengers in upper bunk positions.

i). Side Window Blinds

i). Applicability: All sleeper cabins

ii). Side window blinds shall meet the requirements of Section 31.15.

j). Outlets

i). Applicability: All sleeper cabins, and Sleeper Cabin Showers

ii). There shall be a minimum number of duplex outlets in each cabin, as shown in Figure 31-22. This shall include:

(1) Seat Outlets

(a) Two duplex outlets with two USB sockets shall be provided for each seated passenger.

(b) The outlets shall be located above the armrest height and in easy reach of people while seated.

(2) Partition Wall Outlets

(a) Two duplex outlets with two USB sockets shall be provided on the aisle partition wall near the vanity.

(3) Sink Outlet

(a) A duplex 120VAC GFCI receptacle shall be located on a panel adjacent to the sink, preferably located to keep it dry from splashes from the sink.

(4) Upper Bunk Outlets

(a) In rooms with upper bunks, one duplex outlet with two USB sockets shall be provided in the upper bunk cubbies.

Figure 31-22: Minimum Outlets by Cabin Type

Cabin Type	Duplex w/USB at Seat	Duplex w/USB at Partition	120VAC GFCI at Sink	Minimum Outlets
Roomette	2	2	1	**5**
SoloSuite	1	1	1	**3**
Club Bedroom	2	2	1	**5**
Accessible Bedroom	3	3	1	**7**

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Sleeper Cabin Showers			1	**1**

k). Master Light Switch(es)

i). Applicability: All sleeper cabins

ii). Master light switches shall be supplied at the following two locations near the door:

(1) At standing height

(2) At upper berth reach height

iii). The master light switches shall default to turn on a preset lighting condition and turn off all lights.

iv). All master light switches shall be analog.

l). Master Thermostat Control

i). Applicability: All sleeper cabins

ii). A digital mechanical method of controlling the room temperature shall be mounted to the wall.

m). Floor Heat

i). Applicability: All sleeper cabins

ii). Floor heating elements shall be provided as specified in Chapter 10.

n). Grab Bars – Standard

i). Applicability: All sleeper cabins

ii). Grab bar(s) shall be provided for a standing passenger to steady themself against train motion.

iii). Bars shall be directly secured to car secondary structure or module structure.

iv). Grab bar shall meet the requirements in 49 CFR 38.115.

v). Grab bar positioning shall be subject to mockup testing and Amtrak approval.

o). Grab Bars – Restroom

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). Stainless steel grab bars shall be provided on one side of the restroom to allow passengers to steady themselves against train motion while using the facility.

iii). Bars shall be directly secured to car secondary structure or module structure.

iv). These bars shall be anti-slip grab bars in accordance with Subpart F of 49 CFR Part 38.123 (a) (3).

v). Grab bar positioning shall be subject to mockup testing and Amtrak approval.

31.45 Sleeper Cabin Key Features – Communications

a). Passenger Information Screen (PIS/OTIS)

i). Space should be provided for an additional passenger information screen in all accessible rooms.

ii). Electrical, diagnostic, and mechanical interfaces shall be provided to this area regardless of Amtrak's decision to provide a screen at this location.

iii). The screen provided shall be a minimum of 21".

b). Attendant Call Button

i). Button in the room used to page the service attendant in non-emergency uses.

c). Emergency Call Button

i). Two waterproof Emergency Call Buttons shall interface with the Passenger Emergency Intercom (PEI) in the toilet room.

ii). The Emergency Call Buttons provide better access for passengers if they are not able to reach the PEI unit.

(1) The Emergency Call buttons shall have illuminated and audible indications when actuated.

(2) One Emergency Call button shall be located within easy reach while seated on the toilet and not easily confused with the flush button or other controls

(3) A second button located within 12 inches from the floor or otherwise reachable for someone who has fallen.

(4) Placement of the buttons is subject to approval during design review.

d). Passenger Emergency Intercom (PEI)

i). The PEI in the toilet room shall interface with the Emergency Call Buttons.

ii). The PEI and Emergency Call button arrangement, including the interfaces used between them, must maintain the same safety level and a standalone PEI.

iii). The PEI and Emergency Call Buttons must remain functional under any toilet module degraded mode condition.

iv). See Chapter 14 for additional details.

31.46 Sleeper Cabin Key Features – Seating Area / Lower Sleeping Berth / Bed

a). Seats – Standard Sleeper Cabin

i). Applicability

(1) This shall be used in all sleeper cabins. This includes the: Roomette, SoloSuite, Club Bedroom, Accessible Bedroom.

ii). General

(1) Seats shall be optimized with strong consideration for safety, comfort, and longevity.

(2) Attachment of the seats shall meet requirements of APTA SS-C&S-016.

(3) Seats shall be mounted so that they can be readily removed for maintenance and/ or overhaul.

(4) Seats shall be subject to full design review and testing, in accordance with the seat specification.

(5) The design will be subject to Amtrak approval.

(a) All seat dimensions, cushion shore hardness will be subject to mockup review and approval of Amtrak.

(6) Space under the seats should be easy to clean and maintain.

iii). Seat

(1) The Contractor shall install adjustable reclining sleeper seat(s).

(2) When folded down, the seat becomes the lower berth.

(3) The conversion between the seat and the berth shall require 10 (ten) pounds of force or less.

(4) The seat shall be optimized to fill the available space with strong consideration for safety, comfort, and longevity.

(5) In accessible cabins the seat shall also be optimized to maximize clear floor area, aid wheeled mobility device transfer and facilitate an accessible and self-sufficient bed deployment.

(6) The seat shall be supported from the side wall sleeper seat rail via a seat bracket on the outboard end and a suitable bracket attached to the floor structure on the inboard end.

iv). Dimensions

(1) Dimension of seats (between inside surface of armrests), cushions and headrests vary by car type, as shown in Figure 31-23.

Figure 31-23: Standard Sleeper Cabin Seat Widths

Sleeper Cabin Type	Minimum Seat Width*
Roomette	26”
SoloSuite	34”
Club Bedroom	48”
Accessible Bedroom	28” per person
* Width between inside surfaces of armrests/side pads.	

v). Seat Movement

(1) Applicability: SoloSuite

(a) Seat shall track forward so customers can utilize the large central console table.

(b) The result will provide some recline for the seat.

(2) Applicability: Accessible Bedroom

(a) The seat height shall be 18”-19” from the floor.

(b) When folded down to the lower berth position, the bed height from the top of the mattress shall be 22”-23” from the floor.

vi). Seat Pan

(1) Applicability: SoloSuite

(a) The seat pan should be profiled to maintain ingress and egress clearance (chamfered edge).

(b) This is a high wearing area of the seat surfaces in this area should be suitably designed to be durable and free from snagging or entrapment.

vii). Headrest

(1) Seat headrest should be adjustable in height for the span of seated passenger heights from the 95th percentile male to the 5th percentile female.

(2) The headrest shall have adjustable wings that fold outwards to adjust the width of the headrest while also providing lateral support for the head while resting and sleeping in an upright seated position.

(3) Headrest dimensions shall match those of the associated seat.

viii). Cushions

(1) Seat cushions should be contoured to aid seat comfort.

(2) Seat cushions shall provide ergonomic support in the following locations:

(a) lumbar,

(b) side bolsters,

(c) back support,

(d) seat back and

(e) seat pan pillowing.

(3) Dimensions shall match those of the associated seat.

(4) Cushioning, seat trim, and detailing will be evaluated during the design review process.

(5) Final seat configuration and comfort shall be subject to Amtrak approval based on documentation and mockup information presented by the Contractor.

ix). Side Pad

(1) A soft seat side pad shall be located on the inside side of the seat (opposite the window-side armrest) to:

(a) balance the seat

(b) cushion the inside edge to soften joining panel work

(c) create a soft finish bumper around the bed when deployed.

(2) The side pad shall be provided on all Standard Sleeper Cabin Seats, with the exception of those in the SoloSuite which shall instead have a second armrest.

b). Seats – Tip Up

i). Applicability: Accessible Bedroom

ii). Tip up seat should fold up flush with the side wall to provide a clear and unobstructed space for wheeled mobility devices.

iii). Spaces when folded should be durable and suitable to back a wheeled mobility device against.

iv). When deployed the seat should reveal a soft cushioned seat back and headrest so when deployed it should have similar comfort levels as the other seats in the room.

v). The seat should be positioned to have good access to the fold-out table with a minimum seat width of 21” and minimum seat pan depth of 19”.

c). Armrest – Standard Sleeper Cabin

i). Applicability: This shall be used in all sleeper cabins. This includes the: Roomette, SoloSuite, Club Bedroom, Accessible Bedroom

ii). A full and cushioned armrest of 3.5” width shall be provided on the window side.

iii). The armrest should be of a suitable length for a 5th percentile female and a 95th percentile male seated passenger to rest their forearm on the cushioned section.

iv). It is acceptable for the armrest to be integrated or wrap over a sidewall shelf.

v). In SoloSuite Only: An armrest shall be provided on both sides of the seat as this seat does not have a side pad.

d). Armrest – Center

i). Applicability: Accessible Bedroom

ii). An additional full and cushioned armrest of 8” minimum should be provided between the two seats.

iii). The armrest should be of a suitable length for seated passengers to rest their forearm on the cushioned section.

iv). The armrest should be provision for two cup holders.

(1) The through hole diameter should be a minimum of 3.5”.

(2) The cup holders and surrounding area should be hardwearing and spill proof.

e). Headboard – Standard Sleeper Cabin

i). Applicability: This shall be used in all sleeper cabins. This includes the: Roomette, SoloSuite, Club Bedroom, Accessible Bedroom.

ii). The armrest and seat side pad should continue and connect to form a thin, soft headboard around the back of the seat when the bed for the lower berth is down.

iii). In SoloSuite Only: The headboard shall be the same as the standard headboard except that it shall be formed by two armrests rather than an armrest and a sidepad.

f). Cup Holder

i). Applicability: All sleeper cabins

ii). Cup holders shall be accessible from a seated positioning, easy to deploy, and intuitive to use.

iii). Cup holders should be able to fold out when in use and fold away discreetly.

iv). They should be made from stainless-steel, be self-supporting, and structurally sound.

v). The through hole diameter should be a minimum of 3.5” and with a landing area for the cup to sit of at least 4”.

g). Fold Out Table – Single Leaf

i). Applicability: This shall be used in all sleeper cabins except the Crew Sleeper Cabin.

ii). This includes the: Roomette, SoloSuite, Club Bedroom, and Accessible Bedroom.

iii). Table height should provide adequate knee clearance for seated passengers.

iv). The height from the floor to the surface of the table shall be between 27” and 29”.

v). The table should be easy to deploy and stow with an intuitive handle.

vi). The table shall slide out to rest in a position that is usable from the seated position.

vii). The table in its stored position should not prevent the conversion of the seat to a bed or impact bed length.

viii). A single leaf table shall be stored and deployed from the side wall.

ix). The table shall support a 50lbf point load on the end of the table without damage.

x). Fold out table in the Accessible Bedroom shall allow for passenger(s) in a wheeled mobility device to adequately access the table.

xi). Table dimensions vary by sideboard, as listed in

xii). Figure 31-24.

xiii). Each table shall operate independently of the other.

Figure 31-24: Single Leaf Fold Out Table Dimensions

Sleeper Cabin Type	Minimum Usable Surface	Extends from Sidewall
Roomette	18" x 18"	20"
SoloSuite	12.5” x 22”	24”
Club Bedroom	18" x 26"	28"
Accessible Bedroom	18” x 26"	28”

31.47 Sleeper Cabin Key Features – Upper Sleeping Berth

a). Upper Berth

i). Applicability: Roomette, Club Bedroom, Accessible Bedroom.

ii). A pull-down upper berth with safety restraint shall be provided. The upper berth shall latch into the stored position and also be able to latch into the deployed position.

iii). This berth shall be stored in the horizontal position against the ceiling lining and shall be pulled down along a wall-mounted, stainless-steel track to be used as a sleeping berth.

iv). The berth height when deployed will be evaluated and judged carefully during the design review process.

v). The distance between the top of the mattress surface and the underside of the ceiling should be a minimum of 24”.

vi). The seated area below the berth should still be usable by seated passengers when the upper berth is deployed.

vii). While restricted access to the area is expected, the area should still be well lit and tables and other amenities should not be restricted by a deployed berth bed.

viii). The access to the upper berth should be free from obstructions and snagging points to allow a person to climb onto the upper bunk freely and safely.

ix). There should be a minimum distance of 14” between the side of the bunk when deployed and the outer wall of the room to allow a clear route to the upper bunk.

x). Key dimensions and access to the upper berth will be subject to mockup testing and Amtrak approval.

xi). Upper berth restraint straps, that engage with the upper berth and the ceiling restraint shall be attached to module structure for strength.

xii). These should retract into the ceiling and be easily pulled down and click into place using an automatic locking retractor belt system (similar to a car seat belt system).

xiii). The upper berth shall be counter-balanced so that the total force to deploy or stow the berth shall be no more than 10 lbf to operate

xiv). The berth shall be subject to full design review and testing at the mockup review.

b). Upper Berth Grab Bar

i). Applicability: Roomette, Club Bedroom, Accessible Bedroom

ii). An upper berth grab bar, secured to module structure, shall be provided as a grab point for steadying passengers entering/exiting the upper berth.

iii). Grab bar positioning will be subject to mockup testing and Amtrak approval.

iv). Grab bar shall meet the requirements in 49 CFR 38.115.

c). Upper Berth Steps

i). Applicability: Roomette, Club Bedroom

ii). Built-in steps shall be provided to allow passengers to enter/ exit the upper berth.

iii). Integrated steps should be built into the area beside the seat to allow people to safely transit to the upper berth.

(1) Roomette shall have at least two (2) steps.

(2) Club Bedroom shall have at least three (3) steps.

iv). Step surfaces shall be free from trip hazards and have an anti-slip finish to the tread surfaces.

v). Steps shall be designed in such a way that the seat cushions, armrests, or any soft furnishings are protected and clear of tread surfaces.

vi). Design of this function shall be part of the mockup and be part of the preliminary design review.

d). Upper Berth Ladder

i). Applicability: Accessible Bedroom

ii). The ladder shall be provided with an identified storage location.

iii). It should be durable and lightweight.

iv). It should not have any sharp corners or edges.

v). It must be intuitive to use and locate.

vi). The fixation method should be robust and easy to lock and unlock.

vii). Successful locking should be visually indicated, and safety measures should be put in place to prevent accidental unlatching and prevent misuse.

viii). The ladder should be usable in multiple positions based on user specific needs and preference.

ix). Each step should clearly contrast the floor and it should also have integrated battery powered lights for safe use during low level light conditions.

31.48 Sleeper Cabin Key Features – Personal Care

a). Sink – Fold Out Style

i). Applicability: Roomette and SoloSuite.

ii). General

(1) A fold-down Solid Surface Material sink with hot and cold water shall be provided for roomette and SoloSuite passengers.

(2) The retractable pins on which the sink pivots shall engage stainless steel “keepers”, securely fastened to the recess housing, and remain secure for the life of the car.

(3) When not in use, the sink shall be retained in the up position through the use of an approved ¼ turn tab-type latch, pressing against a metal area of the sink.

(4) An easy to clean, captive stainless-steel screen shall be provided over the sink drain cavity behind/ below the sink to catch items that might be inadvertently left on the sink surface before closing and would otherwise be lost down the drain.

(5) The design of the sink hinge shall allow removal of the sink and its re-installation to be done in a maximum of one minute.

(6) The ability to do this, as well as interchangeability of 3 replacement sinks shall be demonstrated in room FAI.

iii). Fold Out Sink Basin

(1) The sink basin shall have the minimum internal dimensions shown in Figure 31-25.

(a) The sink shall be lipped to prevent splashing from train motion.

(b) The sink shall have a 1/2 to 1 gallon capacity, be equipped with an overflow and shall be easily removable, without tools, for cleaning.

(c) The sink is drained through a nominal 1-1/4” diameter drain by the user by closing it back into its alcove.

Figure 31-25: Fold Out Sink Basin Minimum Internal Dimensions

Sleeper Cabin Type	Minimum Dimension		
	W	L	D
Roomette	8”	12”	3.7”
SoloSuite	8”	12”	3.7”

iv). Fold Out Sink Faucet

(1) The faucet shall be mounted behind the sink in the sink alcove.

(2) The faucet shall use IR sensor to control water dispensing. The faucet shall not activate when the sink is moved to the open usable position or back to the stored position.

(3) Water flow shall be directly aligned with the drain and shall be directed into the sink and not splash the user.

v). Fold Out Sink Open Indicator Light

(1) A red, wide viewing angle LED “Sink Open” indicator light shall illuminate when the sink is open, as sensed by a limit switch located in the sink alcove housing.

(2) This is to encourage the user to close the sink when it is left open.

(3) The switch shall be accessible for replacement.

b). Sink – Solid Surface Style

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Shower Room

ii). General

(1) A solid surface sink with hot and cold water faucet shall be provided.

(2) The sink countertop shall be made from solid surface material and shall include a marine edge, 6” backsplash, and ¾” radius for cleanability.

(3) Note that all sink countertops shall be sloped toward the basin and drain.

iii). Sink Basin

(1) The sink basin shall have minimum internal dimensions as shown in Figure 31-26.

Figure 31-26: Solid Surface Sink Basin Minimum Internal Dimensions

Sleeper Cabin Type	Minimum Dimension		
	W	L	D
Club Bedroom	8”	11”	5”
Accessible Bedroom	15”	11”	5”
Sleeper Cabin Shower Room	15”	11”	5”

(2) The sink shall have a 1/2 to 1 gallon capacity, be equipped with an overflow.

(3) The sink is drained through a nominal 1-1/4” diameter drain.

iv). Faucet

(1) The faucet shall be mounted behind the sink.

(2) The faucet shall use IR sensor to control water dispensing.

(3) Water flow from the faucet shall be directed into the sink and not splash the user.

c). Sink Vanity Cabinet – Standard

i). Applicability: Roomette, SoloSuite, Club Bedroom and Shower Room

ii). Vanity cabinets shall be provided in each designated room location, with size, configuration, and exact positioning permitted to vary to suit room layout

iii). Cabinets shall be located behind the sink and aligned with the washbasin zone.

iv). A safety-glass mirror shall be integrated on or within the vanity cabinet and located above the sink

v). The mirror shall be positioned at a usable and appropriate height, with the mirror area maximized within the available envelope.

vi). The mirror shall be suitably lit by integrated LED perimeter lighting or backlighting.

vii). Cabinets shall provide maximized storage capacity and functional organization within the available volume.

viii). 3131Contents

(1) The vanity shall provide a place for a passenger to place small toiletries.

(2) Additionally, Amtrak supplied towels and facecloths shall be provided and stored in this location as shown in Figure 31-27.

Figure 31-27: Compact Vanity Towel Capacity

Sleeper Cabin Type	Towel Storage Capacity
Roomette	2 hand towels 2 facecloths
SoloSuite	1 hand towel 1 facecloth
Accessible Bedroom	3 hand towels 3 facecloths
Club Bedroom	4 hand towels 4 facecloths

d). Sink Vanity Cabinet – Accessible

i). Applicability: Accessible Bedroom.

ii). The vanity cabinet shall be provided at an accessible height and within accessible reach ranges.

iii). Where this cannot be achieved, a shelf or suitable alternative storage for hand towels and facecloths shall be provided within an accessible reach range.

iv). Mirrors shall comply with ADA requirements for height and usability.

e). Under Sink Cover

i). Applicability: Sleeper Cabin Shower Room

ii). Sink pipes should be covered with a panel that is accessible for maintenance behind the towel bin.

f). Hand soap Dispenser

i). Applicability: All sleeper cabins with sinks

ii). An automatic liquid soap dispenser which will accept a Celeste Industries liquid soap refill shall be installed and shall be located adjacent to the over-sink mirror.

g). Lotion Bottle

i). A lotion bottle shall be provided near the sink in all sleeper cabins with sinks.

h). Towel Ring

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A stainless-steel combination towel ring/coat hook shall be provided.

iii). It shall be capable of supporting up to 25lbs each.

i). Hand Dryer

i). Applicability: Club Bedroom, Accessible Bedroom, and Sleeper Cabin Showers

ii). A high velocity motion-activated hand dryer shall be mounted on the wall near the sink in an easily accessible location.

j). Shower Curtain

i). Applicability: Accessible Bedroom

ii). A shower curtain should be provided to control water spread in the room while the shower is on.

iii). It should also provide a modesty screen for users.

iv). The curtain should be easy to deploy and stow with an intuitive handle.

v). The mechanism should be durable, free from jamming and racking.

vi). The design should meet abuse loads. Dimensions, position, and usability will be subject to Amtrak approval at the mockup review.

k). Shower Seat

i). Applicability: Accessible Bedroom, Sleeper Cabin Showers

ii). A fold down shower seat shall be provided.

iii). Sleeper Cabin Shower Room:

(1) A fixed cantilevered shower seat should be provided inside the shower with an anti-slip finish with a minimum depth of 11.5” running the full width of the shower enclosure.

l). Rain Shower

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). A rain shower in the ceiling provides a shower above head height.

iii). Rain shower should be seamlessly integrated into the ceiling in order to maximize head room in the restroom.

m). Adjustable Shower Head

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

ii). A commercial grade shower with hose-mounted wand and controls shall be provided.

iii). A shower hose clip shall also be provided.

n). Shower Control

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). An on/off button and temperature control are located on the restroom wall close to the door.

iii). The shower control should prevent any accidental activation when using the toilet.

iv). In the Accessible Bedroom, shower controls shall be located within ADA-compliant reach ranges.

o). Shower Drain

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). A round drain shall be provided in the shower stall to collect shower water. The drain shall be recessed as standing water is not acceptable.

iii). Shower water shall drain to the ground.

iv). The drain strainer shall be easily removable for cleaning.

v). Fasteners, if required, shall be captive.

vi). The shower tray should be designed to prevent water from escaping into the main area of the room during train movement.

vii). Club Bedroom and Sleeper Cabin Showers:

(1) The restroom floor shall have a built-in shower tray with a raised lip.

(2) A slatted platform finishes flush with the top of the tray to allow the shower water to drain out underneath and prevent the floor remaining wet after use as a shower.

p). Shower Exhaust

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). An exhaust grille shall be provided in the ceiling.

iii). Negative pressure in the restroom shall be provided by the HVAC system.

q). Soap Dish

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). A self-draining soap dish with lip shall be provided in a convenient location to a seated or standing passenger in the shower.

r). Soap Dispensing Bottles

i). Applicability: Club Bedroom, Accessible Bedroom, Sleeper Cabin Showers

ii). Three refillable Amtrak bottles dispensing shampoo, conditioner and body wash shall be provided in the shower.

s). Towel Hook

i). Applicability: All sleeper cabins, Sleeper Cabin Showers

ii). Towel hooks shall be capable of supporting up to 25lbs each.

t). Towel Storage - Standard

i). Applicability: Roomette, SoloSuite, Club Bedroom, Accessible Bedroom

ii). A wall mounted towel holder of hotel quality shall be provided.

iii). The holder shall be stainless steel with capacity as shown in Figure 31-28.

Figure 31-28: Towel Storage Capacity by Cabin Type

Sleeper Cabin Type	Towel Storage Capacity
Roomette	2 of each type
Solo Suite	1 of each type
Club Bedroom	4 folded towels
Accessible Bedroom	3 of each type

iv). The shelf and towels are to be placed out of the direction of any shower water when the shower is in use.

v). The shelf should be free from any potential head strike while using the shower or toilet.

u). Toilet

i). Applicability: Club Bedroom, Accessible Bedroom

ii). An elongated toilet, complete with toilet bowel assembly, shroud, and overflow pan shall be provided in the restroom.

iii). Toilet Bowl Assembly

(1) A toilet stand with shroud assembly shall be located in the toilet room.

(2) Each restroom shall be equipped with a toilet bowl assembly, encased in the toilet shroud.

iv). Toilet Shroud

(1) The shape of the toilet shroud housing shall locate the toilet seat ergonomically for ease of use and comfort.

(2) The toilet shroud shall be constructed of FRP with gel coat color to match the restroom shell or of stainless steel, with brushed finish or approved alternate.

(3) Standard Shroud:

(a) Applicability: Club Bedroom

(b) Sufficient foot room shall be provided. When seated, the user's legs shall not contact the shroud.

(4) Accessible Shroud

(a) Applicability: Accessible Bedroom

(b) The form of the toilet is undercut at the bottom to maximize wheeled mobility device clearance.

v). Toilet Overflow Pan

(1) The toilet bowl assembly shall be mounted on a stainless-steel overflow pan, which shall contain flooding should the toilet outlet become blocked or system leak.

(2) The overflow pan shall:

(a) be watertight with raised edges of ~2 inches height

(b) have the attachment points exterior to the pan

(c) Have all exposed edges folded for safety and to provide stiffness

(d) be equipped with an overflow tube

v). Toilet Seat

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A standard toilet seat and toilet lid shall be provided.

iii). Toilet seat and seat lid should all have soft close mechanisms.

iv). A white toilet seat with lid, meeting Amtrak specification # 352, shall be provided.

v). The toilet seat and cover shall be constructed of reinforced fiberglass or approved alternate.

vi). The lid and seat shall be stable in the up position regardless of train motion, including braking, to prevent it from slamming down suddenly against the shroud.

w). Toilet Flush Mechanism

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A two-button push flush shall be located on the back wall of the restroom above the toilet.

iii). This shall provide standard and eco-flush options for the passenger.

iv). The flush mechanism shall also incorporate an automatic flushing feature when the passenger is done using the toilet.

x). Toilet Paper Dispenser

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A toilet paper dispenser shall be provided adjacent to the toilet.

iii). This dispenser shall protect the toilet paper from getting wet when the restroom is used as a shower.

y). Toilet Seat Cover Dispenser

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A dispenser for paper toilet seat covers should be located by the toilet.

iii). This dispenser shall protect the toilet seat covers from getting wet when the restroom is used as a shower.

z). Shower Seat Cover

i). Applicability: Club Bedroom

ii). The toilet seat shall be covered by a lid that covers the toilet seat and acts as a shower seat.

iii). The shower seat cover shall have a slow close mechanism.

iv). While the restroom is being used as a shower, the lid should disguise the toilet seat forming a bench across the width of the room.

v). The form of the toilet shall be undercut at the bottom to maximize standing space in the shower area.

vi). The design of the toilet, access and lid design will be subject to Amtrak approval during the mockup review.

aa). Baby Changing Table

i). Applicability: Accessible Bedroom

ii). A baby changing table should be provided with an RVAAC compliant clear space in front of it.

iii). The changing table should be easy to deploy and stow with an intuitive handle. The table shall include a strap to ensure passengers with limited reach can operate the table.

iv). The mechanism should be durable, free from jamming and racking.

v). The design should meet abuse loads.

vi). It should have a soft opening mechanism.

31.49 Sleeper Cabin Key Features – Trash

a). Trash Bin – Seating Area

i). Applicability: Roomette, SoloSuite, Accessible Bedroom

ii). A “flip out” Trash Receptacle shall be provided in the room, at an Amtrak approved location.

iii). The trash receptacle shall have a spring-loaded hinged door and be clearly labeled.

iv). The operation and maintenance of the bin should not result in any snagging or finger traps.

v). The bin should be watertight in case of a spill and shall prevent any water escapement.

vi). The trash bin shall meet the requirements of Section 31.17: Trash and Recycling Storage

b). Trash Bin – Restroom

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A trash storage area with accompanying trash bin shall be provided below the sink.

iii). The trash bin shall meet the requirements of Section 31.17: Trash and Recycling Storage, and accommodate the volume indicated in Figure 31-1.

iv). The operation and maintenance of the trash flaps and bin should not result in any snagging or finger traps.

v). The bin should be watertight in case of a spill preventing any water escapement.

c). Trash Bin – Sleeper Cabin Showers

i). Applicability: Sleeper Cabin Showers

ii). A trash bin shall be provided under the sink with push flap cover.

iii). The minimum volume of trash for this receptacle shall be 14 gallons.

iv). The trash flap for this receptacle shall be a minimum of 10” x10”.

d). Sanitary Waste

i). Applicability: Accessible Bedroom

ii). A sanitary waste bin shall be provided to the right of the toilet complete with modesty flap.

e). Sharps Bin

i). Applicability: Accessible Bedroom

ii). Provision for a sharps bin should be provided within the restroom.

iii). The size, position, and method of removal of sharps should be agreed and instructed by Amtrak.

31.50 Sleeper Cabin Key Features – Storage

a). Open Wardrobe

i). Applicability: Club Bedroom, Accessible Bedroom

ii). A dedicated space shall be allocated for an open wardrobe.

iii). This area shall have a coat rod for hanging items and a retaining bar to hold personal items in the open wardrobe area.

b). Coat Hooks

i). Applicability: All sleeper cabins, Sleeper Cabin Showers

ii). Coat hooks shall be capable of supporting up to 50lbs each.

iii). In accessible cabins the coat hooks shall be installed no more than 48” from the floor.

c). Carryon Luggage Storage

i). Applicability: All sleeper cabins

ii). A space shall be dedicated for carryon-sized luggage storage.

iii). The space shall be located as follows:

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

Figure 31-29: Carry-on Luggage Storage Location by Sleeper Cabin Type

Sleeper Cabin Type	Carryon Luggage Storage Location
Roomette	between seat and aisle partition wall and under seats and high-level storage above the aisle
SoloSuite	Overhead rack and under the ottoman
Club Bedroom	under the seats and high-level storage above aisle or restroom
Accessible Bedroom	between seat and aisle partition wall and upper-level storage above the seats

iv). Carryon luggage is defined as a bag with dimensions: 22” x 14” x 9”.

v). This area shall be protected from the seat area so luggage can be stored discretely.

vi). This area shall be free from structure or protrusions that may interfere with luggage storage.

vii). This area shall also be easy to clean.

viii). In SoloSuite an overhead rack shall be used for carryon storage:

(1) The rack should be within easy reach for 5th percentile female passengers.

d). The rack should be designed to prevent luggage falling off in typical railroad conditions, i.e. with lip or retention strap.

e). Under Seat Storage

i). Applicability: Roomette, Club Bedroom, Accessible Bedroom

ii). Unobstructed luggage storage space for carryon sized luggage shall be provided under the seat, regardless of seat recline or seat/ berth mode.

iii). This area shall be free from structure or protrusions, including seat operating mechanisms, that may interfere with luggage storage.

iv). This area shall also be easy to clean.

f). Passenger Storage – Cabinets and Cubbies

i). Applicability: All Sleeper Cabins

ii). Storage shall be provided for clothing and personal items, integrated into cabinets, cubbies, or equivalent features, with configuration, quantity, and location permitted to vary by room type.

iii). Storage shall be usable in all intended room modes (e.g. seating and sleeping), without obstruction or loss of function.

iv). In Accessible Bedrooms, storage shall be provided within ADA-compliant reach ranges for use by seated passengers.

v). Storage shall be safe, intuitive to use, and easy to clean, with appropriate retention to prevent items from falling during operation.

vi). Final dimensions, positioning, and usability of storage solutions shall be subject to Amtrak review and approval at mock-up stage.

31.51 Sleeper Cabin Integrated Systems

a). HVAC

i). Supply Air Diffusers

(1) Conditioned air is delivered to the room via two (2) supply air diffusers with adjustable air flow control and located on the windowsill of the outside window.

ii). Exhaust Grille

(1) Exhaust air is removed from the room via the exhaust air grille which is located at the upper portion of the module.

iii). Air circulation fans

(1) Air circulation fans with controls shall be provided at the head of each sleeping berth.

(2) The purpose is to stir room air and decrease the potential for temperature differential between upper and lower areas of the room especially when the upper berth is down.

(3) The air circulation fans shall have manual adjustment of the airflow direction.

b). Communications

i). Speaker

(1) PA speaker shall be located on the central ceiling panel.

(2) The PA speaker shall have an associated mute button.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(3) The speaker used in this location shall be identical to PA speakers used in other locations in the cars for ease of maintenance and replacement.

ii). Attendant Call Button

(1) An attendant call button shall be located within each room.

(2) The intention of this call button is to direct non-emergency crew to a given location.

iii). Passenger Emergency Intercom

(1) A PEI shall be located in every bathroom floor and wall within a sleeper cabin and shall be located in each accessible sleeper cabin as well.

(2) The intention of this button is to notify the conductor and flag the entire train that there is an onboard emergency.

(3) All communications equipment shall meet the requirements in Chapter 14.

c). Electrical System

i). Electrical equipment information is shared in detail for each room.

ii). All electrical equipment in the sleeper cabins shall meet the requirements in Chapter 15.

iii). Junction Box

(1) The junction box shall be located where practical and shall be presented during the design phase.

(2) It shall be easily accessible by the maintenance group.

d). Lighting System

i). Lighting general information is shared in detail for each room. Detailed lighting information can be found in Chapter 13.

ii). Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

e). Emergency Equipment

i). Chapter 18 details emergency equipment requirements. Generally, the following items shall be included in each room.

(1) Smoke Detector

(a) Smoke Detectors shall be mounted on the central ceiling panel.

(b) The smoke detector used in this location shall be identical to the smoke detectors used in other locations in the cars for ease of maintenance and replacement.

(2) Window Egress

(a) Each window on the carshell in a sleeper cabin shall be considered an emergency egress window and shall comply with 49 CFR 238.113.

f). Security

i). Many items within the sleeper cabin area will need to be secured.

ii). The following items are identified with specific locking preferences.

iii). Any other locking or security items will be discussed with Amtrak during design reviews.

(1) Door Locking Mechanism

(a) There shall be an automatic door locking system in place for each sleeper cabin.

(b) This locking mechanism shall default to ‘locked’ when the power is on in the car and default to ‘unlocked’ when no power is provided on the car. Momentary HEP loss situations shall be addressed during design review; however, delayed locking mechanisms should be utilized to account for these situations.

(c) Additionally, this locking mechanism shall be unlocked/activated by the keycard and keyless entry feature that is described in Section 31.12.

(2) Door Locking Mechanism

(a) There shall also be a manual locking system for a passenger to maintain privacy and block inadvertent access into their sleeper cabin.

(b) This shall be in the form of a deadbolt type lock or latch.

31.52 Additional Storage in Sleeper Cars

a). General

i). See Chapter 1 for quantity of storage units desired across the cars and suggested layouts.

ii). Storage lockers shall be locked with crew keys or as otherwise approved by Amtrak.

b). Required Storage Types

i). Electrical Cabinets

(1) See Chapter 15 for electrical storage requirements.

ii). Linen Storage Closets

(1) See Section 31.18 for requirements.

iii). Consumable Supply Storage

(1) See Section 31.19 for requirements.

iv). Cleaning Supply Storage

(1) See Section 31.20 for requirements.

c). CMF

i). General

(1) Storage lockers shall match the CMF of the adjacent wall paneling and countertop surfaces.

(2) Refer to Exhibit F for more information.

ii). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic or melamine resin composite with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb, melamine resin, or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

Part X: Common Use Areas

31.53 Beverage Stations

a). General Requirements

i). Beverage stations shall be incorporated in storage areas within sleeper cars.

ii). The beverage station shall utilize the same amenities and appliances in the food service areas – refer to Chapter 16 for complete requirements and information.

iii). To the extent possible equipment, parts, and features in the beverage station shall be identical to equipment, parts, and features in the first-class bar self service area.

(1) The intent of this clause is to minimize spares and maintenance techniques.

iv). Beverage stations in cars with accessible sleeper cabins shall be ADA accessible.

b). Proposed layout

i). The Contractor shall use Exhibit F as the basis for the beverage station design and make adjustments as necessary to provide complete functionality.

ii). The final layouts will be approved by Amtrak during the design review process.

c). Appliances

i). The table below lists the desired appliances along with an example part number and the quantity required within the beverage station area.

ii). Note that example part numbers are given to establish a starting place for appliance performance and will be finalized during the design reviews.

iii). The car builder will propose the exact manufacturer and part number for each appliance based on functionality, shock and vibration, service history, power requirements, and ability to meet crashworthiness requirements for mounting.

Figure 31-30: Beverage Station Appliances

Appliance	Description	Exact Part Number	Quantity Desired
Countertop Workspace	Clear available workspace for food preparation with 6” backsplash and 0.25” radii.		As Space Allows
Coffee Maker	Twin coffee brewer with 1.5-gallon satellite servers	Wilbur Curtis GEMTS16A 1000	1
Water Dispenser	Recessed Water Dispenser with Drain		1
Storage	storage space with built in condiment storage compartments		1

iv). Detailed functional requirements for each appliance are listed below.

(1) Countertop Workspace

(a) All features for the countertop workspace shall be identical to the countertop workspace described in the kitchen Chapter 16.

(i) With the following exception: In this food service area, the minimum surface area for workspace required is 1 sq ft.

(2) Coffee Maker

(a) A purchased off the shelf item that meets or exceeds the features from the example part number.

(b) Example part number listed as Wilbur Curtis GEMTS16A-1000.

(c) Twin coffee brewer

(d) 1.5-gallon satellite servers

(e) Coffee maker drain shall handle both warmers emptying at the same time with no liquid splashing outside of the drain channel

(3) Water Dispenser

(a) Recessed water dispenser with drain.

(b) An access side panel secured with quarter-turn fasteners for access to the water valves for maintenance.

(c) ADA compliant design.

(d) The dispenser shall be arranged to permit passengers to easily refill a 1-quart water container.

(e) The design shall be in compliance with 21 CFR Part 1250 and US Public Health Service (USPHS) requirements, arranged for ease of sanitation, and approved by Amtrak. Alternative designs can be provided for review and approval by Amtrak.

(4) Storage Cabinets

(a) Storage cabinets shall be constructed from stainless-steel or approved alternative to be discussed during the design review process.

(b) These modules shall be designed to retain goods while the train is in motion.

(c) Storage in this location shall be open shelving with retaining bars and include built in condiment storage compartments.

(d) This will depend on the item stored in each location and shall be determined with Amtrak during the design reviews.

(e) Option for adjustable shelving to accommodate varying products.

(f) Stainless steel retention bars to prevent items from sliding off the shelf while the train is in motion.

(g) Built in condiment storage shall include but not be limited to cups, lids, creamers, stirrers, and sweeteners.

d). Evaluation Criteria

i). Sanitary Design

(1) Sanitary design shall be evaluated with the following criteria:

(a) Appropriate cleaning radii of at least 0.25” on worksurfaces and 0.75” on sink areas.

(b) Backsplashes of at least 6” on worksurfaces and sink areas.

(c) Appropriate cleaning clearances around appliances such that a 95th percentile male can fit their hand and a rag easily between objects for cleaning.

(d) All edges and seams are sealed with silicone sealant and gaps greater than 1/32” are sealed.

(e) Floor drains are provided for locations prone to spills and leaks, especially near water piping.

(f) Openings are protected from allowing pests and vermin to congregate

(g) Proper sealing methods are used to prevent moisture from corroding or otherwise damaging the food service area

(h) All drain pans and catches are accessible for cleaning

(i) No tools are required to move objects subject to daily cleaning Rituals.

31.54 Diner/Lounge

a). General

i). The Diner/Lounge shall include all of the elements listed in this Chapter; however, the arrangement of these elements can be modified by the Contractor to best meet the design requirements for the car as a whole.

ii). Amtrak envisions half of the car to be Diner seating and the other half Lounge seating; however, the Contractor has the flexibility to provide the optimal general arrangement to Amtrak for review and approval.

b). Key Features

i). A comprehensive list of expected features in the Diner/Lounge is provided in Figure 31-31 and described in detail below.

(1) Detailed functional requirements for each feature are listed below.

(2) In addition to these requirements, the Contractor shall factor in safety, crashworthiness, materials and workmanship, FDA cleaning clearances, radii, and sanitary design.

(3) All mechanisms described below should be durable, free from jamming, and racking.

(4) The design should meet abuse, load, and crash criteria.

(5) Dimensions, position, and usability will be subject to Amtrak approval during the mockup review.

Figure 31-31: Key Features – Diner/Lounge

Feature	Short Description	Qty
Accessibility		
Accessible Path	32” continuous aisle through entire car for ADA regulated aisle	1
RVAAC Accessible Space in Diner	Location for a passenger using a wheeled mobility device to dine and remain using device- including 60" diameter turning circle	1
RVAAC Accessible Space in Lounge	Location for a passenger using a wheeled mobility device to dine and remain using device- including 60" diameter turning circle	2
Folded Wheeled mobility device Storage in Diner	Open storage location for wheeled mobility devices	1
Folded Wheeled mobility device Storage in Lounge	Open storage location for wheeled mobility devices	2
60” Turning Circle	60” diameter turning circle for accessibility at each end of the car	1 in diner area, + 1 in lounge area + 1 in vestibule
Interior Structures		
Beverage Sation in Lounge Area	Standard beverage station with vended coffee machine and water fountain	1
Service Station in Diner Area	Convenience station for LSA in the diner	1
Windows	Aligned to booth tables and includes emergency egress features	TBD
Skylights (Option)	Aligned to booth tables - in diner area	1 per window
Blinds	A single blind system that provides sunshade and blackout performance	1 per window (+ skylight option)
Doors	Vestibule with a passenger door each side	1
Seating and Tables		
Diner Booth Seating	Repeatable and modular bench seating for 2 passengers each - minimum 40" width	18 booth seats (36 passengers)
Dining Table Module	Repeatable dining table for 4 passengers	9
Accessible Table	Modified version of table module with flip up portion	1
Privacy Divider	Safety glass divider between booths with hand grab features	1 between each booth
Lounge Seating	Repeatable and modular seating for 1 passenger arranged as twin seats in bays or longitudinal benches	30 single seats
Coffee Table Module	Small cantilevered coffee tables for resting beverages between face to face bay seats	4
Side Tables	Small side tables on longitudinal benches	4

Accessible Coffee Table	Modified version of coffee table module with flip up portion	2
Privacy Divider	Short privacy divider between booths with hand grab features	1 between each back-to-back twin
Lighting (Car Specific)		
Wall Lamps	Light fixtures mounted to each available window pillars in dining area	1 on each window pillar in Diner and Lounge
Table Lamps	Light fixtures mounted to tables	1 per dining table

i). Accessible Table

(1) Provisions for integrating a new accessible table or changing the booth table at the accessible space location shall differ from the standard booth table but shall meet the same strength requirements.

(2) In order to utilize the space to its full extent, fold-down seats may be incorporated.

(3) In this instance, the accessible space shall also include a foldout seat from the side wall in this location so that if a person using a wheeled mobility device is not occupying the space, another passenger can opt to utilize the area instead.

ii). Folded Wheeled Mobility Device Storage

(1) A storage space for two folded wheeled mobility devices shall be located at the Lounge end of the Diner/Lounge car for passengers wishing to transfer to another seat.

iii). Accessible Space

(1) Provisions for two accessible spaces with RVAAC compliant dimensions shall be provided as part of the lounge seating arrangement and one accessible space with RVAAC compliant dimensions as part of the diner seating arrangement.

(2) When reconfigured, the accessible space should include access to a coffee table and side table that aesthetically and functionally matches the coffee table and side table used in other locations in the lounge. The accessible coffee table and side table shall conform to all ADA reach and height requirements.

iv). Accessible Path

(1) The Diner/Lounge car should be fully accessible end to end.

(2) There should be a 32” wide accessible path between seating booths.

(3) Where a 90° turn is required across the car, the aisle should be 44” wide.

v). 60” Turning Circle

(1) There should be two 60” accessible turning spaces in the lounge.

vi). Skylight Windows (Option)

(1) Skylight windows shall be included for the diner/lounge car, café car and diner car in table and booth seating areas.

(2) Please refer to Section 31.13 for window requirements.

vii). Skylight Blinds (Option)

(1) Skylight blinds shall be provided that meet the requirements of Section 31.15.

viii). Skylight Valance (Option)

(1) Skylight design should incorporate a valance without a luggage shelf, that contains only blinds, and coat hooks.

ix). Windows shall be provided that meet the requirements of Section 31.13.

(1) Side window blinds shall be provided that meet the requirements of Section 31.15.

x). Side Rails

(1) Side rails under each window shall include a tideline.

xi). Lower Sidewall Panels

(1) Lower side wall panels shall be provided such that the trim panel has minimized thickness to take advantage of full width of the car body.

(2) These should be designed to have well-fitted clean panels with a high tolerance build to manage split lines and cabinet edging.

(3) Lower side wall panels shall define a material split, with the lower panel in a wood finish.

(4) There should be no protruding equipment, snag point, or dirt traps.

xii). Kick Strips

(1) Stainless steel kick strips at 9” high should be used in all coach areas.

xiii). Hand Grab

(1) Where possible, a compliant accessible grab for passenger navigation shall be available.

(2) Grab bar positioning will be subject to mockup testing and Amtrak approval. Grab bar shall meet the requirements in 49 CFR 38.115.

xiv). Window Pillar

(1) Window pillar width should be minimized.

(2) In the case of a car with skylights the pillar trim should continue over the side ceiling to create an arched aesthetic.

xv). HVAC Gondola

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(1) Gondola shall be designed to maximize headroom and be suitable to accommodate skylight windows.

(2) Lighting washes both centrally into gondola and across side ceilings shall be provided.

(3) The gondola should terminate and transition to a separate lower ceiling section if any equipment or junction in the interior architecture prevents the gondola from completing a full uninterrupted run.

(4) At these junctions the gondola should terminate in a straight line with architecture that creates a visual ring at the termination point.

(5) The transition between ceiling profiles should be treated with clean and well considered intersections.

(6) These lower ceilings should have their own lighting light wells and HVAC vents.

xvi). Wall Lamps

(1) Wall lamps should be provided on every window pillar.

xvii). Lounge Seat

(1) Lounge seats should purposefully differ in style to booth seats and should utilize modular design so that they can be repeated to form both bay and longitudinal seating arrangements.

(2) These structures should allow for creation of groups of seats that create a mix of private and convivial settings.

(3) The furniture system should be simple to maintain and repair, with robust detailing designed for heavy usage.

(4) The system shall allow seats to be arranged in a variety of seating positions to provide a full range of viewing experiences.

(5) All individual seat modules should have the same dimensions but can be orientated differently either by rotating them through 90 or 180 degrees.

(6) Creating a mirrored instance is also acceptable.

(7) Twin seats should be arranged to form couches for two in combination with single seats for one.

(8) Seating orientations should be created so that passengers can be seated in positions that look out both sides of the train.

(9) Lounge seats should have a minimum seat pan depth of 20” and a minimum seat width of 20”. Seat pan height should be a minimum of 18”.

xviii). Outlets

(1) Duplex outlets with two USB sockets shall be provided for each seated passenger.

(2) The outlets shall be located in easy reach of people while seated.

xix). Lounge Coffee Table

(1) Coffee tables should be provided within lounge booths.

(2) Coffee tables shall follow the same requirements as the work station table modules but be shorter in length.

(3) Coffee tables should have marine edge milled into the solid surface material.

xx). Lounge Side Tables

(1) Any longitudinal arrangements of lounge seats shall provide small integrated side tables - side tables should have marine edges built into the top surface or created using a trim edge.

xxi). Lounge Privacy Dividers

(1) Privacy dividers should be included where seating is back-to-back or where passengers' heads are in close proximity.

(2) The height of the divider will need to be managed carefully as to be low enough not to obstruct view out of the windows, yet high enough to provide some level of privacy for seated passengers.

(3) Dividers should include different levels of transparency and material selections to break up volumes and to allow spread of light.

(4) Divider edges are protected by a trim detail which should be strong enough to act as a proxy handhold.

(5) Purposeful and compliant handholds integrated with the divider should be located on entry and exit points to lounge booths.

xxii). Trash Bin

(1) Trash bins shall be provided with stainless steel push flaps.

(2) Please refer to section 31.17 for more information on trash and recycling requirements.

xxiii). Dining Table Modules

(1) A repeatable 'workstation' table module shall be used for diner seating.

(2) A high-quality table surface should be used and shall have a protective edge trim detail.

(3) Split lines should be managed to a high tolerance and sealed to create a flush finish and prevent any potential dirt build up in edges.

(4) A minimum usable table length of 32” shall be provided.

(5) Access in and out of the seat should be evaluated carefully. A tapered leading edge may be required to aid access to the seat.

(6) Top of table surface should be between 27” and 28” while also allowing 3” clearances in height for the legs for a 95th percentile male.

(7) Table leg location shall be positioned as to not provide a knee clash for passengers.

(8) All table dimensions will be subject to mock-up review, testing and approval by Amtrak.

(9) A fixed workstation table shall be provided compliant with APTA Standard PR-CS-S-018-13.

(10) Although APTA Standard PR-CS-S-018-13 excludes cafe and diner tables, it shall apply for the purposes of this Contract.

(11) Energy absorption features shall be built into the workstation table and/or its attachments such that human injury criteria for the 50th percentile HIII male ATDs are not exceeded during dynamic sled testing, per the requirements specified in APTA Standard PR-CS-S-018-13, Section 5.2.1, modified for testing with a workstation table installed.

(12) The table must meet the performance requirements specified in Section 5.2.1.3 of APTA Standard PR-CS-S-018-13.

(13) The table must not become detached from its mountings and the ATDs must remain compartmentalized between the table and the launch seat.

(14) Workstation tables shall be attached to the carbody via the wall seat track and to the floor seat track.

xxiv). Dining Booth Seating

(1) Arrangement and Dimensions

(a) A repeatable booth module of back-to-back seating shall be provided in the diner.

(b) Booths should be 2x2 across the aisle.

(c) Seats shall be mounted to the seat tracks in accordance with the strength and crashworthiness requirements of 49 CFR Section 238.233 (a) and APTA standard PR-CS-S-016-99 as applicable.

(d) Seat width shall be maximized with a minimum acceptable dimension of 40” wide for a seat suitable for two passengers.

(e) To achieve a 32” accessible path between diner seats the side wall detail/clearance will need to be minimized and tolerances will need to be tightly controlled.

(f) Seat pan height shall be between 18” and 19” with a seat pan depth of no less than 18”.

(g) Seat back height from finished floor should be a minimum of 38” with a higher divider no lower than 44”.

(h) All seat dimensions, cushion density/ shore hardness will be subject to mock-up review, testing and approval by Amtrak.

(i) Booths shall be located on either side of a table in the diner.

(j) The table shall be centered in the window alignment.

(k) The privacy dividers in each booth shall align with the window pillars in a repeating 81” pitch.

(2) Under Seat Storage

(a) Each booth seat shall be designed such that under the seat cushion there is a storage compartment for crew and diner emergency storage items.

(b) The access to these seats should not impact the seat comfort or aesthetic.

(c) The actions required to access the storage location should take the average person under 30 seconds.

(3) Seat Cushions

(a) Booth seat cushions should be contoured to aid seat comfort.

(b) Seat cushions shall provide ergonomic support in the following locations: back support, seat back and seat pan pillowing.

(c) Cushioning, seat trim, and detailing will be evaluated during the design review process.

(4) Pedestals

(a) Booth seats shall be mounted on a pedestal that is seamless with the floor, with no dirt traps, or protruding edges.

(b) Pedestals shall be undercut from the seat base to provide a floating seat aesthetic.

(5) Materials

(a) The seat structure should be finished with high-quality, hard-wearing laminates and veneers.

(b) Laminate edges shall be protected with delicate trim details.

(6) Amtrak Approval

(a) Booth seating details shall be presented for Amtrak approval during the PDR.

(b) Final seat configuration and comfort shall be subject to Amtrak approval based on documentation and mockup information presented by the Contractor.

xxv). Dining Privacy Dividers

(1) A glazed privacy divider shall be provided between back-to-back booth seats. The divider frame shall be integrated with handholds.

(2) Handholds complying with 49 CFR 38.115 shall be provided as part of the privacy divider on the aisle side of every booth seat.

xxvi). Service Station

(1) A service station should be provided within the Diner/Lounge.

(2) The purpose of this station is to assist crew with performing an efficient food service.

(3) Crew will use the station to replenish the tables so should be designed to store provisions needed for table settings including cutlery, napkins (standard and small beverage) menus and items to support coffee service.

(4) It should have open storage and closed storage and may also require a trash bin.

(5) The detailed design and service strategy will be defined further during PDR.

(6) The exact design, use, and purpose of the cubbies in the service station shall be developed with Amtrak during the PDR.

(7) A single large opening in the solid surface countertop where smaller bins, trays, or tubs can be stored shall function as the starting place.

c). CMF

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

i). Please refer to Chapter 19 and Exhibit F for more information.

ii). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iii). Ceiling

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

iv). Flooring

(1) Flooring within the diner/lounge area shall be carpet flooring as listed in Section 31.31.

(2) Flooring shall be durable to withstand spills, leaks, and all methods of cleaning. Flooring shall also not become frequently damaged or worn.

(3) Flooring shall have enough give to prevent fatigue from standing.

v). Lighting

(1) General

(a) Lighting general information is shared in detail.

(b) Detailed lighting information can be found in Chapter 13, Lighting System.

(c) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(d) Ceiling lighting shall match the ceiling lighting in the coach cars.

(e) A digital controller shall be provided allowing for crew to adjust the brightness and color temperature of the lighting in the room in grouped sections.

(2) Lighting Types and Locations

(a) Compartment Lighting

(i) Under Table and Seat Lighting

1. Wash lighting under the table or seats shall provide indirect light.

(ii) Wall Lamps

1. On each window pillar, a wall lamp shall be provided that casts indirect light on the pillar.

2. The lamp is intended to be a premium design feature that contributes to the overall lighting of the space.

3. Lamp design, spread of light, lamp materials, and detail design will be subject to Amtrak's approval.

(iii) Table-mounted Booth Lamps (Diner tables)

1. A table lamp shall be provided at every table against the side wall.

2. The lamp is intended to be a premium design feature that contributes to the overall lighting levels of the space.

3. Lamp design, spread of light, lamp shade material and detail design will be subject to Amtrak's approval.

31.55 Diner

a). General

i). The diner shall include all of the elements listed in this section; however, the arrangement of these elements can be modified by the Contractor to best meet the design requirements for the car as a whole.

ii). If the final layout for the diner area differs from the suggested layout, the Contractor shall propose the new layout at the PDR with the justification for differences in design and layout.

iii). The suggested layout for the diner area shown in Exhibit F shall be used as a reference when designing this area of the car.

b). Key Features

i). A comprehensive list of expected features in the diner is provided in Figure 31-32 and described in detail below.

(1) Detailed functional requirements for each feature are listed below.

Figure 31-32: Key Features – Diner

Feature	Short Description	Qty
Accessibility		
Accessible Path	32” continuous aisle through entire car for ADA regulated aisle	1
RVAAC Accessible Space	Location for a passenger using a wheeled mobility device to dine and remain using device- including 60" diameter turning circle	1
Folded Wheeled Mobility Device Storage	Open storage location for wheeled mobility devices	1
60” Turning Circle	60” diameter turning circle for accessibility at each end of the car	2
Interior Structures		
Galley	Food service Area described in Chapter 16	1
Service Station	Crew convenience station in the diner	1
Windows	Aligned to booth tables and includes emergency egress features	TBD
Skylights (Option)	Aligned to booth tables - in diner area	1 per window
Blinds	A single blind system that provides sunshade and blackout performance	1 per window (+ skylight option)
Doors	Central loading doors on each side	1
Seating and Tables		
Booth Seating	Repeatable and modular bench seating for 2 passengers each - minimum 40" width	9 booth seats
Table Module	Repeatable dining table for 4 passengers	4
Accessible Table	Modified version of table module with flip up portion	1
Privacy Divider	Safety glass divider between booths with hand grab features	1 between each booth
Lighting (Car Specific)		
Wall Lamps	Light fixtures mounted to each available window pillars in dining area	1 on each window pillar
Table Lamps	Light fixtures mounted to tables	1 per table

ii). Table Module

(1) A repeatable ‘workstation’ table module shall be used in the diner.

(2) A high-quality table surface should be used and shall have a protective edge trim detail.

(3) Split lines should be managed to a high tolerance and sealed to create a flush finish and prevent any potential dirt build up in edges.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

(4) A minimum usable table length of 32” shall be provided.

(5) Access in and out of the seat should be evaluated carefully. A tapered leading edge may be required to aid access to the seat.

(6) Top of table surface should be between 27” and 28” while also allowing 3” clearances in height for the legs for a 95th percentile male.

(7) Table leg location shall be positioned as to not provide a knee clash for passengers.

(8) All table dimensions will be subject to mock-up review, testing and approval by Amtrak.

(9) A fixed workstation table shall be provided compliant with APTA Standard PR-CS-S-018-13.

(10) Although APTA Standard PR-CS-S-018-13 excludes cafe and diner tables, it shall apply for the purposes of this Contract.

(11) Energy absorption features shall be built into the workstation table and/or its attachments such that human injury criteria for the 50th percentile HIII male ATDs are not exceeded during dynamic sled testing, per the requirements specified in APTA Standard PR-CS-S-018-13, Section 5.2.1, modified for testing with a workstation table installed.

(12) The table must meet the performance requirements specified in Section 5.2.1.3 of APTA Standard PR-CS-S-018-13.

(13) The table must not become detached from its mountings and the ATDs must remain compartmentalized between the table and the launch seat.

(14) Workstation tables shall be attached to the carbody via the wall seat track and to the floor seat track.

iii). Booth Seating

(1) Arrangement and Dimensions

(a) A repeatable booth module of back-to-back seating shall be provided in the diner.

(b) Booths should be 2x2 across the aisle.

(c) Seats shall be mounted to the seat tracks in accordance with the strength and crashworthiness requirements of 49 CFR Section 238.233 (a) and APTA standard PR-CS-S-016-99 as applicable.

(d) Seat width shall be maximized with a minimum acceptable dimension of 40” wide for a seat suitable for two passengers.

(e) To achieve a 32” accessible path between diner seats the side wall detail/clearance will need to be minimized and tolerances will need to be tightly controlled.

(f) Seat pan height shall be between 18” and 19” with a seat pan depth of no less than 18”.

(g) Seat back height from finished floor should be a minimum of 38” with a higher divider no lower than 44”.

(h) All seat dimensions, cushion density/ shore hardness will be subject to mock-up review, testing and approval by Amtrak.

(i) Booths shall be located on either side of a table in the diner.

(j) The table shall be centered in the window alignment.

(k) The privacy dividers in each booth shall align with the window pillars in a repeating 81” pitch.

(2) Under-Seat Storage

(a) Each booth seat shall be designed such that under the seat cushion there is a storage compartment for crew and diner emergency storage items.

(b) The access to these seats should not impact the seat comfort or aesthetic.

(c) The actions required to access to the storage location should take the average person under 30 seconds.

(3) Seat Cushions

(a) Booth seat cushions should be contoured to aid seat comfort.

(b) Seat cushions shall provide ergonomic support in the following locations: back support, seat back and seat pan pillowing.

(c) Cushioning, seat trim, and detailing will be evaluated during the design review process.

(4) Pedestals

(a) Booth seats shall be mounted on a pedestal that is seamless with the floor, with no dirt traps, or protruding edges.

(b) Pedestals shall be undercut from the seat base to provide a floating seat aesthetic.

(5) Materials

(a) The seat structure should be finished with high-quality, hard-wearing laminates and veneers.

(b) Laminate edges shall be protected with delicate trim details.

(6) Amtrak Approval

(a) Booth seating details shall be presented for Amtrak approval during the PDR.

(b) Final seat configuration and comfort shall be subject to Amtrak approval based on documentation and mockup information presented by the Contractor.

iv). Accessible Table

(1) Provisions for integrating a new accessible table or changing the booth table at the accessible space location shall differ from the standard booth table but shall meet the same strength requirements.

(2) In order to utilize the space to its full extent, fold-down seats may be incorporated.

(3) In this instance, the accessible space shall also include a foldout seat from the side wall in this location so that if a person using a wheeled mobility device is not occupying the space, another passenger can opt to utilize the area instead.

(4) The accessible table shall be adjustable in height between 27” and 34”.

v). Folded Wheeled Mobility Device Storage

(1) A storage space for two folded wheeled mobility devices shall be located at the end of the diner car for passengers wishing to transfer to another seat.

vi). Accessible Space

(1) Provisions for an accessible space with RVAAC compliant dimensions shall be provided at the accessible table.

(2) The accessible space shall also include a fold out seat from the side wall in this location so that if a person using a wheeled mobility device is not occupying the space, another passenger can opt to utilize the area instead.

vii). Accessible Path

(1) The diner car should be fully accessible end to end. There should be a 32” wide accessible path between seating booths and down the side of the kitchen. Where a 90° turn is required across the car, the aisle shall be 44” wide.

viii). 60” Turning Circle

(1) There should be two 60” accessible turning spaces.

ix). Service Station

(1) A service station should be provided within the Diner.

(2) The purpose of this station is to assist crew with performing an efficient food service.

(3) Crew will use the station to replenish the tables so should be designed to store provisions needed for table settings including cutlery, napkins (standard and small beverage) menus and items to support coffee service.

(4) It should have open storage and closed storage and may also require a trash bin.

(5) Service station should provision for a countertop POS Ticket Screen Outlet

(6) The detailed design and service strategy will be defined further during PDR.

(7) The exact design, use, and purpose of the cubbies in the service station shall be developed with Amtrak during the PDR.

(8) A single large opening in the solid surface countertop where smaller bins, trays, or tubs can be stored shall function as the starting place.

x). Windows

(1) Side window shall be provided that meet the requirements of Section 31.13.

(2) Each window shall be an emergency exit window and rescue access window. Windows shall comply with 49 CFR 238.113 and 238.114.

xi). Skylight Windows (Option)

(1) Skylight windows shall be included for the diner/lounge car, café car and diner car in table and booth seating areas.

(2) Please refer to Section 31.13 for window requirements.

xii). Skylight Blinds (Option)

(1) Skylight blinds shall be provided that meet the requirements of Section 31.15

xiii). Skylight Valance (Option)

xiv). Skylight design should incorporate a valance without a luggage shelf, that contains only blinds, and coat hooks.

xv). Windows shall be provided that meet the requirements of Section 31.13

xvi). Blinds

(1) Side window blinds shall be provided that meet the requirements of Section 31.15.

xvii). Wall Lamps

(1) Wall lamps shall be provided on every window pillar.

xviii). Table Lamps

(1) A table lamp shall be provided at every table against the side wall.

(2) An integrated condiment basket or rail shall be provided on the base of the lamp suitable to store a varied arrangement of condiments to be defined during PDR.

xix). Privacy Dividers

(1) A glazed privacy divider shall be provided between back-to-back booth seats. The divider frame shall be integrated with handholds.

(2) Handholds complying with 49 CFR 38.115 shall be provided as part of the privacy divider on the aisle side of every booth seat.

c). Diner Interior Structures

i). Side Rails

(1) Side rails shall be included under the windows along the side walls. The side rails shall include a tideline features with integrated lighting to wash lower side wall panel.

ii). Lighting and HVAC Gondola

(1) The lighting and HVAC gondola features should match the coach interior structure specification in Chapter 11.

(2) Ceiling profiles should transition to an alternate section to accommodate the Servery architecture.

(3) Ceiling profiles should transition to an alternate section to accommodate electrical cupboard, plenum chambers or crew cupboards.

iii). Window Pillars

(1) Window pillar width should be minimized. The pillar trim should continue over the side ceiling to create an arched aesthetic.

iv). Kick Strips

(1) 9” tall stainless steel kick strips shall be mounted along the length of the diner.

v). Side Wall Panels

(1) Side wall panels shall include trim panels with minimized thickness to take advantage of full width of the car body.

d). CMF

i). Please refer to Chapter 19 and Exhibit F for more information.

ii). Wall Panels

(1) Sidewall Panels along the carshell wall shall be made from molded thermoplastic with an easy to clean surface finish.

(2) Partition Walls shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(3) The finish of the wall and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

iii). Ceiling

(1) Ceiling shall be created from a composite structure such as aluminum honeycomb or HPL skinned honeycomb panels.

(2) The finish of the passenger facing side of the ceiling panel and material of the outside skin shall meet all structural requirements for crashworthiness based on mounting and attached loads to the panel.

(3) The finish of the material on the non-passenger facing side shall be coated such that there is no risk of corrosion from moisture from steam or humidity within the car.

iv). Flooring

(1) Flooring within the diner area shall be anti-slip flooring in the hallway by the kitchen and high traffic carpet through the seated area in Section 31.31.

(2) Flooring shall be durable to withstand spills, leaks, and all methods of cleaning. Flooring shall also not become frequently damaged or worn.

(3) Flooring shall have enough give to prevent fatigue from standing.

v). Lighting

(1) General

(a) Lighting general information is shared in detail for each room.

(b) Detailed lighting information can be found in Chapter 13.

(c) Note that all lighting part numbers, manufacturers, and temperatures shall be proposed by the Contractor and approved at Amtrak after the lighting simulation during the design review process.

(2) Lighting Types and Locations

(a) Ceiling Lighting

(i) Ceiling lighting shall match the ceiling lighting in the coach cars.

(b) Compartment Lighting

(i) Table Booth Lamp

1. A table lamp shall be provided at every table against the side wall.

2. An integrated condiment basket or rail shall be provided on the base of the lamp suitable to store a varied arrangement of condiments to be defined during PDR.

3. The lamp is intended to be a premium design feature that contributes to the overall lighting levels of the space.

4. Lamp design, spread of light, lamp shade material and detail design will be subject to Amtrak's approval.

(ii) Wall Lamp

1. On each window pillar a wall lamp shall be provided that casts indirect light onto the pillar.

2. The lamp is intended to be a premium design feature that contributes to the overall lighting levels of the space.

3. Lamp design, spread of light, lamp shade material and detail design will be subject to Amtrak's approval.

Part XI: Utility Car (Option)

31.56 Utility Car (Option)

a). The utility car shall be constructed using a carshell selected from one of the proposed car types to maintain a modular build approach. The baggage area will be physically separated from the crew sleeping quarters by a reinforced, hinged, and lockable door to ensure room security. Located at the B-end of the car, the baggage compartment will feature powered doors, a trap door, folding steps, and HVAC, along with additional amenities to support the modular design concept. The A-end of the car will accommodate at least six roomettes, two standard restrooms, one communal shower, and a dedicated crew break area.

31.57 Utility Crew Accessible Baggage Area

a). General

i). The baggage room occupies the B-end half of the car and is divided from the crew area with a reinforced hinged locked door to provide security to the room. Likewise, a lockable collision post door is provided at the blind end of the room to access an adjacent car. Outside access is provided by side loading doors located at the B-end of the car

(1) The baggage room shall be 1770 cu ft.

ii). The baggage area will be used in Amtrak's long-distance passenger trains and will be loaded with a mix of baggage types, such as checked baggage, carry-on baggage, bicycles, etc.

iii). Configuration of the interior shall provide flexibility to handle different baggage types with relative ease and not require tools to reconfigure.

iv). Functionality of various equipment within the car shall be intuitive and obvious. Design and assembly of the interior shall be clean and integrated with easy access for routine maintenance.

v). The car's interior shall be designed for safety, modularity, functionality, reliability, durability and require minimal maintenance.

b). Configuration

i). Provided in 8 sections, folding tubular luggage racks are provided along both sides of a central aisle. Under the racks, a raised perforated platform places luggage slightly above floor level to keep it dry, etc. These platforms are typically down but shall be hinged and foldable against the side walls. In each section, two robust tubular racks fold outward from the wall (similar to the Viewliner II) to accommodate luggage of varying sizes, or if retracted, to expose bicycle racks, two per each rack section. All folding devices shall be secured by passive latches, which cannot be accidentally deployed. Dividers are included between the rack sections to compartmentalize cargo so it does not shift.

c). CMF

i). Car interior walls, end sheets and ceiling shall be painted gloss white to improve visibility in the room.

ii). Interior ends and side walls as well as the ceiling of the Baggage car shall be austenitic stainless steel painted gloss white with a durable paint to enhance artificial and natural lighting within the car.

d). Lighting

i). Lighting for the side loading doors areas shall be LED type fixtures, designed and located to illuminate not only the area inside the car, but also to shine outward onto the station/ shop platform to facilitate the loading/unloading process during the trip.

31.58 Utility Baggage Area Luggage Racks

a). A luggage tower shall be of robust tubular brushed stainless steel construction and include shelves.

b). Bumper guards shall be mechanically attached to the wall panels within the luggage rack/tower to prevent damage to walls or luggage.

c). The rack/tower shall incorporate suitable brackets for handling garment bags. Golf bags and other larger items shall be able to be stored in this area.

d). This feature shall only be present in luggage racks located in the baggage car.

e). The luggage rack/tower shall be a convertible unit that can be reconfigured to hold two bicycles.

i). This feature shall only be present in luggage racks located in the baggage car.

f). All surfaces shall be smoothly finished to prevent damage to luggage or crew injury.

g). Each luggage tower shall be equipped with 2 tiers of folding, tubular luggage racks.

i). The racks shall pivot at the inner walls to allow them to be stowed to accommodate varying sizes of luggage/cargo.

h). The load bearing surface shall be inclined upward at an angle of 3° to 4°.

i). Steel cables enclosed in weather resistant jacket shall provide for each folding shelf as secondary support.

j). The lowest rack keeps baggage off the floor, protecting it from water, dust, etc. on the room floor.

k). Dividers are included between the luggage towers to compartmentalize cargo, so it

does not shift.

l). Luggage racks and supporting structure shall be made of stainless-steel transversal tubing, with a raised edge for luggage retention.

m). The racks shall have sufficient strength to support a load of 250 pounds midway between adjacent supports with a deflection not to exceed 1/4 inch and without permanent deformation. This shall be demonstrated at FAI.

n). Two passive ¼ turn latches shall be provided to stow each of the racks in the raised position. The luggage racks shall be easily moveable with one hand to stow or deploy.

o). Rack design and shelf dimensions shall provide the flexibility of having:

i). all luggage racks lowered for luggage handling any rack lowered for luggage handling

ii). all the luggage racks stowed.

iii). enable bicycles to be secured when all luggage racks are stowed.

iv). racks of different luggage towers function mutually independently of each other.

p). Rutland Industries, Mini-Mum model # MMW2XMHV or Amtrak approved equivalent for securing bicycles shall be provided along the inner walls folding out as needed to support a bicycle hung on it.

i). An instruction placard shall be provided on the wall adjacent these racks, giving instructions for proper rack use.

q). The fully loaded luggage racks and bicycle rack, mounting hardware and associated structure shall meet the strength requirements per APTA SS-C&S-034-98 for equipment support as well as RP-C&S-006-98 for attachment strength.

r). Due to anticipated harsh environment exposure, rough handling of luggage/cargo, the luggage racks, bicycle racks and associated support structure and mounting hardware shall be robust and corrosion resistant.

i). They shall be simple in design, operation, and maintenance without the need for springs, dampers, etc.

ii). Likewise, the interior walls, bulkheads and cargo nets shall be designed for durability in handling heavy luggage and various sizes of bicycles.

iii). The entire baggage room installation of racks shall be designed, manufactured, and installed to prevent rattles, etc., resulting from car movement at any speed.

iv). All exposed fasteners in the area shall be countersunk or flush mount types to preclude any damage to passengers' luggage.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

v). All edges and corners shall be rounded with generous radii. Bump strips shall be incorporated along the sides of each of the spaces to avoid scuffing the wall finish or the luggage.

s). Design of the luggage towers and bicycle racks shall be subject to design review. The final interior equipment, arrangement, dimensions, and locations shall be developed during design review, with the aid of mockups.

31.59 Utility Baggage Area - Gun Case Modules

a). Gun Case Modules (GCM) shall be provided in the baggage area of the utility car.

b). Gun Case modules shall be McMaster Carr part number E.33.54.601

c). Each GCM shall Measure approximately 78” H x 48” W x 24” D.

d). Each utility car shall incorporate one (1) GCM in the baggage area.

e). The final arrangement of the GCM and their application to the cars will be submitted to Amtrak for review and approval during the design review process.

31.60 Utility Baggage Area – Miscellaneous Storage Areas

a). General

i). The baggage area shall also serve as a storage area for additional trash, electrical equipment, and as a location for supply storage to be distributed throughout the car.

ii). The distribution of various storage capacities will be finalized during the Design Review Process.

iii). Utility cars shall also include the electrical cabinets and storage lockers, as described below.

b). Electrical Cabinets

i). See Chapter 15 for details.

c). Storage Lockers/Closets

i). Storage lockers shall be locked with crew keys or as otherwise approved by Amtrak.

ii). Storage lockers shall match the CMF of the adjacent wall paneling and countertop surfaces.

iii). Please refer to Chapter 19.

iv). Storage Lockers/Closets include the following:

(1) Trash Storage

(a) See Section 31.17 for details.

(2) Linen Storage Closets

(a) See Section 31.18 for details.

(3) Consumable Supply Storage

(a) See Section 31.19 for details.

(4) Cleaning Supply Storage

(a) See Section 31.20 for details.

(5) Dirty Linen Storage

(a) Dirty or used linens shall be stored exclusively in the utility car for ease of unloading at designated laundry stops.

(b) Used linen storage shall come in the form of a large hamper that can be easily stored or carried off the car.

(c) The reserved area shall be large enough to store up to 6 days of used linens throughout the consist. This includes tablecloths, napkins, pillowcases, sheets, etc.

(d) Exact dimensions and configuration for dirty linen storage shall be developed in conjunction with Amtrak during the design review process.

31.61 Utility Crew Sleeper

a). The Crew Area located in the A-End half of the car is essentially a simplified version of the Standard Sleeper. It includes the same body end door, electric/ switch locker, and emergency tools. Likewise, the center aisle is similar, with up to six (6) Roomettes located along both sides of the car. These rooms will be utilized by on-board personnel. A small “kitchenette” space for crew shall be provided between the Roomettes on the A-End and the checked baggage area on the B-end including dedicated, securable crew storage lockers, countertop space, a sink, a microwave and refrigerated storage.

b). The Roomettes, shower, restrooms and booth seats for the crew shall be identical in every way to the amenities used in the proposed car types.

Figure 31-33: Key Features – Utility Crew Sleeper

Feature	Short Description	Qty
Accessibility		
Aisle	22" minmium aisle between bedrooms	1
Interior Structures		
STR	Standard Toilet Room	2
Communal Shower	Communal Shower	1

Windows	Upper and lower windows- includes emergency egress features in each room	1 in each room
Blinds	A single blind system that provides sunshade and blackout performance	1 per window
Doors	Vestibule with a passenger door on each side	1
Baggage Area	Dedicated Baggage area with baggage racks totaling a minimum of 1600 cubic feet. Access is provided with both external doors and an internal doorway from crew area.	1
Kitchenette	Small crew Kitchenette with crew lockers	1
Linen Closet	Linen closet full height cabinet that is at least 2.5 ft wide and 2 ft deep.	1
Cleaning Supply Closet	See section 31.20 f	1
Consumable Supply Closet	See section 31.19 & 31.20 for details	1
Dirty Linen Storage	Used linen storage in the form of a large hamper	1
Accommodation		
Roomettes	Roomette for a single crew member	6
Seating & Tables		
Booth Seating	Repeatable and modular bench seating for 2 crew each - minimum 40" width	4 booth seats (8 seats)
Table Module	Repeatable dining table for 4 passengers	2

31.62 Lactation Room (Option)

a). A lactation room is defined as a hygienic place that is:

i). Not part of a bathroom

ii). Shielded from view

iii). Free from intrusion

iv). Accessible to disabled individuals including wheeled mobility device users

v). Contains a seat and a working surface

vi). Easy to locate

vii). Clearly defined with signage

viii). Contains an electrical outlet

ix). Available to employees and passengers for expressing breast milk

b). As an option, a lactation room shall be provided. This room shall have the following features:

i). Lactation Compartment Door

(1) The door to the compartment shall be the same manually operated, sliding door as is used for a standard sleeper compartment. (see Section 31.44a)

(2) The door latch, with a handle on both sides of the door, shall engage automatically when the door moves towards a closed position, but the lock requires definite action to engage.

(3) The door shall remain in the fully closed position at any permissible train speed.

(4) The lock shall be operable, in an emergency, from the outside with a standard Amtrak coach key.

(5) An instruction, in accordance with Amtrak Specification # 697, located on the interior side of the door, shall provide lock operating instructions.

ii). Outlets

(1) Three duplex outlets with three USB sockets shall be provided in the lactation room.

(2) The outlets shall be located above the armrest height and in easy reach of passengers while seated.

iii). Attendant Call Button

(1) A backlit button that pages the attendant assigned to this sleeper cabin. Please refer to Chapter 14 for complete information on this call button.

iv). Cup Holder

(1) A cup holder shall be provided as described in Section 31.46f).

v). Vanity Area

(1) A vanity surface shall be provided to support lactation and infant-care activities.

(2) A safety-glass mirror shall be provided above or adjacent to the vanity surface, positioned at a usable height and, where practicable, common with other mirrors used in the train.

(3) Storage provision shall be provided for personal items and infant-care accessories.

(4) A fold-out baby changing table shall be provided, integrated into the surrounding structure and designed to be safe, hygienic, and easy to clean.

(5) Final dimensions, configuration, and usability shall be subject to Amtrak review and approval at mock-up stage.

vi). Baby Cradle

(1) Cradle shall have 4 sides so that a baby can be retained within the cradle in a hands-free manner.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

vii). Facial Tissue Dispenser

(1) A facial tissue dispenser with a finished front plate shall be integrated into the vanity space.

viii). Hand Sanitizer Dispenser

(1) A base for a liquid hand sanitizer dispenser shall be installed adjacent to the mirror.

(2) The base shall one that will accept a Celeste Industries liquid hand sanitizer refill.

ix). Lighting

(1) General

(a) All lighting shall be dimmable, with a fixed color temperature to be determined during design review and mockups.

(i) Color temperature shall be determined per light fixture and may not be the same temperature for all fixtures within the compartment.

(2) Lighting Types and Locations

(a) Wash Lights in the Lactation Room

(i) Wall wash lights for both carshell walls shall be provided along the length of each wall above the windows and shall illuminate the sidewall and blinds.

(b) LED Panel Spotlights (White Lights)

(i) Two small circular LED light panels shall act as spotlights above the entry door. The frame for the spotlights shall be color matched to the ceiling.

26-FOI-00415 00000006276 "UNCLASSIFIED" 4/30/2026

32.28 CDRLs 32-42

32.1 Overview

a). This chapter describes the design and functionality of the optional cab car to be included in this procurement, including control equipment, instruments and gauges for systems necessary for the safe and efficient operation of rail cars and trailing propulsion vehicles from the Engineer's cab, and ancillary equipment for crew comfort and safety.

b). The Cab Car F-End shall include streamlined styling for reduced wind resistance to reduce fuel consumption and enhance locomotive performance at high speeds when the consist is operated in push mode. An end door, if provided for egress, must not detract from the end of train strength and safeguards for train crew protection from accidents at highway grade crossings.

c). Space behind the operating cab shall be physically separated by a door and used for revenue seating of coach class seats in a 2x2 configuration, with an accessible seating location and accessible restroom with a 60 inch turning circle identical to the High Capacity Coach Car. The materials and workmanship shall comply with Chapter 19.

32.2 Cab Arrangement

a). This chapter provides details regarding the Engineer's operating cab while the passenger seating area shall closely resemble the seating arrangement provided for the High-Capacity Coach Car.

b). The Engineer's cab compartment shall conform to FRA requirements and be sized for three crew members (Engineer, Assistant and extra observer), using two fixed seats and a jump seat, at the F-end. This cab compartment shall extend the full carbody width. The Cab mockup submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-01]**

c). The Engineer shall be located on the right side of the cab in the direction of travel, with the Assistant on the left side of the cab. It is of great importance that the cab compartment be designed to provide maximum comfort and alertness for the Engineer and Assistant for long periods of duty, as well as have the highest level of durability, reliability and maintainability.

d). The cab area shall be laid out so as to be neat and orderly in appearance, with all apparatus designed and arranged in a manner that will not cause confusion to the Engineer.

e). The layout shall maximize the use of available space and shall employ sound ergonomic and industrial design principles in its development yet designed to be rugged and easily maintained.

f). The more critical displays as identified herein shall meet human machine interface standards.

i). The displays shall be located adjacent to the windshield, in the Engineer's plane of normal forward vision, for ease of viewing.

g). Utility shall not be sacrificed to aesthetics, although a pleasing and comfortable

environment for the Engineer shall be a design objective.

h). Controls shall be arranged so that those which are most often used, or are of critical importance, are the most convenient to the Engineer, and others shall be located such that the hazard of misuse is minimized.

i). The cab arrangement shall be in compliance with the Tier I cab requirements of 49 CFR Part 238. All cab designs, materials and workmanship shall comply with the requirements of the appropriate chapters of this Specification and shall be submitted to Amtrak for approval during the design review process. A cab mock-up shall be constructed for review and approval by Amtrak in the same fashion as the requirements in Chapter 3.

j). Adequate space shall be provided on the cab console for maintenance personnel to place a standard laptop computer (10 in. by 15 in.) for operation during vehicle tests.

k). The Engineer's cab shall be isolated from passenger access, and shall be configured, including its door and locking provisions, to be in compliance with all applicable security guidelines. The cab shall be configured so that it may be closed off and locked when not in use.

l). The cab compartment linings shall be highly durable, scuff and scratch resistant materials, such as fiberglass reinforced plastic or melamine covered with Tedlar composite laminate or other Amtrak approved materials.

m). Modular console construction shall be used, with quick-opening captive black-finished stainless-steel fasteners used for attachment of console panels.

n). All interior panels shall be designed with large radius corners [0.5 in. (12.7 mm) minimum] and smooth transitions to facilitate cleaning and prevent injuries. The number of exposed fasteners, seams and moldings shall be minimized.

o). The control panels facing a seated Engineer shall be provided with a dull black finish to eliminate glare.

p). Exposed fasteners used to retain components shall be captive and have a black anodized finish to match the surrounding area.

q). The cab shall be arranged and finished to minimize injury to the Engineer and Assistant in the event of an accident or collision, and shall be free of sharp edges, protruding objects, safety hazards and floor obstructions as required by Military Standard MIL- STD-1472, latest revision. Areas in which newspapers and other debris can accumulate are not permitted.

r). Cab equipment and controls shall be mounted in modules and/or panels to be easily replaceable from the front or top of the installed position.

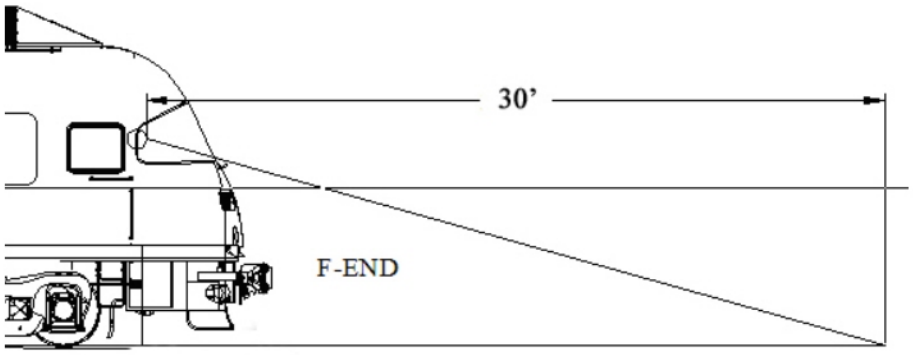
s). Electrical control panels shall have all wiring for the panel electrical devices terminate in an approved keyed quick-disconnect interface to the carbody wiring, so as to permit ease of panel removal.

t). All pressure switches and sensors, and all pneumatic cutout cocks, shall be arranged for ease of complete crew and/or maintenance access. Innovative

methods to facilitate cab equipment servicing and troubleshooting shall be proposed, such as mounting equipment panels using hinges and hold-open hydraulic pistons for access to electrical terminations.

u). All modules and panels, however, shall be designed for rapid complete removal from the car.

v). Pneumatic devices shall be fed from a non- kinking hose to permit ready panel removal and have in-line connections for removal, arranged to prevent incorrect connections of adjacent hoses. As it is expected over the life of the cars that future regulations will mandate additional controls and indicators be added to the cab consoles, the Contractor as an aspect of its design must provide adequate spare room on all panels for future additions. Ergonomic control layout, maintainability access and provisions for future additions shall be key aspects of the cab design review and the cab mock-up.



w). All annunciator lights and shall have a self-test feature or separate test switch to verify operation.

x). All indicator lights and controls shall be either permanently engraved white paint filled identification signs on a flat epoxy powder coat black background, switch label inserts protected by a clear durable plastic cover, panels protected by a clear Tedlar overlay, or other approved techniques with equal permanence.

y). Indicator and warning lights shall have sufficient brightness to be distinguished in peak daylight brighness, but not so bright as to cause hotspots or distraction during nighttime operation. A dimming function may be implemented as a solution.

z). The Engineer's minimum clear viewing distance from the seated position shall be no more than 30 ft (9.15 m) to the top of rail as shown in Figure 16-1, which may also be achieved by a camera and an additional display, subject to Amtrak's approval.

Figure 32-1: Engineer's Minimum Clear Viewing Distance from the Seated Position

aa). The cab layout shall also be arranged so as to provide the Engineer with an effective field of view to the right and left of the direction of travel. Obstructions to the field of view caused by required collision and corner post structural members shall be minimized. F-end operator Line-of-Sight Drawing submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-06]**

i). The arrangement of the cab shall be under the direction of the Contractor's Industrial Designer, who shall verify all human factors data.

ii). The Contractor shall submit for design review and Amtrak approval a series of general arrangement diagrams of the interior of the Engineer's cab compartment.

iii). Cab arrangement shall meet all necessary compliance to accommodate a 5th percentile female and a 95th percentile male.

iv). They shall include the location of all features and appointments, as well as general arrangement diagrams of the Engineer's control consoles, Assistant's work station, and jump seat illustrating the location of all features, appointments, controls, switches, gauges, meters and indicators.

bb). Fields of view, legroom provisions and ranges of arm movement for a seated Engineer and Assistant of the specified percentile range shall be included.

i). The review period for these initial cab and controls arrangement drawings shall permit internal review by Amtrak personnel.

ii). The final console arrangement shall be submitted for approval during drawing and design review and at cab mock-up reviews. **[CDRL 32-05]**

cc). The entire cab area shall be properly heated, ventilated and cooled, be draft-free, and insulated against noise and thermal loss.

dd). The cab compartment arrangement and all controls shall be approved in detail by Amtrak during design review.

ee). Cab installation, arrangement and design submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-04]**

32.3 Cab Windows

a). Windshield

i). Two FRA Type I windshields consisting of triple-laminated high impact untinted glass shall be provided at the Engineer's Cab of the cab car for the Engineer and Assistant positions. The windshields shall be a Frame type installation, with the glazing installed so that it is not unduly stressed by frame or carbody flexure.

ii). The windshield dimensions shall permit a maximum field of view for a seated Engineer.

iii). The design and installation of the windshield shall minimize external glare as well as reflections from inside the car. When the car is operated at night or in tunnels, no reflections shall be visible in the windshield.

iv). The windshields shall be installed in an anodized aluminum frame. Mounting shall be designed to prevent the glazing from being pushed into the car interior and shall be arranged for replacement from outside the car. Design by spall shield or other approved means shall be provided.

v). The windshields shall be electrically heated using cab switch control. When activated, a clear and unobstructed view shall be provided.

vi). A two part “Emergency” handle shall be provided for both cab end windshields to allow for removal of the windshields from inside of the car in the event of an emergency. The design of the glazing rubber shall also allow removal of the windshields from the outside of the car by emergency responders. Identification and removal instructions shall be provided.

b). Sliding Side Window

i). Each side of the Engineer’s Cab in the cab car shall have a sliding side window for Engineer and Assistant use. The sash shall be designed to permit an Engineer to easily lean out, when either seated or standing, and be able to view a station platform or the wayside in either direction. An alternate design hinged side window may be proposed for review and approval. When in any position, the side window shall not interfere with any cab controls or engineer’s field of view, operation of controls or movement.

ii). The minimum clear opening shall be 16” wide by 18.4” high. Locks and keepers shall not encroach into this opening.

iii). The sash shall use FRA Type II untinted window glazing, installed in the frame with elastomer sections to form a watertight seal. Easy reglazing of the sash shall be a required design feature.

iv). The sliding portion of the sash shall be designed to slide freely in either direction

v). The sash shall be secured by a rugged latch assembly of an approved design, easily reached by a seated Operator.

vi). The sash design shall be such to allow the sliding portion to maintain any derived opening during normal operating conditions.

vii). Positive latching in the closed position is required as well as positive retention in any of the designated open positions.

viii). All window functions shall require less than 5 lbf to operate.

ix). The latch handle shall be designed and positioned to provide the best ergonomic condition for closing, locking, latching and opening movements.

32.4 Emergency Egress/Ingress

a). A means for emergency egress or ingress of the cab shall be incorporated into the design of the Engineer’s cab.

b). The Contractor shall design the layout incorporating provisions for the cab occupants to exit in an emergency via normal exit doors and another Amtrak approved alternative method.

i). Exit pathways must be considered in the design by not locating other cab equipment in the exit pathway(s).

ii). Emergency lighting shall comply with AAR and APTA standards for Cab Cars, The provisions shall also incorporate a means for outside emergency personnel to enter the cab area.

c). Provisions shall also be incorporated in the design of the cab area for emergency exit or ingress and an emergency evacuation ladder or another Amtrak approved alternative method from the cab to the track level at the end of the train, for situations when there is no side access to the cars.

d). There shall be one roof hatch emergency access point located in the Engineer's Cab area. The designs shall comply with 49 CFR Part 238.123 requirements.

e). Emergency Egress and Ingress submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-07]**

32.5 Cab Enclosure

a). The cab shall be completely enclosed and shall contain an Engineer's control console located below the windshield, a right and left side vertical panel on either side of the windshield, an overhead panel located above the windshield and a circuit breaker panel in an approved location.

b). To the Engineer's and Assistant's rear shall be a transverse partition extending across the full carbody width, incorporating a door, centered transversely, and exiting to the passenger area.

i). This partition wall shall completely separate the passenger area from the cab enclosure. The cab will be arranged as to allow the Engineer visibility to observe the far left side of the track such as at grade crossings.

c). Cab layout, materials and coatings shall be used to make the view through the windshield as distortion and glare free as possible.

d). The carbody, adjacent roof, end and sidewalls shall be fully sound insulated throughout the cab to achieve the lowest possible cab interior ambient noise level of less than 80 dBA.

e). All cab components shall be evaluated individually for their noise contribution such as windows, cab seats, doors, lighting fixtures and hardware.

i). Air ducts shall be baffled as required to control wind noises and to attenuate exterior noises.

ii). Use of components that cause noise, vibration or oil canning will not be acceptable. If noise from vibration is caused by any part of the vehicle equipment, the Contractor shall modify and revise the design to eliminate this condition.

iii). Under all normal conditions of operation, vibration of interior components such as partitions, walls, doors, ceiling panels, light fixtures, etc., shall not be visible nor audible.

f). Design and styling shall seek to improve safety, ergonomics and ease of operation. Engineer's right and Assistant's left side operable windows and shall

incorporate an exterior rain deflection gutter.

g). The cab partitions shall be securely mounted to run from floor to ceiling and be of adequate structural integrity to withstand all normal or extraordinary loading from passenger contact, such as from vandalism.

i). Each partition, when mounted, shall withstand a horizontal load of 330 lbs. (149.82 kg) applied at any location without permanent deformation. The exterior face shall match the styling of the car interior, and the interior face shall match the Engineer compartment styling.

h). Incorporated into the rear wall of the cab in an approved, easily accessed location, shall be lockers for the Engineer's and Assistant's personal effects.

i). These lockers shall be solidly constructed and lined with stainless steel or similar finishes and have a hinged door.

ii). The door shall have a compression latch with an integrated padlock hole.

iii). The doors shall be mounted with a stainless-steel piano hinge and have an external face treatment matching the cab decorative effect. The minimum inside dimensions shall be 22.7 in. wide by 20 in. high by 21 in. deep (576 mm wide by 511 mm high by 555 mm deep), unless otherwise approved by Amtrak. An open doorstop shall be provided.

iv). A second, smaller storage locker shall also be located on the rear wall, without a hasp.

(1) It shall contain an intermediate shelf, and be used for storage of crew individual portion water bottles, crew kit, paper towels, etc.

i). All interior appurtenances and surfaces shall not create glare in the interior glazing and control console. If there is not space for locked lockers in the cab, it can be installed in the optional crew space or in a location immediately adjacent to the cab as proposed by the Contractor and approved by Amtrak.

j). A rugged fold-down jump seat for a third crew member shall be installed at an appropriate location in the cab.

32.6 Cab Door

a). The center-rear of the Engineer's cab shall have a fully hinged door which shall swing outward, toward the passenger area. The door design, hardware and location shall facilitate rapid Engineer evacuation in the event of an emergency. The door operation shall require less than 10 lbf to operate.

b). The cab door shall contain an emergency removable panel at the bottom of the door. The door shall be of hollow stainless-steel or painted aluminum unless otherwise approved by Amtrak.

c). Each door shall be provided with adequate stainless-steel reinforcements for the attachment of all hardware. The door shall be bound on all four edges by welding, rolled seams, or a combination.

d). The cab door shall be hung on a continuous, full length, stainless steel self-closing hinges having a stainless-steel hinge pin, located at the outboard edge of the door. When closed, the door shall bear against a neoprene elastomer cushioned door stop across the top and both sides. The cab door shall be of sufficiently rigid and strong construction to withstand, when mounted and closed, a horizontal load of 330 lbf (1,468 N) applied at any point without permanent deformation.

e). The door shall not rattle or squeak in any position and shall be sealed when closed to provide a highly soundproof barrier.

f). The cab door shall have a window in its upper portion of the door frame.

g). The clear viewing area shall be approximately maximized in both lower and upper portion, but not less than 30 in. (762 mm) vertically by 8 in. (203.2 mm) horizontally so that the crew members, whether seated or standing can look back into the passenger area.

h). The window material shall be a minimum of 0.25 in. (6.35 mm) thick mar-resistant polycarbonate or other approved material.

i). The window shall be glazed in a neoprene rubber section and mounted to the door using a two-piece frame (inner and outer) aluminum extrusion or by the silicon rubber sealing profile so that it provides security and can only be replaced from the inside of the cab.

ii). The exterior face shall either have no exposed fasteners or fasteners with tamperproof heads.

iii). An opaque roller curtain or similar approved arrangement shall be provided on the inner face to permit an Engineer to block any light transmission through the door window into the cab.

i). Unless a dedicated HVAC system is provided to the cab car, a sight-tight, louvered, heavy-duty, nonadjustable stainless steel or anodized aluminum air grille shall be located in the lower part of the cab door for ventilation.

i). The size of the grille shall be approximately 7 in. (177.8 mm) vertically by 9 in. (228.6 mm) horizontally and located on the centerline of the door, at least 12 in. (304.8 mm) above the floor.

j). The cab door shall have an approved snap-type lock, which shall hold the door closed and can only be opened from the passenger area side by a JL Howard 2555 coach key, unless otherwise approved by Amtrak.

i). The design of the lock case on the aisle side shall have a security cover plate to preclude any unauthorized entry into the cab by forcing the latch head back.

ii). A large horizontal push-type panic bar handle shall be provided on the cab side of the door to facilitate rapid unlatching and exit without the use of the key.

iii). The door lock mechanism shall be easy to access for repair or replacement.

k). The cab door shall have a center aisle ceiling mounted recessed metallic latch, which will hold the door in the open position when desired. An elastomer bumper shall cushion the door when fully opened.

32.7 Windshield Wiper

a). An Amtrak approved, heavy-duty, automatic electric windshield wiper powered by the low voltage power system shall be installed at the top of the Engineer's and Assistant's windshield at each cab.

b). The wiper motor shall be brushless, be thermally protected against stall conditions, have Radio Frequency Interference (RFI) suppression, and shall be easily accessed and removable from inside the end of the car, using quick disconnect fittings.

c). A heavy-duty transit quality tubular low wind lift pantograph wiper arm shall be used, with all visible parts having a black finish.

i). A curved-glass type black finished heavy-duty wiper blade with a replaceable rubber element sufficiently, long to wipe at least 80% of the glass, shall be used, mounted with a saddle type connector.

d). The system shall operate successfully in rain or snow at all vehicle speeds.

e). Windshield wiper control knobs shall be located on the Engineer's side.

f). The windshield wiper shall have an off position, two fixed delays of 3.8 sec (from Off to Int) and 6.7 sec (from Slow to Int), and either a variable speed of approximately 30 to 90 cycles per minute or two fixed speeds.

g). The wipers shall automatically move to the park position (edge of the windshield opposite of the camera location) when turned off.

h). The wiper mechanisms shall operate smoothly without hesitation throughout its cycle under all conditions, including clearing rain and snow at vehicle speeds up to 125 mph (201.1 km).

i). Wiper operating mechanisms and drive units shall be accessible for repair and replacement.

ii). The operating mechanisms shall be enclosed.

i). An Amtrak approved, service proven electrically operated windshield washer, with fan-type pattern spraying nozzles mounted on each windshield wiper arm, shall be provided.

i). The washer system shall effectively cover the entire portion of the windshield within the sweep range of the wiper.

ii). A windshield washer reservoir using corrosion-resistant materials and fittings, of minimum 5 gallon (18.93 L) capacity shall be mounted under the car.

iii). The design shall allow refilling without the need for step ladders or tools.

32.8 Sun Visor

a). An Amtrak approved, adjustable sun visor shall be installed in each cab for the Engineer and Assistant which meets flammability smoke and toxicity emission requirements.

b). Roller blinds are acceptable for cab window sun visors. Blinds must have the ability to stop/stay fixed in every intermediate position and allowed to raise upwards when required using a spring-operated mechanism which winds the blind up. A similar visor will be provided for the Assistant as well as visors mounted for windows on the left and right side of the cab.

c). The sun visor construction shall be consistent with 49 CFR Part 238.103. The design and placement shall be approved by Amtrak.

32.9 Mirror

a). On both sides of the cab at the forward edge of the side window, shall be an exterior locomotive style combination adjustable windshield wing and mirror.

b). It shall contain an integral vertical tilt mirror and be arranged to swing flat against the carbody.

c). The mirror mounting, and support shall be designed so that when overloaded the mirror will break away without damage, scuffing or deformation of the carbody.

d). Final location and arrangement of all mirrors shall be approved by Amtrak and determined at the front-end mock-up.

32.10 Engineer’s Seat

a). Each cab shall be equipped with heavy-duty, high-back style Engineer and Assistant locomotive seats, each supported on a center pedestal designed to provide satisfactory comfort and proper access to cab controls with good visibility.

b). The cab seats shall be mounted symmetrically about the longitudinal centerline of the car, between the collision and corner posts in order to optimize viewing and ergonomic interaction with the car controls.

c). They shall also be even with each other and accommodate the clear view distance defined in Chapter 16.2. There will be a minimum of 0.5 in. (12.7 mm) clearance from the back wall when in the rearmost position. Cab seat will be designed in a way which will not cause damage to cab console.

d). The seat design shall take into account the limited amount of space available in the cab, and also the possible standing of the Engineer/Assistant to look out of the side cab window.

e). The seat assembly shall incorporate failsafe operating features and adjustment methodology to prevent sudden seat failures during the life of the car to avoid Engineer/Assistant injuries.

i). All mounting hardware to the cab floor shall be stainless steel.

ii). The seat frame shall be of tubular steel construction designed for hard usage. The seat bottom and back cushions shall be properly contoured to provide adequate lumbar, back, side and thigh support, and shall be constructed from foam material meeting the requirements of Chapter 19.

iii). The Contractor shall make every reasonable effort to minimize the number of unique parts (especially adjustment mechanisms and knobs) used in its construction and installation. No seat component shall be removable without tools.

f). All strength, performance, and other criteria defined within this Chapter shall be considered minimums.

i). The seat and its attachment shall comply with the requirements of 49 CFR Part 238.233 (FRA Tier I vehicle).

ii). In addition, the seat shall comply with the requirements of APTA Standard PR-CS-S-011-99 but may be supplied without a rotation feature. Where conflicts exist, the most restrictive shall apply.

g). The seat assembly shall meet the smoke and flammability requirements of Chapters 2 and 19.

h). Heavy-duty transportation grade upholstery having an approved color shall be used. All seams shall have high mechanical strength, and bottom cushion transverse seams in the area of the top front corner are to be avoided.

i). The details and colors of the seat design shall be reviewed and approved by Amtrak.

ii). The Contractor shall consider utilizing darker colors in areas that tend to accumulate dirt and stains, such as the head rests and the armrest caps.

i). As part of the design review efforts, the Contractor shall present an ergonomic analysis and report of the seating system. One sample seat shall be submitted by the Contractor for approval by Amtrak prior to testing**. [CDRL 32-08]**

j). The seat suspension shall have a scissor mechanism with a pendulum design to eliminate lateral wobble and shall use service-proven bearings at all moving points.

i). A protective bellows shall encase the suspension system mechanism.

ii). The seat back height shall be coordinated with the cab arrangement.

iii). The seat back shall have an infinitely adjustable mechanical lumbar support and a back shell to protect the rear cab wall from damage.

iv). There shall be no sharp edges or surfaces which could cause injury.

k). The seats shall contain mechanical components only and shall provide simple, smooth adjustments while an Engineer is seated.

l). The seats shall have a minimum of 6 in. (152.4 mm) fore/aft adjustment [9 in.

(228.6 mm) being desirable if the cab arrangement permits] with roller bearing slides each having locking mechanisms.

m). The seat height adjustment range shall be a minimum of 5 in. (127 mm) and shall not allow the seat to free fall.

n). The seat bottom cushion shall have a range of 8° of tilt, and the back cushion shall have a range of 8° of tilt past the vertical, if cab arrangement permits.

o). Recliner mechanisms shall be double gear with a tooth and sprocket on both sides of the seat. Adjustment devices using simple notched cam plates with flat sides for setting heights or pitch are prohibited.

p). A wall or partition-mounted folding Observer's seat shall be provided in the cab area. It shall be padded and upholstered similar to the Engineer's seat and shall be approved by Amtrak.

32.11 Horn

a). A roof mounted heated pneumatic horn, Nathan/Airchime model K-5LA, with bell frequencies of 311, 370, 415, 494 and 622 Hz, with all bells facing outward, shall be installed on the roof at the Cab car F-end.

b). Each horn bell shall be provided with the manufacturer's stainless steel conical debris/snow filter to prevent accumulation and packing of debris and snow in the bell mouth. The method of debris and snow deflection shall be subject to the approval of Amtrak.

c). To reduce vibrations transmitted into the carbody, the horn shall be mounted on a 0.25 in. (6.4 mm) thick elastomer mounting pad.

i). The horn mounting location on the car roof shall take into account airflow patterns and snow accumulations, in both the leading and trailing modes, to minimize snow and ice accumulation.

d). The horn shall be operated by an electronic switch located on both the Engineer's and Assistant's center cab console controlling a dual-volume electro-pneumatic horn valve.

i). The valve shall be a Graham-White Manufacturing Company model 412 series or approved equivalent manual metering horn valve, with prior successful use in this application, and a high cycle life.

e). In addition, a foot pedal activated switch shall be located on the floor beneath the Engineer's center cab console which shall automatically produce a standard grade crossing warning signal sequence (long - long - short - long), with adjustable timing settings.

i). The switch function shall be inoperative below 3 mph. Pressing the switch again during the automatic horn sequence shall instantly cancel the remainder of the sequence and silence the horn.

ii). The foot pedal switch shall be finished in a contrasting color.

f). The air supply to the valves shall be on Horn manifold cutouts inside the control cabinet.

i). All control valves and supply piping shall be sized to handle the required air flow, so that there is no delay in the buildup to full horn volume when activated.

g). The horn as installed shall comply with the requirements of 49 CFR Part 229.129. The horn volume shall be compliant with both “high” and “low” volume activation. A restriction choke shall be installed in the base of the horn as required to prevent excessive sound level. Activation of the horn as sensed by an appropriately located pressure switch shall cause the bell control in Section 32.12 and the auxiliary light control in Section 32.17 to operate as approved by Amtrak.

h). All valves, switches and controls shall be completely accessible for maintenance. Details of the horn installation shall be approved by Amtrak.

32.12 Bell

a). An electronic bell shall be located under the Cab car near the F-end. Its mounting location shall minimize the accumulation of snow and ice in either travel direction.

b). A momentary contact two position (On/Off) yellow push button control switch shall be located on the left side of the Engineer's console.

c). The method of actuation shall be approved by Amtrak. Activation of the bell shall cause the auxiliary light control in Section 32.17 to operate as approved by Amtrak. All switches and controls shall be completely accessible for maintenance. Details of the bell installation shall be approved by Amtrak.

32.13 Miscellaneous Cab Items

a). The following shall be provided in each cab and require approval by Amtrak, exceptions for standardized cab subject to Amtrak approval:

i). A Cab Signal/ACSES/I-ETMS and provisions for ITCS and IITS for the Engineer, and I-ETMS display screens for the Assistant.

ii). White reading lights using LEDs for both Engineer and Assistant, with individual switch controls.

iii). Alerter system and both dashboard and foot pedal reset switch.

iv). A ceiling air diffuser, a floor heater element and a forced air heater or radiant heat system as approved by Amtrak.

v). A Conductor communications signal system pushbutton and alarm shall be located in the cab, along with a crew intercom speaker with integral volume control which cannot be muted.

vi). The cab windshield shall be heated electrically with a clear film.

vii). A permanent car number identification plate shall be applied to the console in a prominent location near the speedometer.

viii). Three flush, heavy-duty, spring loaded coat hooks with integral rubber bumper shall be located on the rear partition.

ix). One 8.5 in. by 11 in. (216.9 mm by 279.4 mm) "blue form" inspection card frame with transparent cover, conforming to FRA document size requirements, shall be located on the inside face of the rear partition electric circuit breaker locker door, as directed by Amtrak and in accordance with 49 CFR Part 229.23(d).

x). An 8.5 in. by 11 in. (216.9 mm by 279.4 mm) "air slip" inspection form holder for a daily inspection form shall be located on the rear partition wall near the cab door.

xi). Clipboard-type spring loaded holders shall be installed with clear areas sufficient to hold 8.5 in. by 11 in. (216.9 mm by 279.4 mm) bulletin orders shall be located within easy reach of the Engineer and Assistant. Spring loaded holders shall be replaceable.

xii). A cup holder to retain a large coffee cup or soft drink container shall be mounted on the side wall below the side window sliding sash and forward of the Engineer's seat. It shall be a rugged design with a bottom drain hole, designed for ease of cleaning. A similar cup holder will be provided for the Assistant.

xiii). One 120VAC grounded duplex GFI-protected receptacle, protected for 20 amps service, and a 74VDC receptacle, shall be located in the lower cab wall.

xiv). Flat writing surfaces sufficiently large to hold 8.5 in. by 11 in. (216.9 mm by 279.4 mm) paper shall be located directly in front of the Engineer and Assistant, at the base of the windshield, in order to permit the Engineer or Assistant to write Track Warrants and Form D papers. These surfaces shall also be sufficiently large to allow a (10 in. by 15 in.) laptop computer to be used by maintenance personnel.

xv). For train crew use during backing movements, a two-position key switch operated by a standard coach key shall be included in the cab console in an approved location, for use by the Conductor and train crew in a trailing cab of the train. When this switch is turned 90 degrees to the right, it shall activate the controls for the headlights, cab ceiling lights and cab gauges and the communications system (radio, public address and crew intercom). The key shall be captive in the on position.

xvi). For train crew use during backing movements, a conductor's emergency brake valve shall be provided in an approved location. It may be located immediately outside the cab door.

xvii). A flag holder and a fireproof closed metal container for fuses shall be provided in accordance with 49 CFR Part 229.119(f).

xviii). A small trash container, approximately 18 in. by 12 in. by 6 in. (457.2 mm by 304.8 mm by 152.4 mm) in size shall be provided that uses a standard-sized trash liner.

xix). Exterior FRA marker lights at end of the car, with the lights at the cab end controlled by a switch on the cab console.

xx). Appliances, fully loaded, shall be restrained against accelerations of up to: 8g in the car longitudinal direction, 4g in the car lateral direction and 4g in the vertical direction with an approved restraint system.

xxi). A refrigerator shall be provided with a minimum capacity of 2 cu ft.

32.14 Cab Controls

a). Arrangement of Controls

i). The Engineer's cab shall feature a desk-type, primary control console centered below the Engineer’s windshield, with an additional vertical instrument and control panel located to the Engineer’s right by the cab corner, and to the left.

ii). The layout of the cab shall be coordinated with Amtrak, shall be incorporated into the cab mock-up and shall be subject to review and final approval by Amtrak.

iii). Consoles and panels shall be neat in appearance, with all equipment, indicators, devices and controls arranged in an orderly manner.

iv). The console and panels shall be constructed of a stain, burn and corrosion-resistant, integrally colored, non- glare material as approved by Amtrak.

v). The console cabinet color and design shall match the adjacent cab lining scheme.

(1) Indicator and annunciator lights shall be positioned centrally to the Engineer's forward line of sight, arranged so they do not cause reflections in the Engineer's windshield, shaded against direct sunlight and readily visible under all ambient light conditions, and provided with intensity adjustment capability.

(2) The cab console shall be illuminated for day and night operation without causing reflections on the windshield.

vi). The console lighting shall be located so as to properly illuminate all switches and gauges necessary for train operation and shall be LED dimmer controlled.

vii). The consoles shall be designed and shaped in such a manner to permit the Engineer or Assistant to open and lean out of the cab side windows to inspect the train.

(1) The center console shall extend to the bottom of the windshield (no dead areas in cab to collect debris and dirt).

viii). The arrangement of controls to satisfy the ergonomics of a wide range of Engineer physical sizes (from the 95-percentile male to the 5-percentile female) shall be given particular attention by the Contractor.

ix). The speedometer, cab signal aspect display unit, I-ETMS CDU, car number sign and air pressure gauges shall be positioned from the horizontal to 15 degree downward range of a 50th percentile adult male Engineer's eye position.

x). The Contractor shall also provide provisions for the ITCS CLD.

xi). Locomotive traction power shall be controlled by the Engineer by means of a master controller, positioned for ease of operation by the left hand, which shall contain a reverser control handle and a controller handle for power level selection. It is desired that the master controller shall generally be patterned after the ACS-64 locomotive units now in use on Amtrak.

xii). The cab console must provide sufficient space for reverser handle movement. Braking shall be controlled by the Engineer by means of a brake controller, located for ease of operation by the right hand. Between the two controllers shall be a flat area suitable for use as a writing surface by the Engineer.

xiii). The cab master controller key shall be used by the Engineer to activate the cab electrical controls and propulsion system master controller.

xiv). The vertical instrument and control panels flanking the windshield shall be arranged to be angled toward the Engineer, so that critical displays are located at a 90° angle to the Engineer’s field of view. All indicators and annunciator lights shall be LEDs, which shall have a lamp test feature.

xv). All operating controls displays, and all indicators shall be positioned within the Engineer's normal reach and normal line-of-sight when seated.

(1) Controls or indicators, associated with a specific side of the train, shall be positioned on the associated side of the console or indicator panel. Cab Signal/ACSES ADU, IETMS CDU and provisions for future ITCS CLD will require an HMI study. **[CDRL 32-02]**

xvi). All displays, switches, controls and indicators on the control console or adjacent panels shall be rugged, high-quality devices suitable for rail vehicle application and readily available from commercial sources.

(1) A minimum number of different types of devices shall be used, and individual functional designations shall not be marked on the device.

(2) Designations shall be permanently attached to or engraved on the console. Multi-position controls shall have all positions identified. Adhesive bonded tags shall not be permitted.

(3) All device types shall be subject to approval by Amtrak.

(4) See Table 32-1 at the end of this Chapter for control locations. Note that the Switch Type/Colors in the table are representative, acceptable parts; the Contractor may propose using equivalent parts or locations subject to Amtrak approval.

b). Center Console

i). The center console located in front of the Engineer and Assistant at the bottom of the windshield shall be generally arranged as a flat desk sloped downward toward the user.

ii). All control devices shall be logically installed to provide an integrated appearance. Mounting hardware and all interface connections for the propulsion and braking controllers shall provide ease of access for maintenance or removal. The console shall be designed so that liquid spilled on the surface will not damage or interfere with operation of components, apparatus, equipment under the console, or wiring. Its finish shall be easily cleaned with a soap and water solution.

iii). The Engineer's side center desktop console shall contain the following, generally from left to right:

(1) Bell ringer pushbutton switch (On/Off)

(2) Master controller

(3) Sanding switch/push button

(4) Writing space for train orders

(5) Headlight control switch

(6) Cab Signal/ACSES, acknowledge pushbutton and ITCS provisions

(7) Horn control valve lever

(8) Reading light/cab lighting rocker switches and dimmers

(9) Brake controller with integral display screen

(10) Auxiliary light control switch

(11) Windshield wiper control

c). Other Controls, Switches and Gages

i). The following controls, switches and gages shall be positioned at appropriate locations in proximity to the Engineer to provide optimum access to the Engineer, with minimal hindrance to visibility.

(1) Potential areas include the vertical control panel on the right and the upper panel. Alternate arrangements for a standardized cab may be proposed, subject to Amtrak approval.

(2) Fault display panel

(3) Conductor communicating signal pushbutton switch

(4) Fault reset switch

(5) Gauge LED dimmer control

(6) Heated windshield switch

(7) Cab HVAC control

(8) Car number plate (at optimum viewing location)

(9) Two duplex air gauges (at optimum viewing location). Digital representation of air gauges can be proposed for review and Amtrak approval.

(10) main reservoir/equalizing reservoir

(11) brake pipe/brake cylinder

(12) Radio and communications control

(13) Emergency engine shutdown pushbutton (This button shall shut down a diesel or electric locomotive)

(14) Locomotive alarm bell silence pushbutton switch (bell inside panel)

(15) Main circuit breaker (electric) toggle switch

(16) Pantograph Control

(17) Bulletin order clipboard

(18) Cab signal departure test panel

(19) Cab signal cutout and bypass switches

(20) Cab signal train type selector switch

(21) Indicator LED and annunciator panel

(22) Alerter acknowledgement button, yellow

(23) Alerter panel

(24) Speedometer

(25) Non-cab signal territory mode switch

(26) Marker light switch

(27) Headlight/auxiliary light status indicators (centered)

(28) Locomotive dynamic brake/wheel slide warning buzzer

(29) Locomotive alarm bell pushbutton switch (bell inside panel)

ii). The following switches are to be sealed in the normal (down) position using a secure plastic tie seal method. A 0.1015 in. (2.5781 mm) (No. 38 drill) diameter hole shall be provided in each switch toggle and in an adjacent sealing wire standoff for each switch:

(1) Propulsion/doors interlock bypass switch

(2) Propulsion/ADA interlock bypass switch

(3) Cab Signal, ACSES, I-ETMS, ITCS and IITS cut out switches

(4) Spare switch location

(5) Train control bypass

(6) Alerter

iii). Ideally, a vertical control panel to the left of the Engineer shall be avoided to provide improved visibility.

iv). The area above the windshield shall be used for infrequently used devices, if required.

d). Desktop Console – Assistant's Side

i). The Assistant's desktop console will contain the following equipment and controls with deviations approved by Amtrak through the design review process:

(1) Bell pushbutton (On/Off)

(2) Modulating horn valve with cushioned lever

(3) Conductor's Emergency brake valve

(4) Track warrant holder with spring clip

e). Other Controls, Switches and Gages – Assistant's Side

i). The Assistant's side will contain the following equipment and controls with deviations approved by Amtrak through the design review process:

(1) Radio handset, control panel and handset storage cradle

(2) Radio keypad

(3) Car number plate

(4) Reading light switch

(5) Ceiling light switch

(6) Speedometer

(7) Cab reading light dimmer

(8) Cab Signal/ACSES display units, and provisions for I-ETMS, ITCS and IITS display units

f). Lower Cab

i). The area under the console and above the floor shall be clear of all piping and obstructions to provide room for the Crew members' feet and legs.

ii). A raised platform, approximately 6 to 8 in. (152.4 to 203.2 mm) above the floor, shall be provided in front of the cab seat.

iii). An approved full-width footrest, e.g., stainless steel tubular bars for both the Engineer and Assistant, at least 9 in. (228.6 mm) long shall be provided.

iv). Foot switches specified by Amtrak shall be installed on the Engineer's side.

v). A properly identified and recessed horn system pneumatic cutout cock and associated pressure switches (if provided) shall be located below the center console or similar location where it can be easily reached by the Engineer.

g). Master Controller

i). The propulsion commands for the train shall be produced by manipulation of a compact, all electric master controller provided in each cab. Activation of the master controller and the cab controls shall be accomplished by use of the reverser handle.

ii). The proper ergonomics of the design and operation of the master controller is of great importance and shall be approved by Amtrak.

iii). The master controller shall directly produce trainline command signals through the actuation of heavy-duty cam switches.

iv). The camshaft shall be directly driven by a single handle to control all operations of the propulsion system.

v). A mechanically interlocked reverser activated by the reverser handle driving a smaller camshaft shall select the direction of motion.

vi). The master controller handle axis of rotation shall be horizontal, with an ergonomically comfortable arc travel.

(1) The controller shall be rugged and designed for the railroad or transit cab environment.

(2) Rubbing surfaces shall be enclosed to exclude dust and dirt. Internal components shall, as much as possible, consist of parts common to the propulsion system of other recently produced cars, and where not possible shall be of an equal quality level.

vii). The master controller top plate shall be removable without any disassembly of the controller mechanism other than handle and knob removal.

viii). An alternate master controller may be proposed for a standardized cab, subject to Amtrak approval.

ix). The master controller shall have a coast position, which shall be closest to the Engineer, and eight power positions (power level 1-8).

(1) Each position shall have a medium detent tactile indicator sufficient for the Engineer to sense that the controller contacts are fully closed. The coast position shall have a more noticeable detent that is readily detectable.

x). The controller top shall have approved raised and painted markings to easily identify each position. Power shall be applied by moving the handle forward away from the Engineer. The master controller handle shall not have a deadman feature.

xi). The Contractor may provide a cruise control feature, subject to Amtrak approval. The design interface between the master controller and brake controller/system shall prohibit any braking application when the master controller is in propulsion notches 1-8.

xii). The reverser and main controller handle shall be interlocked mechanically as described below.

(1) The main controller handle shall be permanently attached.

(2) It shall be possible to move the reverser handle only with the master controller handle in the coast position. With the reverser handle in the neutral position or in the off position, the master controller handle shall be mechanically immobilized in the coast position.

xiii). The mechanical interlocking mechanism shall be robust and require no lubrication, cleaning or maintenance other than at the major overhaul periods for the rest of the car equipment.

xiv). The electrical connections between the controller and the car wiring shall be by means of electrical connectors per Chapter 19.

xv). The controller shall be bolted to the cab. The bolts shall have open access, and the entire controller shall be easily removed and replaced for maintenance purposes. The details of the controller shall be approved by Amtrak.

h). Control Functions

i). The reverser handle interface of the master controller shall have four positions, out, reverse, neutral and forward, and shall control other cab equipment (other than the cab air brake system) to produce the following functions.

(1) In the out position, the cab shall have all cab operating systems de-energized other than the train control systems, and the master controller handle shall remain mechanically locked.

(2) In neutral, all operating systems other than propulsion control shall be powered.

(3) In forward and in reverse, all systems shall be operable. The reverser handle shall be removable in the out positions. The cab air brake

system shall be controlled by the brake handle controller, per Chapter 9.

ii). Circuits needed to establish the controlling cab and provide the interface with all the other car systems, such as doors, annunciators, etc., shall be carefully designed for safety, reliability and simplicity. Since such circuits can contain single-point failure locations that are capable of incapacitating a cab or a train, the Contractor shall treat them as a subsystem worthy of special attention and include consistency check diagnostics. In evolving its designs, the Contractor shall treat the need to operate from other than the lead cab of the train as potentially hazardous and as a solution of last resort. The Contractor shall prepare a document which contains four items for Amtrak's approval during design review **[CDRL 32-03]**:

(1) An analysis of potential failures, their operational importance and how they will be annunciated to Amtrak.

(2) Explanation of how each of the identified failures can be overcome by the train crew, i.e., what provisions have been incorporated in the design for reestablishing train operability.

(3) Explanation of how the recommended troubleshooting procedures, test equipment supplied, and features of the basic circuit design will direct the attention of maintenance personnel to the point of failure.

(4) A Preliminary Hazard Analysis (PHA) and Failure Mode and Effects Analysis (FMEA) to confirm that no hazardous failure modes exist.

iii). Alternate arrangements for a standardized cab may be proposed, subject to Amtrak approval.

i). Audible Alarms

i). All required audible alarms and signals shall be electronic and shall be provided in the cab, located so as to be clearly audible to the Engineer and Assistant under conditions of loud ambient noise, and be readily accessible for maintenance.

ii). Audible signals requiring different actions shall have different sounds as specified below. Audible signals shall be no louder than necessary to be clearly audible in the cab under worst case conditions such as passing another train in a tunnel. The final audio levels shall be determined during acceptance testing.

iii). Provisions shall be provided to announce a digital verbal one-time message to the Engineer and Assistant at the beginning of each of the below audible alarms. This functionality shall be non-vital and not integrated in any manner with the system being announced. There shall be a volume control settable by the Engineer for these messages. The minimum db setting is to be determined by Amtrak.

(1) Cab Signal - TBD at Design Review

(2) ACSES - TBD

(3) I-ETMS - TBD

(4) ITCS - TBD

(5) Engine Fire activation alarm - 2.9 KHz intermittent fast pulse tone

(6) Conductor communicating signal (Buzzer) 4.5 KHz continuous tone

(7) Wheel slip/brake warning (Sonalert) 1.9 KHz continuous tone

(8) Alerter audible alarm (yelp) - TBD

(9) Overspeed Alarm - TBD

j). Indicator Lights

i). The indicator lights shall be provided in the left and right-side panels the approved locations and groupings.

ii). Each indicator shall be backlit with the specified color when illuminated.

(1) It shall be possible to change the indicator color at a later date if required.

iii). Activation of each indicator must be clearly discerned by the Engineer even under conditions of bright sunlight or other ambient illumination.

iv). Each indicator shall be a long-life LED. Note that some cab signal system indicators will be contained in the alerter display unit.

Light Group	Condition	Indicator Light Color
Operating Status Indicator	MU Control (power on)	Green
	PCS Open	White

32.15 Electrical Circuits

a). Cab Switch Panels

i). Low voltage cab setup switches, circuit breakers, etc. shall be mounted on a panel on the upper console in the cab or an approved equivalent location, accessible to the seated Engineer, in a location approved by Amtrak. All devices will be clearly labeled by name and position.

ii). Switches shall be provided, at a minimum, for the following with deviations as approved by the customer through design reviews:

(1) Circuit Breakers

(a) Locomotive control

(b) Heated windshield

(c) Auxiliary lights

(d) Number signs

(e) Voice Radio

(f) Indicator and gauge lights

(g) I-ETMS

(h) I-ETMS Data Radio

(i) Cab Signal/ACSES

(j) ACSES Data Radio

(k) ITCS

(l) Event recorder (load side connected to battery)

(m) Alerter (load side connected to battery)

(n) Low voltage DC receptacle

(o) Headlights

(p) MU 13T

(q) Aux Cab Heater (low voltage DC)

(r) ECP Brake system

(s) Spare

(2) Switches

(a) Engine run

(b) Engine shut down button

(c) Generator field

(d) Door interlock bypass switch (sealed)

(e) Headlight

(f) Marker Light

(g) Pantograph Up/Down

(h) MCB Open

(i) Cab Light

(j) Order Light

(k) Aux Cab Heat

(l) Number Lights

(m) Step Lights

(n) Territory Switch Cab/Non-Cab

(o) ITCS Territory

(p) Train Control Territory Selector

(q) Windshield Wiper/Washer

(3) HVAC Controls

(a) Low Heat

(b) High Heat

(c) Fan Low

(d) Fan High

(e) Low Cool

(f) High Cool

(4) Cut-Out Switches

(a) Dynamic Brake

(b) Alerter

b). Propulsion (MU) Control Circuits

i). Trainline Requirements

(1) Cab Cars will be used to control a locomotive used to propel the train in Push mode.

ii). Trainline circuit protection

(1) A two pole, 20-amp circuit breaker shall be provided between the number 13 (positive control) and number 4 (negative control) MU control trainlines.

(a) This circuit breaker shall protect the cab equipment from faults in the MU trainline system and shall be used to provide an on/off switch function to activate or deactivate the cab.

(b) A green MU control power indicator light shall be provided on the load side of this circuit breaker, to provide the Engineer an indication that MU trainline power is available from the locomotive.

(c) Alternative circuit arrangements may be approved by the customer after design review.

c). Power Knockout functions

i). Power knockout (PKO) to disable locomotive propulsion shall occur in response to emergency or penalty brake applications in the Cab car.

ii). The MU propulsion control system shall remove traction power by de-energizing MU Control trainlines 6 (GF), 15 (AV), 12 (BV), 7 (CV) and 3 (DV), and illuminate the "PCS Open" indication on the cab console. Operation of this interface will be subject to design review.

iii). To restore locomotive traction from an emergency brake application after PKO occurs, the Engineer must be required to perform the following actions:

(1) Place brake handle in emergency brake position;

(2) Wait for brake system timeout from the application of emergency brakes;

(3) Place throttle handle in coast;

(4) Move brake handle to release position; and

(5) Move throttle handle to a power position.

iv). To restore locomotive traction from a penalty brake application after PKO occurs, the Engineer must be required to perform the following actions:

(1) Place brake handle in suppression position;

(2) Place throttle handle in coast;

(3) Perform actions that satisfy the system that initiated penalty (i.e., acknowledge alerter)

(4) Move brake handle to release position; and

(5) Move throttle handle to a power position.

d). Digital Trainline

i). The Contractor shall provide a digital trainline.

ii). Digital trainline shall provide redundancy and other non-critical functions such as passenger information displays, announcements, video, computer networking, system monitoring and data logging.

32.16 Heating, Ventilation and Air Conditioning

a). Climate Control

i). The cab shall be provided with a quiet, forced air supply of conditioned air from the car's main HVAC system (or separate cab HVAC system, at Amtrak's request), along with a separate cab heater system. See Chapter 10 for additional details.

ii). Full climate control with air supply through an individual fully adjustable ceiling diffuser shall be provided.

iii). The local cab heater shall be controlled independently of the HVAC unit using the car battery, with an adjustable digital thermostat control. Care shall be taken to avoid all drafts. The Cab HVAC system shall provide sufficient heat automatically when 480 Volts Head End Power is available to keep the cab temperature similar to the passenger car interior.

b). Air Distribution

i). The cab shall have durable individually adjustable diffusers for the Engineer and Assistant with manual direction and volume, infinite adjustment between maximum and minimum air volume and direction.

ii). The diffusers shall not create drafts on the Engineer's or Assistant's back or neck.

(1) The diffusers shall not allow complete blockage of the cab air.

(2) The volume of conditioned air delivered to the cab through each diffuser shall not exceed 30 cubic feet per minute (cfm) (0.85 m3/min) when the diffuser is in a minimum position and shall be a minimum of 175 cfm (4.96 m3/min) when the diffuser is fully opened.

(3) Other arrangements meeting the intent of this specification may be proposed for approval.

32.17 Cab Lighting

a). Headlights and Auxiliary Lights

i). Two LED headlights located at the upper center of the carbody, and two LED auxiliary lights located approximately at the bottom of the end sheet, one toward each outboard edge, shall be provided at the F-end of Cab Car using approved fixtures, located such that they produce a triangular lighting appearance.

ii). The lights shall be suitable located to prevent damage when the F-end of the Cab car is coupled to other equipment (including another Cab car) and operated under all track conditions identified in PRIIA Specification 305-912.

iii). The fixtures shall comply with the requirements of 49 CFR Parts 229.125 and 229.133. All exterior lighting shall be powered from the low voltage power supply. All lamps shall be designed for ease of replacement from the car interior by access hatches, unless otherwise approved by Amtrak.

iv). All lighting fixtures shall be weather tight, of stainless steel construction and hardware. Fixtures shall be designed to avoid snow and ice buildup and preclude snagging of car washer brushes.

v). Headlight and auxiliary light lenses shall contain thermostat-controlled heating elements to protect against frosting, or be recessed behind heated cover heaters.

vi). Materials surrounding and facing the headlights and auxiliary lights, including a coupled car, shall be capable of withstanding the heat caused by leaving these lights on bright indefinitely on a clear summer day with maximum ambient temperature.

vii). The headlight and auxiliary lights shall comply with 49 CFR Part 229.125 and AAR standard for LED headlights.

(1) The color temperature shall be between 2600K and 3200K unless otherwise approved by Amtrak during Design Review.

viii). Failure of a single lamp shall not cause the other lamps to be subjected to increased voltage. Rated lamp life shall be a minimum of 50,000 hours.

ix). The headlight and auxiliary light fixtures shall be easily adjustable for horizontal and vertical alignment and shall be provided with a locking device. Bezel design shall assure correct rotational alignment. The design and location of the light fixtures shall be approved by Amtrak.

x). The headlights shall be under the control of an easily-reached Engineer's cab console mounted four position switch (off, bright ditch, bright, dim).

(1) The headlight switch in the bright position shall automatically turn on the ditch lights. In auto flash position, the auxiliary lights will flash in accordance with 49 CFR Part 229.133.

(2) In all three operating modes the sounding of the horn or activation of the bell, as detected by a pressure switch downstream of the horn or bell control switch, shall cause the auxiliary lights to immediately flash alternately until the bell is silenced

(3) A set of four green indicator LEDs telltales in an approved arrangement shall be provided in the cab above the windshield to indicate the functional status of each headlight and auxiliary light bulb (on steady, flashing, etc.).

(4) An approved momentary contact switch shall be provided to permit the Engineer to dim the auxiliary lights for an adjustable time period, initially set for 20 seconds, to avoid blinding an oncoming train Engineer.

(5) The exterior lighting layout submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-09]**

xi). All cab switches shall be clearly identified with permanent labels.

b). Interior Cab Lighting

i). For general area illumination, the cab area shall have at least two white lens light fixtures, suitably placed in the ceiling to illuminate the Engineer's console, Assistant's console and the general cab area and avoid glare on the windshield.

ii). LED light fixtures shall be used.

(1) These lights shall be controlled by a rotary dimmer control switch.

(2) The minimum lighting intensity provided by the white ceiling lights shall be 15 foot-candles on both the floor and the console.

iii). For reading purposes, 5 additional lights shall be located in the console as approved by Amtrak during design review process.

(1) The reading lights shall be controlled by a rotary dimmer control switch. These lights shall not reflect onto the windshield or interfere with outside observation during night operation and shall be capable of location adjustment by the Engineer/Assistant.

iv). All lights shall be powered by the battery circuit. All light fixtures shall be dust tight, designed for ease of relamping. The type and location of the lights shall be approved by Amtrak.

v). The duplex air pressure gauges and the speedometer illumination shall be dimmable.

vi). All non-essential buttons and switches which are illuminated shall have the option to turn off the backlighting for night operation or hardware light diffusers.

c). Road Number Signs

i). Two illuminated back lighted road number signs shall be provided at the F-end of the Cab car, arranged to be easily visible from the wayside. Signs shall be located on each side of the car as near to the cab end as possible and shall be located on the front cab F-end at an approved location.

ii). Each number sign shall have four (4) digits. The digits in the number signs shall be at least 5 in. (127mm) high.

iii). The design and location shall be approved by Amtrak.

32.18 Alerter and Event Recorder System

a). Alerter System

i). The Engineer's activities shall be monitored over a specified time period as listed in 49 CFR Part 229.

(1) If the Engineer is inactive during this time period and no system reset is generated, the alerter system display shall issue a combination pulsing audible/visual alarm for a specified time interval.

(2) Continued lack of Engineer activity shall result in a continuous audio alarm, a continuous visual alarm and a penalty brake application with power knockout.

ii). It shall be possible to perform a self-test of the system with the car stationary. If the alerter system fails, the Engineer shall be able to cutout the system through the use of a sealed switch or sealed cutout cock. Activation of the alerter cutout shall provide an indication on the cab console indicator.

b). Event Recorder

i). The event recorder system location shall be approved by Amtrak.

ii). The event recorder shall be Wi-Tronix VIOLET 800.

(1) The line side of the event recorder circuit breaker shall be connected to the Cab Car battery.

(2) Event recorder data shall be downloadable via a standard laptop computer, remote memory card download ports or wirelessly. The event recorder shall be easily identified following an accident.

(3) All Vehicle Fault conditions should be communicated over the communications network and integrated with Wi-Tronix VIOLET.

iii). Amtrak shall approve the actual channels of data to be recorded during design reviews.

iv). The event recorder shall be crash hardened and be in full compliance with 49 CFR Part 229.135.

v). Reasonably secure and tamper resistant means that the system shall have data retention during extended loss of power to the system, provide physical protection during vehicle catastrophic occurrences, be flame resistant and contain constraints against accidental or deliberate data erasure or overwriting. Incorporating data streams from the following systems: I-ETMS, ACSES, ITCS, ECP and Inward/Outward Cameras, shall be discussed during the design review process. Vehicle control system architecture submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-10]**

c). Positive Train Control (PTC)

i). Amtrak requires several different types of Positive Train Control (PTC) systems, including a Siemens Advanced Civil Speed Enforcement System (ACSES), Wabtec Interoperable Electronic Train Management System (I-ETMS) and KB-Signaling Incremental Train Communication System (ITCS).

ii). Each Cab car shall be designed to be equipped with these three Positive Train Control (PTC) systems. Each PTC system shall conform to all applicable Amtrak, AAR, APTA, and FRA Standards and Code of Federal Regulations (49 CFR), and be fully functional and interoperable with the host railroads where Amtrak trains operates.

iii). The vehicle shall include an overspeed function.

(1) Overspeed shall be provided for operations above 79 mph if the PTC system is disabled.

(2) Should the car with the active cab exceed the allowed speed, the overspeed indicator will flash. After 3 MPH overspeed there will be a Power Knock Out and at 4 MPH overspeed a penalty brake will occur.

iv). To recover brake control, the brake controlled must be brought to suppression position and the train brought down below overspeed. After the PCS light goes out, the brakes can then be released. It is not necessary to stop the train. Overspeed will be dormant when the brake valve is cutout.

(1) It shall be possible to do a self-test on the overspeed when the car is stationary. Adjustment for wheel size shall be done easily.

v). Positive Train Control System Architecture submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-11]**

d). Cab Signal/ACSES

i). The Contractor shall provide a fully tested, Amtrak approved, Siemens combined Advanced Civil Speed Enforcement System (ACSES) and Nine (9) Aspect Cab Signal System that complies with 49 CFR Part 236 Subpart I and H.

ii). The Cab Signal/ACSES system shall comply with Amtrak's latest hardware and software revisions and include the latest Secure Positive Train Stop Release functionality.

iii). The Contractor shall provide and install Sti-Co HDLP-NB-220 216–218 MHz antenna, a single Cellular/ GPS/Wi-Fi Antenna capable of 5G LTE connectivity, GNSS/GPS and Wi-Fi antenna. A Polyphaser RRF-ACE-220-NFF (217-219MHz) Narrowband Filter shall be used for the ACSES 220 Radio.

iv). Amtrak will provide the Contractor a fully operational ACSES Communication Package (ACP), and/or a Mobile Communication Package (MCP) consisting of a 220MHz data radio, and cellular modem/router. The functionality of the Contractor's prototype Cab Signal and ACSES systems shall be validated.

v). The Contractor shall host design reviews with Amtrak during the design and installation of this system.

e). I-ETMS

i). The Contractor shall provide a full Wabtec Interoperable Electronic Train Management System (I-ETMS) and all ancillary equipment including two (2) Polyphaser RRF-ITC-219-NFF (219.5-222MHz) Narrowband Filters.

ii). This system shall be tested using the Wabtec Validation Test Procedure prior to delivery to Amtrak. Amtrak will supply the I-ETMS TMC Slot 10 software image, MeteorComm 220 MHz Data Radio, Wabtec Ancillary Card Cage.

iii). The TMC used shall be a 41015 that includes a CPU Slot 4.

iv). GoLINC Precision Navigation Modules (PNMs) with Wabtec Tri-Mode 5G Cell/GNSS/Wi-Fi antennas shall be used in place of the standard NSMs.

v). An additional CDU shall be provided for the Assistant.

vi). Two speed sensor inputs for I-ETMS shall be provided to meet requirements of Wabtec I-ETMS Protect.

vii). The Contractor shall host design reviews with Amtrak during the design and installation of this system.

f). ITCS Provisions

i). Provisions shall be made in the design of the cab to allow full equipment space for installation of an Alstom Incremental Train Control System (ITCS) including the location and mounting of equipment and Engineer/Assistant displays.

ii). Provisions shall be made for conduits, switches, antenna, active speed sensors and other required items as required.

iii). The ITCS Systems must be tested to the extent practical with the associated OEM supplied hardware and software.

iv). The ITCS shall also contain an inline Polyphaser RRF-ATC-220-NFF (217-219MHz) Narrowband Filter. The Contractor shall supply Amtrak validation test reports prior to removing the hardware for shipment. **[CDRL 32-04]**

g). Data Collection

i). Train operating parameters along with train control data shall also be provided to a Crash Hardened Event Recorder (CHER) in accordance with 49 CFR 229.135 and 236. Minimum scan rate occurs as a result of a change in any train operating parameter or any train control system event.

ii). Data retained shall cover a period of at least 48 hours in normal railroad operation. Recorded data will be capable of conveniently being downloaded on demand to a compatible computer, memory device or wirelessly.

h). Data Retrieving

i). Event recorder download capability shall be available at any time, including when the train is not in motion. Train operating data shall also be retrievable to monitor operational performance.

ii). Downloaded data shall be in compliance with 49CFR229.135 and approved by Amtrak. The format of downloaded data shall also in compliance with 49CFR229.135 and approved by Amtrak.

i). Delivering

i). Prior to the delivery of the first cab car, the Contractor shall deliver to Amtrak one complete set of all system diagnostic software with license as agreed per service contract to Amtrak to use the software, required for retrieving and manipulating the recorder data, all proper download connection cables and memory devices. Instructions for using the software will be provided.

ii). The software packages shall incorporate all methods to download data.

iii). All deliverables shall comply with the Materials and Workmanship requirements of Chapter 19 and shall be updated as required until the expiration of the warranty period. Any further costs or restrictions associated with this software to Amtrak are subject to agreements and service contracts between the Contractor and customer.

j). Speed Signal

i). The Contractor shall provide dedicated active speed signals for the speedometer, alerter, event recorder, cab signal/ACSES system I-ETMS, and ITCS systems as required for each individual system. Speed sensors shall be electrically isolated.

ii). The design of the speed sensor and associated wiring shall minimize the vulnerability of damage from wayside debris and be reviewed during the design process.

iii). Speed Sensor installation and mounting design shall not require any manual adjustment to meet air gap requirements.

32.19 Radio System

a). The Cab car shall be equipped with a Clean Cab 160 MHz VHF voice radio that is independent of the train's passenger communications systems. Amtrak Ritron Radio [RCCR-151-NX-AM] is required.

b). The voice radio shall consist of a single transmitter/receiver (T/R) including operation controls and a handset.

c). The radio shall be flush mounted in an approved location on the Engineer side of the cab.

d). The radio mounting shall be arranged to facilitate easy removal and replacement. The radio handset shall also be easily accessible to the assistant in a seated position or a second handset shall be provided. It is critical that the radio be located for ease of single hand operation by the Engineer. This shall be verified during design review and in the cab mock-up.

e). All wiring, connector plugs, and mounting systems shall be compatible with the Clean cab locomotive radios currently used by Amtrak.

f). The electrical power input of the Clean cab radio shall also be circuit breaker protected. The line side of the circuit breaker shall be connected to the car battery.

g). The mountings shall provide adequate access for servicing in compliance with AAR Specification 12-10, Figures 122-2 and 122-3. Sufficient cable slack shall be provided for ease of servicing or replacement. The Clean cab radio shall be mounted in the console panel in a way that allow easy replacement without removal of unrelated parts such as through slide-out or other methods approved by Amtrak.

h). A 160 MHz inline bandpass filter shall be installed to prevent RF interference with other systems. All equipment must meet or exceed the standards of the Electronic Industries Association and the rules and regulations of the Federal Communications Commission in addition to those specified herein.

i). The radio system components and design shall be approved by Amtrak.

j). Antennas

i). Low-profile voice, ACSES, I-ETMS, ITCS, Cellular, Wi-Fi, GPS and Violet antennas shall be installed on the roof. None of these antennas shall be shared.

ii). The coaxial cable from radio antennas shall be routed to the connected to radio transceiver through an inline, wideband and narrowband filters. Orientation of the antennas on the roof shall minimize damage from mechanical carwash brushes and maximize signal strength.

iii). The antenna shall be designed for severe environmental conditions. The antenna and coaxial cabling shall be approved by Amtrak.

iv). The voice and PTC antennas ground planes shall meet the suppliers' installation requirements including the recommended ground plane.

v). Sinclair products shall not be used.

k). Voice Radio Backup Power Supply

i). The cab voice radio system shall be powered from the low voltage power supply with automatic backup by the battery in the event of power loss and shall have sufficient capacity to meet all peak power requirements.

32.20 Locomotive Digital Video Recorder System

a). Inward/Outward Facing Camera Systems

i). The inward/outward facing camera systems shall be a Wi-Tronix VIOLET 800.

ii). There shall be a minimum of three (3) cab cameras to record the engineer's face, conductors face, general cab area including console switches and indicators, and the right-of-way forward facing camera in compliance with CFR229.136 and Transport Canada SOR/2020-178 Locomotive Voice and Video Recorder regulations.

iii). The right-of-way forward facing camera shall have a connected microphone for recording actuation of the horn and bell. The horn shall be clearly audible in recordings at 125mph vehicle operation, and the bell shall be clearly audible at 110mph or above. The forward-facing microphone shall not record conversation from the vehicle operators.

iv). The inward-facing cameras shall have integrated or connected microphones for recording cab conversation and shall meet the requirements in Transport Canada SOR/2020-178 Locomotive Voice and Video Recorder.

v). There shall be two (2) sideview cameras, one on each side for the engineer and conductor sides.

32.21 Train Communication and Data System

a). The onboard train communication and data system shall communicate wirelessly with Amtrak's Wi-Tronix Communication and Data System sever. This interface shall support at a minimum the following systems:

i). Event Recorder

ii). Cameras (Camera viewing area shall not be obscured by equipment, final placement to approved by Amtrak)

iii). Ride Quality

iv). GPS Coordinates

32.22 Cab Controls Testing

a). Proof of Design Tests

i). Train control, event recorder, train data system and video camera

(1) The train control system, event recorder, forward-facing camera, train data system and associated components in the cab car shall be subjected to qualification tests to verify that they comply with the requirements.

(2) As a minimum, these tests shall include complete functional tests before and after the equipment is subjected to the simulated environmental conditions such as appropriate extremes of temperature, vibration and shock. Tests shall also confirm resistance to interference limits as specified.

(3) Equipment so tested shall conform to the manufacturing drawings.

b). Operation of Positive Train Control (PTC)

i). Where cab signal and/or positive train control is provided, the Contractor shall develop proof-of-design test procedures that validate all systemic, operational and programming designs, functions and requirements for the Positive Train Control (PTC) system, including component performance, integrity of system architecture, data collection and retention functions, and train status evaluation. These procedures shall be developed in accordance with system requirements as established by the system manufacturer, the FRA and railroads, and shall include evaluation and verification of compliance with requirements for:

(1) Accurate determination of train location, speed, direction of travel and status of all operating systems;

(2) Communication to wayside signal systems and railroad data centers;

(3) System monitoring of train performance;

(4) Display of graphic data as received from the railroad;

(5) Initiation of service or penalty brake applications and locomotive PKO functions;

(6) Interface between the PTC system and on-board systems, including event recorders, train

(7) monitoring systems and others;

(8) Data recording, security and download requirements; and

(9) Compliance with all applicable regulations, standards and system requirements.

ii). Additional railroad-specific data transfer and uploading to the system may occur after the cars have been delivered to Amtrak if necessary. The PTC system as designed and installed shall be subject to review and approval by Amtrak, the FRA, Amtrak and representatives of the host railroads over which the cars will operate

c). Cab audio alarm levels performance

i). The audio level of all cab alarms: locomotive failure, wheelslip/brake warning, alerter, overspeed, PTC and conductor signal shall be tested to verify suitable loudness.

d). Event recorder (FRA) performance

i). Tests shall verify proper operation of the entire integrated system hardware and software. They shall show correct interpretation of each input, including combinations (such as throttle) through the use of the verifier function on a laptop. Resolution, set point and calibration of all analogue inputs shall be shown at zero, midscale and maximum values, which will include applying pneumatic pressure to those inputs by manipulating the brake system. All modes of downloading shall be demonstrated.

ii). After downloading, graphic and tabular readings shall be compared in detail to verify all channels show activity consistent with the test code and that graphic and tabular values of analogue functions match: speed, brake pipe, brake cylinder pressures at zero, full scale and mid-scale values.

iii). Operation of self-test and health monitoring functions shall be demonstrated. A disk of the download, labeled for car number and date, shall be provided for each car.

e). Event recorder-video performance

i). Tests shall verify operation of the entire integrated system hardware and software. They shall show correct interpretation of each input. Video focus and resolution, and other inputs shall be demonstrated.

ii). All modes of downloading shall be demonstrated. Software demonstration shall include validation of inputs and their calibration as a "real time" display as well as data analysis software playback. Operation of self-test and health monitoring functions shall be demonstrated.

f). Horn and bell performance

i). The horn shall be tested to verify compliance with FRA 49 CFR Part 229 loudness requirement. The bell shall be tested to measure loudness and proper continued operation.

g). Engineer’s Seats

i). The seat and its attachment shall be tested to verify compliance with 49 CFR Part 238.233 (FRA Tier I vehicle).

ii). The seat shall shall be tested to verify compliance with APTA Standard PR-CS-S-011-99

h). Emergency Egress/Ingress

i). Emergency Exit Windows Egress shall be tested to verify compliance with 49 CFR .238.113 and 49 CFR 238.121.

ii). Emergency Rescue Ingress shall be tested to verify compliance with 49 CFR 238.114 for windows and windshield.

32.23 Production Tests

a). Alerter Performance

i). Tests shall verify proper timing, operation of each input and output, including at various simulated vehicle speeds. They shall demonstrate all modes of operation, including self-test.

b). Speedometer/overspeed performance

i). Tests shall verify all modes of operation, including self-test. Each input and output shall be demonstrated.

ii). Calibration at zero, mid-scale and maximum speed shall be shown. Calibration and action at each overspeed set point shall be verified.

c). Event recorder performance

i). Tests shall verify operation of the entire integrated system hardware and software according to 49 CFR 229.135.

ii). They shall show correct interpretation of each input, including combinations (such as throttle).

iii). Resolution, set point and calibration of all analogue inputs shall be shown at zero, midscale and maximum values, which will include applying pneumatic pressure to those inputs. All modes of downloading shall be demonstrated.

iv). Software demonstration shall include validation of inputs and their calibration as a "real time" display as well as data analysis software playback, both graphic and tabular. Comparison of the graphic and tabular values must be included. Operation of self-test and health monitoring functions shall be demonstrated.

d). Locomotive Digital Video Recorder performance

i). Tests shall verify operation of the entire integrated system hardware and software according to 49 CFR 229.136 and Transport Canada SOR/2020-178.

ii). They shall show correct interpretation of each input. Video focus and resolution, and other inputs shall be demonstrated. All modes of downloading shall be demonstrated.

iii). Software demonstration shall include validation of inputs and their calibration as a "real time" display as well as data analysis software playback. Operation of self-test and health monitoring functions shall be demonstrated.

e). Positive train control system

i). Where provided, perform a test of the cab signal/PTC system in accordance with manufacturer and railroad requirements.

ii). Tests shall verify all modes of operation, including self-test. Each input and output shall be demonstrated. Calibration of pickup and drop out of each parameter of the carrier shall be demonstrated. Interaction with the brake system to produce a penalty brake application, with associated PCS shall be demonstrated, along with the inability to suppress it. Overspeed, failure to acknowledge and overspeed with failure to acknowledge shall all be demonstrated. Permanent suppression shall be demonstrated. Diagnostics and data-logger shall be demonstrated.

f). Locomotive and air brake control

i). Tests shall verify performance of the integrated system of cab controls, including traction and braking.

ii). They shall include complete demonstration of all interface signals between the brake equipment and other vehicle equipment. All inputs and outputs shall be exercised. Calibration and resolution of all analog signals at zero, midrange and maximum values shall be demonstrated. **[CDRL 32-02]**

g). Brake control operation

i). Note: All compressed air which is connected to the car or its air components shall meet the air quality requirements of APTA Standard PR-M-S-011-99.

(1) Calibration of air pressure gauges shall be verified, and values recorded

(2) Verify operation of each mode of operation shall be demonstrated, in accordance with OEM

(3) brake supplier test code, including but not limited to:

(4) Passenger mode, Freight mode (if equipped), Trail, Test

(5) Parking brake, including effect of cutting out automatic brake and penalty brake

(6) Calibration of brake valve settings of release, min, suppression, full service and emergency

(7) measured on brake pipe and brake cylinder. Values shall be recorded.

(8) Penalty application; non-suppressible and suppressible

(9) Emergency application; local and remote (all sites on car and remote in consist)

(10) PCS function

(11) Operation of pressure switches

h). Cab indicator operation

i). The test shall verify proper operation of all indicator lights and audio alarms.

i). MU and COMM trainline function operation

i). The test shall verify the correct transmit/receive function, including controls, indicators and alarms of each trainline wire. Interaction of PCS/PCR shall also be included.

ii). Windshield wipers operation

iii). The test shall verify proper operation of each wiper unit, including: smooth movement, sweep over the required area of the windshield, speed control, parking position, noise and freedom from air leaks. Also test proper operation of washer.

j). Defroster/heated windshield operation

i). Proper function of the defroster and heated windshield, their controls and indicators shall be verified. Windshield heaters shall have an auto turn-off feature to protect from overheating and potential damage.

k). Horn and bell operation

i). The test shall verify proper operation of devices and all controls, including automatic sequencer and speed input to it.

l). Cab and radio tests

i). Each cab radio shall be tested and adjusted to meet all technical parameters, and the proper certificates supplied in the vehicle history book. Additionally, the antenna shall be verified for conformance with its specified radiation pattern.

m). Headlight and crossing light tests

i). The headlights and crossing lights on each cab/baggage car shall be tested and adjusted in accordance with 49 CFR Part 229.125 for proper illumination, orientation, aim and operation.

32.24 Passenger Area (Option)

a). Overview

i). The passenger area shall be designed using the high capacity coach requirements found in this specification. The seating arrangement shall be modular, allowing flexibility to change configurations.

(1) Expected configurations are business seating, coach seating, long-distance seat pitch and short-distance seat pitch.

32.25 Passenger/Baggage Area (Option)

a). Overview

i). The baggage area shall be located behind the engineer's cab using the utility car requirements for the baggage area found in this specification with a minimum capacity of 1000 cubic feet.

ii). The passenger area shall be designed using the same coach requirements found in this specification. The seating arrangement shall be modular, allowing flexibility to change configurations.

(1) Expected configurations are business seating, coach seating, long-distance seat pitch and short-distance seat pitch.

32.26 Operators Manuals

a). The operator manuals submittal will be subject to Amtrak's review and approval during the design review process. **[CDRL 32-12]**

32.27 Test Matrix

Tests	**Type**	**Type**
Air Brake Test	Production/Acceptance	Acceptance
Event Recorder	Component/Production	Acceptance
Alerter	Component/Production	Acceptance
Positive Train Control (PTC) and/or Automatic Train Control (ATC) if equipped	Production/Acceptance	Acceptance
Cab Car Compatibility with the Locomotive	Production/Acceptance	Acceptance
Radio/PA	Component/Production	Acceptance
Headlights, Misc. Light Adjustment	Production	Acceptance
Horn Test per 49CFR 229.129	Production	Acceptance

32.28 CDRLs

CDRL	**Description**	**Due**
CDRL 32-01	Cab Mockup Development and Review	During PDR, IDR, & FDR
CDRL 32-02	Air Brake System Apparatus & Pneumatic Drawing	During FDR
CDRL 32-03	Cut-Out Cock Location Diagram(s)	During FDR
CDRL 32-04	Cab Installation & Arrangement – Design Detail	During PDR, IDR, & FDR
CDRL 32-05	Console Arrangement	During PDR, IDR, & FDR
CDRL 32-06	F-End Operator Line-of-Sight Drawing	During FDR
CDRL 32-07	Emergency Egress & Ingress Provisions	During PDR, IDR, & FDR
CDRL 32-08	Cab Seat	During PDR, IDR, & FDR
CDRL 32-09	Exterior Lighting Location Layout	During PDR, IDR, & FDR

CDRL 32-10	Vehicle Control System Architecture (Event Recorder)	During PDR, IDR, & FDR
CDRL 32-11	Positive Train Control System Architecture	During PDR, IDR, & FDR
CDRL 32-12	Operator Manuals Development Plan	During FDR

* End of Chapter 32 *

CDRL	Description	Due
CDRL 3-01	Project Management Plan (PMP)	NTP + 30 days
CDRL 3-02	System Integration Plan (SIP)	60 days prior to 1st PDR meeting
CDRL 3-03	Interface Control Document (ICD)	60 days prior to 1st PDR meeting
CDRL 3-04	Kickoff Meeting Presentation	At least 5 days before kickoff meeting and within 10 days of NTP
CDRL 3-05	Baseline Project Schedule (Baseline PS) and Narrative	NTP + 30 days
CDRL 3-06	Design Review Plan	NTP + 30 days
CDRL 3-07	Detailed Drawing Tree	30 days prior to 1st PDR meeting
CDRL 3-08	Compliance Matrix	Contract Award and 30 days prior to each design review
CDRL 3-09	Preliminary Design Review (PDR)	90 days after Contract Award

CDRL 3-67	All Approved Physical Material Samples	30 days prior to FDR

CDRL	Description	Due
CDRL 3-68	Initial Color Material and Finish (CMF) Boards	30 days prior to PDR
CDRL 3-69	Sampling and Color Boards	30 days prior to IDR
CDRL 3-70	Color Material and Finish Boards	30 days prior to FDR
CDRL 3-71	Material Suppliers and detailed Material Specifications and Data Sheets	30 days prior to each Design Review
CDRL 3-72	Interior Schedule of Finish documentation	30 days prior to each Design Review
CDRL 3-73	Draft Formats – Electrical Schematics	30 days prior to IDR
CDRL 3-74	Draft Formats – Pneumatic Schematics	30 days prior to IDR
CDRL 3-75	Draft Formats – Electrical Component / Device Table	30 days prior to IDR
CDRL 3-76	Draft Formats – Wiring Diagram	30 days prior to IDR
CDRL 3-77	Draft Formats – Wire Run List	30 days prior to IDR
CDRL 4-01	Reliability Program Plan	NTP + 30 days
CDRL 4-02	Reliability Progress Reports	Within 90 days following the 1st FRB,
CDRL 4-03	Reliability Prediction Analysis	30 days prior to PDR
CDRL 4-04	Reliability Demonstration Report	Reliability Demonstration Test +
CDRL 4-05	Reliability Demonstration Plan	30 days prior to start of FDR
CDRL 4-06	Maintainability Program Plan	30 days prior to PDR
CDRL 4-07	Maintainability Analysis	30 days prior to FDR
CDRL 4-08	Life Cycle Cost Analysis	30 days prior to IDR
CDRL 4-09	Maintainability Demonstration Plan	180 days prior to qualification testing of 1st car
CDRL 4-10	Maintainability Demonstration Report	Within 30 days after completion of the Maintainability Demonstration Test
CDRL 4-11	FMI Plan	90 days prior to
CDRL 5-01	Project Quality Plan (PQP)	NTP + 60 days
CDRL 5-02	Revision Management Procedure	30 days prior to PDR
CDRL 5-03	Internal Audit Schedule	NTP + 30 days
CDRL 5-04	Monthly Quality Report (MQR)	NTP + 60 days, then monthly
CDRL 5-05	Documentation of Initiatives to Promote Sustainability	NTP + 30 days
CDRL 5-06	Waste Reduction Program Quarterly Reports	NTP + 90 days
CDRL 5-07	FAI Plan	NTP + 90 days
CDRL 5-08	FAI – Technical data for maintenance manuals and parts catalogs	Prior to full acceptance of FAI

CDRL	Description	Due
CDRL 5-09	FAI Documentation	30 business days before FAI
CDRL 5-10	FAI Binder	After conclusion of FAI
CDRL 5-11	FAI Report	Within 10 business days of FAI
CDRL 5-12	Complete set of FAI photographs	With 1st shipment of cars delivered
CDRL 5-13	Inspection and Test Log for each car	Before release for shipment
CDRL 5-14	Inspection and Test 1-Week Look Ahead	14 days prior to initiation of any manufacturing activities then, every weekly
CDRL 5-15	PQP – List of Hold Point Inspections for each car type	NTP + 60 days
CDRL 6-01	Method of Corrosion Prevention for Interior Surfaces of Enclosed Structural Sections	30 days prior to PDR
CDRL 6-02	Carshell Drawings	30 prior to initiation of any component fabrication
CDRL 6-03	Three Samples of all Exterior Finishes	30 days prior to FDR
CDRL 6-04	Detailed Fatigue Analysis	30 days prior to PDR and on-going through each DR
CDRL 6-05	Documented Engineering Analysis (Coupling system and supporting structure verification)	NTP + 30 days
CDRL 6-06	PDR – Cross sections of the emergency roof access locations	30 days prior to PDR
CDRL 6-07	IDR – Cross sections of the emergency roof access locations	30 days prior to IDR
CDRL 6-08	FDR – Cross sections of the emergency roof access locations	30 days prior to FDR
CDRL 6-09	FAI – Cross sections of the emergency roof access locations	30 days prior to FAI
CDRL 6-10	Emergency Egress Plan and Emergency Responder Ingress Procedure	30 days prior to PDR
CDRL 6-11	Jacking Pad Locations	30 days prior to PDR
CDRL 6-12	Safety Appliance Placement Ergonomic Evaluation	30 days prior to PDR

CDRL 19-07	Smoke Flammability and Toxicity Matrix	During IDR through FDR
CDRL 19-08	Design and product line for electrical connections	During PDR
CDRL 19-09	Design and product line for conduit fittings and junction boxes	During PDR
CDRL 20-01	Car testing matrix	NTP + 90 days
CDRL 20-02	Master Test Plan	First submittal NTP + 180 days
CDRL 20-03	Test Procedures	Per Figure 20-1

CDRL	Description	Due
CDRL 20-04	Test Results (Reports)	Within 5 days of test completion
CDRL 20-05	Contractor shall provide a single volume incorporating all required engineering tests associated with the pilot program, all copies of all test procedures, reports and approvals.	30 days after successful completion of testing
CDRL 20-06	All material certification and proof-of-design test procedures and reports in a single binder for each car type.	Prior to shipment of each car type
CDRL 20-07	Reliability and Post-Delivery Test Report	30 days after successful completion of testing
CDRL 21-01	List of all service consumables needed to support the cars throughout its service design life	FDR
CDRL 21-02	List of strategic spare parts recommended to support the fleet of equipment after the end of the warranty period	FDR
CDRL 23-01	Training Action Plan	90 days after NTP with on-going updates
CDRL 23-02	Preliminary As-Built Drawings	180 days prior to the delivery of the 1st batch of cars
CDRL 23-03	As Built Drawings	30 days after delivery of first batch of cars
CDRL 23-04	Electronic Documentation Delivery	Within 30 days after the last car of the base order is shipped
CDRL 23-05	Photographs-Car Assembly	30 days after completion and acceptance of first of each car type
CDRL 23-06	Photographs-Completed Car	30 days after completion and acceptance of first of each car type
CDRL 23-07	Conformed Specification	30 days after completion of each car type
CDRL 23-08	Master Manual Plan	90 days before completion of first car
CDRL 23-09	First Draft of Manuals	90 days before completion of first car
CDRL 23-10	Manual Updates	After delivery of the first car, and continuing through the

CDRL	Description	Due
		end of the warranty period
CDRL 23-11	WMS Implementation	360 days prior to shipment of first batch of cars
CDRL 23-12	Service and Cleaning Manual & Maintenance and Inspection Manual	30 days prior to IDR with on-going updates
CDRL 23-13	Illustrated Parts Catalog	30 days prior to shipment of first batch of cars
CDRL 23-14	Car History Book	30 days prior to shipment of first batch of cars
CDRL 23-15	User Training Program	360 days prior to shipment of first batch of cars
CDRL 23-16	Draft copies of Training Material	360 days prior to shipment of first batch of cars
CDRL 23-17	Instructor Guide	360 days prior to shipment of first batch of cars
CDRL 23-18	Training Aids	360 days prior to shipment of first batch of cars
CDRL 23-19	Student Workbooks	360 days prior to shipment of first batch of cars
CDRL 23-20	Equipment Summary Report Outline	30 days prior to the start of Final Design Review
CDRL 23-21	Equipment Summary Report	Prior to the completion of Final Design Review
CDRL 24-01	Central Diagnostics System detailed Functional Description	30 days prior to Diagnostics System PDR meeting
CDRL 24-02	Subsystem Integration Details	30 days prior to Diagnostics System PDR meeting
CDRL 24-03	Fault Management Plan	30 days prior to Diagnostics System IDR meeting.

CDRL	Description	Due
CDRL 24-04	Wayside Server and Train to Wayside Details	30 days prior to Diagnostics System IDR meeting
CDRL 24-05	Security and Safety Analysis of the Network	30 days prior to Diagnostics System IDR meeting
CDRL 24-06	Car Temperature Monitoring system	30 days prior to Diagnostics System IDR meeting
CDRL 24-07	Eight additional sets of all portable test equipment	Prior to Delivery of First Batch of Cars
CDRL 24-08	Eight additional sets of all portable test equipment	With 5th Car Delivery
CDRL 24-09	Six complete sets of each type of bench type shop test equipment	With 5th Car Delivery
CDRL 24-10	Air Brake System Test Rack Adapters	With 5th Car Delivery
CDRL 25-01	System Safety Program Plan (SSPP)	NTP + 60 days
CDRL 25-02	Preliminary Hazard List (PHL)	NTP + 60 days
CDRL 25-03	Preliminary Hazard Analysis (PHA)	30 days prior to PDR
CDRL 25-04	Hazard Tracking Log (HTL)	30 days prior to FDR
CDRL 25-05	Failure Modes, Effects and Criticality Analysis (FMECA)	30 days prior to IDR
CDRL 25-06	Fault Tree Analysis (FTA)	30 days prior to FDR
CDRL 25-07	Subsystem Hazard Analysis (SSHA)	30 days prior to IDR
CDRL 25-08	Operating and Support Hazard Analysis (O&SHA)	30 days prior to FDR
CDRL 25-09	List of all adhesives	30 days prior to IDR
CDRL 25-10	Combustible material matrix	30 days prior to IDR
CDRL 25-11	Fire Safety Analysis	30 days prior to FDR
CDRL 26-01	Provide Solution Architecture, Designs, and Specifications for review and approval by Amtrak throughout the design reviews.	30 days prior to PDR, on-going updates
CDRL 26-02	Identify all Contactor or sub-supplier maintenance and operation support agreements related to the on-going support of equipment, services, or licenses of on-board and wayside software.	30 days prior to PDR, on-going updates
CDRL 26-03	Provide an operations plan and schedule for transitioning support throughout all phases of the procurement.	30 days prior to PDR, on-going updates
CDRL 26-04	Provide detailed system description, functionality, and infrastructure requirements for OTIS wayside customer experience simulation lab.	30 days prior to PDR, on-going updates
CDRL 26-05	Provide details of the data dictionaries and documentation of tools.	90 days prior to delivery of the first car
CDRL 27-01	Software Quality Control Plan	NTP + 60 days
CDRL 27-02	Non-COTS Software Supplier Quality Audits	FDR

CDRL	Description	Due
CDRL 27-03	Non-COTS Software Supplier Quality Audit Results/Reports	Within 30 days of each audit
CDRL 27-04	Non-COTS Software Supplier Quality Audit Remedial Action for Open Comments	Within 90 days of each audit
CDRL 27-05	Software Configuration Control Plan (SCCP)	30 days prior to IDR
CDRL 27-06	Database of Software Versions – Cars & Non-vehicle Equipment	30 days prior to IDR, then ongoing updates
CDRL 27-07	Software Version - Cars	In Car History Book
CDRL 27-08	Software Version - Non-vehicle Equipment	With delivery of equipment
CDRL 27-09	Software – all executables	At the end of warranty period for each software release
CDRL 27-10	Software – Updated software documentation	At the end of warranty period for each software release
CDRL 27-11	Software – Updated user documentation	At the end of warranty period for each software release
CDRL 27-12	Software – Software Version Description (SVD)	At the end of warranty period for each software release
CDRL 27-13	Software Developer Documentation	30 days prior to IDR, then ongoing updates
CDRL 27-14	Demonstration to ensure that the ICD and DBDD or SID is complete and accurate	FDR
CDRL 27-15	COTS Software – Original data storage/transfer media functional and usage details	30 days prior to IDR, then ongoing updates
CDRL 27-16	COTS Software – All manuals and instructions to configure and install the software	30 days prior to IDR, then ongoing updates
CDRL 27-17	COTS Software – All licenses required for Amtrak's site use	30 days prior to IDR, then ongoing updates
CDRL 27-18	Test Reports for Software Unit Tests	30 days after performance of tests
CDRL 27-19	Test Reports for Software Type Tests	30 days after performance of tests
CDRL 27-20	Software Validation Test Procedures	30 days prior to IDR, then ongoing updates
CDRL 27-21	Results of a current, independent, BSIMM and/or OWASP SAMM software security assessment of Contractor	360 days prior to shipment of first cars
CDRL 27-22	Transfer of Software to Replacement Devices – Master copies of the compiled executable for all programmable devices	180 days prior to shipment of first cars, then ongoing updates

CDRL	Description	Due
CDRL 27-23	Transfer of Software to Replacement Devices – Six (6) sets of equipment and software to transfer the compiled software	180 days prior to shipment of first cars then ongoing updates
CDRL 27-24	Escrow of Proprietary Source Code	180 days prior to shipment of first cars, then ongoing updates
CDRL 27-25	Demonstration that source code in Escrow is same as on vehicles.	180 days prior to shipment of first cars, then ongoing updates
CDRL 27-26	Software Executable Generation Procedure (SEGP) to use Escrowed files	30 days prior to FDR, then ongoing updates
CDRL 27-27	Full Instructions for Workstation to use escrowed files	30 days prior to FDR, then ongoing updates
CDRL 27-28	Documentation of Escrowed Source Code to allow for maintenance, troubleshooting and adjustment	30 days prior to FDR, then ongoing updates
CDRL 27-29	Microprocessor System Shutdown Special Procedure	30 days prior to IDR, then ongoing updates
CDRL 27-30	License for unlimited use of software in test computers	360 days prior to shipment of first cars, then ongoing updates
CDRL 27-31	PTU and BTE software documentation	30 days prior to IDR, then ongoing updates
CDRL 28-01	Listing of Contractor personnel involved in the cars' development, maintenance, and operation who will be accountable for security-related decisions and actions	NTP+90
CDRL 28-02	Software Bill of Materials (SBOM) and Hardware Bill of Materials (HBOM) format	30 days prior to PDR
CDRL 28-03	List of the proposed products identifying the country of origin	NTP+90
CDRL 28-04	Documentation of disabled ports, connectors, and interfaces	30 days prior to PDR, on-going updates
CDRL 28-05	Summary documentation of the product's security features and security-focused instructions on maintenance, support, and reconfiguration of the product's default settings	30 days prior to PDR, on-going updates
CDRL 28-06	List of all known methods for bypassing computer authentication contained in the product and provide written documentation that all such backdoors have been permanently deleted from the product	30 days prior to PDR, on-going updates
CDRL 28-07	Document options for defining access and security permissions, user accounts, and applications with associated roles	30 days prior to PDR, on-going updates
CDRL 28-08	Provide documentation for the product, attesting that unauthorized logging devices are not installed	30 days prior to IDR

CDRL	Description	Due
CDRL 28-09	List of all log management activities that the product is capable of generating and the format of those logs	30 days prior to PDR, on-going updates
CDRL 28-10	Information on all communications (e.g., protocols) required between Amtrak's network security zones whether inbound or outbound and identify each	30 days prior to PDR, on-going updates
CDRL 28-11	List of all remote access entry pathways and ensure that they can be enabled or disabled by Amtrak	30 days prior to PDR, on-going updates
CDRL 28-12	Certification that all interfaces which implement administrative management capabilities of onboard devices are secure	30 days prior to FDR, on-going updates
CDRL 28-13	Preliminary NIST checklist	30 days prior to PDR
CDRL 28-14	Final completed NIST checklists	30 days prior to FDR
CDRL 28-15	The results of a current, independent, BSIMM and/or OWASP SAMM software security assessment shall be provided by the Contractor.	30 days prior to FDR, on-going updates
CDRL 28-16	Name of Independent Assessment Organization	30 days prior to PDR
CDRL 28-17	Software Security Assessment Plan	30 days prior to IDR, on-going updates
CDRL 28-18	Results of any independent software and firmware quality assurance assessment	30 days prior to FDR, on-going updates
CDRL 28-19	Contractor's response to the findings of the software and firmware quality assurance assessment	30 days prior to FDR, on-going updates
CDRL 28-20	Name of Independent Third-Party Penetration Test Provider	30 days prior to PDR
CDRL 28-21	Independent third-party's penetration test plan	30 days prior to FDR, on-going updates
CDRL 28-22	Results of the independent third-party's penetration test plan	30 days after
CDRL 28-23	Contractor's response to the findings of the independent third-party's penetration test plan	60 days after
CDRL 28-24	Design for on-board monitoring and intrusion detection and provisions	30 days prior to PDR, on-going updates

AIR BRAKE, EQUIPMENT AND TRAIN HANDLING RULES AND INSTRUCTIONS

DRAFT

These instructions govern the testing and operation of air brake and other equipment on Amtrak trains and must be observed by all employees whose duties are in any way affected by them.

These instructions apply to all Train and Engine service employees, QPs, QMPs, QMIs, Mechanical employees, certain Engineering employees, Yardmasters, and Supervisors. Amtrak employees governed by these instructions are not governed by the air brake and train handling rules/instructions of Host Railroads or Tenant Railroads. All Amtrak employees will be governed by these instructions unless a more restrictive rule or special instruction of the railroad over which you are operating specifically conflicts with these instructions.

Employees whose duties require that they understand and comply with these instructions must attend the required classes.

Employees who are governed by these instructions will be provided with a copy, must maintain same and have it with them while on duty.

NOTE: Due to infrequent AMT-3 publication, if conflicting information is found between the current AMT-3 version and General Orders or Special Instructions, then the employee will be governed by the most recent General Orders or Special Instructions in effect.

This document is divided into five (5) major sections: (1) General, (2) Operations, (3) Equipment Inspections / Brake Tests, (4) Train Control Systems and (5) Tables and Forms.

DRAFT

1.1 Definitions

ACTUATE: A term used to indicate the release of locomotive brake cylinder pressure that develops as a result of an automatic brake application.
AFTER COOLER: Radiating piping, which cools compressed air before it flows to the brake system.
AIR BRAKE: A combination of parts operated by compressed air and controlled manually, pneumatically, or electronically, which will slow or stop a car or locomotive.
AIR BRAKE INSPECTION AND TEST RECORD: This written record indicates that air brakes have been properly tested and inspected and must include the following information:

- All locomotives – including cab cars that will be used to operate train
- Number of cars inspected
- Date
- Time
- Location tested
- Name & Signature of Qualified Person who performed the test
- Selector volume handle position
- Interior/Exterior Inspection
- Communication signal status
- GRA/DIR release status
- EOT tested
- Total Train Weight and Length- Non-Passenger Only
- Any special weight distribution requiring special train handling- Non-Passenger Only
- 10C Summary portion

The MAP 1173/10C Summary is the form issued when a Class I brake test is performed at the originating point or a scheduled Class I brake test location for the train. When multiple MAP 1173 forms are issued only one will be used as the "Summary" form and will be indicated by writing the word "Summary" at the top of the form (see instruction 3.8.4). Engineer must list defective car number(s) on reverse side of Summary MAP 1173 indicating condition EN ROUTE and initialize form.

The 10C Summary is used by the mechanical department to list cars in a passenger train consist that received a calendar day inspection. The 10C Summary is part of MAP 1173/10C Summary form. A train MUST not be delayed for missing or conflicting information on 10C summary or missing MAP 10C Summary.

NOTE: When MAP 1173 is referenced in the AMT-3, Metrolink may use SMP 1173 form, MARC may use ECR 1173 form.
AIR COMPRESSOR: A rotary or reciprocating device for compressing air.
AIR GAUGE: An instrument that indicates the amount of air pressure.
AIR RESERVOIR: A reservoir or tank found on passenger or freight locomotive and car brake systems for storing a supply of air.
ALERTER: A device, which detects frequency of movement of the Engineer and initiates a penalty brake application when required frequency of movement is not maintained.
ANGLE COCK: A device used to open and close the brake pipe on locomotives and cars. To open, move the handle in line with the brake pipe. To close, move the handle at a right angle (crosswise) to the brake pipe. Note that these positions are the opposite of other cutout cock positions.
AUTOMATIC BRAKE VALVE (ABV): A manually operated device positioned by the Engineer to control the flow of air into the brake pipe for charging, applying, and releasing the automatic brake system on each car or locomotive.
AUTOMATIC DRAIN VALVE: Automatic device, which assists in draining condensation from the compressed air system.
AUTOMATIC SLACK ADJUSTER: A device to maintain brake cylinder piston travel within a predetermined range.
BACK-UP HOSE: A device consisting of a manually operated valve with a warning whistle, length of hose, and standard brake pipe hose coupling. When properly coupled to the brake pipe hose on the leading end of a car or cars being pushed, provides a means of sounding a warning whistle and/or applying the brakes in emergency.
BIND: Restrict the intended movement of one or more brake system components by reduced clearance, by obstruction, or by increased friction.
BLENDED BRAKE: Simultaneous use of air and dynamic braking controlled by the automatic brake valve and mixed automatically, to provide a retarding force on engines and self-propelled cars.
BLOCK OF CARS: One car or multiple cars in a solid unit coupled together for the purpose of being added to or removed from a train as a solid unit.
BRAKE APPLICATION (AUTOMATIC): A reduction of brake pipe pressure of sufficient amount to cause the control valve to move to the service or emergency position, which, if made in the service position (or zone) of the ABV, may consist of one or more reductions. A BRAKE APPLICATION IS NOT COMPLETE UNTIL BRAKE PIPE EXHAUST HAS COMPLETELY STOPPED.

DRAFT

BRAKE CYLINDER: A cylinder in which compressed air acts on a piston that transmits the force of the compressed air to the associated brake rigging.

BRAKE CYLINDER PRESSURE LIMITING VALVE: A feature built into the 26-C or 26-F control valve, which limits service and emergency brake cylinder pressure to a predetermined amount.

BRAKE CYLINDER RELEASE VALVE: A manually operated valve on brake equipment, which permits the brake cylinder to be released without draining the reservoirs.

BRAKE, EFFECTIVE: A brake that is capable of producing its required designed retarding force on the train. A car's air brake is not considered effective if it is not capable of producing its designed retarding force or if its piston travel exceeds; (a) 10 ½ inches for cars equipped with nominal 12-inch stroke brake cylinders; or (b) the piston travel limits indicated on the stencil, sticker, or badge plate for that brake cylinder.

BRAKE INDICATOR: A device actuated by brake cylinder pressure (light or plunger), which indicates whether brakes are applied or released.

BRAKE PIPE: The system of piping including branch pipes, angle cocks, cutout cocks, dirt collectors, hose, and hose couplings, used for connecting locomotives and cars for the passage of air to control the locomotive and car brakes.

BRAKE PIPE CUTOFF (PILOT) VALVE/SWITCH: Manually operated device used to cut in or cut out the ABV on locomotive brake equipment.

BRAKE PIPE VENT VALVE: A device connected to the brake pipe, which propagates an emergency brake pipe reduction by rapidly venting the brake pipe pressure locally.

BRAKE, PRIMARY: Those components of the train brake system necessary to stop the train within the signal spacing distance without thermal damage to friction braking surfaces.

BRAKE, SECONDARY: Those components of the train brake system which develop supplemental brake retarding force that is not needed to stop the train within signal spacing distances or to prevent thermal damage to wheels.

BRAKE SYSTEM: Includes all brake apparatus such as air, electro-pneumatic, electronic brake, related piping, hand brake, foundation brake rigging, and dynamic brake.

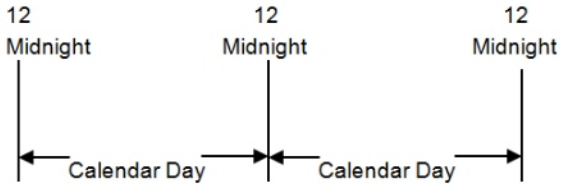
BRAKE TEST TYPES:

Passenger

- Class I: Complete passenger train brake system test and inspection performed by a QMP to ensure air brake system is 100% effective. This test fulfills the requirements of a Passenger-Class IA and a Passenger-Class II brake test.
- Class IA: Test and inspection performed by QP or QMP to ensure that brakes apply and release on each car in a passenger train in response to train line commands. This test fulfills the requirements of a Passenger-Class II brake test.
- Class II: Test and inspection performed by QP or QMP to determine brake pipe integrity and continuity from the controlling locomotive to the rear passenger equipment of a passenger train.

Non-Passenger

- Class I: Complete non-passenger train brake system test and inspection performed by a QP or QMI to ensure air brake system is 100% effective. This test fulfills the requirements of a Non-Passenger Class II and a Non-Passenger-Class III brake test.
- Class II: Test and inspection performed by QP or QMI to ensure that brakes apply and release on each car in a non-passenger train in response to train line commands. This test fulfills the requirements of a Non-Passenger-Class III brake test.
- Class III: Test and inspection performed by QP or QMI to determine brake pipe integrity and continuity from the controlling locomotive to the rear equipment of a non-passenger train.
- Transfer Train: Test and inspection performed by QP or QMI to ensure that brakes apply and release on each car in a non-passenger train which is a transfer train.



Passenger & Non-Passenger

Running Brake Test: A test performed by a locomotive engineer while the train is in motion to verify that the brake system functions as intended.

BUFF FORCES: The forces caused by compression such as during dynamic or independent braking, helper locomotive on rear of train, back-up movements, or run-in of slack.

CAB CAR: A Passenger Carrying Car equipped with a control compartment from which a train can be operated while being pushed by a locomotive. A cab car is considered a locomotive when it is the controlling locomotive.

CALENDAR DAY: A time period running from one midnight to the next midnight on a given date.

CHARGING CUTOFF PILOT VALVE (A-1): Provides the following features during an emergency application of brakes: automatic sanding, dynamic brake cutoff, power knock out (PCS), and cuts off brake pipe charging.

DRAFT

26-FQL90415 00000006208 "UNCLASSIFIED" 4/30/2026

CHECK VALVE: A device so designed that it permits air to flow in one direction while preventing the air from flowing in the opposite direction.

CHOCK: A wedge or block of sufficient size used to block the movement of a wheel (holding a wheel motionless).

CLASP BRAKE: An arrangement of brake rigging in which two brake shoes/pads per wheel/disc are used to clasp the braking surface.

COMMUNICATING SIGNAL SYSTEM: A manually operated device used to transmit an electronic signal to the operating cab. If electronic communication signal system is inoperative or not equipped, operative two-way radio system may be substituted.

COMPRESSOR GOVERNOR: A device to automatically control the operation of an air compressor.

COMPUTER CONTROLLED BRAKE (CCB): Microprocessor locomotive or cab car air brake control system commonly referred to as E-Brake.

CONTROL VALVE: A device on locomotives and cars to apply and release brake cylinder control pressure in response to a reduction or increase of brake pipe pressure.

- **Direct Release:**
  A feature of the control valve that provides for the total release of brake cylinder control pressure when brake pipe pressure is increased.
- **Graduated Release:**
  A feature of the control valve that provides for the incremental release of brake cylinder control pressure proportionate to increases in brake pipe pressure.

CONTROLLING LOCOMOTIVE: The locomotive from which the engineer exercises control over the train.

CUTOUT COCK: A device used to cut in or cut out certain air brake functions. To open “cut in” the cock, move the handle at a right angle (crosswise) to the pipe. To close “cut out” the cock, move the handle in line with the pipe. Note that these positions are the opposite of angle cock positions.

DEAD ENGINE FEATURE: A manually positioned device for charging the main reservoir on a locomotive from the brake pipe when main reservoir pressure is not available.

DEADMAN FOOT VALVE: A device on some locomotives which will initiate a penalty brake application shortly after the foot pedal is released on the locomotive and brake cylinder pressure is at least 25 psi.

DECELOSTAT: A wheel slide system that automatically releases brake cylinder pressure rapidly upon detection of wheel slide and restores brake cylinder pressure as soon as wheel begins to revolve.

DEFECTS – RUNNING GEAR - Any condition not in compliance with CFR49 Part 238, which involves:

- Suspension.
- Draft System.
- Trucks.
- Wheels.

DEFECTS – NON RUNNING GEAR - Any condition not in compliance with CFR49 Part 238, which involves:

- Exhaust gases released outside cab or other compartments.
- Batteries properly vented.
- Jumper cables – May not hang free, no exposed wire, no broken plugs, or receptacles.
- High voltage safety labels for exterior doors and cover plates marked
- Buffer plates in place.
- Diaphragms in place and aligned
- Exposed moving parts and electrical equipment both equipped with guards.
- Floors, etc. free from oil, water, waste, or any obstruction
- Manual door releases are in place.
- Emergency equipment… as applicable, in place.
- Safety related signage in place and legible.
- High voltage safety labels for interior doors and cover plates marked
- Emergency brake valves stenciled.
- Trap doors safely operate and securely latch.
- Vestibule steps are illuminated.
- End doors and side doors operate.
- Seats or attachments not broken or loose.

DISC BRAKES: An arrangement of brake cylinders and levers, which force brake pads against a disc fastened to the wheel or axle.

DISTRIBUTING VALVE: A device which applies and releases brakes and automatically maintains pressure in brake cylinders after a brake application. Also known as a RELAY VALVE.

DOUBLE CHECK VALVE: A valve with two seats arranged so that air flowing past either seat cannot flow out past the other seat but will flow through a third common delivery connection.

DRAFT FORCE: A term used to describe coupler forces in a state of tension.

DUAL PORTED CUTOUT COCK: A device on some locomotive brake equipment that cuts in or out the IBV.

DRAFT

AS-FOI-0415 20000096203 "UNCLASSIFIED" 4/30/2026

DUPLEX RELEASE VALVE: An appliance permitting manual depletion of auxiliary reservoir pressure alone, or auxiliary and emergency reservoir pressure together.

DYNAMIC BRAKING: A means of using traction motors to create a braking effect.

ELECTRONIC EMAP 21A and MAP 21A: En route defect reporting.

ELECTRONICALLY CONTROLLED PNEUMATIC BRAKE (ECP BRAKE): A train powered braking system actuated by compressed air and controlled by electronic signals from the locomotive, cab car, or an ECP-EOT to the cars in the consist for service and emergency brake applications in which the brake pipe is used to provide a constant supply of compressed air to the reservoirs on each car but does not convey braking signals to the car. ECP brake systems include dual mode and stand-alone ECP brake systems.

ELECTRO-PNEUMATIC BRAKE: A system consisting of an interface unit on a locomotive and magnet valves on each car, which vents or recharges the brake pipe on each car electrically, at the same time a pneumatic application or release is taking place.

EMERGENCY APPLICATION: A rate of brake pipe reduction fast enough to cause the control valves to move to emergency position.

EMERGENCY BRAKE VALVE: A valve for the purpose of initiating an emergency brake application on all locomotives and passenger carrying cars.

EQUALIZING RESERVOIR: Serves as reference volume for the brake pipe relay valve portion. The relay valve portion establishes a pressure in the brake pipe equal to the pressure in the equalizing reservoir.

EQUIPMENT CONDITION REPORT: Inspection record for locomotive calendar day and brake test inspections**:** Amtrak MAP 100, MARC ECR 100, Metrolink SMP 100. When MAP 100 is referenced in the AMT-3, Metrolink locomotives and cab cars may use Calendar Day Inspection Forms SMP 100. MARC locomotives and cab cars may use the Calendar Day Inspection Form ECR 100.

FACE-TO-FACE RELIEF: The exchange of information between employees when taking charge of equipment. When any of the following occurs, it is considered Face-To-Face Relief**:**

- When the inbound Engineer does not leave the equipment unattended and communicates with the outbound Engineer the condition of the brakes and the status (location) of the MAP 1173(s).
- When the inbound Conductor or Assistant Conductor does not leave the equipment unattended and communicates with the outbound Engineer the condition of the brakes and the status (location) of the MAP 1173(s).
- When a mechanical department employee who is a QMP or QP who participated in the required brake test does not leave the equipment unattended and communicates with the outbound Engineer the condition of the brakes and the status of the MAP 1173(s) (located on the locomotive, possession of conductor, etc.).

When FACE-TO-FACE RELIEF does not occur as described above, a Passenger-Class II brake test is required.

NOTE: See definition of **UNATTENDED EQUIPMENT**.

FOUL: Any condition which restricts the intended movement of one or more brake system components because the component is snagged, entangled, or twisted.

FREIGHT EQUIPMENT: Railroad locomotives and cars not included in the definition of **PASSENGER EQUIPMENT**.

FULL SERVICE REDUCTION: The amount of brake pipe reduction necessary to obtain maximum brake cylinder pressure during service brake application.

GRADIENT, BRAKE PIPE: The difference in brake pipe pressure between front and rear of train.

HAND BRAKE: A brake apparatus used to manually apply the brakes on a car or locomotive, if so equipped.

HEAD END POWER (HEP): The system on a locomotive that supplies electrical power to a train for air conditioning, heat, light, etc.

HST DEPARTURE TEST: Passenger-Class I Brake Test and Locomotive Departure Test equivalent for Tier II equipment.

INDEPENDENT BRAKE VALVE (IBV): A device to operate air brakes on the locomotive, or locomotive consist if MU'd, independently of train brakes.

INITIAL TERMINAL: Place where train is originally made up or a locomotive receives its Calendar Day Inspection. If locomotive power is changed en route, the previous "Initial Terminal" location of the train does not change.

INTERCOM SYSTEM: Two-way voice communication system

INTERCOOLER: Radiating piping which cools compressed air between stages of compression.

LOCOMOTIVE: On-track equipment, other than hi-rail, specialized maintenance, or other similar equipment, which may consist of one or more units operated from a single control stand with one or more propelling motors designed for moving other passenger equipment, with one or more propelling motors designed to transport freight or passenger traffic, or both, or without propelling motors but with one or more control stands.

LOCOMOTIVE INSPECTION AND REPAIR REPORT (Blue Form/MAP 816): Federal form (FRA F6180-49A) that records the locomotive's inspections and repairs for the calendar year.

MAGNET VALVE: A device for controlling the flow of air, which is dependent on a magnetic coil being energized or de-energized.

MAIN RESERVOIRS: One or more reservoirs on locomotives or cars for storing the main supply of compressed air.

MAP 816: See definition of Locomotive Inspection and Repair Report.

MAP 1173/10C SUMMARY: See **AIR BRAKE INSPECTION AND TEST RECORD**

MINIMUM REDUCTION: Handle position on 26, 30, and E-type ABVs that produces a brake pipe reduction of 6-8 psi at a service rate.

MIXED CONSIST TRAIN: A train consisting of passenger carrying cars and two or more non-passenger carrying cars.

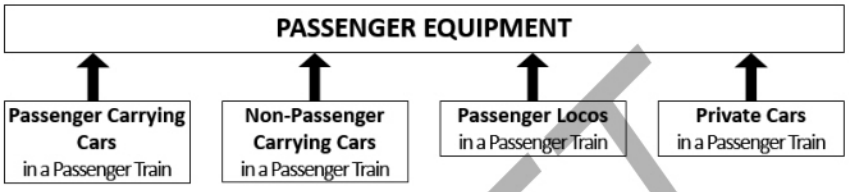
MU-2, MU-2A VALVE: A two or three-position valve, which cuts the IBV IN or OUT.

DRAFT

MU EQUIPMENT: Self-propelled diesel or electric passenger equipment with one or more control stands and seating for carrying passengers. MU equipment may be operated as a single unit or coupled in multiples to provide added passenger capacity. MU equipment with a control stand is considered an MU locomotive.

MU HOSES: Air hoses that are only common to locomotives including: main reservoir equalizing, actuating (if equipped), and application and release.

NON-PASSENGER CARRYING CAR: A car designed to handle Mail, Baggage, and Express (MB&E) that is operated as part of a passenger train consist. e.g., Baggage car (BAG), Material Handling Car (MHC), Express (EXP), Auto Carriers.



OFF AIR: Not connected to a continuous source of compressed air of at least 60 pounds per square inch.

ORIGINATING PASSENGER TERMINAL: The passenger terminal where a train first receives passengers, in the same city or terminal where it is initially made up.

PARKING BRAKE: A spring applied and air released brake found on certain cab cars and locomotives.

PASSENGER CARRYING CAR: A car designed to carry passengers and/or to provide on-board services, e.g., coaches, sleepers, food service, or cars designed with a combination of passenger facilities. This definition includes Cab Cars and MU Equipment. This term does NOT include a Private Car.

PASSENGER EQUIPMENT: All Passenger Carrying Cars, Non-Passenger Carrying Cars, Private Cars, and Passenger Locomotives in a Passenger Train. This definition does NOT include a freight locomotive when used to haul a passenger train due to failure of a Passenger Locomotive.

PASSENGER TRAIN: A train consisting of any combination of Passenger Equipment. A passenger train may transport passengers only when required passenger train brake tests and mechanical inspections have been performed.

PA SYSTEM (PUBLIC ADRESS SYSTEM): A one-way voice communication system.

PENALTY BRAKE APPLICATION: An automatic service application of air brakes caused by Overspeed Control, Train Control Systems, or Alerter/Deadman.

PNEUMATIC CONTROL SWITCH (PCS): Indication on a locomotive control console that represents power loss/knockout. It displays whenever a penalty or emergency brake application occurs.

POWER CAR: Rail vehicle that propels a Tier II passenger train or is the lead vehicle in a Tier II passenger train or both. A Power Car is considered a locomotive for the purposes of these instructions.

PRESSURE MAINTAINING: A feature of certain types of ABVs which compensates brake pipe pressure against maximum permissible leakage during a service application.

PRESSURE RETAINING VALVE: A manually positioned valve found on freight, Non-Passenger Carrying Cars (MB&E), and Private Cars that will control release of brake cylinder pressure.

PRIVATE CAR: Rail rolling equipment that is used only for excursion, recreational or private transportation purposes. A Private Car is not a Passenger Carrying Car.

P-2-A APPLICATION VALVE: A valve which provides a full service penalty brake application when actuated by any one of the following features: Overspeed Control, Train Control Systems, or Alerter/Deadman.

QUALIFIED EMPLOYEE: An employee who is classified as a QP, QMP, or QMI.

QUALIFIED MAINTENANCE PERSON (QMP): A person who has received instruction and training that includes "hands-on" experience in one or more of the following functions:

- Troubleshooting
- Inspection
- Testing
- Maintenance or repair of specific train brake and other components and systems for which the person is assigned responsibility.

The person's primary responsibility includes work in the functions listed above and is designated to:

- Conduct Class I Brake Tests.
- Conduct exterior calendar day mechanical inspections.
- Determine whether defective equipment may be moved.

QMP qualifications are valid for three years. Employee's qualifications may be revoked if he/she demonstrates insufficient knowledge or skills to perform assigned duties. It is the employee's responsibility to attend required classes and maintain their qualifications.

NOTE: T&E employees are NOT considered QMPs.

DRAFT

QUALIFIED MECHANICAL INSPECTOR (QMI): A "Qualified Person" who has received instruction and training that includes "hands-on" experience in one or more of the following functions:

- Troubleshooting.
- Inspection.
- Testing.
- Maintenance or repair of specific locomotive equipment/train brake components and systems for which the person is assigned responsibility.

Each QMI shall also possess a current understanding of what is required to properly repair and maintain the safety-critical brake components/locomotive equipment for which the person is assigned responsibility. The person's primary responsibility includes work generally consistent with the functions listed above

QMI qualifications are valid for three years. Employee's qualifications may be revoked if he/she demonstrates insufficient knowledge or skills to perform assigned duties. It is the employee's responsibility to attend required classes and maintain their qualifications.

NOTE: T&E employees are NOT considered QMIs.

QUALIFIED PERSON (QP): Person who has received instruction and training to perform various functions as determined by the railroad. Qualified Supervisors and T&E crews are considered QPs. This individual may perform a/an:

- Interior Calendar Day Mechanical Inspection on Tier I Passenger Carrying Cars
- Class IA Brake Test for Passenger Trains
- Class II Brake Test for Passenger Trains
- Class I Brake Test for Non-Passenger Trains
- Class II Brake Test for Non-Passenger Trains
- Class III Brake Test for Non-Passenger Trains
- Transfer Train Brake Test for Non-Passenger Trains

QUICK SERVICE VALVE: A device connected to the brake pipe for the purpose of propagating quick service by making a brake pipe reduction on each car so equipped.

REDUCING VALVE: A valve designed to reduce and maintain air pressure to a predetermined amount.

REDUCTION RELAY VALVE: A device comprising a quick service valve and a vent or emergency valve mounted on a common pipe bracket. It is connected to the brake pipe to provide additional local venting of brake pipe air on each car so equipped, during both service and emergency brake applications. This device is auxiliary to the control valve and utilized on cars having a great amount of brake pipe volume.

REGULATING VALVE: A device which controls pressure and maintains it at a predetermined setting. The regulating valve is usually found within the automatic brake valve.

REPAIR POINT: Location designated by a railroad where inspections and/or repairs of the type necessary occur on a regular basis. A repair point has or should have the facilities, tools, and personnel qualified to make the necessary repairs.

RESERVOIR RELEASE VALVE: An appliance permitting manual depletion of control reservoir pressure.

ROLL BY INSPECTION: An inspection performed while equipment is moving.

RUNNING BRAKE TEST: A test performed by a locomotive engineer while the train is in motion to verify that the brake system functions as intended.

SAFETY VALVE: A valve designed to open and close at predetermined pressures.

SERVICE APPLICATION: A brake application consisting of one or more brake pipe reductions at a service rate.

SERVICE RATE OF REDUCTION: A reduction of brake pipe pressure at a rate fast enough to cause control valves to move to the service position, but not fast enough to cause them to move to emergency.

SERVICE ZONE: That portion of the brake valve quadrant on 26, 30, and E-types ranging from minimum reduction position to full service position that produces a self-lapping brake pipe reduction at a service rate proportional to handle position.

SPEEDOMETER OVERSPEED: A device that initiates a penalty brake application when the speed indicated on the speed indicator exceeds maximum allowed.

SPLIT REDUCTION: Automatic brake application consisting of an initial reduction of 6-8 psi followed 20-30 seconds later with additional reductions to the desired amount.

SUPPRESSION POSITION: Handle position on 26, 30, and E-type ABVs used to forestall or recover from a penalty brake application.

SWITCHING (YARD) OPERATIONS: Assembling or changing the position of cars for train movements; for the purposes of loading, unloading, or servicing; or placing of locomotives or cars for repair or storage. During switching operations, brake pipe must be charged, except when brake pipe is defective or damaged. SWITCHING is NOT considered a TRAIN MOVEMENT.

TERMINAL: Starting point or ending point of a single scheduled trip for a train, where passengers may get on or off a train. Normally, this location is a point where the train would reverse direction or change destinations.

TIER I TRAIN: Operating at speeds not exceeding 125 mph.

TIER II TRAIN: Operating at speeds exceeding 125 mph but not exceeding 160 mph.

TIER III TRAIN: Operating in a shared right-of-way at speeds not exceeding 125 mph, and in an exclusive right-of-way without grade crossings at speeds exceeding 125 mph but not exceeding 220 mph.

TRAIN: One or more locomotives, coupled with or without cars.

DRAFT

TRAIN, COMMUTER: Passenger train providing commuter service within an urban, suburban, or metropolitan area.

TRAIN CONTROL SYSTEMS:

- **Automatic Train Control (ATC):** A train control system which consists of Cab Signals, Speed Control, and ATS. Engineer is required to maintain speed associated with each cab signal aspect. Any overspeed condition will require suppression within 8 seconds.
  - **Cab Signal:** A signal that is located in the engine control compartment which indicates track occupancy or condition. The cab signal is used in conjunction with interlocking signals and with or in lieu of block signals.
  - **Speed Control:** A device on an engine which will cause a penalty application of the brakes if the engineer fails to reduce the train's speed to the speed required by the cab signal indication.
- **Automatic Train Stop (ATS):**
  - **Continuous:** A component of the Automatic Train Control (ATC) system. Any downward change in the cab signal aspect results in an audible alarm and requires acknowledgment within eight seconds to avoid a penalty brake application.
  - **Intermittent Inductive Train Stop (IITS):** A system which enforces acknowledgment as a train passes over a wayside inductor. If the signal is clear no action is required. If the signal displays a more restrictive indication than clear, the audible alarm will sound, and engineer is required to acknowledge within 8 seconds to avoid a penalty brake application.
  - **Inert Inductor Automatic Train Stop (IIATS):** Wayside inductors not connected with a block signal system; positioned to provide advance warning to trains of certain permanent speed restrictions and designed to apply the brakes automatically until train stops.
- **Advanced Civil Speed Enforcement System (ACSES):** A transponder and data radio-based train control system that supplements the ATC system by enforcing permanent speed restrictions, temporary speed restrictions, and a positive stop at interlocking and controlled point signals displaying Stop Signal.
  - **Interlocking Area:** An interlocking or closely located group of interlockings served by a single Base Communication Package (BCP).
- **Grade Crossing - Incremental Train Control System (X-ITCS):** A Differential Global Positioning Satellite (DGPS) and data radio based train control system that monitors grade crossing protection status and enforces conditional speeds at which a train may approach and occupy a grade crossing. The system also enforces entrance to and exit from X-ITCS territory.
- **Incremental Train Control System (ITCS):** A Differential Global Positioning Satellite (DGPS) and data radio based train control system that supplements the underlying method of operation and fixed signal system by enforcing permanent speed restrictions, temporary speed restrictions, entrance to out-of-service tracks, and speeds required by fixed signal indications.
- **Interoperable Electronic Train Management System (I-ETMS):** A Differential Global Positioning Satellite (DGPS) and data radio based positive train control system that supplements the underlying method of operation and fixed signal system by enforcing permanent speed restrictions, temporary speed restrictions, known highway crossing malfunctions, working limit authorities and speeds required by fixed signal indications.

TRAIN CONTROL SYSTEM TESTS:

- **Departure Test:** Train Control System Test required on all locomotives, which will enter train control system territory, 24 hours or less before locomotive departs its initial terminal.

NOTE: Successful On-Board Self-Test and a Daily Mechanical Inspection both qualify as a successful Departure Test.

- **On-Board Self-Test:** Performs functionality test of the On-Board Train Control System.
- **MAP 8 Periodic Inspection:** Train Control System Inspection required to be performed after a failure or during scheduled maintenance intervals.

TRAIN, LONG DISTANCE INTERCITY: Passenger train that provides service between large cities more than 125 miles apart and is not operated exclusively on Amtrak's NEC.

TRAIN MOVEMENT: Movement of equipment BETWEEN yards and/or terminals on tracks which require:

- Authority to occupy, or
- Movement over public road crossings.

Before making any "Train Movement", applicable train brake tests are required.

NOTE: A "Train Movement" is NOT considered switching.

TRAIN, PASSENGER or TRAIN SET, PASSENGER: See **PASSENGER TRAIN**

TRAIN, SHORT DISTANCE INTERCITY: Passenger train that provides service exclusively on Amtrak's NEC or between cities that are not more than 125 miles apart.

TRAIN CONTROL TIMING DEVICE: Device used to provide a 6 second warning whistle and delay time which, if not acknowledged within 8 seconds, will produce a penalty brake application.

TRANSFER TRAIN: A train that travels between a point of origin and a point of destination not exceeding 20 miles. Such trains may pick up or deliver freight equipment while en route to destination.

TWO-WAY END-OF-TRAIN DEVICE: A system consisting of a head end or locomotive control unit (LCU) and a rear end or end of train unit (EOT). This system monitors brake pipe pressure, motion, marker light status, and battery condition at the rear of the train and transmits this information to the locomotive cab for display. Activating an emergency toggle switch in the locomotive cab initiates an emergency brake application from the rear of the train.

DRAFT

UNATTENDED EQUIPMENT: Equipment left standing and unmanned in such a manner that would hinder immediate application of hand/parking brakes or air brakes by a qualified employee to prevent equipment from moving.
UNDESIRED EMERGENCY (UDE): Emergency brake application on a train for which no apparent cause can be determined.
WHEEL SLIDE CONTROL SYSTEM: A system that automatically releases or reduces brake cylinder pressure rapidly upon detection of an impending wheel slide. Brake cylinder pressure is restored as soon as the wheel begins to revolve or after a preset safety timeout.
YARD: System of tracks within defined limits provided for the making up of trains, storing of cars, or other purposes.

1.2 Equipment - General Instructions

NOTE: When CNOC mechanical desk is referenced in the following instructions, Metrolink T&E employees will contact Metrolink MOC at 909-593-0661, and MARC T&E employees will contact the Amtrak Commuter Operations Center at 202-906-2772.

1.2.1 Reporting Non-Complying Conditions (Defects)

A. Engineer must report any known locomotive non-complying conditions (defects) per instruction 3.1.15.
B. Conductor must report any known car defects on EMAP 21A **and** contact the CNOC mechanical desk at 1-800-424-0217.
C. Communication of Defects – Inbound.
1. Inbound Engineers will inform relieving Engineers of any known defects in their train either personally or on prescribed form.
2. With Face-to-Face relief, inbound Conductors will personally inform relieving Conductors of any known defect in their train.
3. Without Face-to-Face relief, outbound Conductors must check with outbound Engineer for any defects noted on MAP 1173/10C Summary and, during the performance of their duties, must check each car of their train for any Out of Service tags. If an Out of Service tag is found, Conductors must verify that the defect is been documented on the EMAP 21A. If the defect is not documented on the EMAP 21A, add the defect on the EMAP 21A and contact CNOC mechanical desk at 1-800-424-0217.

D. Engineers and Conductors are jointly responsible for reporting all cases of undesired emergency brake application.
E. The conductor or engineer must immediately notify the train dispatcher after any train parting with the following information:
1. Location where parting occurred.
2. Position in train and identification of equipment involved.
3. Position of knuckles at parting, if determinable.
4. Distance between parted sections and whether or not any run-in occurred following parting.
5. Throttle position, speed, type/amount of air applied, if any.
6. Apparent reason for parting.
7. Any other unusual conditions.
8. Notify CNOC Mechanical Desk (1-800-424-0217) as soon as possible without delaying train.

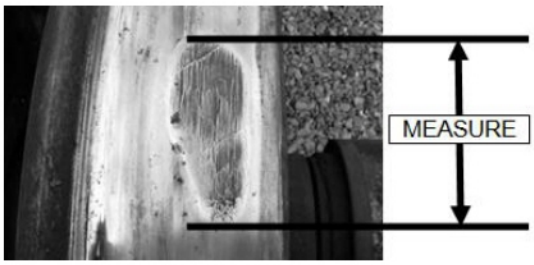
1.2.2 Safety Alert Regarding Class P-40BH, P-42BH and P32AC-DM Locomotives

A. The bottom rung of the F-end ladder on Amtrak Class P-42BH, Class P-40BH, and Class P32AC-DM locomotives is in close proximity to F-end truck components. To avoid personal injury, employees MUST NOT use this rung while the locomotive is in motion. This rung is only for mounting or dismounting the locomotive while the train is stopped.

1.2.3 Safety Alert Regarding Class HHP-8 Locomotives and HST Power Cars

A. Cab Door - In the application of “Employee Safety Rules”, employees must be aware of pinch-point when using the door handle to the cab.
B. Carbody Entrance Door Ladders Bottom Step - In the application of “Employee Safety Rules”, employees **must not ride** on entrance door ladders while HHP-8 Locomotive or HST Power Car is in motion. The bottom rung of the ladder is not designed to stand on while the train is in motion; the bottom rung is for mounting and dismounting equipment only.

1.2.4 Flat Spots



A. All flat spots must be reported to CNOC mechanical desk at 1-800-424-0217 and on MAP 100 for locomotives and EMAP 21A for cars.

NOTE: When more restrictive railroad rules or instructions are in effect concerning flat spots, those instructions will apply.

B. Wheels must not have a single flat or shelled spot 2 ½ inches or more in length. When these dimensions are exceeded, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning flat spots.
C. Wheels must not have two adjoining flat or shelled spots that are each 2 inches or more in length. When these dimensions are exceeded, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the defect.

DRAFT

D. Wheels must not have defects such as broken, gouged, chipped, or cracked rim or flange. When these conditions exist, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the defect. Contact QMP at CNOC mechanical desk at 1-800-424-0217.

Single Flat Spot

EXAMPLE

Flat Spot measures 2 ½ inches or more:

- QMP must be contacted before equipment is moved.

1.3 Equipment - Speeds

1.3.1 Freight Locomotive in Passenger Train Consist

A. Unless otherwise restricted, passenger trains with a freight locomotive in the locomotive consist will operate at passenger speeds, not exceeding the maximum speed of the freight locomotive. Prior to movement of a passenger train with a freight locomotive, the maximum authorized speed of the freight locomotive must be determined by contacting the train dispatcher or appropriate supervisor.

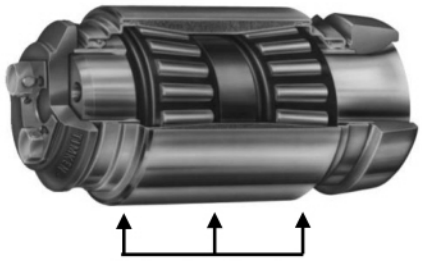
NOTE: When locomotive or equipment is not listed in the System General Order, the maximum speed must be determined by contacting the appropriate supervisor, train dispatcher, and/or CNOC mechanical desk.

NOTE: Locomotives and equipment may be further restricted by Timetable General Order and/or Special Instructions of the railroad over which the train is operating; in these instances, those railroad instructions take precedence.

1.3.2 Speed Table

TIME PER MILE		SPEED MPH	TIME PER MILE		SPEED MPH
MINS	SECS		MINS	SECS	
0	22.5	160	0	48.0	75
0	23.2	155	0	51.1	70
0	24.0	150	0	55	65
0	24.8	145	1	00	60
0	25.7	140	1	5.5	55
0	26.6	135	1	12	50
0	28.8	125	1	20	45
0	30.0	120	1	30	40
0	31.3	115	1	43	35
0	32.8	110	2	00	30
0	34.3	105	2	24	25
0	36.0	100	3	00	20
0	37.9	95	4	00	15
0	40.0	90	6	00	10
0	42.4	85	12	00	5
0	45	80			

DRAFT



1.4 Equipment - Locomotive and Car Bearings

1.4.1 Locomotives and Cars - Checking for Hot Journal Bearings

A. Carry and use a 219-degree Tempilstik to check for hot bearings. Employees inspecting High Speed Trainsets will also carry a 200-degree Tempilstik and use it on that equipment exclusively.

B. Use the tempilstick to mark the surface of the bearing housing/adapter.

C. Make a visible mark with the tip of the tempilstick on or as close to the bearing cup as possible. If the roller bearing cup is not accessible, use the tempilstick on the top surface of the adapter where the heat is concentrated.

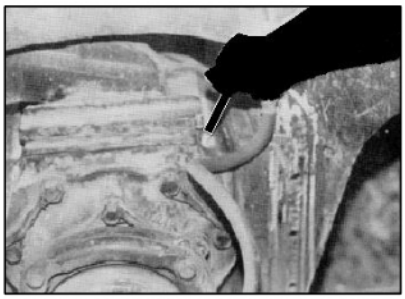
Roller Bearing Cup

D. Except for Amfleet cars, all Amtrak passenger-carrying cars currently in use have rotating end caps on the journals. Should you encounter equipment not described above, such as a locomotive or private car without a rotating end cap, place the tempilstick on both the roller bearing adapter and the roller bearing end cap or bearing housing cover.

E. If the surface marked with the tempilstick exceeds 219 degrees (200-degrees on High Speed Trainsets), the end of the tempilstick will melt on the surface.

F. When tempilstick melts, indicating a hot or failed journal bearing, comply with the following:

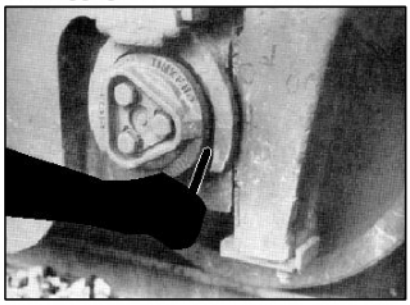
1. QP or QMP must visually inspect equipment,
2. Train must not move until QMP determines if safe for movement. Communicate to QMP any host railroad rules, speed restrictions or any other instructions concerning the defect. If communication with QMP not immediately available, contact QMP at CNOC mechanical desk at 1-800-424-0217,
3. QMP will determine whether car is to be set out, maximum speed and any other restrictions necessary for safe movement.



G. Journal Bearing Illustrations:

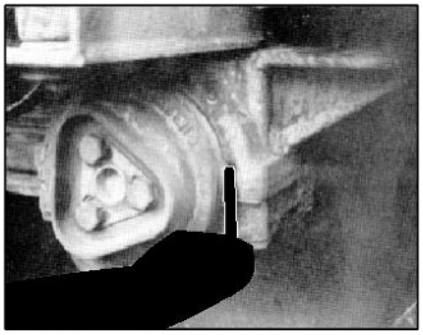
1. Amtrak Heritage Car with Timken EE Roller Bearing on GSI style truck.

Reach in through adapter and end cap to touch bearing cup.



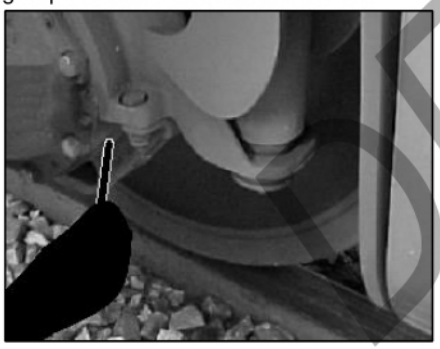
2. Amtrak Heritage Car with Timken EE Roller Bearings and Decelostat Housing Bolted to Roller Bearing Adapter.

Place tempilstick on top of adapter just above bearing location



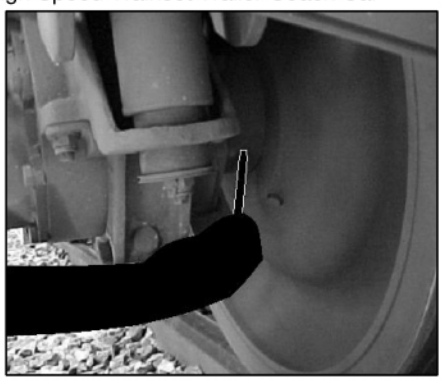
DRAFT

3. GSI Truck Used on Auto Train Auto Carriers, Material Handling Cars, Viewliner, Superliner II, and Some Types of Baggage Cars.

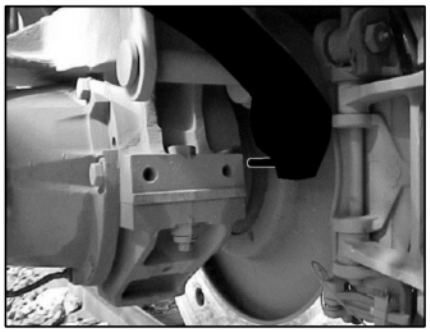


Reach in behind roller bearing end cap to place tip of tempilstick on roller bearing cup

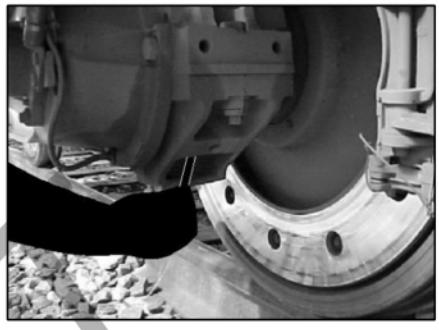
4. MD-76 Truck Used on Amtrak Superliner I Cars.



Reach in behind roller bearing end cap to place tip of tempilstick on roller bearing cup.



5. High Speed Trainset Trailer Coach Car

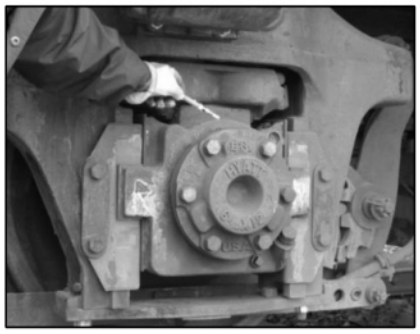


6. High Speed Trainset Trailer Coach Car

7. High Speed Trainset Power Car/ HHP-8 Locomotive

8. High Speed Trainset Power Car/ HHP-8 Locomotives

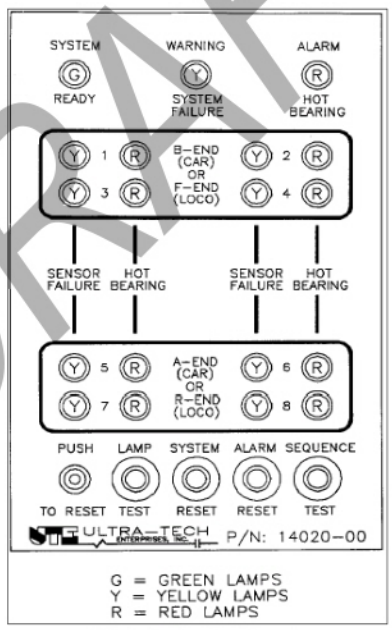
9. ACS-64 / Charger SC-44 / ALC-42 Locomotives



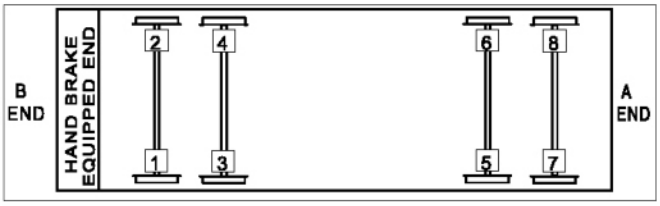
10. P-32ACDM & P-40/42 Locomotives

DRAFT

11. F-59PHI Locomotive



1.4.2 On-Board Hot Bearing Detection System



A. Amfleet cars and CDTX Comet Cars 5001 to 5014 are equipped with an On-Board Hot Bearing Detection (OBHBD) system, which is designed to give the crew an audible and visual alarm if the system detects an overheated journal bearing. The system operates with the following components:

1. Journal bearing heat sensor probes that are mounted on each of the car's bearings and connected by cables to a Main Indicator Panel.
2. Trainline connection to enable equipped locomotives to indicate when a hot bearing or problem with the detection system is detected.
3. An alarm panel that is located above the electric locker door. This panel contains a red alarm light and an audible alarm device.
4. Main Indicator Panel (black box) is located on the wall inside the electric locker.

NOTE: Under normal conditions, the only light that is illuminated is the “SYSTEM READY” light.

Main Indicator Panel

Amfleet Journal Bearing Position Numbers

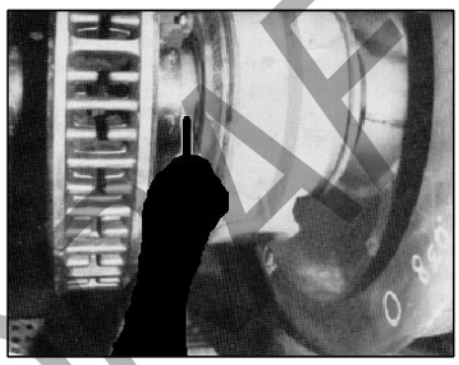
DRAFT

B. Actions Employees Must Take In Response to Air Alarms:

1. Stop the train as soon as safe handling will permit.
2. Open the electric locker door on the car with the alarm actuation.
3. Press the "ALARM RESET" button to silence the audible alarm in the car. This will also extinguish the "Hot Journal" warning light on the locomotive.
4. Look at the detector's Main Indicator Panel to determine which alarm light is illuminated (e.g., Wheel 5 Sensor Failure light).
5. Record alarm light information on EMAP 21A, indicating specific location and car number, then verbally report it to the Dispatcher and CNOC mechanical desk at 1-800-424-0217.
6. Take the specific actions listed below, based on the alarm light type.

NOTE: Before going under equipment to inspect bearings, employees must obtain "Three Point Protection". Employees must ensure that they **apply the Tempilstik to the proper location** on roller bearing adaptor or seal, as illustrated below.

7. Notify the Dispatcher and the Engineer of the results of any inspections.
8. When an alarm occurs before a crew change location, the incoming crew must be advised of any alarm light that remains illuminated, any speed restriction that is in effect, and whether a mechanical inspection is required. If the outgoing crew cannot personally give this information to the incoming crew, they must ask the Dispatcher to relay it.



C. Actions Employees Must Take Based on Alarm Light Type.

1. **Red "Hot Bearing" Alarm Light:**

a. Inspect all bearings on the **affected truck** with a 219-degree Tempilstik, starting with the bearing that actuated the alarm.

(1) Place Tempilstik on either:

- The adapter on the side of the roller bearing housing facing the disc brake rotor, or
- The roller bearing seal ring next to the adapter.

CAUTION: USE CARE, AS THE DISC BRAKE ROTOR AND THE AREA AROUND THE JOURNAL BEARING MAY BE VERY HOT.

b. Take the following additional actions while performing bearing inspections:

(1) Look for signs of a hot bearing smoke bomb actuation (i.e., violet colored smoke or dye, and rotten egg smell).

(2) Look for damage to the heat sensor probe cable that is connected to the bearing, and to the wiring that runs from the heat sensor probe cable to the car body.

(3) Hand tighten the connectors on the heat sensor probe cable, and the connector on the Main Indicator Panel located in the electric locker.

c. When tempilstick melts, indicating a hot or failed journal bearing, comply with the following:

(1) QP or QMP must visually inspect equipment.

(2) Train must not move until QMP determines if safe for movement.

(3) If communication with QMP not immediately available, contact QMP at CNOC mechanical desk at 1-800-424-0217.

(4) QMP will determine whether car is to be set out, maximum speed and any other restrictions necessary for safe movement.

d. If **no** hot bearing is found, try to reset the detector by pressing the "SYSTEM RESET" button on the Main Indicator Panel.

e. If the red "Hot Bearing" alarm light goes out, proceed at NORMAL SPEED. Defect must be recorded on EMAP 21A, noting location and car number.

(1) If a red "Hot Bearing" alarm light comes on again at the same bearing location, reduce train speed to not exceeding 80 MPH to the next location where mechanical forces are available to inspect car.

(2) If at this mechanical inspection location, mechanical forces determine there is no hot bearing, and that the On-Board Hot Bearing Detection (OBHBD) system is defective, train may proceed at NORMAL SPEED.

(3) If mechanical forces determine that bearing is hot, train will be terminated.

DRAFT

f. If the red "Hot Bearing" alarm light remains illuminated after pressing the "SYSTEM RESET" button on the Main Indicator Panel:

(1) Proceed not exceeding 80 MPH to the next location where mechanical forces are available to inspect the car.

(2) If at this mechanical inspection location, mechanical forces determine there is no hot bearing, and that the On-Board Hot Bearing Detection (OBHBD) system is defective, train may proceed at NORMAL SPEED.

(3) If mechanical forces determine that bearing is hot, train will be terminated.

g. When a "Hot Bearing" alarm occurs before a crew change location, the incoming crew must be advised of any alarm light that remains illuminated, any speed restriction that is in effect, and whether a mechanical inspection is required. If the outgoing crew cannot personally give this information to the incoming crew, they must ask the Dispatcher to relay it.

2. **Yellow "Sensor Failure" Alarm Light:**

a. Proceed at NORMAL SPEED. The Main Indicator Panel displays a yellow "Sensor Failure" alarm light when an electrical fault is detected, such as a loose connection in the detector wiring, or a shorted or grounded sensor probe. Since yellow "Sensor Failure" alarms do not indicate that there is a hot bearing, all cars have been modified so that a yellow "Sensor Failure" alarm will not actuate the audible and visual alarm outside the car's electric locker door, or the red "Hot Journal" light on equipped engines. The yellow "Sensor Failure" light is simply an indication that the OBHBD system needs to be repaired.

b. Crewmembers discovering an illuminated yellow "Sensor Failure" alarm light must notify the Train Dispatcher, Engineer and CNOC mechanical desk at 1-800-424-0217 of the defect, and record it on EMAP 21A , indicating specific location and car number.

3. **Yellow "Warning System Failure" Alarm Light:**

a. Check for a problem with the detector's computer system by pressing the "SYSTEM RESET" button (bottom center).

b. If the "WARNING SYSTEM FAILURE" light goes out, proceed at NORMAL SPEED.

c. If "WARNING SYSTEM FAILURE" light remains illuminated, proceed not exceeding 80 MPH to the next location where mechanical forces are available to repair the detector.

d. If mechanical forces cannot repair the detector, proceed not exceeding 80 MPH to the final terminal.

e. Crewmembers discovering an illuminated "Warning System Failure" alarm light must notify the Train Dispatcher, Engineer and CNOC mechanical desk at 1-800-424-0217 of the defect, and record it on EMAP 21A , indicating location and car number.

4. **No Lights Illuminated on Main Indicator Panel:**

a. The following instructions apply when an OBHBD alarm actuation has occurred on the alarm panel outside the electric locker door, and no lights are illuminated on the Main Indicator Panel inside the electric locker.

NOTE: If no OBHBD alarm has occurred, and the Main Indicator Panel is dark simply because of an HEP failure or loss of DC power on a specific car, the train may proceed at NORMAL SPEED.

b. Check for a circuit breaker trip on the detector by pressing the "PUSH TO RESET" button. (bottom left corner)

c. If the green "SYSTEM READY" light illuminates, check all lamps by pressing the "LAMP TEST" button. If no sensor or bearing lights illuminate, proceed at NORMAL SPEED.

d. If the "SYSTEM READY" light remains out, check all lamps by pressing the "LAMP TEST" button:

(1) If all lamps illuminate except the "SYSTEM READY", proceed at NORMAL SPEED.

(2) If all lamps illuminate except the "SYSTEM READY" light and one of the hot bearing lights, follow the instructions for a Red "Hot Bearing" alarm light.

(3) If all lamps illuminate except the "SYSTEM READY" light and one of the sensor failure lights, follow the instructions in 1.4.2C.2.

(4) If NO lamps illuminate, proceed not exceeding 80 MPH to the next location where mechanical forces are available to repair the detector. If mechanical forces cannot repair the detector, proceed not exceeding 80 MPH to the final terminal.

e. Crewmembers discovering defective OBHBD lamp(s) must record the defect on EMAP21A, indicating location(s) and car number.

1.4.3 Diesel Locomotive Traction Motor Support Bearing Monitor System

A. The following instructions will be used to correct Traction Motor Support Bearing Faults on diesel locomotives equipped with the system.

B. Hot Support Bearing Detection System.

1. The traction motor support bearing detector system consists of a Hot Support Bearing Detector Box and an IFD screen (GE), DID panel (GE) or DDS panel (EMD).
2. In the event of an overheated TRACTION MOTOR SUPPORT BEARING, the locomotive screen or panel (IFD/DID/DDS) will display one of the following messages:

a. "WARNING! Hot Axle Bearing On This Loco"

b. "WARNING! Hot Journal On This Loco"

DRAFT

c. "WARNING! Hot Support Bearing On This Loco"
d. "Hot TM Support Bearings On This Locomotive"
e. "WARNING! Axle Problem On Other Loco"
f. "Axle Problem On Other Locomotive"

NOTE: The messages above DO NOT pertain to the journal bearings on the locomotive; only the traction motor support bearings.

NOTE: Letter e. and f. above would be displayed on the LEAD unit in the event of an overheated traction motor support bearing or other axle problem on a TRAILING unit in the consist.

3. When a hot traction motor support bearing is detected, the message must be reset on the screen or panel (IFD/DID/DDS) **AND** the Hot Support Bearing Detector Box must be checked and reset. **If BOTH are not reset, and the locomotive is moved, an alarm bell will ring, and a continuous wheel slip light will be displayed.**
4. Location of the Hot Support Bearing Detector Box
   a. GE P-32BWH, GE P-32ACDM, P-40DC, P-42DC - Inside the electrical cabinet door (CA1) on the rear cab wall. It is connected to the 8 traction motor support bearing sensors and to the locomotive computer. Flashing red LEDs indicate the location of a suspected hot support bearing.
   b. EMD F-59 - Inside the upper right door of the electrical control cabinet in the locomotive cab.

C. Inspection Procedure
1. Safely stop the train and determine which locomotive is causing the alarm.
2. Determine which support bearing is hot by observing the LEDs on the detector box to see which is illuminated and flashing red.
3. Perform a visual inspection of the identified support bearing for failure. If the support bearing is moist from water or oil and vapor or mist is not observed, the temperature is not critical. If a failure is indicated by smoke, burnt odor, discoloration and/or flames originating from the bearing area – SET LOCOMOTIVE OUT.
4. If no obvious signs of overheating are present and a question still remains as to the condition of the support bearing, a "FEEL" test may be conducted. Using only your hand, protected with a glove, reach out to lightly brush the support bearing area. If heat is radiating from the support bearing area– SET LOCOMOTIVE OUT.

D. Failure Found – Setting Locomotive Out
1. Isolate locomotives with evidence of a failed support bearing and cutout the traction motor circuit to the effected motor. Follow reset procedures shown below to silence alarm and allow unit to load. The locomotive should then be moved **not to exceed 10 MPH to the next point where the locomotive can be set out**. Defect must be noted on the MAP 100.

E. Reset Procedure
1. Press the "Alarm Reset" button located at the bottom of the detector box. This will cause the LED which is indicating the hot support bearing to stop flashing and illuminate continuously. The "Alarm Hot Bearing" light will also turn off.
2. Press the "System Reset" button located at the bottom of the detector box. This will cause all detector box LEDs to reset (turn off).
3. If the Bearing Indicator LED's do not reset (turn off) and the system will not reset after completing steps 1 and 2 above, proceed with the following steps.
4. Press the "Sequence Test" button located at the bottom of the detector box. This will begin a system sequence test.
5. As soon as the sequence test begins (all LED's will be lit), press the "System Reset" button. This will stop the sequence test and reset all LED's and related circuitry.
6. Reset the fault on the screen or panel (IFD/DID/DDS).
7. GE locomotives - If, after resetting the Hot Support Bearing Detector Box AND the screen or panel (IFD/DID), the alarm continues to sound and/or a continuous wheel slip light is displayed, separate the cable from the bottom of the Hot Support Bearing Box by unscrewing and removing it from the receptacle. Notify Train Dispatcher and CNOC mechanical desk. NOTATION MUST BE MADE ON MAP 100 (Failure En Route / Equipment Condition).
8. EMD F-59 locomotives - If, after resetting the Hot Support Bearing Detector Box AND DDS panel, the alarm continues to sound and/or a continuous wheel slip light is displayed, shut off power to the system by opening the "HOT BEARING" circuit breaker in the electrical control cabinet. Notify Train Dispatcher and CNOC mechanical desk. NOTATION MUST BE MADE ON MAP 100.

F. No Failure Found – Further Movement
1. Upon inspection, if nothing is found to indicate a failed support bearing:
   a. Follow the reset procedures above to silence alarm, extinguish LEDs and allow unit to load.
   b. Verify that all wheels are seen to be rolling freely.
   c. The locomotive may then proceed not exceeding 50 MPH for a distance of at least 10 miles. The support bearing must then be reinspected.
   d. After reinspecting, if nothing is found to indicate a hot or failed traction motor support bearing, movement may continue at **normal speed**.
   e. All faults must be noted on MAP 100.

DRAFT

1.5 Equipment - Locomotives, Cars and Other Equipment

1.5.1 Amfleet Cars – Air Bellows

A. When Under-Inflated – No action necessary except to report on EMAP 21-A.
B. When Over-Inflated – Speed of train reduced per System General Order and bellows deflated as soon as practicable.
C. Deflating Air Bellows
1. Locate “Air Spring Cutout“ badge plate on car side sill (each end of car).
2. Close both “Air Supply Cocks“ on affected end. (Located near badge plate, have yellow handles, and are tagged.)
3. Open “Deflate Air Spring Valve“. (Located near air spring supply cocks and has a red handle.)
4. After bellows are deflated resume normal speed.

D. Cars Not Equipped With “Deflate Air Spring Valve”
1. Locate “Air Spring Cutout“ badge plate on car side sill (each end of car).
2. Close both “Air Supply Cocks“ on affected end. (Located near badge plate, have yellow handles, and are tagged.)
3. Operate at speeds per System General Order to next terminal.
4. Notify Train Dispatcher as soon as possible.

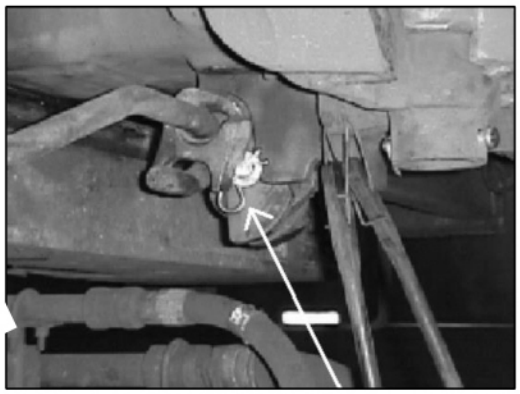
1.5.2 Passenger Cars – Main Reservoir

A. If M/R hose or pipe is damaged en route, close M/R cock ahead of damaged car.
B. If M/R tank is damaged and cannot readily be repaired
1. Close M/R cock ahead of damaged car.
2. Cut out control valve cutout cock on damaged car.
3. Cut out brake cylinders on each truck on damaged car.
4. Report car number and incident to train dispatcher.

1.5.3 Defective Bolster Anchor/Radius Rod En Route

A. Train must not exceed 30 MPH.
B. Notify Train Dispatcher as soon as possible.
C. Train Dispatcher will designate where car is to be set off.

1.5.4 Overriding Buffer Plates – Action to Be Taken



A. Notify Train Dispatcher immediately.
B. Train must not exceed 15 MPH and when moving through crossovers and turnouts, 5 MPH.
C. Employees and passengers must not occupy or pass-through vestibule area while train is in motion.

1.5.5 Coupler Locking Pins

A. To preclude the unintentional uncoupling of automatic H-type couplers of Amtrak cars, the H-coupler locking mechanism will be pinned. These pins are located in the “rotary lock lift” mechanism underneath the coupler and are secured with a “hair pin” which is placed through a hole drilled in the end of the bolt. This “pin” should be visible from the operating side of the cut lever. All trains with passenger equipment operating on main tracks are required to have their couplers pinned.

NOTE: All Metrolink trains are pinned.

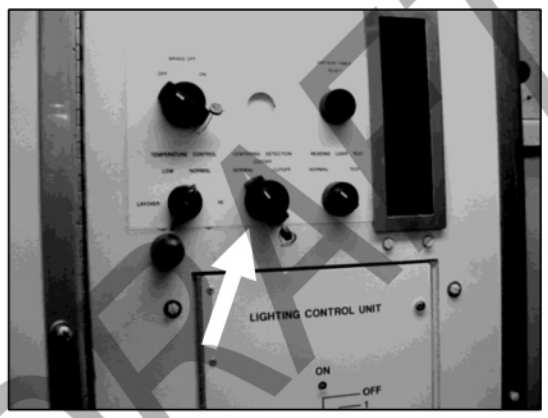
EXCEPTION: Trains conducting Switching Operations (instruction 2.21.13), trains operating exclusively in yard facilities on other than main track, trains moving freight type equipment, and lite locomotive moves are not required to have their couplers pinned.

Hair Pin

DRAFT

B. The transportation, or mechanical crew, that makes up a train or couples cars to a train is responsible for removing and inserting pins on the cars they couple to the train. Requirements for HEP shutdown and blue signal protection are in effect during this procedure.

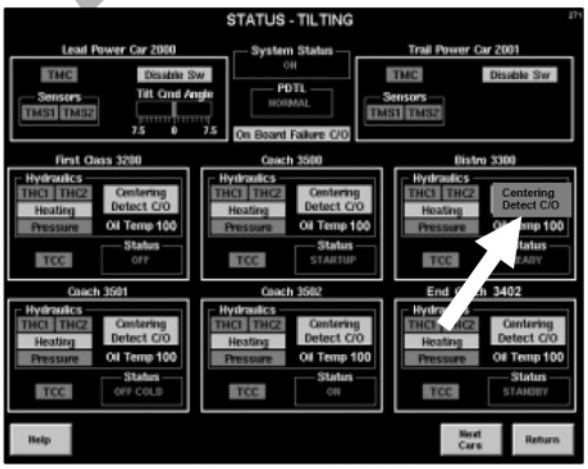
C. If it becomes necessary to uncouple any cars from these trains en route, employees must:



1. Visually check for locking pins before attempting to operate the cut lever. If none are visible, carefully operate cut lever to avoid injury if lever does not fully rotate.
2. If locking pin is visible, ensure that protection against equipment moving is provided, then remove “hair pin” from end of locking pin. Locking pin may be removed by pulling it out from opposite side of coupler. DO NOT USE FINGER TO PUSH PIN OUT OF THE ROTARY LOCK LIFT.

D. Pinning of cars has been added to the Mechanical Inspection prior to release into revenue service. Employees must expect trains to be pinned and take precautions to avoid injury when uncoupling locomotives and cars.

1.5.6 High-Speed Trainset (HST) Tilting Fault “Car Not Centered”



A. If a High-Speed Trainset (HST) receives a Level 1 fault on the Primary Operating Display (POD) indicating a “Car Not Centered” accompanied by an audible alarm, the following instructions must be followed:

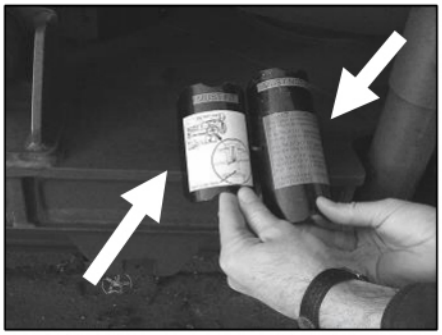
1. The alarm block on Multi-Function Display (MFD-1) will display the fault “Car Not Centered” car number XXXX.
2. Engineer will acknowledge the alarm with the soft keys (F-7 or F-8) and notify the Conductor of the “Car Not Centered” fault.
3. A 20 mph maximum speed restriction will be enforced.
4. Crew must go to the electric locker on the affected car, break the seal on the Centering Detection Switch, and move it to the “CUTOUT” position. This will release the train speed restriction of 20 MPH.
5. Engineer will continue at Train Type C speeds.

Car Centering Switch Located in Passenger Car Electric Locker

6. The sub system status of the tilting system on the affected car must be checked to ensure that the centering detection C/O block is highlighted. The Conductor must check on MFD-B as soon as practical and the Engineer must check on MFD-2 at next location where the train is stopped.

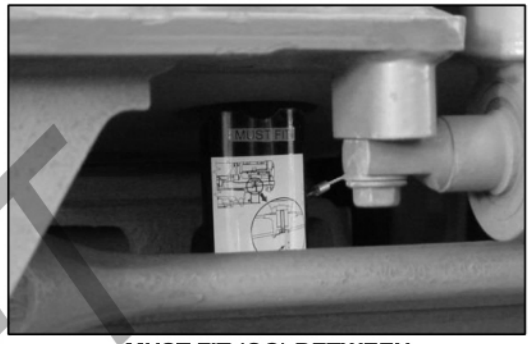
Centering Detect C/O

7. Engineer will also have a message on the MFD-1 Alarm section that centering detection is cut out on the affected car.



DRAFT

8. If the car is not centered and seating capacity permits, the Conductor will offer passengers seating in another car to avoid discomfort related to off center car condition.
9. Report the condition to the Dispatcher and operate at Train Type "C" speeds with the centering detection switch cutout.
10. Engineer must report these conditions on the MAP 100, *Equipment Condition Report*, and Conductors are required to report the conditions on the Record of Defect and Repair - EMAP 21A.



B. If the "Car Not Centered" fault can be reset with the "Portable Test Equipment" the train may proceed at Train Type A speeds. Centering switch must be cut back in. Notify Dispatcher that "Car Not Centered" fault is reset.

C. If the "Car Not Centered" fault is not reset en route by a Mechanical Technician or Road Foreman the train may proceed at Train Type C Speeds to its final destination, unless directed by a QMP to inspect the affected car. If so directed, perform the inspection as follows:

1. The "Car Not Centered" tools are stored on each Power Car in the tool locker directly behind the Engineer on the cab rear wall.

MUST FIT (GO) GAUGE **MUST NOT FIT (NO/GO) GAUGE**

MUST FIT (GO) BETWEEN TRUCK FRAME AND BOLSTER

2. After notifying the Dispatcher of the "Car Not Centered" fault, and receiving the required protection if required, a member of the train crew will go to the affected Trailer Car (Coach) that triggered the "Car Not Centered" alarm and check either side of the truck with both the Must Fit (GO) Gauge and the Must Not Fit (NO GO) Gauge.
3. On the affected Trailer Car (Coach) place the Must Fit (GO) Gauge between the truck frame and bolster. If the Must Fit (GO) Gauge does not fit, the car is NOT Centered. Proceed at train type C Speeds.
4. Take the Must Not Fit (NO GO) Gauge and place between the truck frame and bolster. If the gauge fits, this also confirms that the car is NOT centered. Both gauges must be used in the vertical position. It will be visible to the eye that the car is NOT centered and is slightly tilted, compared to the rest of the cars in the Trainset.
5. Check both trucks on the affected car with the (GO/NO GO) gauges.
6. If car is centered (GO) gauge fits, proceed at train type B speeds.

1.5.7 Operation of Dead General Electric Locomotives P32-BWH, P32AC-DM, P-40BH or P-42BH in Lead with a Multiple Unit Consist

A. When the lead GE P32-BWH, P32AC-DM, P-40BH or P-42BH Locomotive shuts down (prime mover shut down) and cannot be restarted, it is necessary to provide a charging circuit to the batteries of the lead locomotive. This is accomplished by properly connecting and setting up HEP from a trailing unit in the consist. If the proper HEP connections and settings are not made between the units in the consist, the batteries will discharge causing the **NO BATTERY CHARGE** circuit feature to disconnect safety critical components – e.g., IFC screens, horn, and headlight.

B. Proper HEP arrangement is as follows:

1. Connect all HEP cables between all units in consist.
2. If GE locomotive is trailing unit and will supply HEP:
   - **a.** HEP Mode Switch – Normal
   - **b.** HEP Locomotive Position Switch – Trail
3. If F-59PHI locomotive is trailing unit and will supply HEP:
   - **a.** HEP Source Switch – Local
   - **b.** HEP Trainline Setup Switch – Single Bus
4. Lead (Dead) GE unit:
   - **a.** HEP Mode Switch – Off
   - **b.** HEP Locomotive Position Switch – Lead

DRAFT

23-CV-02419 Dkt. 1-6 Filed 06/26/23 Page 24 of 154 PageID #: 24 UNCLASSIFIED 4/30/2026

c. After ensuring proper setup of HEP, engineer must observe battery charge ammeter for charging and note that **NO BATTERY CHARGE** indicator light is not lit.

C. If the **NO BATTERY CHARGE** light is "on", after HEP is properly connected and setup, reset the Battery Connect Pushbutton (BCPB) on electrical control panel. If the BCPB will not reset and battery ammeter indicates batteries are not charging, locomotive consist will have to be shifted or another lead unit added to consist.

D. Pneumatic operation requires all multiple unit hoses to be coupled for air supply and air brake control of the consist.

NOTE: DO NOT CUT IN THE DEAD ENGINE FEATURE

1.5.8 Fuel Transfer / Balancing on General Electric Locomotives P-40 and P-42

A. The fuel tank on General Electric P-40 and P-42 locomotives is divided into four compartments. Located inside the engine compartment on each side of the locomotive are supply and return shut-off valves for each compartment. These valves are used to open and close fuel supply and return to individual fuel compartments.

B. The fuel tank is equipped with two sensors to calculate the total fuel available. One sensor is located in the right-front compartment, the other sensor is located in the left-rear compartment. Total fuel is calculated by adding the amount of fuel in the right-front and left-rear compartments, then multiplying by two. This is the amount of fuel you see on the digital displays on each side of the locomotive as well as on the IFD screen. The digital displays are accurate only if fuel is being drawn from all four fuel compartments at the same rate. If fuel is being used at a higher rate from one compartment, especially the left-front or right-rear, the digital display will not accurately indicate total fuel available.

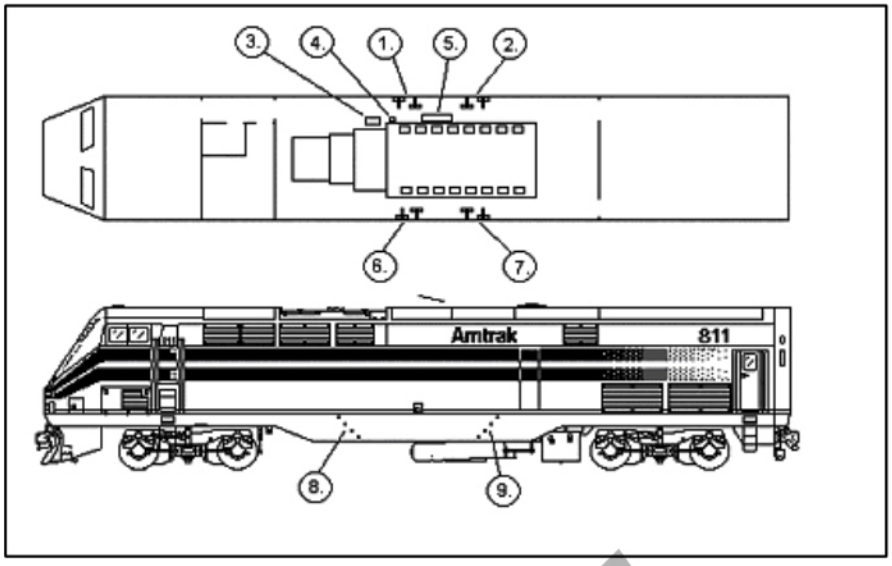
C. To determine the amount of fuel in individual compartments, the fuel sight glasses on each side of the locomotive must be used. Each fuel compartment is equipped with four sight glasses. The approximate fuel levels per sight glass are as follows:

1. Top Sight Glass – 500 Gallons
2. Second Sight Glass – 315 Gallons
3. Third Sight Glass – 150 Gallons
4. Bottom Sight Glass – 30 Gallons

D. If the fuel level in a compartment is at or below the bottom sight glass, it is likely that air will be drawn into the fuel system causing engine shut-down. **It is important to note that sufficient fuel may be remaining in the other three compartments to operate the diesel engine to the final destination or fueling point.** When this condition exists, the following procedure should be followed to identify the empty fuel compartment and restart the diesel engine:

1. Make certain that train is stopped in a safe location and properly secured.
2. Observe the fuel sight glasses on both sides **from the ground** to determine which compartment is empty or low.
3. In the engine compartment, close the supply and return valves to the compartment which is empty or low.
4. Open the vent petcock on top of the fuel filter housing. The fuel filter housing is located in the engine compartment, at floor level, on the engineer's side, at approximately the middle of the diesel engine.
5. Move the Fuel Prime/Engine Start switch to the Fuel Prime position and hold.
6. Observe fuel and air exhausting from the vent petcock on the fuel filter housing.
7. Continue holding the Fuel Prime/Engine Start switch in the Fuel prime position until all air is exhausted from the fuel system.
8. When fuel flows clear from the vent petcock, close it.
9. Continue priming until the fuel sight glass, located at floor level, adjacent to the Fuel Prime/Engine Start switch, is clear of bubbles.
10. If the sight glass does not clear, open vent petcock on fuel filter housing again to expel air. Close vent petcock when air is expelled.
11. Repeat steps as necessary until fuel flows clear in fuel sight glass.
12. Restart diesel engine.

E. Make note on MAP 100 when a fuel compartment is isolated as described in the steps above. This must be done in order to have the valves positioned correctly at the next mechanical facility. This also serves to document the occurrence of this problem on a particular locomotive.



F. When fuel is added to the locomotive, the following items must be taken into consideration before opening the supply and return valves to the isolated compartment:

1. The two compartments are first filled on the side which has the fuel hose connected. When these compartments are full, fuel then flows to the opposite side of the locomotive to fill the remaining two compartments.
2. If the locomotive is only partially filled with fuel, observe the fuel sight glasses on the sides of the locomotive to make certain that fuel is in the isolated compartment before opening the supply and return valves.
3. If the locomotive is completely filled with fuel at a fueling point, all supply and return valves must be opened.

DRAFT

4. When in doubt about the fuel levels in each compartment, observe the sight glasses on the side of the locomotive.

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

1. Butterfly type Supply Valves for right front and rear compartments (Non-modified units - Supply and Return Valves for right-front compartment)	6. Butterfly type Supply Valves for left front and rear compartments (Non-modified units - Supply and Return Valves for left-front compartment)
2. Butterfly type Return Valves for right front and rear compartments (Non-modified units - Supply and Return Valves for right-rear compartment)	7. Butterfly type Return Valves for left front and rear compartments (Non-modified units - Supply and Return Valves for left-rear compartment)
3. Engine Start Station	8. Left-Front Compartment Sight Glasses
4. Fuel Sight Glass	9. Left-Rear Compartment Sight Glasses
5. Fuel Filter Housing & Petcock	

DRAFT

1.5.9 Parking Brake Cut-Out Cocks on General Electric Locomotives P-40DC, P-42DC and P32ACDM

A. The General Electric P-40DC, P-42DC and P-32ACDM locomotives are not equipped with the conventional hand brake. It has a spring-applied, air-released parking brake. When the parking brake handle in the operator's cab is moved to the RELEASED position, main reservoir air is sent to all eight parking brake units (four per truck). The main reservoir air pressure overcomes spring pressure to release the parking brake. When the parking brake handle is moved to the APPLIED position, air is vented at the handle. When the air is vented, a large spring on each brake unit applies the parking brakes.

B. There have been reported incidents that when adding or cutting off locomotive(s), the parking brake cut-out cock on the front of the locomotive has been closed. When the parking brake cut-out cock is closed, the parking brake will apply and not release regardless of what position the parking brake handle in cab.

C. To prevent inadvertent closure of the parking brake cut-out cock, the handle has been painted bright orange or red. Do not confuse the brake cylinder cut-out cock (outboard) with the parking brake cut-out cock (inboard).

1.5.10 Door Close By-Pass Function on General Electric Locomotives P-42 and P-32BWH

A. General Electric P-42 and P-32 BWH locomotives are modified for operation with cars equipped with a door closed sensing circuit. This modification includes installation of a Door Closed By-Pass Switch (DCBS), a Coach Door Closed Light (CDCL) and a Door Override Light (DORL).

B. P-42 Equipment Description:

1. Door Closed By-Pass Switch (DCBS) – This switch, which is labeled "Normal / By- Pass Door Closed", is located on the Engine Control Panel, adjacent to the MU Headlight switch. When locomotive is used with cars equipped with a door closed sensing circuit, the DCBS will be sealed in the Normal (Up) position.

26-FCP-0541-S 0000006205 UNCLASSIFIED 4/30/2026

2. Coach Door Closed Light (CDCL) – This light (green), which is located on the panel above the engineer's side windshield, illuminates to indicate that the doors are closed throughout the train when cars are equipped with a door closed sensing circuit.
3. Door Override Light (DORL) – This light (red), which is located on the panel above the engineer's side windshield, illuminates to indicate that the DCBS is in the By- Pass position.

C. P-32 BWH Equipment Description:

1. Door Closed By-Pass Switch (DCBS) – This switch, which is labeled "Door Override", is located on the Engineer's Console, adjacent to the gauge light switch. When locomotive is used with cars equipped with a door closed sensing circuit, the Door Override Switch will be in the Normal (Up) position.
2. Coach Door Closed Light (CDCL) – This light (green) which is located on the Engineer's console next to the Ditch Light toggle switch, illuminates to indicate that the doors are closed throughout the train when cars are equipped with a door closed sensing circuit.
3. Door Override Light (DORL) – This light (red), which is located on the Engineer's console next to the Ditch Light toggle switch, illuminates to indicate that the DCBS is in the By-Pass position.

D. During normal operation with cars equipped with a door sensing circuit, the locomotive will not load until all doors are closed in the train. When all doors are closed the CDCL illuminates, allowing the locomotive to load. If a fault occurs, door won't close, or the door sensor fails, the CDCL will not illuminate, preventing the locomotive from loading.

E. When the CDCL is not illuminated, due to fault, door won't close or door sensor failure the DCBS may be operated to allow locomotive loading as follows:

1. Contact the train crew to establish a clear understanding that the DCBS will be operated, and
2. When it is known that the train crew understands that the door close sensing circuit will be by-passed, operate DCBS by placing it in the By-Pass (down) position.

F. While in operation with cars NOT equipped with a door closed sensing circuit, place the DCBS in the By-Pass (down) position, breaking the seal if necessary.

1.5.11 Crossing Light Pulsing Manual Stop on General Electric Locomotives P-40, P-42 ,P-32DM, and P32-BWH

A. General Electric locomotives have been retrofitted with an upgraded Crossing Light (Ditch Light) controller. This pushbutton, labeled "Crossing Light Pulsar Stop", is located on the right side of the Engineer's console, just above the Crossing Light Switch.

B. If the Crossing Lights are activated by sounding the horn, the flashing of the Crossing Lights can be deactivated by pushing the Crossing Light Pulsar Stop button.

C. The Crossing Lights will start flashing again with the next activation of the horn. Crossing Lights can still be activated manually using the Crossing Light switch; no changes have been made to the functionality of the Crossing Light Switch.

1.5.12 Locomotive Car Body Doors

A. Engine crews must ensure that all locomotive car body doors are kept closed. Failure to keep these doors closed can cause leaves and debris to restrict or stop air flow causing equipment failure.

DRAFT

1.6 Equipment – Head End Power (HEP)

1.6.1 HEP Short Looping Procedures

A. A train must not depart its originating terminal with HEP cables short looped when qualified mechanical forces are on duty to make the necessary repairs.

B. A train may be short looped en route only:

1. When other corrective actions have failed to restore HEP to train consist, and
2. After it is determined that there are no damaged or dragging cables.

C. Short Looping Procedure

1. Short loop behind locomotive on side which trainline complete indication is not displayed.
2. Be sure to short loop cable back into remaining receptacle on car.
3. Ensure that locking ring on receptacle is engaged if equipped.
4. Notify CNOC mechanical desk at 1-800-424-0217 that train is short looped.
5. Notify relieving Engineer and Conductor that train is short looped and location.

1.6.2 HEP Set Up Procedures on EMD F-59 Locomotives

A. EMD F59PHI locomotives used in Amtrak service must have the "HEP Trainline Set-Up" switch in the "Single Bus" position.

26-FRA-50419 0000008280 UNCLASSIFIED 4/30/2026

NOTE: If the "HEP Trainline Set-Up" switch is placed in the "Dual Bus" position, the TLC protection is nullified.

1.6.3 HEP Used as Ground/Wayside Power

A. When available, Ground/Wayside power will be used instead of using a locomotive to provide HEP.

B. When Ground/Wayside power is used for HEP source with General Electric locomotives P-32BWH, P40 or P-42 in a train, set up must be as follows:

1. HEP Mode switch must be in the "OFF" position on all units in a locomotive consist, except the unit which will later provide HEP to the train.
2. HEP Mode switch must be in the "WAYSIDE" position on the unit which will later provide HEP to the train.
3. All trailing units in a locomotive consist must have Locomotive Position switch positioned to the "TRAIL or WAYSIDE" position.
4. When ground or wayside power will be connected to the rear of the train, the Locomotive Position switch on the lead locomotive will be set to the "Lead" position.
5. When ground or wayside power will be connected to the front of the lead locomotive, the Locomotive Position switch on the lead locomotive will be set to the "TRAIL or WAYSIDE" position.

C. When Ground/Wayside power is used for HEP source with EMD F-59 locomotive(s) in train, set up must be as follows:

1. Close the layover protection system circuit breakers located on the LAYOVER circuit breaker panel.
2. Ensure that the HEP source switch is placed in the "TRAIN-LINED" position.
3. Place the LAYOVER switch in the "LAYOVER ON" position. This will allow for battery charging and protection of both the main engine and HEP engine during low ambient temperatures by heating and circulating cooling water and lube oil.
4. Ensure battery trickle charger located in short hood (nose) is on.

D. When Ground/Wayside power is used for HEP source with a Siemens Charger locomotive, set up must be as follows:

1. Shut down HEP on Charger on cab rear wall panel.
2. Set HEP SELECTOR switch in Electrical Room to "Feed Thru'.
3. When ground or wayside power is connected, verify Train Operators Display TOD indicates "HEP ON (EXT)"

1.6.4 Locomotive HEP Operation Troubleshooting Guidelines

NOTE: BEFORE PERFORMING ANY WORK ON HEP AND/OR TRAINLINE, REVIEW ALL APPLICABLE SAFETY INSTRUCTIONS AND REQUEST THREE POINT PROTECTION!

A. If a train loses HEP while on the line of road, the train electrical system will shut down. Head End Power loss can be caused by many different problems; the first step is to determine whether to troubleshoot the HEP source in the locomotive, or the 480v cable system.

1. Indicator(s) show 480v HEP trainline circuit is complete.
   a. Possible Cause: HEP Failure.
   b. Action: Refer to HEP troubleshooting section of appropriate locomotive operator's manual for DC units.

NOTE: AC locomotives will automatically use a traction inverter to provide HEP when the HEP inverter has a fault condition.

2. No Trainline Complete Indication
   a. Possible Cause: A loose or defective 480v cable or receptacle.
   b. Action:
   (1) SHUT DOWN AND ISOLATE HEP.
   (2) Visually inspect each 480v receptacle for an unseated or loose cable.
   (3) If no defective cables can be seen, the fault may be corrected by "short looping" one side of the train. Short loop behind the locomotive when practical, unless conditions require short looping in another location.
   (4) Report any troubleshooting steps taken and note where the fault is located on the appropriate MAP 100.

CAUTION: Amtrak locomotives are equipped with a 5 mph trainline complete function. This will allow HEP output to continue at train speeds above 5 mph even though trainline complete is lost. At train speeds below 5 mph, HEP will

DRAFT

shut down. Any time trainline complete is lost, visually inspect each 480v receptacle for an unseated, loose, or dragging cable. 26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

NOTE: On GE locomotives, if train speed is below 5 mph for more than 20 minutes without trainline complete, HEP will NOT restart. Cause of no trainline complete must be corrected before HEP can be restarted.

1.7 Equipment – Diesel Engines - General

NOTE: BEFORE PERFORMING ANY WORK ON HEP AND/OR TRAINLINE, REVIEW ALL APPLICABLE SAFETY INSTRUCTIONS AND REQUEST THREE POINT PROTECTION!

1.7.1 Diesel Engine Restart. Whenever a diesel locomotive shuts down and cannot be restarted after ONE attempt, the following procedure will apply:

A. Single Unit Consist

1. Shut down and isolate HEP if it is not a separate HEP system.
2. Disconnect all communication and MU jumper cables(s) between dead unit and train due to possible ground.
3. Restart the dead unit.
4. Reconnect the jumper cable(s).
5. Restore HEP.

B. Multiple Unit Consist

1. Shut down and isolate HEP if it is not a separate HEP system.
2. Disconnect all communication and MU jumper cables(s) from the dead unit.
3. Restart the dead unit.
4. Reconnect the jumper cable(s). If the unit shuts down again and cannot be restarted, isolate the dead unit, and drain if necessary.
5. Restore HEP.

1.7.2 Diesel Engine Protective Devices. The following pertains to Crankcase Over-Pressure and Low Water Pressure protective devices used on diesel-electric locomotives.

A. General Electric - Crankcase Overpressure Monitoring

1. A crankcase overpressure fault is indicated by a summary message on the DID panel or IFD screen.
2. Unit may not shut down after crankcase overpressure fault occurs.
3. This fault must **NOT** be reset by engine crews unless specifically instructed to do so by the Mechanical Department.
4. Affected unit should be isolated to silence the alarm and drain if necessary.
5. Report occurrence on the MAP 100 for that unit.
6. Notify Train Dispatcher/CNOC as quickly as possible.

B. EMD - Crankcase Overpressure Monitoring

1. Once tripped, the crankcase overpressure device must **NOT** be reset, and the engine must not be restarted. Device must not be blocked or otherwise prevented from functioning as intended.
2. This device is located near the main engine start station.
3. Affected unit should be isolated to silence the alarm and drain if necessary.
4. Report occurrence on the MAP 100 for that unit.
5. Notify Train Dispatcher/CNOC as quickly as possible.

C. General Electric – Low Water Pressure Monitoring

1. A low water pressure fault is indicated by a summary message on the DID panel or IFD screen.
2. Diesel engine load and speed reduces progressively until water pressure or temperature reaches a certain level at which time the diesel engine shuts down.
3. This fault may be reset by engine crews provided that a sufficient level of water is indicated in the sight glass.
4. The fault is reset using either the DID panel or IFD screen.

CAUTION — If low water pressure fault occurs after engine is restarted, such condition may indicate a water pump failure which could cause serious damage to the engine. In such cases, DO NOT RESTART THE ENGINE. If unit is to remain shut down, isolate unit to silence the alarm and drain if necessary.

5. Notify Train Dispatcher/CNOC as quickly as possible. Report must also be made on the MAP 100 for effected unit.

DRAFT

D. EMD – Low Water Pressure Monitoring

1. Once tripped, this device/fault may be reset, and the engine restarted provided that a sufficient level of water is indicated in the sight glass.
2. Older EMD units:
   - **a.** This device shares a common housing with the crankcase overpressure device which is located near the main engine start station.
   - **b.** The low lube oil button on the engine governor must also be reset to restart engine.
   - **c.** The "test cock" connected to the low water pressure device may need to be opened and closed in order for reset button to remain reset.
   - **d.** The low water pressure reset button may be temporarily held in until engine reaches idle speed and water pressure is restored. However, this device must not be blocked or otherwise prevented from functioning as intended.
3. Newer "EMDEC" equipped units:
   - **a.** Locate the "Fuel Injection" switch handle on the annunciator (fault) panel near the main engine start station.
   - **b.** Move the switch to the "STOP" position and return the switch to the "RUN" position to reset the fault.
   - **c.** Restart the engine.
   - **d.** Notify Train Dispatcher/CNOC as quickly as possible. Report must also be made on the MAP 100 for effected unit.

CAUTION — If low water pressure device trips after engine is restarted, such condition may indicate a water pump failure which could cause serious damage to the engine. In such cases, DO NOT RESTART THE ENGINE. If unit is to remain shut down, isolate unit to silence the alarm and drain if necessary.

DRAFT

1.7.3 Diesel Engines utilizing Diesel Exhaust Fluid (DEF).

The following pertains to Siemens SC-44 and ALC-42 type locomotives.

A. SC-44 and ALC-42 locomotives require the use of Diesel Exhaust Fluid (DEF) to operate the main engine's Aftertreatment System to achieve the required EPA Compliance (Tier 4) for the locomotive. To consistently meet this EPA requirement, the locomotive DEF tank fluid level should be checked daily by accessing the Train Operator Display (TOD) screens in the locomotive cab or utilizing the DEF Tank fluid level indicator.

B. To monitor the DEF level utilizing the TOD, perform the following steps at the Main Menu Screen:

1. Press "System" soft key.
2. Press "Engine" Soft Key.
3. The DEF Tank level will be shown as a percentage on the bottom right.

Engine System			
Ambient temperature	70 °F	0.00 A	Alt. excitation current
Fuel tank content	491 gal.	1 A	Alternator current
Fuel temperature	79 °F	67 °F	Alternator temperature
Oil temperature	82 °F	0 V	DC-link voltage
Coolant temperature	82 °F	-1 V	Ground fault detect. volt.
Air starter pressure	81 psi	no request	ACM
Engine setpoint speed	600 RPM	denied	ACM interlock
Engine speed	0 RPM	100 %	DEF tank level
Engine shaft power	0 hp	66 °F	DEF temperature
Engine cooling power	0 hp	0h	Engine running w/o DEF

C. Fluid Level Indicators on the side of the DEF Tank can also be used to confirm the tank level.

D. If DEF runs out (0% in the DEF tank), Engineers are required to report this to the CNOC Mechanical Desk (302-737-2082 or 2083) and note it on the MAP 100 in the Failure En Route / Equipment Conditions section.

E. The locomotive can continue to be operated to its final destination or to the next location where DEF can be added.

Note: For most passenger line-haul applications, the nominal DEF consumption rate will be approximately 10% of the Diesel Fuel consumption rate.

1.7.4 Draining the Diesel Engine Conditions

A. When the diesel engine is shut down and cannot be restarted, with outside temperature less than 40 degrees Fahrenheit, the cooling system must be drained to prevent freezing.

1.7.5 Diesel Engine Fuel Conservation - Shutting Down Diesel Engines

A. Manually shut down trailing units after arrival (Including AESS and SmartStart equipped units).

1. When temperature is above 40 degrees Fahrenheit and is not expected to fall below 40 degrees Fahrenheit, engineers of inbound trains will shut down all trailing units upon arrival at the train's final terminal. When necessary to provide HEP on train due to passenger detraining or employees working on train with P-42/P-40/P-32 locomotives, place HEP on the lead engine in STANDBY mode.

B. Manually shut down all units not scheduled to be used within ONE Hour (Including AESS and SmartStart equipped units).

1. When temperature is above 40 degrees Fahrenheit and is not expected to fall below 40 degrees Fahrenheit, all locomotives that are not scheduled to be placed in service within ONE hour must be shut down. When necessary to provide HEP on train due to passengers de-training, food service refrigeration or employees working on train, place HEP on the lead engine in STANDBY mode.

C. Securing Shut Down Units NOT on Ground/Wayside Power.

1. Secure equipment in accordance with instruction 2.14.
2. Turn off all unnecessary auxiliaries (i.e., heater, lights, etc.).
3. **DO NOT** turn off the Turbo Lube Pump circuit breaker on turbocharged EMD locomotives.
4. **DO NOT** turn off the Computer circuit breaker on F-59PHI locomotives.
5. Open Generator Field switch.
6. If equipped, move Isolation switch to Isolate position (GE units to Start position).
7. Open the battery switch except as follows:
   - **a.** **DO NOT** open battery switch when HEP will be connected to locomotive. HEP will charge batteries on locomotive.
   - **b.** **DO NOT** open battery switch when Train Control System must remain energized. If battery switch is opened, train control system must be retested.

D. On EMD units, except F-59PHI locomotives, wait 35 minutes prior to opening the battery switch unless it is known that the turbo lube pump is directly connected to the batteries.

1.7.6 Diesel Engine Fuel Conservation – Standby HEP Actions

A. When a unit is providing HEP and the train is expected to be standing for more than 15 minutes, place HEP in STANDBY mode. If the trailing unit cannot be reached by walking through the locomotive consist, change mode to STANDBY only if operating conditions do not present a safety hazard.

B. HEP Mode Change Procedure:

1. Press the HEP Off button (HEP contactor will open).
2. Move the HEP Mode switch to the desired position (Normal or Standby).
3. Wait one minute.

NOTE: If extreme outside air temperature (hot or cold) would affect passenger comfort while waiting one minute to restart HEP, do not change mode from Normal to Standby.

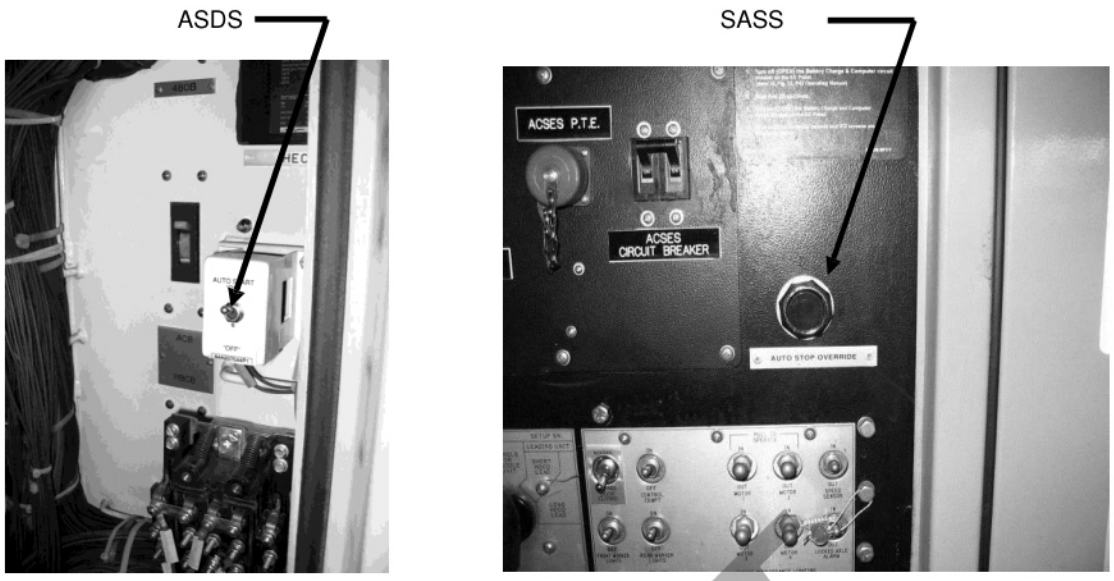
4. Press and hold the HEP On button (HEP contactor closes).
5. When the locomotive unit is supplying HEP in the Standby mode, it will be considered "Isolated" for the purposes of securing equipment per instruction 2.14. (The locomotive cannot provide power while in Standby mode).

DRAFT

1.8 Equipment – Diesel Engines – Automatic Engine Start Stop System (AESS)

1.8.1 Engineers must ensure that the AESS system is active on all units so equipped.

A. When a locomotive will be standing for more than 5 minutes, Engineers must ensure that the control stand settings are correct on the controlling locomotive in order for the AESS system to function.



1.8.2 AESS Equipment Description

A. Auto Start Disable Switch (ASDS). This switch is located in Control Area 1, on the left side of the cab, behind the access door to the traction motor support bearing monitor. This switch is used to turn the system ON (up) and OFF (down) on the local unit only (the function is not MU trainlined). This switch must be ON (up) on all units in the locomotive consist and all push-pull units for normal operation.

B. Diesel engine "Auto Stop Override" (SASS) pushbutton. This pushbutton is located on the Engine Control Panel above the traction motor cut-out switches. This pushbutton is used to suspend (delay) automatic diesel engine shutdown for

approximately 120 minutes on the locomotive on which it was pressed (the function is not MU trainlined). The pushbutton can also be used to force the system to shut down the diesel engine sooner that the normal programmed time.

26-PCI-90415 0000006203 UNCLASSIFIED 4/30/2026

1.8.3 AESS Basic Functions

A. When the Auto Start Disable Switch (ASDS) is OFF (down), the Automatic Engine Start/Stop (AESS) system will not shut down the diesel engine on that locomotive only (function NOT MU trainlined).

NOTE: If the diesel engine is running and the Auto Start Disable Switch (ASDS) is OFF (down), the IFD message "**Engine Stop Control NOT ACTIVE**" is displayed on the affected locomotive only.

NOTE: If power (load) is attempted with the Auto Start Disable Switch (ASDS) OFF (down), a continuous alarm bell will ring on the affected locomotive only.

B. The Auto Start Disable Switch (ASDS) and the Auto Stop Override (SASS) pushbutton function on the local locomotive only (function NOT MU trainlined). Therefore, activation of either switch or pushbutton affects only the locomotive on which it was activated.

C. All IFD messages and alarm bells related to the Automatic Engine Start/Stop system are displayed/sounded on the local locomotive only (this function is not MU trainlined). Therefore, when units in a multiple unit consist automatically shut down and start up, the engineer will only see/hear indications for the unit on which he/she is located.

D. Automatic diesel engine shutdown will NOT occur on locomotives supplying HEP.

DRAFT

1.8.4 AESS Automatic Diesel Engine Shutdown

A. Engineers must ensure that the control stand settings are correct on the controlling locomotive for automatic shutdown/startup to occur. Proper set up is:

1. Throttle is in IDLE position.
2. Independent brake applied (IBS closed).
3. Reverser handle is in NEUTRAL position.

NOTE: The AESS system determines Reverser position ONLY while the Generator Field Breaker is CLOSED (up).

NOTE: If necessary to OPEN (down) the Generator Field Breaker, the Reverser position defaults to Neutral regardless of actual handle position.

B. When the system determines that the control stand settings are correct, "**Auto Stop May Occur: MMM:SS Minutes**" is displayed on the IFD with a 10-minute countdown. If the control stand settings do not change, automatic engine shutdown will occur when the 10-minute countdown expires on the affected unit(s) as follows:

1. An alarm bell will ring for 30 seconds.
2. IFD message displayed "Auto Engine Start/Stop in Process".
3. Diesel engine shuts down.

NOTE: If predefined locomotive system conditions (temperature, battery voltage, pressure) are out of limits, the diesel engine may not shut down until the conditions are within limits, even though control stand settings are correct.

C. After the diesel engine has been shut down by the system, "**Auto Engine Start Control ACTIVE**" is displayed on the IFD accompanied by an alarm bell ring for 1 second every 5 minutes.

D. To automatically shut down the diesel engine without waiting the 10-minute period (fast shutdown) as described above:
1. Press the Auto Stop Override (SASS) pushbutton twice within 30 seconds.
2. If the control stand settings and other system limits are within range, in 60 seconds an automatic shutdown will occur on the unit on which the pushbutton was pressed (local unit only, this function is not MU trainlined).

1.8.5 AESS Suspend (Delay) Automatic Diesel Shutdown (Local Unit Only)

A. To suspend automatic shutdown for 120 minutes (2 hours):
1. Press the Auto Stop Override (SASS) pushbutton (local unit only, this function is not MU trainlined).
2. When shutdown is suspended, the following IFD message is displayed with a countdown: "**AESS SUSPENDED for MMM:SS Minutes**".
3. Each time the Auto Stop Override (SASS) pushbutton is pressed the countdown is reset to 120 minutes (2 hours).

1.8.6 AESS Automatic Diesel Engine Startup

NOTE: Automatic diesel engine restart will only function on units which were shut down automatically by AESS. If diesel engine was shut down by another means, manual restart is required.

A. Careful consideration must be given to physical characteristics, especially grade, prior to movement of train/equipment with automatically shut down locomotives in consist.

NOTE: Approximately 2 minutes is required for diesel engine restart.

B. To automatically restart ALL the diesel engines of MU'ed locomotives (includes multiple unit consists and push-pull equipment), do the following:
1. Close (up) Generator Field Breaker.
2. Move the reverser handle to FORWARD or REVERSE.
3. Wait approximately 2 minutes for diesel engine restart.

NOTE: If independent brake is released, automatic restart will also occur. However, it is prohibited to intentionally release the independent brake solely for the purpose of causing automatic engine restart.

C. Automatic engine restart occurs on all equipped locomotives as follows:
1. An alarm bell will ring for 30 seconds.
2. IFD message displayed – "Auto Engine Start/Stop in Process".
3. Diesel engine restarts.

NOTE: Automatic engine restart will occur any time predefined locomotive system conditions (temperature, battery voltage, pressure) are out of limits.

1.8.7 AESS Troubleshooting

A. If an IFD message "**Auto Engine Start Control NOT ACTIVE**" is displayed on affected unit while the diesel engine is running, move the ASDS switch to the ON (up) position on affected unit for normal operation.

B. If automatic shutdown does not occur when the control stand settings are correct, check that the following locomotive settings are correct:
1. ASDS switch in "ON" (up).
2. Auxiliary cab door is closed.
3. Battery knife switch is closed.
4. Engine Control Switch is in RUN, START, or ISOLATE.

C. After auto shutdown has occurred, IFD message "**Auto Engine Start Control NOT ACTIVE**" is displayed accompanied by a 30 second alarm bell on the affected unit, this indicated that at least one locomotive setting has changed, and a manual

DRAFT

engine restart is required. Ensure that the locomotive settings are correct as indicated below and manually restart the diesel engine from the start station.

1. ASDS switch is “ON” (up).
2. Auxiliary cab door is closed.
3. Battery knife switch is closed.
4. Engine Control Switch is in RUN, START, or ISOLATE.

D. If an IFD message “AESS OFF: Turn ON to Silence Alarm” is displayed on the affected unit, accompanied by a continuous alarm bell when the throttle is moved out of IDLE, this indicated that the ASDS switch is OFF (down) on the affected unit. Correct the condition by positioning the ASDS switch ON (up) on all units in the locomotive consist.

E. If the diesel engine does not restart automatically on the affected unit after an automatic shutdown due to a system fault or other condition, manually restart the diesel engine from the start station and place the ASDS switch in the ON (up) position.

1.8.8 AESS on Siemens Charger Locomotives SC-44 and ALC-42

A. The engineer can control the AESS by a rotary type switch located on the rear wall control panel in the cab to either cut in or cut out status. AESS will stop the diesel engine automatically if all the following criteria is met:

1. Engine in idle mode for more than 30 minutes
2. Reverser set to N (neutral) position or OUT and removed
3. Master Controller in position 0 (idle)
4. Parking brake is applied
5. Vehicle speed is 0 mph
6. Coolant temperature allows normal engine operation (above +30°C/+86°F)
7. Outside air temperature is high (above +10°C/+50°F)
8. Battery voltage is OK
9. Air pressure reservoir for engine start is OK (= 8.5 bar/123.3 psi)
10. Isolation switch in position START/STOP/ISOLATE
11. DEF temperature above +5°C/41°F

B. The diesel engine will be started automatically by AESS, if any one of the following criteria is met:

1. Coolant temperature is low (below +12°C/+53.6°F)
2. Outside air temperature is low (below +10°C/+50°F)
3. Traction lever not in position 0
4. DEF temperature is low (below 0°C/+32°F)
5. Air pressure reservoir for engine start is low (less than 6.5 bar/94.3 psi)
6. Battery voltage is not okay
7. Vehicle speed is not 0 mph
8. Parking brake released
9. AESS shutdown time expired

C. If an override of the AESS shutdown becomes necessary, it can be accomplished in one of the following ways:

1. Turn AESS rotary switch to CUT OUT status
2. Move traction lever out of Neutral (N) position
3. ISOLATION SWITCH placed in RUN position
4. Release parking brake
5. Driving direction selected with reverser

2.1 Locomotives - Non-Complying Condition (Defect) Discovered En Route at Other Than Calendar Day Inspection Point

NOTE: For instructions 2.1.1 through 2.1.35, any non-complying condition (defect) discovered en route must be documented per instruction 3.1.15. In addition to particulars noted in instructions 2.1.1 through 2.1.35, the following must also be complied with:

A. Locomotive may continue in use to next Amtrak locomotive repair facility,
B. Complete non-complying tag per instruction 3.1.15,
C. Note defect on MAP 100,
D. In multiple unit consists or push/pull operations, note on MAP 100 of lead unit that non-complying locomotive is in consist or train,
E. Notify the CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.
1. If applicable, notify the Siemens mechanical desk at CNOC at 1-302-683-2753.
2. If applicable, MARC locomotive issues are to be reported to the Amtrak Commuter Operations Center at 1-202-906-2772.

2.1.1 Hand/Parking brakes are in a safe and suitable condition for service.

2.1.2 Cab seats properly secured to the floor or sides.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.3 Cab windows and wipers provide clear vision and windows are free of broken areas.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.4 Cab heaters and Air Conditioning (if equipped) function as intended.

A. Switch locomotive to trailing position if unsafe to continue as lead unit. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.5 Cab lights and gauge lights are operative and provide sufficient illumination.

A. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.6 Speed indicator and related apparatus is undamaged.

A. The performance and accuracy of the speed indicator can only be ascertained after departure (10 mph to 30 mph +-3 mph; above 30 mph +- 5 mph). If found in non-compliance or out of limits as indicated above, at next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.7 Deadman/Alerter functions as intended.

A. An alerter will be considered as having failed only when it will not acknowledge by pressing the “Alerter Acknowledge Button/Switch”.

EXCEPTION: When ATC is cut out on High Speed Trainset or HHP-8 Locomotive, the alerter cannot be acknowledged using the alerter switch or foot pedal. In this case the alerter will **not** be considered as having failed.

NOTE: Alerter cycle times vary. Alerters which seem to cycle with short or long times must be reported on the MAP 100.

B. If deadman/alerter fails en route, the locomotive may continue in use to the next Amtrak locomotive repair facility when the following is complied with in a “single engineer” operation:
1. An employee trained to apply the emergency brake MUST be IMMEDIATELY positioned in the operating control compartment with the Engineer.
2. When qualified employee, as described above, is not available to position in operating control compartment, the Engineer shall be in constant communication with a second crewmember as follows:
a. Engineer will communicate with a designated train crewmember, either verbally or by radio, the name of all block/interlocking signals, the approach to the limits of authority (DTC blocks, Track Warrants, Form D, etc.) and temporary speed restrictions.

DRAFT

b. A designated train crewmember will be alert for and acknowledge these communications. If the Engineer does not remain in communication as described above, the designated train crewmember must determine the cause and if necessary, take action to stop the train.

NOTE: The Conductor will designate the train crewmember who will be positioned in the operating control compartment with the Engineer.

C. Alerter may be cut out electronically or pneumatically,
D. Place non-complying tag on control stand or engine control panel indicating “Defective Alerter”.
E. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.8 Air brake gauges register variations in pressure when brake valves are manipulated.

A. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.9 Air compressor or compressors control main reservoir pressure, as indicated by cab gauges, within range specified for type locomotive.

A. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.10 Headlights operate properly and can be dimmed as required. One defective bulb of an Incandescent or LED **IS NOT** considered non-compliant.

A. Locomotive may continue in use until next calendar day inspection,
B. At next Calendar Day Inspection location repair or switch to trailing position.

2.1.11 All auxiliary (ditch) lights operate as intended.

A. If (1) defective auxiliary light is discovered at initial/originating terminal of train, repair, or switch locomotive to trailing position, and repair no later than next Locomotive Calendar Day Inspection,
B. If (1) auxiliary light is defective, proceed and repair no later than next Locomotive Calendar Day Inspection,
C. If (2) auxiliary lights are defective:
1. Proceed, not exceeding 20 mph over public road crossings, to the next point where repairs can be made or the next Locomotive Calendar Day Inspection, whichever occurs first, or
2. Switch locomotive to the trailing position.

NOTE: Auxiliary lights are considered non-complying if one or more lightbulbs are burned out. A failure of the flashing function is not considered a failure of the auxiliary lights but must be reported on MAP 100.

2.1.12 Locomotive radio operates as intended.

A. Repair, or replace with another operative radio if available,
B. At next Calendar Day Inspection location, repair, replace radio or switch to trailing position.

2.1.13 Inward and Forward Facing Cameras are securely mounted and not damaged.

NOTE: Damage or defective conditions of any part of the system (cameras, bracket, cables, LDVR) must be reported on MAP 100. Employees must not disconnect, disable, or tamper with the Locomotive Camera Recorder or components.

2.1.14 Dynamic brake equipment is in place and cut in if locomotive is equipped. Locomotives with non-complying dynamic brake equipment will proceed as follows:

A. Place inoperative dynamic brakes (NRPC 3129) tag on control stand or Engine Control panel indicating locomotive number, date, location, and signature of person who discovered (instruction 2.18.7),
B. Conventional locomotives must be repaired within 3 calendar days.
C. MU locomotives must be repaired by the next Locomotive Calendar Day Inspection.

2.1.15 Horn and bell operate as intended. If either found to be non-complying:

A. At next Calendar Day Inspection location, repair, or switch to trailing position.

2.1.16 Sanitation, Toilet Compartment, and Toilet:

A. Locomotive can be used as a lead unit only until unsanitary condition can be corrected, replaced with another locomotive, or the next Locomotive Calendar Day Inspection.
B. Note on MAP 100 date toilet or toilet compartment becomes unsanitary or defective.

DRAFT

C. If toilet compartment door lock is defective, lock must be repaired on or before the next 92-day inspection. Note on MAP 100 date toilet compartment becomes defective.

2.1.17 Sanders function on each locomotive to deliver sand to each rail in front of the first power operated wheel set in the direction of movement.

2.1.18 No traction motor is cut out. If traction motor is cut out comply with the note in instruction 2.1.

2.1.19 Emergency Brake Valve (Conductor's Valve) properly labeled and accessible.

2.1.20 Doors and cover plates that are marked "Danger" and covering high voltage electrical apparatus must be secured in their proper locations.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit.

2.1.21 Fan openings, exposed gears and pinions, and exposed moving parts protected to prevent injury.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit.

2.1.22 No accumulations of oil, water, fuel, debris, and other items in passageways, walkways, cab compartment floors, and engine compartment floors which present an unsafe condition such as a slipping hazard.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit

2.1.23 No battery gas leaks in cab or engine compartment.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit.

2.1.24 No obvious diesel engine exhaust gas leaks into the engine compartment.

A. Verbally notify all crewmembers of non-complying condition. Switch locomotive to trailing position if unsafe to continue as lead unit.

2.1.25 Brake rigging properly secured.

A. Set out locomotive if unsafe to continue,
B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

2.1.26 No part of trucks, brake rigging, and running gear, with the exception of the wheels and non-metallic sand hoses, are less than 2-1/2 inches above top of rail. Determination can be made by inspecting under side of the locomotive from outside the gage of the rail.

A. Set out locomotive if unsafe to continue,
B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

2.1.27 Pilots, snowplows, end plates properly secured and not less than 3 inches nor more than 6 inches above top of rail.

A. Set out locomotive if unsafe to continue,
B. Determine any operating restrictions (rules or equipment) which apply.

2.1.28 Draft gear and uncoupling mechanisms properly secured and not bent, cracked, broken, or missing parts.

A. Set out locomotive if unsafe to continue,
B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

DRAFT

RS-EQI-00415 00000006293 "UNCLASSIFIED" 4/30/2028

2.1.29 Brake shoes are properly applied and aligned with tread of wheels or other braking surfaces.

A. Set out locomotive if unsafe to continue,

B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

2.1.30 Visible traction motor, HEP cables and cable connections are free from damage.

A. If unsafe to continue under power, locomotive MUST be set up to prohibit propulsion (isolated).

2.1.31 Trucks, shocks, spring rigging, and associated parts in proper position and free of cracks and breaks.

A. Set out locomotive if unsafe to continue,

B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

2.1.32 Any wheel does not have a single flat or shelled spot 2 ½ inches or more in length. Any wheel does not have adjoining flat or shelled spots that are each 2 inches or more in length. Any wheel does not have defects such as broken, gouged, chipped, or cracked rim or flange. When more restrictive railroad rules or instructions are in effect concerning wheel defects, those instructions will apply.

A. Set out locomotive if unsafe to continue,

B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

2.1.33 Emergency fuel cutoff devices and pantograph down devices are properly marked and free of any impediment which could prevent their operation.

2.1.34 Fuel tank is not leaking.

A. If leak is severe, stop train, and notify train dispatcher and CNOC mechanical desk at 1-800-424-0217 as soon as possible,

B. Determine actions to be taken from train dispatcher and/or CNOC mechanical desk, setting out locomotive if necessary.

2.1.35 Brake cylinder travel must provide proper clearance when the brakes are released. Piston travel, if applicable, may not exceed 1 ½ inches less than total piston travel as indicated on Blue Form/MAP 816.

A. Set out locomotive if unsafe to continue,

B. Determine any operating restrictions (rules or equipment) which apply.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

2.2 Locomotives - Double Heading and Helper Locomotives

2.2.1 When more than one locomotive is attached to a train, Engineer on leading locomotive in direction of movement will operate train air brakes.

2.2.2 All brake valve cutout cocks, and handles shall be positioned as specified in instruction 2.6 and Table A (Air Brake Handle Positions & Cutouts).

2.2.3 When necessary for leading locomotive to give up control of air brakes, perform a brake test per instruction 3.9.4 (Passenger Train Class II Brake Test) from new controlling locomotive.

2.2.4 In case of emergency, brakes can be applied by moving the ABV handle or Emergency Brake Valve on any unit in the consist to “EMERGENCY” position.

2.2.5 Before detaching power, train must be brought to a complete stop.

DRAFT

2.3 Locomotives - Dead Locomotive(s) in a Train

2.3.1 If main reservoir supply is available, make up hoses and set up brake valves per instruction 2.6 and Table A (Air Brake Handle Positions & Cutouts); OR

2.3.2 If NO main reservoir supply is available, drain main reservoir pressure to 0 psi and cut out automatic drain valves (stem is recessed in knob);cut in dead engine feature and set up brake valves per instruction 2.6 and Table A (Air Brake Handle Positions & Cutouts); AND

2.3.3 Automatic and independent brake handles must be removed or secured in proper position per instruction 2.6 and Table A (Air Brake Handle Positions & Cutouts).

2.3.4 Dead locomotive in consist, must have all control breaker in the on position, 480 volt to the battery changer and the battery charger in the on position, MU cables applied to the live locomotive.

2.4 Locomotives - Charging a Train

2.4.1 Before air hoses are coupled, condensation must be blown from brake pipe and main reservoir supply hoses of locomotive.

2.4.2 No chemicals, which are known to degrade or harm brake system components, shall be placed in the train air brake system.

2.4.3 While charging train, independent brake must remain fully applied.

2.4.4 Charge train using “RELEASE” position of ABV handle. Pressure maintaining feature must be cut in.

2.5 Locomotives - Recovery from Penalty Brake Application

2.5.1 When a penalty brake application occurs, acknowledge and place ABV handle in “LAP” or “SUPPRESSION” position.

2.5.2 Ensure throttle/controller is in “Idle” or “OFF” position.

2.5.3 Penalty brake application may be recovered while moving provided there is sufficient time to recharge train before next brake application is required.

NOTE: I-ETMS penalty brake application can only be recovered after the train comes to a complete stop.

2.6 Locomotives - Locomotive Air Brake and Equipment Set Up

2.6.1 Handles of brake valves, brake valve cutout cocks, and other brake devices must be in position as indicated by Table A (Air Brake Handle Positions & Cutouts).

2.6.2 Single locomotives, multiple units (including push/pull) or dual cab locomotives must have one control stand set up as a lead unit unless being hauled dead in train.

A. Trailing units must have the ENGINE RUN, GENERATOR FIELD, and CONTROL/FUEL PUMP switches in the Off, Open or Down position.

2.6.3 Ensure all air and electrical connections are properly configured.

A. For movements Over-The-Road, connect M.U., Main Reservoir, and Brake Pipe hoses per Table B and open associated angle cocks and cutout cocks. Install MU cable (black), communication cable (blue), and any other require electrical connections such as HEP or EP.

B. Movements may be made within the confines of a yard or terminal without connecting the MU hoses, as long as the Brake Pipe and Main Reservoir hoses are connected with associated angle and main reservoir cocks open.

C. When uncoupling locomotives, ensure that all air cutout cocks and angle cocks are closed.

DRAFT

25-EQP-00415 0000009303 "UNCLASSIFIED" 4/20/2026

2.6.4 On P-42DC and P-32ACDM locomotives, the Brake Pipe Cutoff (Pilot) Valve/Switch must be in the "TRL" position when NOT set up as the controlling brake valve or when Table A requires the use of "OUT" position. The "TEST" position will only be used during required standing brake tests or to comply with the instructions in 2.6.6.

2.6.5 P-42DC and P-32ACDM locomotives are not equipped with MU2, MU2A, or Dual Ported Cutout Cocks.

2.6.6 Complete the following procedure to prevent trapped air in the independent brake system when setting up the air brakes on a P-42DC or a P-32ACDM to be used:

- In Push Service,
- In Double Heading (Helper) Service, or
- In a train consist, with MU hoses NOT connected to the unit controlling the air brakes.

A. Secure equipment per instruction 2.14.
B. Make a full service brake application with the ABV handle.
C. Wait for air exhaust to stop.
D. Place the Independent Brake handle in the "RELEASE" position **(DO NOT BAIL OFF BRAKE CYCLINDER PRESSURE)**
E. Move the brake pipe cutoff pilot switch to the "TEST" position for 10 seconds.
F. Move the brake pipe cutoff pilot switch to "TRL" position.
G. Move the ABV handle to the "HANDLE OFF" position.
H. Ascertain, that brake cylinder pressure fully releases on the Push, Double Heading, or In-Train locomotive when train brakes are released. If brake cylinder pressure does not fully release, perform the following from the Push, Double Heading, or In-Train locomotive brake valve:
1. Move brake pipe cutoff pilot switch to "TEST" position.
2. Bail off brake cylinder pressure.
3. Return brake pipe cutoff pilot switch to "TRL" position.

I. If a P-32ACDM or P-42DC locomotive is Double Headed (Helper) Service or in a train consist with no MU cables connected, an employee must immediately take position in the operating control compartment to observe for a locked axle indication.

2.7 Locomotives - Sealing of Protective Devices on Locomotives

2.7.1 Mechanical forces will verify cutouts (switches and cocks) or enclosures for safety devices are properly positioned, then apply seals and record numbers on the MAP 100 form:

A. ACSES Cutout Cock/Switch
B. Cab Signal Cutout Cock/Switch
C. ITCS/X-ITCS Cutout Cock/Switch
D. IITS
E. I-ETMS Penalty Brake Cutout Cock/Switch
F. I-ETMS Emergency Cutout Cock/Switch
G. I-ETMS Horn Cutout Cock/Switch
H. Alerter Cutout Cock/Switch
I. ATC/IITS Transfer Switch
J. Speedometer (Locomotive) Overspeed (OS) Cutout Cock/Switch
K. Speed Control Cutout Cock/Switch
L. Door Bypass Switch
M. Multiple Penalty Brake Device Switch
N. Event Recorder
O. Amtrak/MNRR Territory Switch
P. Overspeed Selector Switch

2.7.2 If seal numbers are not recorded on the MAP 100, train is not to be delayed. Engineer must note on MAP 100 that no numbers were recorded when taking charge of locomotive.

2.7.3 Any time a seal is broken the following information must be entered on MAP 100:

A. Select reason for cutting out.
B. Device/system cut out.
C. Geographic location(s) where cut out and cut in.
D. To whom report was made.

DRAFT

2.8 Locomotives - Failure of Locomotive Air Brakes

2.8.1 All locomotives must leave terminal points with air brakes in operative condition.

2.8.2 In the event that locomotive brakes become inoperative while locomotive is moving lite, the following procedure applies:

A. Locomotives with dynamic braking should be stopped by use of dynamic brake and hand/parking brake.
B. Locomotives without dynamic braking, rail cars, and other equipment must be stopped with hand/parking brake, if practicable.
C. It not practicable to stop with hand/parking brake, locomotives may be stopped by “plugging the motors“.

CAUTION: THIS MUST ONLY BE USED AS A LAST RESORT. THE RETARDING FORCE WILL BE SEVERE WHEN POWER IS APPLIED IN REVERSE ON A MOVING LOCOMOTIVE. CREWS MUST ANTICIPATE THIS FORCE AND PROTECT THEMSELVES FROM INJURY.

D. To “plug the motors“: Place throttle lever in “IDLE” position; place reverse lever in position opposite direction of movement; move throttle lever to first notch; locomotive must be secured with hand/parking brakes immediately after movement is stopped, secure equipment per instruction 2.14.

NOTE: Plugging locomotives on certain Amtrak locomotives may not be effective due to protection by electrical interlocks.

2.9 Locomotives - Emergency Brake Application

2.9.1 Emergency Brake Application - General

A. Full emergency brake effort must be allowed to apply.
B. Leave handle in “EMERGENCY” position until stopped.
C. Ensure throttle/controller is in “IDLE” or “OFF” position.

2.9.2 When equipped with Two-Way End-Of-Train device

A. Engineer or other train crewmembers must activate the two-way end-of-train device using the “EMERGENCY” toggle switch when any emergency application occurs.

2.9.3 Recovery from emergency after stopping

A. Move ABV handle to “RELEASE” position.
B. Inspect ENTIRE train for derailed cars, shifted loads, etc.
C. Perform a Class II brake test per instruction 3.9.4 for Passenger Train Operations.
D. Perform a Class III brake test per instruction 3.9.6 for Non-Passenger Train Operations.

2.9.4 After proceeding, a Train Running Brake Test must be performed per instruction 3.9.8.

2.10 Train Make Up - General

2.10.1 A safety stop must be made (approximately 50 feet) just prior to coupling to any equipment. A safety stop is not required when distance, between **standing** equipment to be coupled, is less than 50 feet.

2.10.2 When coupling equipment, care must be taken to prevent injury or damage. Coupling must be made at the minimum speed required to complete the coupling but not exceeding 4 mph. ACS-64, Charger SC-44, ALC-42, HHP-8 Locomotives, HST Power Cars, and equipment with spear type couplers must be coupled at a speed NOT to exceed 2 MPH.

2.10.3 After coupling equipment, ensure that:

A. Both coupler operating rods (cut levers) are properly secured in the down position, with the knuckle locked.
B. The coupler telltale hole or recess (inverted V) is fully visible, and the rotary lock lift has fully dropped.
C. Each coupling must be double stretched.
D. In the event the equipment does not couple as intended, uncouple and inspect both couplers. Open and close each knuckle to check for proper lock drop and engagement, free of binding. Attempt to couple equipment again and if another failed coupling occurs, equipment must be moved to a repair or servicing track for proper repair.
E. Once the train is assembled and switching is complete, the requirements of instruction 1.5.5 Coupler Locking Pins apply.

DRAFT

36-FGI-00415 20000006303 "UNCLASSIFIED" 4/30/2026

2.10.4 Before air hoses are coupled, condensation must be blown from brake pipe and main reservoir supply hoses of locomotive.

2.10.5 Connect all brake pipe and main reservoir air hoses.

2.10.6 Cut in main reservoir supply by opening cutout cocks slowly.

2.10.7 Cut in brake pipe by opening angle cocks slowly, beginning with cock closest to locomotive.

2.10.8 Connect required HEP cables, MU, and communication jumpers.

2.10.9 Release all hand/parking brakes unless required.

2.10.10 Cars equipped with pressure retaining valves must be set in "DIRECT EXHAUST" position or as specified in Timetable Special Instructions.

2.10.11 Train blocking for mixed consist trains

A. Private Cars may be blocked anywhere in train consist. Private Cars ARE NOT classified as Passenger Carrying Cars (See Definition for "Passenger Carrying Car"). Private Cars are classified as Passenger Equipment (See Definition for "Passenger Equipment).

B. Passenger Carrying Cars (except Private cars) must be blocked ahead of any car not equipped with Head End Power.

C. When EOT is required, rear car of train consist must be capable of accepting the device in the proper location on the coupler.

NOTE: 2.10.11 does not apply to Non-Passenger train movements (e.g., switching, shop moves).

2.10.12 Superliner, High-Level, and other cars with high diaphragms MUST NOT be coupled to cars with low diaphragms except:

A. When coupling the low diaphragm end of a Transition car to any car with low diaphragm(s).

B. When coupling the high diaphragm end of a car to a low-level car equipped with tubular type diaphragm(s).

C. When permission is received from person in charge of train and engine movements **AND** coupling/movement will not be made on curves or diverging movements through switches.

2.10.13 Set equipment to Graduated or Direct Release according to the instructions below.

A. Passenger equipment in a freight train must have the DIR/GRA cap on the control valve set in "DIRECT RELEASE".

B. All locomotive control valve service portions are to be set in "GRADUATED RELEASE".

Train Consist (excluding Locomotives)	# of Direct Release Cars in Train	Set-Up Balance of train in:
25-56 cars	-	Always Direct Release
7-24 cars	3 or more cars	Direct Release
7-24 cars	2 or less cars	Graduated*
1-6 cars	1 or more cars	Direct Release
1-6 cars	None	Graduated*

NOTE: Train may be set up in Direct Release if additional direct release cars will be added later.

2.10.14 Train consists in Passenger service must not exceed 56 cars.

2.10.15 Car(s) set in "DIRECT RELEASE" may be positioned anywhere in the consist, subject to the train blocking requirements provided in instruction 2.10.11 and compatibility with cars with high diaphragms prescribed in instruction 2.10.12.

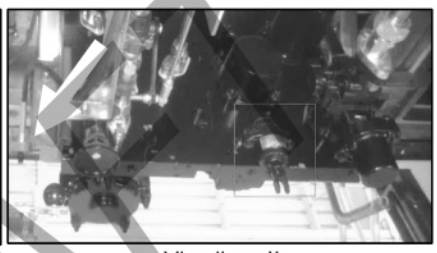
DRAFT

2.11 Train Make Up - Graduated Release Operation

2.11.1 Brake pipe cutoff pilot valve/switch on controlling locomotive must be set to "PASS" position.

EXCEPTION: When a passenger train which is set to graduated release is assisted by a controlling locomotive not equipped with a "PASS" position on the brake pipe cutoff pilot valve/switch (or IFD/locomotive screen) comply with the following:

- Leave the train consist set to graduated release,
- Place the brake pipe cutoff pilot valve/switch (or IFD/locomotive screen) in the "FRT" or "IN" position,
- Note on "Conditions En Route" portion of MAP 1173/10C Summary that "brake pipe cutoff pilot valve/switch is set to FRT position with train consist set to graduated release.



A. If unable to adjust the brake pipe pressure of the controlling locomotive to 110 psi:

1. Secure the train per instruction 2.14,
2. Place the train in "Emergency" and ensure the brake pipe drops to 0 psi,
3. Activate the reservoir release valve (see pictures below) on each piece of equipment in consist until all air pressure is depleted (air stops blowing),
4. Charge the brake pipe of the train and perform a walking inspection of the entire train, ensuring that all operable brakes apply and release. Perform a Train Running Brake Test per instruction 3.9.8.

EXAMPLES

Amfleet and Horizon Cars

Viewliner II

NOTE: When operating in the above configuration, the train will function as a direct release train even though the train consist is set to graduated release ("Graduating off" will have no effect; a brake release will only occur in the "RELEASE" position of the ABV handle).

2.11.2 When operating train consists in graduated release, all cars equipped with "GRADUATED RELEASE" brake systems must have the DIR/GRA cap on the control valve set in "GRADUATED RELEASE".

2.11.3 All cars (including private cars) equipped with a supplemental selector volume must have selector volume cock cut out.

2.11.4 If assistance is needed to verify car brake equipment, contact CNOC mechanical desk via:

A. 1-800-424-0217 and follow voice prompts,
B. TMU communication system, or
C. Train Dispatcher.

2.12 Train Make Up - Direct Release Operation

2.12.1 Train consists in Passenger service must not exceed 56 cars.

2.12.2 Train consists exceeding 30 cars will comply with the following:

A. All cars (including private cars) that are equipped with 26-C control valves must also be equipped with a supplemental selector volume reservoir.
B. Must have supplemental selector volume reservoir "cut in".
C. Viewliners and Superliner II cars must have the badge plate located on the air brake rack set to "EXPRESS" position.

2.12.3 Brake pipe cutoff pilot valve/switch on controlling locomotive must be set to "FRT" position.

DRAFT

2.12.4 When operating trains in direct release, all cars equipped with "GRADUATED RELEASE" brake system must have the DIR/GRA caps on the control valves set in "**DIRECT RELEASE**".

2.12.5 Auto Train consists, with cars so equipped, must have the badge plate located on the air brake rack set to "AUTO TRAIN" position.

2.12.6 All train consists operating on the Northeast Corridor are limited to a maximum of 24 cars.

2.12.7 If assistance is needed to verify car brake equipment, contact CNOC mechanical desk via:

A. 1-800-424-0217 and follow voice prompts,
B. TMU communication system, or
C. Train Dispatcher.

2.13 Train Make Up - Cutting Off Car(s) or Locomotive(s)

2.13.1 SHUT DOWN AND ISOLATE HEP AND ECP, IF EQUIPPED.

2.13.2 Cutting off locomotives ONLY

A. Secure equipment per instruction 2.14.
B. Locomotives must be set up per instruction 2.6.
C. Mechanical Employees MUST reference SMP-MEC-17-50403 "Winterization of Locomotives" for freeze protection.

2.13.3 Cutting off cars ONLY

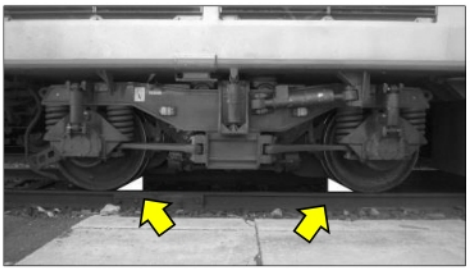
A. Secure equipment per instruction 2.14.
B. Mechanical Employees MUST reference SMP-MEC-17-50601 "Winter Protection – Freeze Damage Prevention" for freeze protection.
C. Make a 20 psi brake pipe reduction; and 30 seconds after application is completed, signal crewmember to close angle cock and main reservoir cutout cock on equipment to be moved.
D. Leave brake pipe angle cock open on equipment left standing. Close main reservoir cutout cock (if equipped).
E. Disconnect all jumpers, cables, and other connections (vestibule curtains, chains, etc.) between cars to be uncoupled.
F. When equipment is fitted with a Two-Way End of Train Device (EOT), place equipment left standing in "EMERGENCY" using this device before uncoupling.
G. When not equipped with an EOT device and equipment to be left standing is equipped with an accessible emergency brake valve on the first or second car, use this valve to place the equipment to be left standing in "EMERGENCY" before uncoupling. After emergency brake application, return emergency brake valve to "CLOSED" position.
H. When emergency brake application cannot be attained with the EOT or emergency brake valve on the first or second car, then emergency application on equipment left standing must take place during the uncoupling process.
I. Before lifting uncoupling lever, ensure coupler is not pinned per instruction 1.5.5.
J. Lift uncoupling lever and turn away from equipment in order to avoid flying debris during hose separation. Stop equipment to be moved after separation and secure hose(s).

2.13.4 Cutting off locomotives coupled to cars with locomotive supplying compressed air.

A. Locomotives must be set up per instruction 2.6.
B. Secure equipment per instruction 2.14.
C. Lift uncoupling lever and turn away from equipment in order to avoid flying debris during hose separation. Stop equipment to be moved after separation and secure hose(s).
D. On locomotive left standing
1. Make a Full Service automatic brake reduction.
2. Place independent brake in "FULL APPLICATION" position, if equipped.
3. Throttle/controller in "IDLE" or "OFF" position.
4. Place reverser in "NEUTRAL" and remove. If not removable, place in "OFF" position.
5. Place generator field switch/breaker in "Off/DOWN" position (if equipped).
6. Isolate all locomotives.

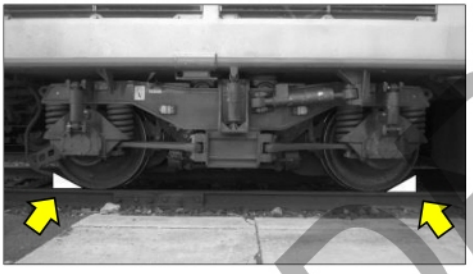
2.13.5 When cutting off locomotives coupled to cars with locomotive DEAD or NOT supplying compressed air, instruction 2.13.3 will apply.

DRAFT



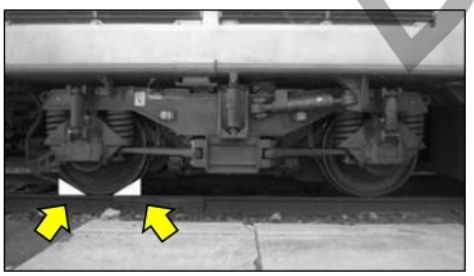
2.14 Train Make Up - Securing Equipment

NOTE: ALL EMPLOYEES ARE RESPONSIBLE FOR PROPERLY SECURING EQUIPMENT.

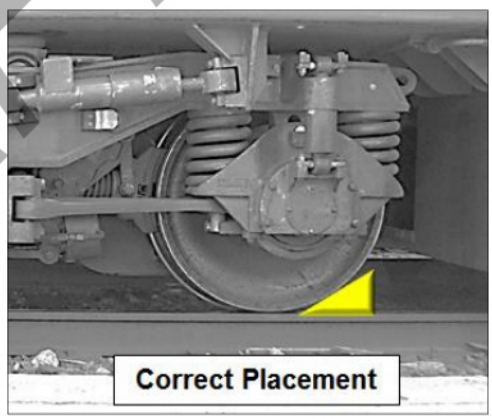


NOTE: Unattended Equipment is equipment left standing and unmanned in such a manner that would hinder immediate application of hand/parking brakes or air brakes by a qualified employee to prevent equipment from moving.

- **PROPER CHOCKING METHODS:** Chocks must be in good working order. Chocks that are crushed or broken must not be used. Chock both sides of at least one truck or one wheel and two additional wheels as necessary to prevent movement. Chocks must be placed flush against the wheel. Chocks must not be removed until proper coupling is made.



PROPER CHOCK POSITIONING



or

or

DRAFT

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

Equipment to be Secured	On Level Track	On a Grade
One car	1. Apply hand/parking brake. 2. Release air brakes. 3. Wait one minute. 4. If car does not move, hand/parking brake is effective. 5. Apply air brakes. 6. Chock both sides of one truck or one wheel. 7. If hand/parking brake is not effective, chock both sides of one additional truck or wheel. Repeat steps 2-6. 8. If car does not move, chocks are effective.	1. Apply hand/parking brake. 2. If engine is on downhill side of car, stretch slack. If engine is on uphill side of car, bunch slack. 3. Release air brakes on car only. 4. If car does not move for one minute, hand/parking brake is effective. 5. Chock both sides of one truck or one wheel. 6. If hand/parking brake is not effective, chock both sides of one additional truck or wheel. Repeat steps 2-6. 7. If car does not move, chocks are effective.
Two or more cars	1. Apply hand/parking brake on at least two cars. 2. Release air brakes. 3. Wait one minute. 4. If cars do not move, hand/parking brake is effective. 5. Apply air brakes. 6. Apply more hand/parking brakes on cars if hand/ parking brake is not effective. Repeat steps 2-5. 7. If hand/parking brakes are not effective or cannot be tested, chock both sides of one truck or one wheel. 8. If cars do not move, chocks are effective.	1. Apply hand/parking brake on at least two cars. 2. If engine is on downhill side of car, stretch slack. If engine is on uphill side of car, bunch slack. 3. Release air brakes on cars only. 4. If cars do not move for one minute, hand/parking brake is effective. 5. Apply more hand/parking brakes on cars if hand/parking brakes is not effective. Repeat steps 2-4. 6. If hand/parking brakes are not effective or cannot be tested, chock both sides of one truck or one wheel
Locomotives (single or multiple)	1. Apply hand/parking brakes on all locomotives. 2. Fully release automatic and independent brake, if equipped. Release parking brake on Cab Cars. 3. Wait one minute. 4. If locomotive(s) do not move, hand/parking brake is effective. 5. If hand/parking brake is not effective, chock both sides of one truck or one wheel. Repeat steps 2-4.	1. Apply hand/parking brakes on all locomotives. 2. Fully release automatic and independent brake, if equipped. Release parking brake on Cab Cars. 3. If locomotives(s) do not move, hand/parking brake is effective. 4. If hand/parking brake is not effective, chock both sides of one wheel or truck. Repeat steps 2-4.
	a. Chock both sides of one wheel or truck when securing a single locomotive. b. Make a Full Service brake application with the ABV handle. c. Place the independent brake in the "Full Application" position, if equipped. d. Place the throttle / controller in "IDLE" or "OFF" position. e. Place reverser in "NEUTRAL" position and remove, if removable. f. Place generator field switch/breaker in the "OFF" or "DOWN" position, if equipped. g. Place the isolation switch in the "ISOLATE" position, if equipped. **NOTE:** GE P-32BWH, P-40BH, and P-42BH locomotives will be considered isolated when unit is providing "STANDBY HEP".	
Locomotives with cars coupled together	Apply all hand/parking brakes on all locomotives. No less than a total of two hand/parking brakes must be applied (Locomotives + cars = total hand/parking brakes).	
	1. Fully release the automatic and independent brake, if equipped. Release parking brake on Cab Cars. 2. Wait one minute. 3. If equipment does not move, hand/parking brakes are effective. 4. Apply more hand/parking brakes if equipment moves. Repeat steps 2-4. 5. If equipment moves after all hand/parking brakes are applied, apply chocks to one wheel or one truck and to additional wheels as necessary to prevent movement.	1. Fully release the automatic and independent brake, if equipped. Release parking brake on Cab Cars. 2. If equipment does not move, the hand/parking brakes are effective. 3. Apply more hand/parking brakes if equipment moves. Repeat steps 2 and 3. 4. If equipment moves after all hand/parking brakes are applied, apply chocks to one wheel or one truck and to additional wheels as necessary to prevent movement.
	a. Make a Full Service brake application with the ABV handle. b. Place the independent brake in the "Full Application" position, if equipped. c. Place the throttle / controller in "IDLE" or "OFF" position. d. Place reverser in "NEUTRAL" position and remove, if removable. e. Place generator field switch/breaker in the "OFF" or "DOWN" position, if equipped. f. Place the isolation switch in the "ISOLATE" position, if equipped. **NOTE:** GE P-32BWH, P-40BH, and P-42BH locomotives will be considered isolated when unit is providing "STANDBY HEP".	

DRAFT

2.14.1 Attended equipment must be secured per instruction 2.14 when required by Rule, Special instruction, General Order, Bulletin Order, other Directive, or when physical characteristics require.

2.14.2 Unattended equipment must be secured according to the applicable part of instruction 2.14. Dependence must never be placed on air brakes to hold equipment left unattended.

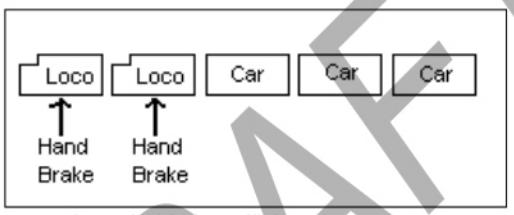
28-FOI-08415 000000006203 "UNCLASSIFIED" 4/30/2026

2.14.3 During switching operations in a yard or terminal, chocks or blocks may be used to secure unattended equipment instead of hand/parking brakes, but only when directed by Rule, Special Instruction, General Order, Bulletin Order, or other Directive. When switching operations conclude, unattended equipment must be secured according to the applicable part of instruction 2.14.

2.14.4 Unattended Locomotives/Cars must be secured per instruction 2.14 unless hand/parking brake is defective or when the hand/parking brakes are being repaired. Under these conditions, chocks or blocks must be used to secure equipment.

2.14.5 Securing Equipment Left Unattended

NOTE: For the purpose of securing equipment, Cab Cars and NPCUs are considered as locomotives when their position in the train would allow use as a controlling unit.

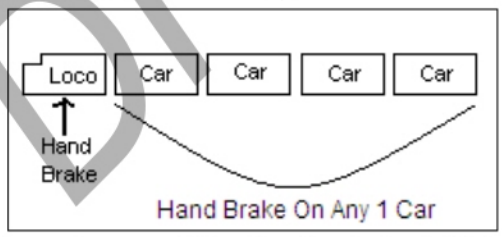


NOTE: When Cab Cars are set up as Lead, both hand brake and parking brake, if equipped, must be applied when securing equipment. When Cab Cars are set up as Trail, apply only hand brake when securing equipment.

NOTE: Report defective hand/parking brake per instruction 1.2.1.

NOTE: The following equipment will not develop tractive effort with the parking brake applied: P-32ACDM, P-40, P-42, F-125, SC-44, ALC-42, ACS-64, and High Speed Trainsets.

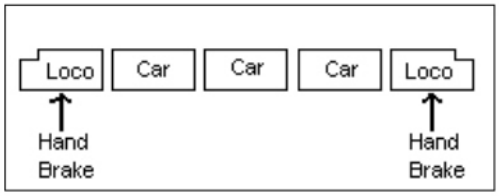
EXAMPLE 1



Unattended consist is 2 locomotives and 3 cars

Apply hand/parking brakes on both locomotives. If this is sufficient to prevent movement, no other hand/parking brakes are required.

EXAMPLE 2

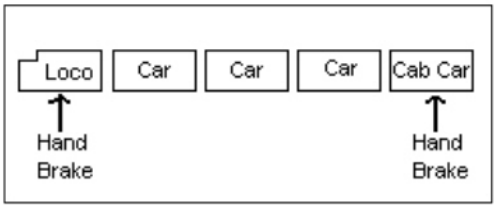


Unattended consist is 1 locomotive and 4 cars

Apply hand/parking brake on locomotive and one car (2 hand/parking brakes). If this is sufficient to prevent movement, no other hand/parking brakes are required.

EXAMPLE 3:

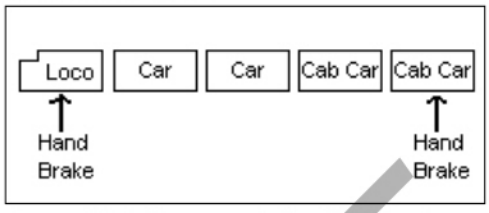
Unattended Push/Pull 2 locos; 3 cars consist



Apply hand/parking brakes on both locomotives. If this is sufficient to prevent movement, no other hand/parking brakes are required.

DRAFT

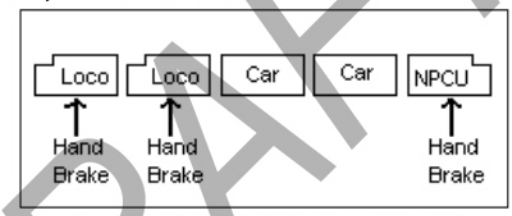
EXAMPLE 4:



Unattended Push/Pull 1 loco; 3 cars;1 Cab Car consist

Apply hand/parking brakes on locomotive and Cab Car. If this is sufficient to prevent movement, no other hand/parking brakes are required.

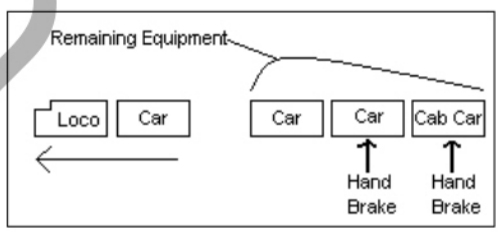
EXAMPLE 5:



Unattended Push/Pull 1 loco; 2 cars; 2 Cab Cars consist

Apply hand/parking brakes on locomotive and Cab Car on end of train (2nd cab car cannot be used as controlling unit). If this is sufficient to prevent movement, no other hand/parking brakes are required.

EXAMPLE 6:



Unattended Push/Pull 2 locos; 2 cars; 1 NPCU consist

Apply hand/parking brakes on both locomotives and NPCU. If this is sufficient to prevent movement, no other hand/parking brakes are required.

2.14.6 When uncoupling equipment which is already secured, ensure remaining equipment is secured according to the requirements of this instruction 2.15.

EXAMPLE:

2.14.7 Apply and Release Hand/Parking Brake on a Grade

A. Hand/parking brakes must be applied starting at lowest level of grade.
B. When ready to proceed, hand/parking brakes remain applied until air brake system is charged and required test made.
C. Hand/parking brakes are to be released starting at highest level of grade.

2.14.8 Securing Equipment During Brake Tests

A. Lite locomotives
1. Apply hand/parking brake on lead locomotive and chock wheels as necessary to prevent movement during testing of Lite locomotives.
2. After chocking wheels, test that lite locomotive(s) are secure by releasing the air brakes on the locomotive(s). No movement should occur.
3. If necessary, in addition to chocking wheels, apply enough hand/parking brake(s) to secure lite locomotives during test.

DRAFT

26-FOI-00415 090000006203 UNCLASSIFIED 4/30/2026

4. After testing, a full service reduction must be made, and independent brake applied in full application (if equipped).
5. If lite locomotive(s) will be left unattended, secure per instruction 2.14.

B. Locomotives Attached To Other Equipment

1. When locomotive(s) are to be tested, two or more cars must always have a minimum of two hand/parking brakes applied and thereafter sufficient numbers to prevent movement.
2. When train/equipment is to be tested:
   a. Fully apply locomotive independent brake if equipped.
   b. If locomotive is not equipped with independent brake or independent brake is not sufficient to secure train/equipment during test, apply a minimum of two hand/parking brakes and thereafter-sufficient numbers to prevent movement.
3. After testing, a full service reduction must be made and independent brake applied in full application (if equipped).
4. If locomotive(s) and/or cars will be left unattended, secure according to the applicable part of instruction 2.14.

2.14.9 Locking Locomotive Doors

A. Locomotives and Cab Cars, including multiple unit consists, that are left unattended on a mainline track or mainline siding must have all doors locked to protect against unauthorized entry. This instruction applies even if Locomotives and/or Cab Cars are coupled to other equipment.

B. If Locomotive or Cab Car Doors will not lock due to a defect, note defect on MAP 100 and notify CNOC mechanical desk at 1-800-424-0217.

2.15 Train Handling – General

2.15.1 These instructions are to provide Engineers with approved standards for operating Amtrak trains. They are designed for the Engineer to use these acceptable train-handling techniques to maximize smooth handling, safe operation, and for energy conservation while operating trains.

NOTE: Conductor must, at once, inform the Engineer when train handling is not smooth in order that technique may be changed.

2.15.2 The following are examples of actions which will cause the most severe slack action and should be avoided.

A. Sudden heavy brake application.

B. Sudden movement of throttle/controller in either direction to “IDLE”, “OFF” or “ZERO”.

2.15.3 Locomotive Engineers must handle trains and engines in a safe and fuel/energy efficient manner, taking full advantage of throttle modulation and dynamic braking where conditions permit.

A. Throttle Use on Diesel Locomotives

1. To control in-train forces and improve passenger ride quality, the throttle on diesel locomotives must be advanced one position at a time with a minimum delay of 1 second per notch.
2. The throttle on diesel locomotives must be reduced one position at a time with a minimum delay of 1 second per notch. (Exception: the throttle on diesel locomotives may be reduced at a quicker rate when emergency or hazardous conditions require immediate train speed reduction.)

B. Throttle Use on Electric Locomotives

1. To control in-train forces and improve passenger ride quality, the throttle/master controller on electric locomotives must be advanced in a manner that creates gradual increase in pounds of effort.
2. The throttle/master controller on electric locomotives must be reduced in a manner that allows for gradual decreases in pounds of effort. (Exception: the throttle/master controller on electric locomotives may be reduced at a quicker rate when emergency or hazardous conditions require immediate train speed reduction.)

2.15.4 The Engineer must be familiar with physical characteristics of the territory and plan ahead for action to be taken.

2.15.5 The Engineer must make frequent on-board visual inspections of both sides of a train while moving, looking out for hot bearings, sticking brakes, sliding wheels, dragging equipment or evidence of fire.

2.15.6 The following factors will affect the slowing and stopping ability of trains: speed, weight, length of train, grade, weather conditions, brake pipe leakage, brake pipe gradient, and operative brakes.

DRAFT

26_FOI_00418_00000008203 "UNCLASSIFIED" 4/30/2026

2.15.7 Where conditions permit, slowdowns or stops should be made with not more than 15 psi total brake pipe reduction. This reduces in-train forces and provides reserve braking capability in the event that additional retardation is required.

2.15.8 Prolonged use of locomotive air brakes or excessive brake cylinder pressure, especially at high speeds, is prohibited. Such action will cause burned and damaged brake shoes/pads and overheated wheels.

2.15.9 During switching operations, throttle and independent brake must be handled in a manner that will permit slack to be adjusted smoothly.

2.15.10 Control of Train Speed

A. Locomotive engineers must operate trains in accordance with operating rule, track, and equipment speed limits. Trains will be considered exceeding maximum authorized speed if:
1. Train exceeds maximum authorized speed limit for more than 30 seconds; Or,
2. Train exceeds maximum authorized speed limit by 5 mph for any period of time.

B. If train exceeds the maximum authorized speed limit, the locomotive engineer must take action to control train speed consistent with AMT-3 train handling rules.

2.15.11 Use of Sand / Handling of Wheel Slip

A. When necessary to use sand, number 1 truck or lead axle sand switch, if equipped, should be used to prevent slipping of locomotive wheels.

B. Slipping of locomotive wheels causes severe stress to draft systems and damage to rails and should be avoided.

C. Do not apply sand while wheels are slipping. Throttle must be reduced to stop wheel slip, and then start sanding and advance throttle slowly (Does NOT apply on ACS-64, Charger SC-44, and ALC-42 Locomotives).

D. Where conditions require, sand should be used as the train is stopping to avoid slipping when starting.

E. Unnecessary Actuation of Locomotive Sanders in Stations
1. Unless equipment designs or specific instructions require otherwise, do not place equipment in “EMERGENCY” and thereby cause sanders to discharge unnecessarily.
2. In the event that locomotive sanders are activated by emergency brake applications, every effort must be taken to reset the emergency brake application as quickly as equipment will permit, **without releasing the train brakes**.

2.15.12 Operating Diesel Locomotives over Rail Crossings and Drawbridges

A. Diesel Locomotives
1. When operating the locomotive(s) at speeds exceeding 25 MPH, do not exceed throttle position No. 4 for at least eight seconds prior to the locomotive reaching a rail crossing at grade or moveable span of a drawbridge.
2. When operating the locomotive(s) at speeds less than 25 MPH, or in throttle position No. 4 or lower, place the throttle in the next lower position at least eight seconds prior to the locomotive reaching a rail crossing at grade or moveable span of a drawbridge.
3. If operating conditions permit, advance the throttle after all units of the consist have passed over the rail crossing at grade or moveable span of a drawbridge.

2.15.13 Train Handling Over Disturbed Track

A. When going through the limits of a track bulletin where track work may have affected track stability, to minimize in train forces the engineer must use the following train handling techniques when possible:
1. Use throttle modulation or low dynamic brake amperage.
2. Avoid making slack adjustments.
3. Avoid applying or releasing automatic brake.
4. Make power and brake adjustments before or after the restriction.

2.15.14 Dynamic Braking

A. Engineers must utilize dynamic brake on descending grades to control train speed when conditions permit. Engineers will carefully consider other locations where dynamic brake may be used without sacrificing schedule time or causing excessive buff or draft forces.

B. Dynamic brake must be used with consideration given to locomotive dynamic brake capability, train consist, and physical characteristics of the territory involved.

C. Exercise care by applying and releasing dynamic brake gradually to avoid unnecessary slack action.

D. When operating through turnouts and crossovers with more than 3 units in consist with effective dynamic brake, limit dynamic brake effort to 50% of maximum (dynamic controller position 4). Limit dynamic brake effort until one-third of train is through turnout or crossover.

DRAFT

E. Automatic brake may be used during dynamic braking. Ensure that locomotive brake cylinder pressure does not develop during the use of dynamic brake except as provided in 2.16.4F, below.

F. Independent brake must NOT be applied during dynamic braking. If speed is less than 15 mph and dynamic brake effort is insufficient, the independent brake may be used to supplement dynamic braking effort. Locomotive brake cylinder pressure must never exceed 15 psi while manual dynamic brake is applied.

2.15.15 Independent Brake must NOT be used in conjunction with blended brake operation.

2.15.16 Independent Brake Quick Release Feature

A. Hold handle in quick release (actuating) position until brake cylinder pressure is 0 psi.

B. After brake cylinder pressure reaches 0 psi, allow three seconds for each additional unit in consist.

C. Tampering with any device or appliance, introducing any object or means to create or maintain any locomotive in a condition to constantly bail off (actuate) brake cylinder pressure, is prohibited.

2.15.17 Train Braking

A. Train braking must be handled in a manner that will ensure passenger safety and prevent damage to cars and lading, keeping brake shoe/pad, wheel wear, and fuel\energy consumption to a minimum.

B. The procedures outlined in instruction 2.16 will be used to slow or stop trains.

1. When operating electric locomotives, do not use the procedures in instruction 2.16.4 unless dynamic brake is inoperative.
2. In order to conserve fuel/energy, do not use the procedures in instruction 2.16.6 unless train handling using other procedures in instruction 2.18 cannot be done smoothly.

C. When equipped, Slow Speed Backing may be used in conjunction with the automatic brake when backing a train.

D. When using air or dynamic braking to slow for speed restrictions, air brakes must not be released, or dynamic braking reduced, until train speed is at, below or within 4 mph of the speed restriction limit.

E. When using the automatic brake to slow or stop a train, the automatic brake valve handle must not go beyond the “Full Service” brake valve position unless placing the train in Emergency. Use of the “Handle Off” brake valve position for train braking is prohibited.

2.15.18 Throttle Placement While Stopped

A. While train is stopped, the throttle must be placed in the “IDLE” position to prevent traction motor damage.

2.16 Train Handling – Starting and Stopping

2.16.1 Starting Trains

A. Power must not be applied until minimum time required for the braking system to recharge has elapsed to insure release of brakes.

NOTE: Push-Pull trains being operated from the control car will be governed by instructions **G** and **H** of this rule as appropriate.

B. Train must be started in lowest throttle position possible.

C. If the train does not start after applying reasonable power, the throttle must be returned to Idle, and the cause determined. Further advancement of throttle may cause train separation, damage to traction motors, or damage to the rail.

D. While the train is being started, locomotive speed must be kept slow and uniform until entire train is moving.

E. When starting a train on a curve, avoid high throttle/controller settings.

F. With slack bunched on level track, slowly open the throttle until entire train is moving, then accelerate.

G. With slack bunched on a descending grade, release the brakes, allow the train to start moving, advance the throttle to run 1 until train is stretched, then accelerate.

NOTE: For Push-Pull trains being operated from the control car, the brakes will be graduated down to the Minimum Reduction position on the Automatic Brake Valve, then advance the throttle to run 1 and fully release the brakes once the slack is bunched and the entire consist is moving, then continue to accelerate.

H. With slack stretched, advance the throttle to the lowest throttle position necessary to start the train, allow amperage to increase, release the brakes, and accelerate smoothly avoiding high draft forces.

NOTE: For Push-Pull trains being operated from the control car, the brakes will be graduated down to the Minimum Reduction position on the Automatic Brake Valve, then advance the throttle to run 1 and fully release the brakes once the slack is bunched and the entire consist is moving, then continue to accelerate.

DRAFT

2.16.2 Accelerating

A. Throttle must be advanced one position at a time (Instruction 2.15.3).
B. Ample time should be allowed between each increase in throttle to prevent high draft forces.

2.16.3 Slowing or Stopping Using Blended Brake

A. Move throttle/controller to “Idle”, “Off, or “Zero”.
B. Allow slack to adjust.
C. Make a minimum automatic brake pipe reduction.
D. Make additional reductions as required.
E. Where conditions permit, slowdowns or stops should be made with not more than 15 psi total automatic brake pipe reduction.
F. When stopping, gradually reduce brake application as train is stopping. Leave a minimum 12 psi reduction on train while stopped and apply the independent brake.

2.16.4 Slowing or Stopping Using Dynamic Brake

A. Move throttle/controller to “Idle”, “Off” or “Zero”.
B. Wait 10 seconds before going into dynamic brake mode.
C. Move dynamic brake controller to setup and allow train slack to bunch.
D. When slack is bunched, gradually move dynamic brake controller to obtain the desired braking effort.
E. If dynamic brake effort is not sufficient, supplement it by making the necessary brake pipe reductions to obtain the required braking effort. DO NOT allow locomotive brake cylinder pressure to develop except as provided in 2.16.4G, below.
F. As speed decreases, dynamic brake effort decreases, which may require additional brake pipe reductions to maintain the desired braking effort.
G. At very low speeds (less than 15 mph), the independent brake may be used to supplement dynamic braking effort and to prevent locomotive slack run-out. **Locomotive brake cylinder pressure must never exceed 15 psi while manual dynamic brake is applied.**
H. When releasing brakes, release air brakes and allow time to release before releasing the dynamic brake.

2.16.5 Slowing or Stopping Using Air Brakes

A. Move throttle/controller to no greater than Notch 2.
B. Make a minimum automatic brake pipe reduction and actuate (bail off) locomotive brake cylinder pressure.
C. Reduce throttle to Idle within 10 seconds.
D. Make additional reductions as required.
1. Trains with less than 10 cars must not actuate (bail off) and utilize Blended Brake.
2. Trains with 10 or more cars may be actuated (bail off) or utilize Blended Brake.

E. Where conditions permit, slowdowns or stops should be made with not more than 15 psi total automatic brake pipe reduction.
F. Leave a minimum 12 psi reduction on train while stopped and independent brake to full application, if equipped.

NOTE: When speed is less than 20 mph, the throttle may remain in Notch 1 or 2 in order to spot station stops.

2.16.6 Slowing or Stopping Using Braking with Power Applied (Mixed Consist Trains)

A. In order to conserve fuel/energy, do not use the procedures in this section unless train handling using other procedures in instruction 2.18 cannot be done smoothly.
B. Where conditions permit, dynamic brake and/or throttle reductions must be used in lieu of braking with power applied to reduce train speed.
C. When in Direct Release, minimum automatic brake pipe reductions of less than 8 psi must not be attempted.
D. Braking should be started at a sufficient distance from objective point to allow use of a split reduction.
E. Reduce throttle to no greater than Notch 2.

EXCEPTION: Auto Train may use throttle notches greater than 2. When braking with power applied, Auto Train engineers must use the lowest throttle position necessary to control slack and conserve fuel.

F. When conditions permit, the minimum automatic brake pipe reduction position should be used for the initial brake pipe reduction.
G. When conditions permit, wait 20 seconds after the brake pipe exhaust stops blowing from initial reduction, then follow with additional reductions as required.
H. Locomotive brakes should not be permitted to apply. After the initial reduction, maintain only enough power to control slack.
I. Where conditions permit, slowdowns or stops should be made with not more than 15 psi total automatic brake pipe reduction.
J. Leave a minimum 12 psi brake pipe reduction on train while stopped, and independent brake to full application.

DRAFT

2.16.7 Releasing Brakes

A. Brake applications must not be released while brake pipe exhaust is blowing.
B. After desired braking has been accomplished, brakes may be released. In the event of sticking brakes, not less than a 12 psi brake pipe reduction must be made, and brakes on entire train will be released before train speed is reduced to 10 mph.
C. If train slack is bunched when brake valve is moved to “RELEASE” position, dynamic brake or independent brake must be used to prevent run out of slack until train brakes are fully released.
D. If power is applied when ABV handle is moved to “RELEASE” position, engineer must not increase throttle/controller until train brakes are completely released.

2.16.8 Stopping Immediately After Starting

A. Make an initial automatic brake reduction (when in direct release, no less than 8 psi).
B. Reduce power gradually, maintain only enough power to control slack.
C. Gradually increase reduction until train stops.
D. DO NOT allow locomotive brakes to apply until train stops.
E. Leave a minimum 12 psi reduction on train while stopped, and independent brake to full application.

2.17 Train Handling - Back Up Moves

2.17.1 Backing/Shoving Train Movements

A. When shoving or backing trains, no more than two locomotives may be working in a consist. Isolate any excess locomotives before starting a shoving or backing move unless additional power is necessary due to an ascending grade.
B. Air brakes must be controlled by the Locomotive Engineer at all times except when testing the back-up hose or when conditions require an emergency application of air brakes.
C. Start smoothly, avoid high buff forces by using lower throttle/controller settings; giving consideration to physical characteristics, train consist, prescribed speed, and distance involved.
D. All crewmembers involved with movement must remain alert for any indication of unusual conditions such as: sudden, harsh slack action, or loss of communication and take immediate action(s) at once, using good judgment, to ensure safe movement.
E. Back-up movements adjacent to station platforms must not exceed 5 mph until leading end of movement is clear of platform.
F. When backing onto stub end tracks, a preliminary stop must be made 250 feet from bumping post/ end of track. After making the preliminary stop, do not exceed 2 mph until the final stop.
G. When preliminary stop is required, Conductors and Assistant Conductors must, before arrival in station, advise passengers and attendants not to detrain until final stop is made.

2.17.2 Back-Up Hose

A. After installing a back-up hose on equipment, it must be tested in EMERGENCY as described in instruction 2.17.2C, below.
B. A Back-Up Hose must be used for back up movements at locations required by Rule, Special Instruction, General Order, Bulletin Order, or other directive.
1. Back-up hose MUST be applied to leading end of lead car at locations where back-up hose is required.
2. When required to use a back-up hose for back up movements, it must be tested in EMERGENCY at locations where back up movements will be made as described in instruction 2.17.2C, below.

NOTE: Once tested, additional back-up hose tests are not required in the same city or terminal unless the crew changes, equipment changes, or back-up hose is replaced or moved to other equipment.

3. Test the back-up hose whistle prior to making back up move. Back-up whistle must be sounded to give warning as prescribed by applicable rules. In addition, it must be sounded when passing bridge abutments, walls, and when entering or moving on station tracks. If back-up hose whistle is found defective, it alone will not cause the back-up hose to be considered defective. However, this defect must be reported.
4. Before commencing back-up move, employee handling back-up hose will communicate with Engineer to determine signaling method to be used to start back-up movement.
5. Back-up hose or emergency brake valve must be used to apply air brakes in EMERGENCY should conditions require.

C. Back-Up Hose Emergency Test

1. Equipment must be stopped.
2. QP or QMP will initiate an emergency brake application using the back-up hose.
3. Locomotive Engineer will inform QP or QMP when locomotive is in emergency.
4. QP or QMP will close back-up hose.

DRAFT

5. Locomotive Engineer will recover from the emergency brake application when signal is given.
6. If back-up hose does not place train in emergency, determine cause.
7. If back-up hose is defective (will not place train in emergency) and no replacement back-up hose is readily available, comply with instruction 2.17.3.
8. When testing the back-up hose, train inspection, and standing train brake test requirements per instruction 3.9.4 A6 or 3.9.6 A3 do not apply.
9. Locomotive Engineer will make a Running Brake Test per instruction 3.7.

2.17.3 Defective Back-Up Hose, No Back-Up Hose Available, or Locomotive leading the back-up movement.

A. If back-up hose is defective, no back-up hose is available or locomotive is leading the back-up movement and the use of a back-up hose is required, the following will apply:
1. Conductor will inform Engineer that back-up hose is defective, that no back-up hose is available, or locomotive is leading back up movement.
2. When properly pointed locomotive (including Cab Car or NPCU) is on the leading end of the backup movement, the emergency brake valve on that equipment will be used to apply the air brakes in EMERGENCY **should conditions require**.
3. When a Passenger Carrying Car or Private Car is on the leading end of the backup movement, the emergency brake valve on that equipment will be used to apply the air brakes in EMERGENCY **should conditions require**.

NOTE: Test of the emergency brake valve on a car or locomotive is not required prior to making a backup move.

2.18 Train Handling – En Route Conditions

2.18.1 Inadequate Performance of Train Brakes

A. If brake performance is found to be inadequate for the brake application made, train must be stopped, and a walking inspection of a brake application must be performed to determine cause.
B. If no defects are found, train may proceed, making periodic running brake tests.
C. When equipped with Two-Way End of Train Device, verify changes in brake pipe pressure at rear of train during running brake tests.

2.18.2 Failure to Maintain Required Pressure

A. If pressure required for safe handling of the train cannot be maintained, the train must be stopped, secured and the train dispatcher notified.
B. If main reservoir pressure falls below 100 psi, immediately bring the train to a safe stop.

NOTE: If brake pipe pressure falls below 50 psi, you will not be able to transmit an emergency brake application.

2.18.3 Sticking Brakes

A. Train and engine crews must keep a lookout for brakes sticking on their train and on trains being met or passed.
B. They must advise one another of location in train of cars with sticking brakes.
C. Probable causes of sticking brakes:
1. Hand/parking brake not fully released.
2. Overcharged brake system.
3. Binding or fouling brake rigging.
4. Retaining valve not in “Release” position.
5. Defective control valve.
6. Excessive brake pipe leakage.
7. Improper handling of ABV.

D. If brakes are stuck from improper handling of ABV, usually an additional heavy automatic brake reduction and release will correct condition.

2.18.4 If Train Breaks in Two

A. SHUT DOWN AND ISOLATE HEP, IF EQUIPPED, AS SOON AS POSSIBLE.
B. After train is re-coupled and brake system has been recharged, perform a:
1. Class II brake test for a Passenger train, or,
2. Class III brake test for a Non-Passenger train.

C. After proceeding, as soon as speed of train permits, a Train Running Brake Test must be made, per instruction 3.9.8.

DRAFT

2.18.5 Reporting Defects - Report defects per instruction 1.2.1.

2.18.6 Emergency Brake Application

A. ABV handle initiated:
1. Full emergency brake effort must be allowed to apply.
2. Leave handle in "EMERGENCY" until stopped.
3. Ensure throttle is in "IDLE" or "OFF" position.

B. When equipped with Two-Way End-Of-Train device, engineer or other train crewmembers must activate the Two-Way End-Of-Train device using the "EMERGENCY" toggle switch when any emergency brake application occurs.

C. Conductor's valve or back-up hose.
1. Open valve quickly.
2. Leave valve open until stopped.
3. Do not attempt to release brakes until stopped.

D. Recovery from emergency brake application after stopping.
1. If conditions required use of conductor's valve, caboose valve, or back-up hose, reset it.
2. Move ABV handle to "RELEASE".
3. Inspect ENTIRE train for derailed cars, shifted loads, etc.
4. Perform a:
   - **a.** Class II brake test for a Passenger train, or,
   - **b.** Class III brake test for a Non-Passenger train.

E. After proceeding, a Running Brake Test must be made.

2.18.7 Inoperative Locomotive Dynamic Brake

A. On locomotive so equipped, Engineer will be informed of the operational status of the dynamic brake when first taking charge of the train.

B. If the locomotive is found to have an inoperative dynamic brake, see instruction 2.1.14.

2.18.8 Winter Weather Conditions

A. Due to ice and snow buildup on the braking surfaces, stopping distances may increase during winter operating conditions. Brake equipment must also be kept free of ice and snow buildup. It is imperative that the locomotive engineer is aware of the potential for ice buildup, and to make sure proper braking effort is being provided.

B. During winter weather conditions, train brakes should be conditioned by performing a Running Brake Test to warm the brake equipment and dislodge ice and snow buildup.

C. During winter weather conditions, perform a Running Brake Test every 10 miles at a speed greater than 20 mph by:
1. Making a 10 PSI Automatic Brake reduction, and
2. Allowing locomotive Brake Cylinder pressure to build to a maximum of 10 PSI for brief periods of time.

D. Operating conditions may require a Running Brake Test more frequently than 10 miles.

E. When leaving a train unattended, or when setting off cars:
1. Apply brakes on cars while moving to reduce ice and snow buildup, and
2. Verify that no ice or snow is between brake shoes/wheels or discs/pads after handbrakes are applied.

DRAFT

2.19 Train Handling - Movement Restrictions

2.19.1 Adding Passenger Equipment En Route

A. Crews must not add Passenger Equipment unless instructions are received to do so.

B. Instructions will not be given to crew unless required inspections and Class I brake test are completed. Inspections and Class I brake test will be valid until next scheduled inspection.

C. Instructions can be conveyed verbally, electronically or in writing.

D. When QMP participates in adding equipment:

1. QMP will perform required test and inspections.
2. QMP will perform Class I or Class IA brake test on Passenger Equipment added to the train when these cars have been off compressed air for more than 4 hours prior to being added.
3. QMP will issue an additional MAP 1173/10C Summary covering the equipment added.
4. Engineer will enter required information on Summary MAP 1173 per instruction 3.8.4.

E. When QMP does NOT participate in adding equipment:

1. Perform Class IA brake test on Passenger Equipment added when these cars have been off compressed air for more than 4 hours prior to being added (date and time shown on MAP 1173/10C Summary may be used for this purpose).
2. Perform Class II brake test.
3. Class II brake test may be made at same time added equipment is tested.
4. Engineer will enter required information on Summary MAP 1173 per instruction 3.8.4.

2.19.2 Air Brake - En Route Movement Restrictions

A. Passenger trains in passenger service must not leave a designated Amtrak repair point with less than 100% operative brakes.

B. Passenger trains MUST HAVE at least 85% operative brakes, unless the provisions of Instructions 3.8.1 are complied with.

C. When operative brakes become less than 85%, **BEFORE PROCEEDING,** notify train dispatcher and contact QMP at CNOC mechanical desk for instructions. CNOC may be contacted either directly at 1-800-424-0217 or through the train dispatcher.

1. Trains with 84%-75% operative brakes must comply with QMP instructions but not exceeding one-half the maximum timetable speed or 40 mph whichever is less.
2. Trains with 74%-50% operative brakes must comply with QMP instructions but not exceeding one-half the maximum timetable speed or 20 mph whichever is less.
    - **a.** Every effort must be made to increase operative brake percentage above 74% by setting out the defective car(s).
    - **b.** If not possible to increase operative brake percentage above 74% by setting out defective car(s):
    - **c.** Train may be moved in passenger service to the next location where passengers can be safely detrained.
    - **d.** After all passengers are discharged, the equipment will be moved to the nearest location where the necessary repairs can be made.

D. When brakes become completely inoperative (Brakes are inoperative on all axles, brake or control valves cut out) on front or rear passenger equipment (including locomotives), proceed as follows:

1. If occupied, passengers MUST be moved to another car.
2. Car shall be locked out except for employees in the performance of duty.
3. Speed must not exceed 20 mph.
4. Proceed to first point where car can be:
    - **a.** Set out,
    - **b.** Switched ahead of a car with operative brakes, or
    - **c.** Repaired.
5. When hand/parking brake is located **INSIDE** equipment, proceed with hand/parking brake manned.

NOTE: Defective brakes on front or rear semi-permanently attached passenger equipment (i.e., High Speed Trainset or rear of Talgo) does not constitute defective brakes on front or rear passenger equipment.

E. When Class I brake test has expired and Mechanical Department personnel are not available to perform test, the following applies:

1. Commuter & Short Distance Intercity Passenger Trains which miss a scheduled Class I brake test due to delay en route.
    - **a.** Train may be moved in passenger service to the next location where passengers can be safely detrained.
    - **b.** After all passengers are discharged, perform a Class IA brake test. The equipment will then be moved to the nearest location where the required tests and inspections can be made.

DRAFT

25-EQL-00415 000000006203 "UNCLASSIFIED" 4/30/2026

2. Long-Distance Intercity Passenger Trains which miss a scheduled Class I brake test due to delay en route may continue in passenger service to the location where the next test and inspections were scheduled to be performed.

NOTE: Locomotives must be inspected and tested per Instructions 3.1 and 3.2 each calendar day.

F. Anytime brakes are cut out, comply with the following:

1. Notify the train dispatcher and CNOC mechanical desk, communicating car number/s and number of axles cut out. CNOC may be contacted either directly at 1-800-424-0217 or through the train dispatcher.
2. If locomotive brakes are cut out, **BEFORE PROCEEDING**, notify train dispatcher and contact QMP at CNOC mechanical desk for instructions (each cut out locomotive axle counts as two cut out axles). CNOC may be contacted either directly at 1-800-424-0217 or through the train dispatcher.

NOTE: Cab Cars and NPCUs are considered cars (not locomotives) for the purpose of determining operative brakes. Therefore, count each cut out axle on this equipment as 1 cut out axle.

3. Passenger trains MUST NOT have two cars in succession with their control valves cut out. If control valve is cut out on front or rear passenger equipment, comply with instruction 2.19.2D.
4. QP or QMP must determine percent of operative brakes (See Operative Brake Chart).
5. Confirm percent of operative brakes by performing a walking inspection of a brake application.
6. Perform Class II brake test.
7. Prior to change of engine crew, inbound engineer will indicate on “Condition En Route” section of Summary MAP 1173 the car numbers and number of axles cut out of any equipment with brakes cut out.

G. EP (Electro Pneumatic) Brake becomes inoperative.

1. No train may depart its originating passenger terminal with inoperative EP brake.
2. If EP brake fails en route train may continue in service until next calendar inspection point or when next class I brake test is required.
3. Report defective EP brake to Train Dispatcher and note on “Conditions En Route” portion of MAP 1173/10C Summary.

2.19.3 Determining Percent Operative Brakes

A. Divide the total number of axles with operative brakes by the total number of axles in the train, including locomotives.
B. Each cut out axle on a locomotive in passenger service counts as 2 cut out axles.
C. Each cut out axle on other than locomotives count as 1 cut out axle.

EXAMPLE 1

1 Locomotive (4 axles)
6 Cars (4 axles each=24 axles)
24 axles + 4 axles = 28 total axles

Cut out 1 truck on 1 Passenger Carrying Car (2 axles)
28 total axles – 2 cutout axles=26 axles with operative brakes.
26 axles with operative brakes divided by 28 total axles = .93 or 93% operative brakes.

EXAMPLE 2

1 Locomotive (4 axles)
6 Cars (4 axles each=24 axles)
24 axles + 4 axles = 28 total axles

Cut out lead truck on locomotive (2 axles cut out = 4 axles cut out)
28 total axles – 4 cutout axles=24 axles with operative brakes.
24 axles with operative brakes divided by 28 total axles = .86 or 86% operative brakes.

DRAFT

2.19.4 Non-Passenger Cars and Locomotives with Operative Brakes

A. Trains must have at least 85% operative air brakes.

B. Determine percent operative brakes by dividing the total number of OPERATIVE control valves in the train by the total number of control valves in the train (see table below).

C. The following table shows the maximum number of cut out control valves to maintain not less than 85% operative brake:

D. Cars with more than one control valve require each control valve to be counted when determining operative brakes.

E. For the purposes of determining operative brakes, a car/locomotive with either or both trucks cut out shall be counted as having its control valve cut out.

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

Control Valves	Number of Control Valves Cut Out
6 control valves or less	0
7 - 13 control valves	1
14 - 19 control valves	2
20 - 26 control valves	3
27 - 33 control valves	4
34 - 39 control valves	5
40 - 46 control valves	6
47 - 53 control valves	7
54 - 59 control valves	8

2.19.5 Non-Passenger Inoperative Brakes

A. A car/locomotive with inoperative brakes must not be placed as the rear car of the train.

B. A train that has air brakes that become inoperative EN ROUTE and complies with 3.9.2 may proceed to the next repair point where repairs and brake test, if required, can be made. When air brakes become inoperative EN ROUTE, contact CNOC mechanical desk (1800-424-0217) for specific instructions and repair point.

C. If air brake on rear car becomes totally inoperative (both trucks cut out or control valve cut out) EN ROUTE:

1. Train may proceed with hand/parking brake manned, to a point where car can be repaired, switched ahead of a car with operative brakes or set out. Train dispatcher must be notified prior to movement of train.

D. Trains must have NO MORE than two consecutive control valves cut out.

E. A train must not leave maintenance location with air brakes inoperative on rear car.

F. A car with an inoperative hand brake must never be the rear car of a train.

G. Anytime brakes are cut out, perform a Class III brake test, and note on MAP 1173/10C Summary or other written document.

2.19.6 Non-Air Brake - En Route Movement Restrictions

A. Use the following table (A) to determine En Route Running Gear Defects and the necessary actions to be taken.

(A) EN ROUTE RUNNING GEAR DEFECT / ACTION TABLE
Defect Description
• Suspension Components (includes Air Bellows)
• Draft System Components
• Trucks and Components (includes Bolster Anchor Radius Rods)
• Wheels and Components (includes hot journals and locomotive support bearings)
Action
1. Stop train, QP or QMP must visually inspect equipment to determine nature of defect.
2. If communication with QMP not immediately available, contact QMP at CNOC mechanical desk via 1-800-424-0217 following voice prompts, Qualcomm communication system or Train Dispatcher with description of running gear defect. Additional numbers: 1-302-683-2082 or 2083, ATS 734-2082 or 2083.
3. Train must not move until QMP determines if safe for movement in passenger service.
4. QMP will determine maximum speed and any other restrictions necessary for safe movement. Alert QMP to any host railroad rules, speed restrictions or any other instructions concerning the defect.
5. Whenever a Running gear defect occurs en route, equipment may continue to next calendar day mechanical inspection point, provided QMP determines that it is safe to remain in passenger service.
6. Comply with instructions 1.2.1, 1.2.4, 1.4, and System General Orders.
7. As clarification, the following conditions are NOT considered defects which require a QMP's approval before the train can proceed:
• Actuation of an on-board or wayside hot journal bearing detector. A QMP need only be contacted if the crew's Tempilstik inspection of affected engine(s) or car(s) indicates an overheated bearing.
• Wheel flat spots of less than 2 ½ inches in length, or two adjoining flat spots of less than 2 inches each in length. A QMP need only be contacted if a flat spot exceeds these dimensions, or if the crew is not sure that they have measured the flat spot correctly.
• Underinflated or overinflated air bellows on cars. Crew will be governed by applicable Timetable instructions and/or 1.5.1. In the case of overinflated air bellows on Amfleet cars, QMP must be contacted if crew is unable to manually deflate air bellows.

DRAFT

B. Use the following table (B) to determine En Route Non-Running Gear Defects and the necessary actions to be taken.

(B) EN ROUTE NON-RUNNING GEAR DEFECT/ACTION TABLE
Defect Description
• Suspension Components (includes Air Bellows)
• Draft System Components
• Trucks and Components (includes Bolster Anchor Radius Rods)
• Wheels and Components (includes hot journals and locomotive support bearings)
• Exhaust gases released inside cab or other compartments.
• Batteries not properly vented.
• Jumper cables – hanging free, exposed wire, broken plugs, or receptacles.
• High voltage safety labels for exterior doors and cover plates missing.
• Buffer plates not in place.
• Diaphragms not in place or not aligned.
• Exposed moving parts and electrical equipment not equipped with guards.
• Floors that contain oil, water, waste, or any obstruction.
• Manual door releases not in place.
• Emergency equipment… as applicable, missing.
• Safety related signage missing or not legible.
• High voltage safety labels for interior doors and cover plates missing.
• Emergency brake valves not stenciled.
• Trap doors that do not safely operate or securely latch.
• Vestibule steps that are not illuminated.
• End doors and side doors that do not operate safely or as intended.
• Baggage car side doors or lighting does not function as intended.
• Seats or attachments broken or loose.
• Public Address/Intercom system inoperative.
Action
1. QP or QMP must visually inspect equipment to determine nature of defect.
2. QP or QMP will determine if safe for movement in passenger service.
3. QP or QMP will determine maximum speed and any other restrictions necessary for safe movement.
4. Whenever a Non-Running gear defect occurs en route, equipment may continue to next calendar day mechanical inspection point, provided a QP or QMP determines that it is safe to remain in passenger service.
5. Report defects on EMAP 21A and notify CNOC Mechanical desk (1-800-424-0217) as soon as possible without delaying train.
6. The specific defects indicated below must be complied with as follows:
• Defective trap door must be secured by locking out door for which it is used.
• Vestibule must be used solely at high platforms when steps are non-illuminated.
• At least one operative and accessible door must be available on each side of car. A notice must be displayed directly on each defective door (see Tables and Forms section).
• Broken or loose seats or seat attachments must be rendered unusable and display a notice indicating defect directly on seat (See Tables and Forms section).
• Whenever a Public Address/Intercom system is found defective, an out of service notice must be displayed directly on the defective Public Address/ Intercom system (see Tables and Forms section).
1. **Short Distance Intercity Trains:** Cars may continue in service 4 calendar days until repaired or replaced.
2. **Long Distance Intercity Trains:** Cars may continue in service 8 calendar days until repaired or replace.

DRAFT

2.20 Train Handling - Two-Way End-Of-Train Device

2.20.1 Two-Way End-Of-Train Device Components

A. A two-way end-of-train device consists of:

1. A Locomotive Control Unit (LCU),
2. An End-of-Train (EOT) Unit,
3. The ability to monitor various train-related functions,
4. The ability to initiate an emergency brake application from the rear of the train, and
5. Satisfies the rear of train marker light requirement.

B. The LCU:

1. Consists of a telemetry receiver/transmitter, provides displays and controls in the locomotive cab to monitor and communicate with the associated EOT. This may be a separate unit or displayed on the GE Integrated Function Display (IFD) screens.

C. The EOT:

1. Consists of a telemetry transmitter/receiver attached to the rear of car coupler and brake pipe,
2. Transmits brake pipe pressure, motion, battery condition and marker light status to the associated LCU, and,
3. Responds to a radio signal command from the LCU to initiate an emergency brake application at the rear of the train.

2.20.2 Two-Way End-Of-Train Device Requirements for Passenger Trains

A. Amtrak passenger trains are **NOT** required to have a two-way end-of-train device, regardless of consist size, when:

1. All cars in the train are equipped with an emergency brake valve readily accessible to a crewmember, or,
2. The rear car of the train is equipped with an emergency brake valve readily accessible to a crewmember in radio contact with the engineer.

B. Amtrak passenger trains must have an operable two-way end-of-train device whenever one or more of the following occurs:

1. The train has 25 or more cars, and a crewmember does not have access to an emergency brake valve on the last car of the train.
2. The train has 13 to 24 cars, and a crewmember does not have access to an emergency brake valve on the last car of the front two-thirds (or further back) of the train consist.
3. The train has 12 or fewer cars, and a crewmember does not have access to an emergency brake valve on the last car of the front half (or further back) of the train consist.
4. Use the following table to determine if a two-way end-of-train device is required. If your train exceeds the maximum number of inaccessible cars on the rear, a two-way end-of-train device is required.

Number of Cars in Train	Two-Way End-of-Train Device is NOT Required If Crewmember Has Access to This Car	Maximum Number of Inaccessible Cars on Rear

DRAFT

29-FOI-00415 09000086203 "UNCLASSIFIED" 4/30/2026

NOTE: Count back from the locomotives (do not count any locomotive).

C. Location of Crewmembers on Trains Not Equipped with a Two-Way End-of-Train Device. Crewmembers must take the following actions when a train, that is not required to be equipped with a two-way end-of-train device (due to meeting the criteria shown in the previous table), will descend a section of track on which the average grade is 2% or greater for at least two continuous miles:

1. At least 10 minutes prior to descending the specified grade, the engineer must communicate with the conductor to ensure that a crewmember with a working two-way radio is stationed in the rearmost car equipped with a readily accessible emergency brake valve when the train begins its descent.
2. The crewmember must remain stationed at this location, and remain in constant radio communication with the engineer, until the train has completely traversed the grade.

EXCEPTION: This requirement does not apply to trains which have all cars in the train equipped with a readily accessible emergency brake valve, or to those in which the rear car has a readily accessible emergency brake valve.

D. En Route Failures

1. An en route failure of the two-way end-of-train device is defined as the inability to initiate an emergency brake application from the rear of the train due to a communication failure or other reasons.
2. A communication failure is considered a loss of communication between the LCU and EOT for a continuous period of 16 minutes and 30 seconds.

E. Operating Restrictions EN ROUTE Failure - If a train which is required to have a two-way end-of-train device experiences an EN ROUTE failure, the train may proceed to the next location where repairs can be made, or where the next required train brake test is to be performed (whichever point is reached first) and must comply with all of the following:

1. Train must not descend a section of track on which the average grade is 2% or greater over a distance of two continuous miles until:
    - **a.** An operable two-way end-of-train device is installed, or,
    - **b.** An alternative method of initiating an emergency brake application from the rear of the train is achieved.
2. At locations other than those specified in item 1. above - A member of the crew equipped with an operable two-way radio that communicates with the engineer must occupy the rearmost passenger carrying car equipped with a readily accessible emergency brake valve.
3. The engineer must make periodic Running Brake Tests until the failure is corrected.

F. When brake pipe continuity is lost, as indicated by any of the following, stop train immediately and determine the cause:

1. Low air audible alarm and low air indicator light.
2. No increase or decrease in brake pipe pressure at rear of train in response to movement of the ABV handle.
3. “0” or “***” brake pipe pressure at rear of train.
4. After determining cause for brake pipe continuity loss and making necessary repairs if possible, perform a Passenger Class II Brake Test using two-way end-of-train device.

NOTE: Determine the cause of loss of continuity by inspecting train brake pipe for air loss and angle cocks/cutout cocks for proper positioning.

G. Marker Light failure does not render the two-way end-of-device inoperative. If the EOT unit’s marker light fails, train may proceed to the next designated terminal for repair. If repairs cannot be made, a portable marker must be placed on rear of train.

H. Circumstances requiring emergency brake application using Two-Way End-Of-Train Device:

1. Whenever it becomes necessary to place the train air brakes in emergency using either the ABV handle or the emergency brake valve, engineer or other train crewmembers must also activate the two-way end-of-train device on trains equipped with the device, using the “EMERGENCY” toggle switch.
2. The two-way end-of-train device must also be activated whenever an undesired emergency brake application of the train air brakes occurs.

2.20.3 Two-Way End-Of-Train Device Requirements for Non-Passenger Trains

A. Use the table below to determine when a Non-passenger train is required to be operated with a functioning Two-Way End-of-Train Device.

B. The alternative method to meet the requirement of a functioning Two-Way End-of-Train Device is a caboose, Passenger Carrying Car or other equipment with an emergency brake valve located at the rear of the train and manned by a crewmember in radio communication with the controlling locomotive.

C. Lite and multiple lite locomotive movements are not required to operate with a Two-Way End-of-Train Device.

DRAFT

Non-Passenger Two-Way End-of-Train Device Table			
Step	Determination	Yes	No
1	Is train weight greater than 4000 tons?	Proceed to Step 3.	Proceed to Step 2.
2	Will train operate over grade of 2% or more for a distance of 2 continuous miles?	Two-Way EOT or alternative method IS Required.	Proceed to Step 4.
3	Will train operate over grade of 1% or more for a distance of 3 continuous miles?	Two-Way EOT or alternative method IS Required.	Proceed to Step 5.
4	Is train classified as a Work Train?	Two-Way EOT or alternative method IS NOT Required.	Proceed to Step 5.
5	Will speed exceed 30 mph?	Two-Way EOT or alternative method IS Required.	Two-Way EOT or alternative method IS NOT Required.

2.20.4 Two-Way End-Of-Train Device En Route Failures

A. An en route failure of the two-way end-of-train device is defined as the inability to initiate an emergency brake application from the rear of the train due to a communication failure or other reasons.

B. A communication failure is considered a loss of communication between the LCU and EOT unit for a continuous period of 16 minutes and 30 seconds.

C. Operating Restrictions during En Route Failure - If a train which is required to have a two-way end-of-train device experiences an EN ROUTE failure:

1. The train may proceed, not exceeding 30 mph, to the next location where repairs can be made or an alternative method of operation is achieved (See instruction 2.20.3B), AND
2. Train must not descend a section of track on which the average grade is 2% or greater over a distance of two continuous miles until:
   - **a.** An operable two-way end-of-train device is installed, or,
   - **b.** An alternative method of initiating an emergency brake application from the rear of the train is achieved (See instruction 2.20.3B).

D. When brake pipe continuity is lost, as indicated by any of the following, stop train immediately and determine the cause:

1. Low air audible alarm and low air indicator light.
2. No increase or decrease in brake pipe pressure at rear of train in response to movement of the ABV handle.
3. “0” or “***” brake pipe pressure at rear of train.
4. After determining cause for brake pipe continuity loss, perform a Class III Brake Test using two-way end-of-train device.

NOTE: Determine the cause of loss of continuity by inspecting train brake pipe for air loss and angle cocks/cutout cocks for proper positioning.

E. Marker Light failure does not render the two-way end-of-device inoperative. If the EOT marker light fails, train may proceed to the next designated terminal for repair. If repairs cannot be made, a portable marker must be placed on rear of train.

F. Circumstances requiring emergency application Using Two-Way End-Of-Train Device:

1. Whenever it becomes necessary to place the train air brakes in emergency using either the ABV handle or the emergency brake valve, engineer or other train crewmembers must also activate the two-way end-of-train device on trains equipped with the device, using the “emergency” toggle switch.
2. The two-way end-of-train device must also be activated whenever an undesired emergency application of the train air brakes occurs.

2.20.5 Two-Way End-Of-Train Device Set Up and Arming the System

A. This procedure requires two individuals; one each positioned at the EOT unit and at the LCU/IFD.

B. Once the EOT Unit ID Code Number is communicated to the individual positioned at the LCU/IFD, it is entered either:

1. On the LCU using the thumbwheel, or,
2. On the IFD using the “F“ keys by:

DRAFT

a. Pressing F1-F5 selecting unit I.D. code, then,
b. Pressing F6 “ENTER CODE“ key, then,
c. Pressing F7 “COMM TEST“ key, and,
d. Verifying “COMM TEST PASSED“ message is displayed.

3. Press “TEST“ button on the EOT unit to effect “ARM NOW“ message on the LCU/IFD display, then immediately press either the:
   a. “Communication Test/Arm” button on the LCU, or,
   b. F7 “Arm Two-Way“ key on the IFD screen.

C. The device is ARMED when either the:
1. LCU displays “ARMD“ and the “EMERG ENABLED“ LED is lit, or
2. IFD screen displays “ARMED AND ENABLED“.

2.20.6 Two-Way End-of-Train Device Emergency Function Test

A. Test must be conducted at point of installation or whenever the LCU or EOT unit is changed.
B. Brake pipe readouts between the LCU and EOT unit must be compared for accuracy.
C. Brake pipe pressure indicated on LCU must be within 3 psi of that indicated on EOT unit or a properly calibrated air gauge.
D. Test Procedure:
1. Charge train to within 15 psi of regulating valve setting.
2. Close angle cock between the last car and the EOT unit.
3. Initiate two-way end-of- train device emergency brake application from locomotive cab using emergency toggle switch.
4. EOT unit must vent a brief exhaust of air.
5. Press EOT unit test button to verify brake pipe pressure is “0".
6. Allow approximately 60 seconds for EOT unit to reset.
7. Slowly open angle cock between last car and EOT unit.
8. If EOT unit fails to respond to an LCU-initiated emergency signal after two attempts, the two-way end-of- train device is considered inoperative, until repaired or replaced and retested.
9. Add info to MAP 1173/10C Summary.

2.20.7 Passenger Train Class II Brake Test Using Two-Way End-of-Train Device

A. The two-way end-of-train device must be utilized to perform the Class II Brake Test.
B. Test Procedure:
1. Observe the display on the LCU/IFD for continuous readout of brake pipe pressure from the EOT unit.
2. Charge system to required pressure.
3. Make a 20 psi brake pipe reduction.
4. Observe appropriate LCU/IFD indications for brake pipe reduction on last car of train.
5. Release brakes.
6. Observe appropriate LCU/IFD indications for brake pipe pressure increase on last car of train.
7. Notify conductor that test was successful.

2.20.8 Non-Passenger Train Class III Brake Test Using Two-Way End-Of-Train Device

A. The two-way end-of-train device must be utilized to perform the Class III Test.
B. Test Procedure:
1. Observe the display on the LCU/IFD for continuous readout of brake pipe pressure from the EOT unit.
2. Charge system to required pressure.
3. Make a 20 psi brake pipe reduction.
4. Observe appropriate LCU/IFD indications for brake pipe reduction on last car of train.
5. Release brakes.
6. Observe appropriate LCU/IFD indications for brake pipe pressure increase on last car of train.
7. Notify conductor that test was successful.

2.20.9 EOT Unit’s Battery

A. The following indications pertain to the condition of the EOT unit’s battery:
1. LCU Messages:
   a. “DEAD BAT” (Dead Battery)
   b. “REPL BAT” (Replace Battery)
2. IFD Screen:
   a. “EOT BATTERY” Yellow (Weak)
   b. “EOT BATTERY” Red (Dead)

B. Replacement procedure:

DRAFT

1. Ensure EOT unit's replacement battery is charged.
2. Remove EOT unit's battery hasp, securing device.
3. Unlatch battery compartment door.
4. Pull battery straight out.
5. Fit replacement battery into the enclosure cavity, aligning the connectors.
6. Push battery fully into the enclosure, then latch and secure battery compartment door.

2.20.10 Disarming Two-Way End-of-Train Device

A. Armed two-way end-of-train device must be disarmed when:
1. Either the EOT unit or LCU is changed, and/or,
2. When train arrives at its final terminal.

B. Disarming Procedure using LCU:
1. Set all thumbwheel numbers to "0", and,
2. Press "Communications Test/Arm" button.

C. Disarming Procedure using IFD:
1. From IFD EOT setup screen, press F6 "EOT 00000" key and,
2. Immediately press F7 "DISARM TWO WAY" key.

D. The system is disarmed when either:
1. LCU displays "DISARMD", and "EMERG ENABLED" LED is off or,
2. IFD screen displays "NOT ARMED AND DISABLED".

2.20.11 Mechanical Department Tracking and Annual Inspection

A. EOT Devices are tracked by the 5-digit ID number located on the dated ID sticker on each unit.

B. Locomotive Control Units (LCU) are tracked by their serial numbers located on the unit.

C. EOT Unit shall be removed from service and tested for accuracy at least every 368 days. The 368 days shall not include a shelf life of up to 92 days.
1. Test and inspection of the EOT unit shall be conducted per CFR 49 Part 232.409, and Amtrak SMP-MEC-12-11004 *Procedures for End-of-Train (EOT) Telemetry Systems.*
2. The date and location of the last calibration or test as well as the name of the person performing the calibration or test shall be legibly displayed on a weather resistant sticker or other marking device affixed to the outside of the EOT unit.

D. LCU shall be removed from service and tested for accuracy at least every 360 days.
1. Test and inspection of the LCU shall be conducted per CFR 49 Part 232.409, and Amtrak SMP-MEC-12-11004 *Procedures for End-of-Train (EOT) Telemetry Systems.*
2. The date and location of the last calibration or test as well as the name of person performing the calibration or test shall be legibly displayed on weather resistant sticker or other marking device affixed to the outside of the front unit; however, if the front unit (LCU) is an integral part of the locomotive or is inaccessible, then the information may be recorded on Blue Form/MAP 816 provided that the serial number of the unit is recorded.

DRAFT

2.21 Train Handling - Yard Service Switching

2.21.1 Ensure Blue Signal protection and associated derails are removed per operating rules.

2.21.2 Brake pipe must be charged on entire train when switching, except when brake pipe is defective or damaged.

2.21.3 Ensure hand/parking brakes are released before moving equipment.

2.21.4 Ensure chocks and/or skates are removed before moving equipment.

2.21.5 Before placing car(s) in a track, determine if there is sufficient room to hold the car(s).

2.21.6 Watch for close clearance. Stop movement if unsure whether equipment will clear.

2.21.7 Before coupling to standing equipment, verify that equipment is properly secured per instruction 2.14 to prevent rolling if coupling is not made. Chocks must not be removed until coupling is made.

2.21.8 When possible, cars must be uncoupled on straight track instead of curves or in turnouts.

2.21.9 When coupling equipment, especially in curves and turnouts, ensure that couplers are properly positioned to prevent damage.

2.21.10 Before coupling or moving passenger equipment, occupants of such cars must be notified that movement will be made.

2.21.11 A safety stop must be made (approximately 50 feet) just prior to coupling to any equipment. A safety stop is not required when distance between **standing** equipment to be coupled is less than 50 feet.

2.21.12 When coupling equipment, care must be taken to prevent injury or damage. Coupling must be made at the minimum speed required to complete the coupling but not exceeding 4 mph. ACS-64, Charger SC-44, ALC-42, HHP-8 Locomotives, HST Power Cars, and equipment with spear type couplers must be coupled at a speed NOT to exceed 2 MPH.

2.21.13 After coupling equipment ensure that:

A. Both coupler operating rods (cut levers) are properly secured in the down position, with the knuckle locked.
B. The coupler telltale hole or recess (inverted V) is fully visible and the rotary lock lift has fully dropped.
C. The train must be double stretched after each coupling.
D. Once the train is assembled and switching is complete, the requirements of instruction 1.5.5 Coupler Locking Pins apply.
E. In the event the equipment does not couple as intended, uncouple, and inspect both couplers. Open and close each knuckle to check for proper lock drop and engagement, free of binding. Attempt to couple equipment again and if another failed coupling occurs, equipment must be moved to a repair or servicing track for proper repair.

2.21.14 Prior to uncoupling equipment, disconnect all cables, chains, and curtains between equipment that is to be uncoupled.

2.21.15 Prior to shoving or pulling equipment, crews must ensure that all cables and air hoses have been disconnected from 480V, Yard Plant (ground air), Telephone, Ground Power, etc.

2.21.16 When switching, equipment must not be placed in the foul until switch / switches are properly aligned.

2.21.17 Secure unattended equipment per instruction 2.14.

Equipment Inspections / Brake Tests Section

DRAFT

3.0 Equipment Inspections / Brake Tests

- 3.1 Locomotives - Employee Responsibility – Locomotive Inspection, Testing, and Documentation
- 3.2 Locomotives - Locomotive Calendar Day Inspection Procedure When Performed By Engineer
- 3.3 Locomotives - Locomotive Calendar Day Air Brake Test
- 3.4 Locomotives - Mechanical Department Locomotive Air Brake Daily Inspection
- 3.5 Locomotives - Locomotive Consist Air Brake Test
- 3.6 Locomotives – Standing Locomotive Brake Test
- 3.7 Locomotives - Locomotive Running Brake Test
- 3.8 Brake Tests – General
- 3.9 Train Brake Tests & Mechanical Inspection

3.0 Equipment Inspections / Brake Tests

3.1 Locomotives - Employee Responsibility – Locomotive Inspection, Testing, and Documentation

3.1.1 When first taking charge of a locomotive, the Engineer will check that a MAP 100 is located on each locomotive in consist and determine that Locomotive Calendar Day Inspection remains valid.

NOTE: When MAP 100 is referenced in the following instructions, Metrolink Locomotives and Cab Cars will use Calendar Day Inspection Forms SMP 100, SMP 1173, and SMP 101. MARC Locomotives and Cab Cars may use the Calendar Day Inspection Form ECR 100. Trains that originate in Canada may use the Via Rail Train Safety Inspection Checklist Form 85-J0099 AF (00-05).

3.1.2 Determining Level of Fuel on Diesel Locomotives

A. Engine service employees will determine the level of fuel on each unit as soon as possible after taking charge of a diesel locomotive consist.

B. Without delay to the train and when safe conditions exist, observe the fuel sight glasses, fuel gauge or fuel monitor to determine if sufficient fuel exists to reach final terminal or next scheduled fueling point. After determining fuel level, note on the back of the MAP 100 of each unit the total gallons, location, date and time.

C. When conditions indicate that sufficient fuel is not available to reach the final terminal or next scheduled fueling point, contact CNOC and/or train dispatcher and inform them of conditions as soon as possible. For the purpose of estimating fuel consumption, several factors must be considered including the size of the train, number of units, weather conditions and expected delays.

3.1.3 Locomotive Calendar Day Inspection Requirements

NOTE: This instruction also applies to non-complying locomotives.

A. Each locomotive must receive a Locomotive Calendar Day Inspection each calendar day, regardless of whether delayed en route.

B. The date on which a locomotive(s) receives the last calendar day inspection and test will be determined by the MAP 100 information entered in the “Signature Of Supervisor approving unit for service and all work complete”, ”Occupation”, “Place”, “Date”, “Time”. The information of the previous calendar day inspection in accordance with 49 CFR 229 will be entered in the “Previous Calendar Day Inspection” box in the top right corner of the MAP 100.

C. If a locomotive has NOT been inspected today and will be in service past 11:59PM tonight, a Locomotive Calendar Day Inspection is required before 11:59PM tonight.

D. When Locomotive Calendar Day Inspection has expired and Mechanical Department personnel are not available, Engineer will perform inspection according to instruction 3.2 before placing locomotive in service.

E. When Locomotive Calendar Day Inspection will be required before 11:59PM tonight and Mechanical Department personnel are not available, engineer will perform inspection as per instruction 3.2 after:

1. Contacting train dispatcher to arrange for location to perform inspection, OR
2. When communication is not available with train dispatcher; perform inspection at any point prior to 11:59PM tonight.

F. When Locomotive Calendar Day Inspection is not current on locomotive(s) within a Mechanical Facility, the locomotive(s) may be moved to a repair or servicing track in order to perform the inspection within the same mechanical facility. Before movement is made:

1. Determine that locomotive is safe to move,
2. Perform locomotive air brake tests as prescribed by instructions 3.5, 3.6 and 3.7,
3. Movement must not exceed 5 mph.

3.1.4 Mechanical Department Employees

A. Mechanical department personnel who are employed to perform locomotive calendar day inspections, air brake daily inspections, and the locomotive departure brake test must perform the above-mentioned inspections / tests in accordance with all applicable Standard Maintenance Procedures and the current edition of this AMT-3 instruction manual.

B. Mechanical Department personnel must perform the air brake daily inspection as outlined in instruction 3.4 and the locomotive air brake departure test as outlined in instruction 3.3 prior to dispatching the locomotive for service.

C. Mechanical Department personnel shall submit a written report of the air brake daily inspection and air brake departure test. Use appropriate MAP form(s) or WMS template.

DRAFT

3.1.5 Each locomotive placed in service must receive all required inspections to ensure compliance with the requirements listed in 49 CFR Part 229.

A. Each locomotive in service must receive the following inspections:
1. Periodic (once each 92 or 184 days depending on locomotive type).
2. Annual (Does not exceed 368 calendar days).
3. Biennial (Does not exceed 736 calendar days).

3.1.6 All inspections, other than the daily inspection will be noted on Form F6180.49A (Blue Form/MAP 816) or "Blue Form") and must be checked for proper dates.

3.1.7 Trains/Locomotives must not enter any Train Control System Territory with defective or cut out Train Control System or "Acknowledger" unless relieved by Rule, Special Instruction, General Order, Bulletin Order, or other directive.

3.1.8 The "Acknowledger" must be tested prior to entering any Train Control System territory. Perform test by briefly depressing the "Acknowledger" for greater than three seconds to verify sounding of the audible alarm.

3.1.9 Engineer must verify that train control system has been tested as per instruction 4.1 prior to operation in any Train Control System Territory. Engineer will accept mechanical forces inspections and tests as documented by MAP 100.

3.1.10 When train control system test(s) is required and Mechanical Department personnel are not available, engineer will perform test(s) according to instruction 4.0.

3.1.11 Any time a seal is broken from the list in section 2.7.1, the following information must be entered on MAP 100:

A. Device cut out.
B. Seal number if available.
C. Reason for cutting out.
D. Geographic location where cut out.
E. To whom report was made.

3.1.12 Engineers must keep a supply of MAP 100s available while on duty.

3.1.13 Engineers must, before going off duty, complete the bottom section of the current MAP 100 by indicating any defects, signature, location, and date. If a non-complying condition exists, comply with instruction 3.1.15.

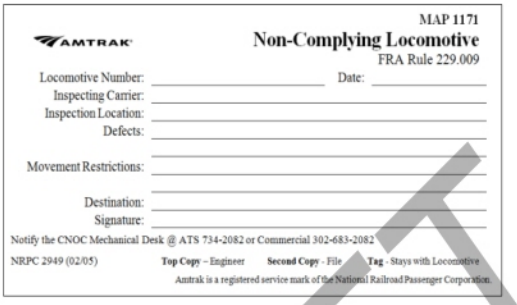
3.1.14 Missing MAP 100 Forms

A. Missing MAP 100
1. Locomotives must not depart an initial terminal without a current MAP 100 on each locomotive.
2. At other than initial terminal, locomotive may proceed without a MAP 100, provided it will not be used as controlling locomotive in train control system territory.
3. At other than initial terminal, if locomotive will be used as controlling locomotive in train control system territory, comply with one of the following:
   a. Obtain a copy of the current MAP 100 that indicates train control system test(s) was performed, OR
   b. Perform required Train Control System test(s) and complete a new MAP 100 as per instruction 4.0, OR
   c. Verify that the proper train control system test(s) was performed by contacting the mechanical desk at CNOC either directly at 1-800-424-0217 or through the train dispatcher. Record on the "Failures En Route" section of the current MAP 100 or a new MAP 100 the type of test, name of employee who performed test and place, date, and time of test.

NOTE: Every effort must be made to use the option which causes the least train delay.

B. Missing Previous Calendar Day Inspection Information
1. Locomotives must not depart an initial terminal without the "Previous Calendar Day Inspection" section (box 36) information.
2. At other than initial terminal, before proceeding, verify place, date, and time of previous Locomotive Calendar Day Inspection by contacting the mechanical desk at CNOC either directly at 1-800-424-0217 or through the train dispatcher. Enter the place, date, and time of the last inspection on "Previous Calendar Day Inspection" section (box 36) section of the current MAP 100.

DRAFT



NOTE: If unable to verify "Previous Calendar Day Inspection" information, a train en route must not be delayed.

C. Locomotive Engineers must immediately report missing MAP 100 or "Previous Calendar Day Inspection" information by contacting the mechanical desk at CNOC either directly at 1-800-424-0217 or through the train dispatcher.

3.1.15 Any locomotive with a non-complying condition must be documented as follows:

A. Attach a completed MAP 1171 *Non-Complying Locomotive Tag* to the control stand, isolation switch or engine control panel.
B. Describe defect on MAP 100. If non-complying tag is not available, write "Non-Complying Locomotive" on "Failure En Route / Equipment Condition" section of MAP 100 in addition to describing defect and any restrictions.
C. In multiple unit consists or push/pull operations, note on MAP 100 of lead unit that non-complying locomotive is in consist or train.
D. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: SMP 130 *Non-Complying Locomotive Tag* must be used when a non-complying condition exists on Metrolink locomotives.

MAP 1171

AMTRAK

Non-Complying Locomotive

FRA Rule 229.009

Locomotive Number: _____ Date: _____

Inspecting Carrier: _____

Inspection Location: _____

Defects: _____

_____

Movement Restrictions: _____

_____

Destination: _____

Signature: _____

Notify the CNOC Mechanical Desk @ ATS 734-2082 or Commercial 302-683-2082

NRPC 2949 (02/05) **Top Copy** – Engineer **Second Copy** - File **Tag** - Stays with Locomotive

Amtrak is a registered service mark of the National Railroad Passenger Corporation

3.1.16 Non-complying locomotives may be moved to the next Amtrak locomotive repair facility, if safe to do so, only as:

A. Lite locomotives, OR
B. In a train either dead or with propelling motors cut out/isolated.

EXCEPTION: A locomotive that develops a non-complying condition en route may continue to utilize its propelling motors, provided instruction 2.1 is complied with.

3.1.17 Locomotive Calendar Day Inspection Documentation for Trains Originating in Canada

A. Supervisors and Locomotive Engineers must ensure that locomotive calendar day inspection remains valid when operating:
1. Foreign line locomotives used to haul Amtrak trains, and,
2. On locomotives hauling Amtrak trains entering the United States from Canada.

B. Foreign line locomotive documents which indicate the date, time, and location of the last locomotive calendar day inspection will be accepted by Amtrak in place of standard Amtrak documents (MAP 100).
C. Canadian locomotive documents which indicate the date, time, and location of the last locomotive calendar day inspection will be accepted by Amtrak in place of standard Amtrak documents (MAP 100).
D. If the last locomotive calendar day inspection has expired or cannot be determined, a locomotive calendar day inspection must be performed on the affected locomotive.

3.2 Locomotives - Locomotive Calendar Day Inspection Procedure When Performed by Engineer

NOTE: If a non-complying condition is discovered at a location where locomotive cannot be repaired or replaced on a revenue passenger train, comply with instruction 2.1.

NOTE: As indicated by instruction 3.2.41, the Locomotive Calendar Day Air Brake Test (instruction 3.3) is part of the Locomotive Calendar Day Inspection and MUST be performed in addition to instruction 3.2.

NOTE: For instructions 3.2.4 through 3.2.40, any non-complying condition discovered during this inspection must be documented per instruction 3.1.15. In addition to particulars noted in instructions 3.2.4 through 3.2.40, the following must also be complied with:

DRAFT

A. Complete non-complying tag per instruction 3.1.13;
B. Note defect on MAP 100,
C. In multiple unit consists or push/pull operations, note on MAP 100 of lead unit that non-complying locomotive is in consist or train.

3.2.1 Locomotive must be secured per instruction 2.14.

3.2.2 Verify that Locomotive Inspection and Repair Report, F6180.49A (Blue Form), is displayed on locomotive and complies with 3.1.4 and 3.1.5.

3.2.3 Verify cutouts (switches and cocks) or enclosures for safety devices listed on MAP 100 are properly positioned and sealed, with numbers recorded on MAP 100 form:

A. ACSES Cutout Cock/Switch
B. Cab Signal Cutout Cock/Switch
C. ITCS/X-ITCS Cutout Cock/Switch
D. IITS
E. I-ETMS Penalty Brake Cutout Cock/Switch
F. I-ETMS Emergency Cutout Cock/Switch
G. I-ETMS Horn Cutout Cock/Switch
H. Alerter Cutout Cock/Switch
I. ATC/IITS Transfer Switch
J. Speedometer (Locomotive) Overspeed (OS) Cutout Cock/Switch
K. Speed Control Cutout Cock/Switch
L. Door Bypass Switch
M. Multiple Penalty Brake Device Switch
N. Event Recorder
O. Amtrak / MNRR Switch
P. Overspeed Selector Switch

3.2.4 Hand/Parking brakes are in a safe and suitable condition for service.

3.2.5 Cab seats properly secured to the floor or sides.

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.6 Cab windows and wipers provide clear vision and windows are free of broken areas.

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.7 Cab heaters and Air conditioning (if equipped) function as intended.

A. If cannot be repaired and weather conditions create an unsafe environment switch to trailing position and continue in use until next Amtrak locomotive repair facility.

3.2.8 Cab lights and gauge lights are operative and provide sufficient illumination.

3.2.9 Speed indicator and related apparatus is undamaged. The performance and accuracy of the speed indicator can only be ascertained after departure (10 mph to 30 mph +-3 mph; above 30 mph +-5 mph).

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.10 Air brake gauges register variations in pressure in relation to brake valve handle position.

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.11 Air compressor or compressors control main reservoir pressure, as indicated by cab gauges, within range specified for type locomotive.

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.12 Headlights operate properly and can be dimmed as required. One defective bulb of a two-bulb Incandescent or LED headlight **IS NOT** considered non-compliant. If found non-compliant (defective):

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

DRAFT

3.2.13 All auxiliary (ditch) lights operate as intended.

A. If 1 defective auxiliary light is discovered at initial/originating terminal of train, repair, or switch locomotive to trailing position.

NOTE: Auxiliary lights are considered non-complying if one or more lightbulbs are burned out. A failure of the flashing function is not considered a failure of the auxiliary lights but must be reported on MAP 100.

3.2.14 Locomotive radio operates as intended.

A. Repair, substitute another radio or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.15 Inward and Forward Facing Cameras are securely mounted and not damaged.

NOTE: Damage or defective conditions of any part of the system (cameras, bracket, cables, LDVR) must be reported on MAP 100. Employees must not disconnect, disable, or tamper with the Locomotive Camera Recorder or components.

3.2.16 Dynamic brake equipment is in place and cut in if locomotive is equipped. Locomotives with defective dynamic brake will proceed as follows:

A. Place tag on control stand or Engine Control panel indicating “Inoperative Dynamic Brakes”, locomotive number, date, location, and signature of person who discovered (see instruction 2.1.14),
B. Conventional locomotives must be repaired within 3 calendar days.
C. MU locomotives must be repaired by the next Locomotive Calendar Day Inspection.

3.2.17 Horn and bell operate as intended. If either found non-complying:

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.18 Sanitation, Toilet Compartment, and Toilet:

A. No significant amount of filth, trash, or human waste in toilet compartment.
B. No strong, persistent, chemical, or human waste odor from toilet compartment
C. Adequate ventilation in toilet compartment.
D. Toilet not defective and flush mechanism functions as intended.
E. Toilet compartment door closes.
F. Toilet compartment door lock functions as intended.
G. Sufficient quantity of toilet paper and trash bags.
H. Sufficient quantity of antibacterial agents such as antibacterial soap and water or antibacterial towelettes and sufficient quantity of paper towels for employee sanitation needs.
I. If toilet or toilet compartment is unsanitary, complete non-complying tag per instruction 3.1.15 and comply with the following:
1. Use locomotive as trailing unit in consist, or
2. Locomotive can be used as a lead unit only until unsanitary condition can be corrected, replaced with another locomotive, or the next Locomotive Calendar Day Inspection, provided all of the following are met:
    a. No other locomotive is available (cannot switch to trail),
    b. Toilet could not have been made sanitary since last Locomotive Calendar Day Inspection,
    c. Toilet compartment door is closed and adequately ventilated so locomotive cab is habitable, and
    d. Engineer is provided other toilet facilities upon reasonable request.
3. Note on MAP 100 date toilet or toilet compartment becomes unsanitary.

J. If toilet is defective but sanitary, complete non-complying tag as per instruction 3.1.15 and comply with the following:
1. When not in switching service, use locomotive as trailing unit in consist, or
2. When not in switching service, locomotive can be used as a lead unit only until defective condition can be corrected, replaced with another locomotive, or the next Locomotive Calendar Day Inspection, provided all of the following are met:
    a. No other locomotive is available (cannot switch to trail),
    b. Toilet could not have been repaired since last Locomotive Calendar Day Inspection, and
    c. Engineer is provided other toilet facility upon reasonable request.
3. Locomotive can be used as a lead unit in switching service for 10 days after toilet becomes defective.
4. Note on MAP 100 date toilet becomes defective.

K. Inadequate ventilation of toilet compartment or defective toilet compartment door
1. If toilet compartment inadequately ventilated locomotive must be repaired, be used as a trailing unit or in switching service.
2. If toilet compartment door is defective or will not close locomotive must be repaired, used as a trailing unit or in switching service.

DRAFT

26-FOI-00415 09000006203 "UNCLASSIFIED" 4/30/2026

L. If toilet compartment door lock is defective, lock must be repaired on or before the next 92-day inspection. Note on MAP 100 date toilet compartment becomes defective.

M. If locomotive has insufficient quantity of toilet paper, trash bags, or sanitary washing needs, obtain prior to use of locomotive.

3.2.19 Sanders function on each locomotive to deliver sand to each rail in front of the first power operated wheel set in the direction of movement.

A. Repair if possible. If not, locomotive MUST be set up to prohibit propulsion (isolated), switch to trailing position, and continue in use to next Amtrak locomotive repair facility.

3.2.20 No traction motor is cut out. If traction motor is cut out:

A. Locomotive MUST be set up to prohibit propulsion (isolated), switch to trailing position, and continue in use to next Amtrak locomotive repair facility.

NOTE: This instruction does not apply to HHP-8, HST, ACS-64, SC-44, ALC-42 and P32ACDM locomotives. However, when traction motor is cut out on this equipment note must be made on MAP 100.

3.2.21 Emergency brake valve (conductor valve) properly labeled and accessible.

A. Repair or use as trailing locomotive to next Amtrak locomotive repair facility.

3.2.22 Doors and cover plates that are marked "Danger" and covering high voltage electrical apparatus must be secured in their proper locations.

A. Repair if possible. If not, shut down locomotive, switch to trailing position and continue in use to next Amtrak locomotive repair facility.

3.2.23 Fan openings, exposed gears and pinions, and exposed moving parts protected to prevent injury.

A. Repair if possible. If not, shut down locomotive, switch to trailing position, and continue to next Amtrak locomotive repair facility.

3.2.24 No bent/broken grab irons or accumulations of oil, water, fuel, debris, and other items in passageways, walkways, cab compartment floors, and engine compartment floors which presents an unsafe condition such as a slipping hazard.

A. Repair if possible. If not, shut down locomotive, switch to trailing position, and continue to next Amtrak locomotive repair facility.

3.2.25 No battery gas leaks in cab or engine compartment.

A. Repair if possible. If not, shut down locomotive, switch to trailing position, and continue to next Amtrak locomotive repair facility.

3.2.26 No obvious diesel engine exhaust gas leaks into the engine compartment.

A. Repair if possible. If not, shut down locomotive, switch to trailing position, and continue to next Amtrak locomotive repair facility.

3.2.27 Water and oil drained from main reservoirs if not equipped with automatic drain valves.

3.2.28 Brake rigging properly secured.

A. Determine any operating restrictions (rules or equipment) which apply,

B. Set out locomotive immediately or move to the next point where it can be set out,

C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.29 No part of trucks, brake rigging, and running gear, with the exception of the wheels and non-metallic sand hoses, are less than 2-1/2 inches above top of rail. Determination can be made by inspecting under side of the locomotive from outside the gauge of the rail.

A. Determine any operating restrictions (rules or equipment) which apply,

B. Set out locomotive immediately or move to the next point where it can be set out,

C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

DRAFT

26-FOI-00415 000000008203 "UNCLASSIFIED" 4/30/2026

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.30 Pilots, snowplows, and end plates properly secured and not less than 3 inches not more than 6 inches above top of rail.

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

3.2.31 Draft gear and uncoupling mechanisms secure and not bent, cracked, broken, or missing parts.

NOTE: This instruction does not apply to the High Speed Trainset (HST).

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.32 Jumper cables are properly stored (ends of cables should not be hanging free) and do not create a tripping hazard.

3.2.33 Brake shoes are properly applied and aligned with tread of wheels or other braking surfaces.

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.34 Visible traction motor, HEP cables, and cable connections are free from damage.

A. Repair if possible. If not, locomotive MUST be set up to prohibit propulsion (isolated), switched to trailing position, and continue in use to next Amtrak locomotive repair facility.

3.2.35 Trucks, shocks, spring rigging, and associated parts in proper position and free of cracks and breaks.

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.36 Any wheel does not have a single flat or shelled spot 2 ½ inches or more in length. Any wheel does not have adjoining flat or shelled spots 2 inches or more in length. Any wheel does not have defects such as broken, gouged, chipped, or cracked rim or flange. When more restrictive railroad rules or instructions are in effect concerning wheel defects, those instructions will apply.

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.37 Emergency fuel cutoff devices and pantograph down devices and MCB are properly marked and free of any impediment which could prevent their operation.

A. Repair if possible. If not, shut down locomotive, switch to trailing position, and continue to next Amtrak locomotive repair facility.

DRAFT

3.2.38 Fuel tank (transformer on electric locomotives) is not leaking.

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

3.2.39 Brake cylinder travel must provide proper clearance when the brakes are released. Piston travel, if applicable, may not exceed 1 ½ inches less than total piston travel as indicated on Blue Form/MAP 816.

A. Determine any operating restrictions (rules or equipment) which apply,
B. Set out locomotive immediately or move to the next point where it can be set out,
C. Notify CNOC mechanical desk at 1-800-424-0217 as soon as possible without delaying train.

NOTE: When locomotive is in passenger service, a QMP must be contacted before equipment is moved. Communicate to QMP any host railroad rules or instructions concerning the non-complying condition.

3.2.40 Pantograph/carbon strip on electric locomotives and 3rd rail shoe on dual mode locomotives not broken or damaged.

A. Locomotive may be moved to next Amtrak locomotive repair facility,
B. Change to undamaged pantograph on electric locomotives.

3.2.41 Perform a Locomotive Calendar Day Air Brake Test, as per instruction 3.3, from the controlling locomotive.

3.2.42 Complete a new MAP 100 to be left on each locomotive, as follows (Tables and Forms section):

A. MAP 100
1. Complete the first line, Unit # (box 1).
2. Enter your signature, occupation, place, date, time of the inspection in the boxes on the line with the heading “Daily Mechanical Inspection” (boxes 2-6).
3. On the MAP 100 of the CONTROLLING locomotive, check the applicable space for “F-End” or “R-End” under heading “Locomotive Calendar Day Air Brake Test” (box 7 or 8).

NOTE: Only complete box 7 or 8 on the MAP 100 of the controlling locomotive. On trailing unit, check “N/A” for boxes 7 and 8.

4. On the MAP 100 of all locomotives in consist, check the applicable “Pass”, “Fail”, or “N/A” (box 9) if the ECP brake equipment has been inspected and tested (box 9). Check “N/A” if not applicable.
5. On the MAP 100 of all locomotives in consist, enter your signature, occupation, place, date, time of the brake test in the boxes on the line with the heading “Locomotive Calendar Day Air Brake Test” (boxes 10-14).
6. Enter a description of any defective or non-complying condition in the “Failure En Route / Equipment Condition” section.
7. Copy “Location” (box 26), “Date” (box 27), and “Time Completed” (box 28) information from “Supervisor/QMP Verifying All Work Completed and Approving Unit for Service” box of the old MAP 100 to the “Previous Calendar Day Inspection” section (box 36) on top right corner of the new MAP 100. This will serve as an inspection record per 49 CFR 229.21. In case the engineer performed the inspection per instruction 2.2 and the “Supervisor/QMP Verifying All Work Completed and Approving Unit for Service” box is not filled, the information in the “Daily Mechanical Inspection” box (boxes 4-6) of the old Map 100 will be used to complete the “Previous Calendar Day Inspection” section (box 36) on top right corner of the new MAP 100.

B. Contact CNOC mechanical desk at 1-800-424-0217 before going off duty to report that inspection has been performed and whether any defects were noted.

3.3 Locomotives - Locomotive Calendar Day Air Brake Test

3.3.1 Preparation

A. Apply Blue Signal protection when required.
B. Secure equipment per instruction 2.14.
C. All MU, main reservoir, and brake pipe hoses properly coupled between locomotive(s) and/or car(s) or on end of locomotives placed in proper receptacles or dummy couplings.
D. All angle cocks, cutout cocks, and end cocks properly positioned, including truck cutout cocks.
E. Charge system to required pressure.

DRAFT

3.3.2 Independent Brake Test

A. Release independent brake.
B. Full application in 10 psi increments.
C. Full release in 10 psi decrements.
D. Note that full independent brake cylinder pressure is correct and holds in 10 psi increments/decrements.

3.3.3 Brake Pipe Leakage Test

A. With the brake system fully charged, make a 20 psi brake pipe reduction.
B. Cut out pressure maintaining feature: move brake pipe cut off pilot valve/switch to “TEST” or “OUT” position.

NOTE: Brake pipe leakage must not exceed 3 psi /minute.

C. Move ABV handle to “Release” position.

NOTE: Brake pipe pressure must not increase for 1 minute.

D. Cut in pressure maintaining feature: move brake pipe cut off pilot valve/switch to “PASS, “FRT“, or “IN” position.

3.3.4 Emergency Brake Test (For locomotives NOT equipped with Dynamic Brake Interlock)

NOTE: On locomotives equipped with Dynamic Brake Interlock (DBI), proceed to instruction 3.3.5.

A. Make emergency brake application with ABV handle. Brake pipe pressure must reduce to 0 psi at emergency rate. PCS light must illuminate on units so equipped.
B. Emergency brake cylinder pressure is obtained within 4 seconds and determine that brakes have applied.
C. Recover from emergency brake application.
D. Determine that brakes have released.

3.3.5 Dynamic Brake Interlock (DBI) Test

NOTE: Does not apply to NPCU.

A. Ensure system is fully charged.
B. Make a full service brake application.
C. Place reverser handle in forward or reverse.

NOTE: On GE units, generator field switch must be “ON”.

D. Move dynamic brake handle to “SET UP“, wait 10 seconds.
E. Move dynamic brake handle to “No. 2” position.
F. Ensure brake cylinder pressure drops to 0 psi.
G. Move ABV handle to “EMERGENCY” position. Brake pipe pressure must reduce to 0 psi at an emergency rate. PCS light must illuminate on units so equipped.

NOTE: Ensure brake cylinder pressure is restored in 4 seconds.

H. Move dynamic brake handle to “OFF” position.
I. Move Reverser to “NEUTRAL” position.
J. Recover from emergency brake application.

NOTE: On GE units, turn generator field switch to “OFF”.

3.3.6 Deadman/Alerter Test

A. Release brake cylinder pressure.
B. If equipped with an Alerter:
1. Allow Alerter to begin cycling or initiate the Alerter test using the on-screen program.
2. Acknowledge by pressing the “Acknowledge” button/switch.
3. Allow Alerter to cycle again.

C. If equipped with a Deadman:

DRAFT

1. Release Deadman foot pedal.

D. Allow penalty application to occur. PCS light must illuminate on units so equipped.

NOTE: Full service brake application should occur.

E. Move ABV handle to “SUPPRESSION” or “LAP” position.
F. Recover from penalty brake application.

3.3.7 Train Control (If equipped and is destined for Train Control System territory)

A. Move ABV handle to “SUPPRESSION” or “LAP” position.
B. Depress train control acknowledger and do not release for at least 8 seconds.

NOTE: Penalty should be suppressed.

C. Continue to acknowledge and move ABV handle to “RELEASE” position.

NOTE: Penalty brake application must occur. PCS light must illuminate on units so equipped.

D. Release acknowledger and move ABV handle to “SUPPRESSION” position.
E. Recover from penalty brake application and recharge system.

3.3.8 Emergency Brake Valve Test

A. Open emergency brake valve. PCS light must illuminate on units so equipped.

NOTE: Brakes should apply at an emergency rate.

B. Activate independent quick release feature and note that brake cylinder pressure drops to zero.
C. Release independent quick release feature.

NOTE: Emergency brake cylinder pressure must be restored.

D. Recover from emergency brake application.
E. Ensure all emergency brake valves operate as intended.

3.3.9 Graduated Release

A. Ensure brake mode is set to “Passenger”
B. Charge brake system to required pressure.
C. Make a full service brake application.
D. Move ABV handle to “RELEASE” position in 6 psi decrements.

NOTE: Brake pipe and Equalizing reservoir should increase and hold at each decrement. Brake cylinder pressure must decrease and hold at each decrement. At least three brake cylinder pressure decreases must be observed.

3.3.10 Direct Release

A. Ensure brake mode is set to “Freight”, if equipped.
B. Charge brake system to required pressure.
C. Make a 20 psi brake pipe reduction.
D. Move ABV handle towards “RELEASE” position and stop movement within the “SERVICE ZONE“.
E. Check for one minute and ensure equalizing pressure does not change.
F. Move ABV handle to “RELEASE” position and note that equalizing reservoir and brake pipe pressures recharge.

3.3.11 Determine That Brakes Apply/Release:

A. Place ABV handle in “FULL SERVICE” position. Independent brake must be in “RELEASE” position. Brake must apply. It must be observed that all brake shoes/disc pads are firmly seated against the wheels or discs.
B. Piston travel must be within prescribed limits.
C. Place ABV handle in ““RELEASE” position. Brake must release and sufficient shoe/pad clearance must be achieved
D. Fully apply independent brake. Brake must apply. It must be observed that all brake shoes/disc pads are firmly seated against the wheels or discs.

DRAFT

3.3.12 ECP Brake System

A. Perform ECP brake setup and initialization.
B. Move ABV handle to REL and verify the ECP Train Brake Command display is 0%. ER and BP remain 110 ± 3 psi.
C. Move ABV handle to MIN and verify the ECP Train Brake Command display is 10%. ER and BP remain 110 ± 3 psi.
D. Move ABV handle to SUPP and verify the ECP Train Brake Command display is 53-56%. ER and BP remain 110 ± 3 psi.
E. Move ABV handle to FS and verify the ECP Train Brake Command display is 100%. ER and BP remain 110 ± 3 psi.
F. Move ABV handle to HO and verify the ECP Train Brake Command display is 120% and PCS is lit. ER and BP remain 110 ± 3 psi.
G. Wait 60 seconds for emergency to reset and then move the ABV to EMER and verify ECP Train Brake Command is 120% and PCS must illuminate. ER and BP reduces to 0 psi.
H. Wait 60 seconds for emergency to reset and then move the ABV to REL and verify ECP Train Brake Command is 120% and PCS must illuminate. ER and BP charge to 110 ± 3 psi.
I. Move ABV handle to FS to reset the emergency interlock and verify the ECP Train Brake Command display is 100% and PCS light goes out. ER and BP remain 110 ± 3 psi.
J. Move ABV to REL and over-acknowledge the Train Control System and verify ECP Train Brake Command is 100% and the PCS light must illuminate.
K. Suppress penalty by moving the ABV to SUPP and verify the PCS light goes out.
L. Move the ABV to REL and verify ECP Train Brake Command is 0%.
M. Shutdown ECP by moving the ABV to EMER and follow prompts to end ECP.

3.3.13 If any of the test procedures in instructions 3.3.1 thru 3.3.12 fail, retest the procedure which failed.

3.3.14 If any of the test procedures in instructions 3.3.1 thru 3.3.12 fail after retesting, locomotive must not be used until repaired, except as noted in instructions 3.3.15 and 3.3.16.

NOTE: Any non-complying condition discovered during this test must be documented per instruction 3.1.15.

3.3.15 If the procedures in instruction 3.3.6 fail after retesting, the following will govern:

A. If the Deadman/Alerter test fails procedure per instruction 3.3.6 at an Amtrak locomotive repair facility, locomotive must be repaired before being used.
B. If the Deadman/Alerter test fails procedure per instruction 3.3.6 at other than an Amtrak locomotive repair facility:
1. Unit must not be used as controlling locomotive,
2. Place tag on control stand or engine control panel indicating “Defective Alerter”,
3. Note defect on MAP 100, and
4. In multiple unit consists or push/pull operations, note on MAP 100 of lead unit that locomotive with defective alerter is in consist or train.

3.3.16 If the procedures in instruction 3.3.7 fail after retesting, the following will govern:

A. If the Train Control test fails per instruction 3.3.7 at an Amtrak locomotive repair facility, locomotive must be repaired before being used in Train Control System territory.
B. If the Train Control test fails per instruction 3.3.7 at other than an Amtrak locomotive repair facility and unit is destined for Train Control System territory:
1. Unit must not be used as controlling locomotive,
2. Note defect on MAP 100, and
3. In multiple unit consists or push/pull operations, note on MAP 100 of lead unit that locomotive with defective Train Control System acknowledger is in consist or train.

3.4 Locomotives - Mechanical Department Locomotive Air Brake Daily Inspection

3.4.1 General Information

A. Air brake and signal equipment on locomotives and cab cars must be inspected, maintained, and tested in accordance with current federal regulations, and Amtrak maintenance procedures.
B. Locomotives and cab cars must be inspected at least once each calendar day that the unit is in service.
C. Locomotives / cab cars must not depart a location where a unit received a Locomotive Air Brake Inspection (see instruction 3.4) and/or Locomotive Calendar Day Air Brake Test (see instruction 3.3) without a current, signed MAP 100.

DRAFT

3.4.2 Preparation

A. During the inspection, if a defect is found and this defect cannot be corrected in a timely manner by the employee performing the inspection, it must be reported immediately to your supervisor.
B. Apply proper Blue Signal Protection.
C. Secure equipment per instruction 2.14.
D. Apply handbrake.
E. Fully apply independent brake or make full service brake application.

3.4.3 Air Compressors

A. Check compressor oil level. Ensure oil is up to full mark or with in operating range.
B. Compressor must not produce undue vibration or pounding, or otherwise make unusual noises that could indicate compressor damage or malfunction.
C. Compressor must operate to control main reservoir pressure 5 pounds above or below standard operating pressure.
D. Main reservoir pressure must increase 10 psi during the compressor loading cycle.
E. Compressor governor shall be adjusted so that the compressor will start when the main reservoir pressure is not less than 15 psi above the maximum brake pipe pressure fixed by the carrier.
F. Water and oil must be drained from the compressor inter-cooler, and after-cooler, if possible.
G. Each air compressor on passenger equipment so equipped must be in effective and operative condition. MU passenger equipment found with an inoperative or ineffective air compressor at the time of its exterior calendar day inspection must be removed from service unless the railway company has in place procedures designed to protect the integrity of the air brake system as outlined in CFR Title 49, Part 238.303.e (17).

3.4.4 Water and oil must be drained from all main reservoirs.

3.4.5 Automatic main reservoir drain valves and air dryers are functioning properly.

3.4.6 Condensation is blown from end brake pipe, main reservoir, and MU hoses before coupling to another hose or attaching to dummy couplings.

NOTE: No chemicals, which are known to degrade or harm brake system components, shall be placed in the train air brake system.

3.4.7 All MU, main reservoir, and brake pipe hoses must be properly coupled between locomotives, stored in proper receptacles, or attached to their proper dummy couplings.

3.4.8 All angle cocks, end cocks, and cutout cocks must be properly positioned for service.

3.4.9 Air regulating devices must function properly and be adjusted to the prescribed pressures.

3.4.10 Air pressure gauges must not be in error more than 3 psi or 5% whichever is less.

3.4.11 Equalizing reservoir pressure must be within 3 psi of brake pipe pressure.

3.4.12 Cutouts for various safety devices and/or enclosures to such devices must be properly positioned and sealed, with numbers recorded on MAP 100.

3.4.13 Brake shoes and pads are properly applied and aligned with tread of wheel or brake disc.

3.4.14 Ensure brake shoes have adequate service material.

3.4.15 Piston travel is properly adjusted.

A. Piston travel must provide proper brake shoe clearance when the brakes are released.
B. Piston may not exceed limits posted in instruction MS.1.0. If locomotive is not listed travel may not exceed 1.5 inches less than the total possible piston travel. Total possible travel is recorded on Blue Form/MAP 816 in cab of locomotive.

3.4.16 Brake equipment and safety supports, where used, are in a safe and suitable condition for service, with no part of foundation rigging or safety supports less than 2-1/2" above the rail.

DRAFT

25-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

3.4.17 Brake rigging.

A. Ensure that brake levers, rods, beams, hangers, and pins do not bind or foul.
B. All pins are properly applied and secured.
C. Brake levers, rods, or pins may not be cracked or broken.
D. Brake levers, rods, or pins may not be worn more than 30%.

3.4.18 Brake disc must be inspected per current Mechanical Department instructions.

3.4.19 Hand/parking brakes are in a safe and suitable condition for service.

A. At each daily inspection the hand/parking brake assembly and all of its associated parts shall be inspected and tested (applied and released) to determine that it functions as intended.
B. Locomotives operating in non-passenger service must have hand/parking brake stenciled with date of last annual inspection, as outlined in CFR Title 49 Part 232.105c. Locomotives subject to this regulation shall also have the hand/parking brake assembly inspected, tested, and stenciled every 368 days.
C. Except for MU locomotives, locomotives operating in passenger service must have the hand/parking brake assembly (including all of its parts and connections) inspected and tested as often as the service requires but not less frequently than every 368 days. The date of the last inspection shall be entered on Blue Form/MAP 816, suitably stenciled or tagged on the equipment or maintained electronically provided the FRA has access to the record upon request. Amtrak locomotives shall have the handbrake inspection dates entered and tracked in the corporation's Work Management System (WMS).

3.4.20 Communicating signal system on passenger locomotives must be tested and known to be in a safe suitable condition for service before each trip.

3.4.21 Ensure the words "Emergency Brake Valve" are legibly stenciled or marked near each brake pipe vent valve or adjacent badge plate.

3.4.22 FRA / Amtrak leakage limits.

A. Main Reservoir: Average of 3 pounds per minute over a period of 3 minutes.
B. Brake Pipe: 3 pounds per minute.
C. Brake Cylinder: Brakes must remain applied for 5 minutes with a full service brake application in effect, and communication to the brake cylinders closed.
D. Control Air System: Average of 3 pounds per minute over a period of 3 minutes.

3.4.23 Main Reservoir Safety Valve: Must not allow pressure to rise more than 15 psi above maximum standard main reservoir pressure.

DRAFT

3.5 Locomotives - Locomotive Consist Air Brake Test

3.5.1 A Locomotive Consist Air Brake Test is required when a locomotive consist changes. Consist changes include coupling or uncoupling locomotive(s), including push-pull equipment. The test will be performed from the controlling locomotive (controlling cab on dual cab locomotives).

A. If a locomotive being added to the consist is due a Calendar Day Inspection, and will be the new controlling locomotive, perform the Locomotive Calendar Day Air Brake Test (Instruction 3.3) from the new controlling locomotive after performing the Locomotive Consist Air Brake Test

B. A Locomotive Consist Air Brake Test is not required when consist movements will only be made within the confines of a yard or terminal.

3.5.2 Follow the steps in the table below to perform a Locomotive Consist Air Brake Test.

Locomotive Consist Air Brake Test	
Step	**Action**
1	Secure locomotive consist against movement.
2	Verify that all required cables and MU hoses are connected and cut in and brakes are cut in on each truck. Visually observe brake cylinders applied, brakes shoes against wheels, brake indicators applied or any other device for the purpose of determining that truck brakes are cut in and applied.
Independent Brake Test	
3	Place independent and automatic brakes in Release position.
4	Confirm that air brakes are released on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure goes to zero.
5	Place independent brake in Full Application position.
6	Confirm that the air brakes apply on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes apply. Brake cylinder pressure applies.
7	Place independent brake in release position.
Automatic Brake Test	
8	Confirm that the air brakes are released on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure is zero.
9	Make a 10-PSI brake pipe reduction.
10	Confirm that the air brakes are applied on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes apply. Brake cylinder pressure is applied.
Air Brake Actuation Test	
11	Activate the independent quick release feature (bail off).
12	Confirm that the air brakes release on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure goes to zero.
13	Make an additional 10-PSI brake pipe reduction (total 20-PSI reduction)
14	Confirm that the air brakes are applied on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes apply. Brake cylinder pressure is applied.
15	Move Automatic Brake Valve to release position.
16	Confirm that the air brakes release on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure goes to zero.
17	Before movement, verify that all hand/parking brakes are released and all chocks, skates, or chains are removed.
18	Upon initial movement, perform a Running Brake Test.
Note: If brakes fail to apply or release during any step, check that all MU hoses are coupled and cut in, Automatic and Independent Brakes are cut in; then retest.	

3.5.3 When picking up locomotives en route, add the locomotive(s) to the 1173/10 Summary in the “Additional Loco and Cab Car” section.

DRAFT

3.6 Locomotives – Standing Locomotive Brake Test

3.6.1 A Standing Locomotive Brake Test is required before initial movement of any lite or multiple lite locomotive consists.

3.6.2 Follow the steps in the table below to perform a Standing Locomotive Brake Test.

Standing Locomotive Brake Test	
Step	**Action**
1	Secure locomotive(s) against movement.
2	Verify that all required hoses are connected and cut in, and brakes are cut in on each truck. Visually observe brake cylinders applied, brakes shoes against wheels, brake indicators applied or any other device for the purpose of determining that truck brakes are cut in and applied.
3	Place independent and automatic brakes in Release position.
4	Confirm that air brakes are released on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure goes to zero.
Independent Brake Test	
5	Place independent brake in Full Application position.
6	Confirm that the air brakes apply on controlling unit and all MU'ed locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes apply. Brake cylinder pressure applies.
7	Place independent brake in release position.
8	Confirm that air brakes are released on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure goes to zero.
Automatic Brake Test	
9	Make a 20-PSI Automatic Brake pipe reduction.
10	Confirm that the air brakes apply on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes apply. Brake cylinder pressure applies.
11	Move Automatic Brake Valve to release position.
12	Confirm that the air brakes release on all locomotives. If parking brake is applied on locomotives with parking brakes that apply brakes to all wheels, use the brake cylinder gauge to verify brakes release. Brake cylinder pressure goes to zero.
13	Test is complete. Fully apply the Independent Brake.
14	Before movement, verify all hand/parking brakes are released and all chocks, skates, or chains are removed.
15	Upon initial movement, perform a Locomotive Running Brake Test (Instruction 2.6).
Note: If brakes fail to apply or release during any step, check that all necessary hose are coupled and cut in, Automatic and Independent Brakes are cut in; then retest.	

DRAFT

3.6.3 Lite and Multiple Lite Movements within Yards or Terminals

A. Lite and multiple lite locomotives may be moved within the confines of a yard or terminal without connecting the MU hoses or cables, as long as the brake pipe and main reservoir hoses are connected with associated angle and main reservoir cocks open.

1. When coupling locomotives, for movements only within a yard or terminal, perform a Standing Locomotive Brake Test on the locomotive(s) being coupled to from the controlling locomotive.
2. Hoses and cables not connected to another piece of equipment should be placed in the proper receptacles to prevent damage.

3.7 Locomotives - Locomotive Running Brake Test

3.7.1 Required on locomotives operated lite or multiple lite upon:

A. Initial movement.
B. Change in consist of lite locomotives.
C. Changing control stations.
D. Frequently, with sufficient force, when snow or ice conditions exist.
E. Any point where a brake pipe angle cock or end cock has been turned.

3.7.2 To determine effectiveness of brakes while locomotive is moving, as soon as speed permits but not exceeding 20 mph:

A. Apply independent brake sufficiently to develop noticeable brake cylinder pressure and retarding force.
B. Release independent brake and make service application with automatic brake. Check brake cylinder pressure/dynamic brake effort and retarding force.
C. Actuate independent brake handle.
D. Check that brake cylinder pressure releases / dynamic brake effort drops and locomotive rolls freely.

3.8 Brake Tests - General

3.8.1 Responsibility

A. Only a Qualified Maintenance Person (QMP) may perform:
1. A Passenger Train Class I Brake Test or HST Departure Test. A locomotive engineer may participate in a Passenger Train Class I brake test by manipulating the ABV handle, checking leakage and testing alerter.
2. An Exterior Calendar Day Mechanical Inspection.
3. Interior Calendar Day Mechanical Inspection on High Speed Trainsets.

B. Either a Qualified Maintenance Person (QMP) or a Qualified Person (QP) may perform:
1. A Passenger Train Class IA brake test.
2. A Passenger Train Class II brake test.
3. An Interior Calendar Day Mechanical Inspection on other than High Speed Trainsets.

C. Either a Qualified Person (QP) or Qualified Mechanical Inspector (QMI) may perform:
1. A Non-Passenger Train Class I brake test.
2. A Non-Passenger Train Class II brake test.
3. A Non-Passenger Train Class III brake test.
4. A Non-Passenger Train Transfer Train Brake Test.

D. Supervisors are jointly responsible with Inspectors, Engineers, Conductors and Assistant Conductors for:
1. Performing Class I, Class IA, Class II, Class III, and Transfer Train Brake Tests on locomotives and cars and detecting defects determined by these tests; and
2. Performing Interior Calendar Day mechanical inspections on other than High Speed Trainsets and detecting defects determined by these inspections.

E. A Running brake test may only be performed by a Locomotive Engineer.

NOTE: Conductor MUST have knowledge that Running Brake Test has been performed.

3.8.2 Signal for Brake Application

A. During standing tests, brake must not be applied or released until proper signal is given or a clear understanding is obtained.

3.8.3 Condition of Brakes

A. Passenger Trains
1. Must have 100% operative brakes on all cars and locomotives at any point where a Class I, HST Departure or Class IA brake test is performed.
2. Must not depart a terminal or yard, which is a repair point, where a Class II brake test has been performed with brakes cutout, inoperative or defective.
3. MUST HAVE at least 85% operative brakes, unless the provisions of instruction 2.19.3 are complied with.
4. Must not leave a designated Amtrak repair point with less than 100% operative brakes.

B. Non-Passenger Trains
1. Must have at least 85% operative brakes.
2. Must have 100% operative brakes on all cars and locomotives at any point where a Class I brake test is performed.

3.8.4 MAP 1173\10C Summary Documentation for Brake Tests and Mechanical Inspections.

NOTE: A train must not be delayed for missing or conflicting information on 10C Summary portion.

NOTE: When MAP 1173/10C Summary is referenced in these instructions, Metrolink T&E employees will use Metrolink Form SMP 1173; MARC T&E Employees will use MARC Form 1173/10C.

A. MAP 1173/10C Summary Requirements

DRAFT

26-FOI-00415 000000006203 "UNCLASSIFIED" 4/30/2026

1. The QMP(s) that completed the Passenger Train Class I brake test or HST departure test must document and complete the "MAP 1173 – Class I Train Brake Test/Lite Locomotive Consist Brake Test" portion of the MAP 1173/10C Summary.
2. The QMP that completed the exterior and interior daily passenger car inspections must document and complete the 10C Summary portion of the MAP 1173/10C Summary.

NOTE: The Passenger Train Class I Brake test and Passenger Car Interior and Exterior daily Inspections are not considered complete until the "Supervisor/QMP Verifying All Work Completed and Approving Unit for Service" portion of the MAP 1173/10C Summary is filled out and approved by the supervisor. This timestamp will start the clock for the cars' mechanical inspections and the Class I Brake Test.

3. The total number of cars (including Cab Cars) in "Number of Cars" box and all other required information on MAP 1173/10c Summary.
   - **a.** For Passenger Trains, the QMP must enter the information.
   - **b.** For Non-Passenger Trains, the QMI or QP must enter the information.
4. Passenger trains must not leave any point where a Class I brake test or HST Departure test was performed without MAP 1173/10C Summary for equipment tested at that point, except per instruction 3.8.4D.
5. Commuter / Short-Distance Intercity Passenger Trains - MAP 1173/10C Summary, once completed, is valid until the next scheduled Class I Brake Test, which is required once each calendar day.
6. Long-Distance Intercity Passenger Trains – MAP 1173/10C Summary, once completed, is valid until the next scheduled Class I Brake Test, which is required every 1500 miles or once each calendar day whichever occurs first.
7. High Speed Trainsets - MAP 1173/10C Summary, once completed, is valid until the next scheduled HST Departure Test, which is required every 1500 miles or once each calendar day whichever occurs first.
8. The MAP 1173/10C Summary remains valid if any one, or more than one, of the following train consist changes occur:
   - **a.** Adding or removing a block of cars from the train. When adding cars, an additional MAP 1173/10C Summary for the added cars is required.
   - **b.** Changing motive power, changing controlling cabs with MU'ed locomotives, changing cabs on locomotives with double end control, changing ends on push-pull trains or running around train with locomotive(s).
9. If the controlling locomotive changes and MAP 1173/10C Summary otherwise remains valid, a QMP or QP will draw a line through (Line Out) the previous controlling locomotive number, write the new locomotive number, and the word "Replaced" and initial the changes.
10. MAP 1173/10C Summary
    - **a.** The MAP 1173/10C Summary is the one issued when a Class I brake test is performed at the originating point or a scheduled Class I brake test location for the train.
    - **b.** Additional MAP 1173/10C Summary forms may be issued at other locations when cars are added between the originating point and scheduled Class I brake test locations.
    - **c.** When multiple MAP 1173/10C Summary forms are issued, only one will be used as the Summary Form. The Engineer must write the word "Summary" at the top of the form that was issued at the originating point or a scheduled Class 1 Brake Test location for the train. (See instruction 3.8.4A.10).

NOTE: When MAP 1173/10C Summaries are issued for both ends of commuter/turnaround service, the requirement to write "Summary" at the top does not apply.

   - **d.** The MAP 1173/10C Summary will be used by Locomotive Engineers to summarize the train consist/brake information as required by instruction 3.8.5.
   - **e.** Only one MAP 1173/10C Summary will be considered the Summary MAP 1173 even though multiple MAP 1173 forms were issued.
   - **f.** All additional MAP 1173/10C Summary forms must remain with the Summary MAP 1173.
   - **g.** When another Class I brake test is performed at a scheduled Class I brake test location, QMP will issue a new MAP 1173/10C Summary which will become the new Summary MAP 1173.

B. 10C Summary Portion

1. The 10C Summary portion is part of MAP 1173/10C Summary and is used by the mechanical department to list cars in a passenger train consist that received a Class I brake test and calendar day interior/exterior inspection without any operational restrictions.
2. Cars with defective side doors, end doors and/or PA/Intercom will be listed by car number.
3. Locomotives with a defective dynamic brake and/or air compressor will be listed by Locomotive number.
4. Train and Engine crews are not responsible for information on 10C Summary portion and must not delay departure of a train with missing or conflicting information on 10C Summary portion.

DRAFT

C. Location of MAP 1173/10C Summary forms

1. The MAP 1173/10C Summary must remain in cab of controlling locomotive (also refers to cab cars in this instruction).
2. When Conductor is in possession of MAP 1173/10C Summary, the forms must be placed in cab of the controlling locomotive at earliest point, without delaying train.
3. When controlling locomotive changes, MAP 1173/10C Summary forms must be moved to cab of controlling locomotive. In commuter/turnaround service, when MAP 1173/10C Summary is placed on both ends of equipment, forms need not be moved to controlling end.
4. When inbound engineer is unable to move MAP 1173/10C Summary forms to cab of controlling locomotive due to crew and locomotive change, forms will be moved to required location by terminal services, mechanical foreman or designated representative.

D. Missing MAP 1173/10C Summary Forms

1. Passenger trains must not leave any point where a Class I brake test or HST Departure test was performed without MAP 1173/10C Summary for equipment tested at that point except as follows:
    - **a.** Movement may be made between maintenance facility where the train was assembled and the originating passenger terminal of the train after performing a Passenger Class IA brake test. Passenger train must not depart initial terminal without required inspections, brake test, and MAP 1173/10C Summary.
    - **b.** When adding cars En Route per instruction 2.19.1E, and MAP 1173/10C Summary is not available.
2. If MAP 1173/10C Summary is lost or missing after leaving a point where a Class I brake test or HST Departure test was performed, another available MAP 1173/10C Summary may be used as the Summary MAP 1173.
3. With Face-To-Face relief, if MAP 1173/10C Summary is not available, report missing form to CNOC mechanical desk either directly at 1-800-424-0217 or through the train dispatcher at earliest point, without delaying train.
4. Without Face-To-Face relief, if MAP 1173/10C Summary is not available, verify condition of brakes (whether any brakes are cut out):
    - **a.** By contacting CNOC mechanical desk either directly at 1-800-424-0217 or through the train dispatcher, or
    - **b.** When CNOC cannot be contacted, by performing a walking inspection of a brake application.

E. For Non-Passenger Trains, completion of the Class I brake test must be documented by completion of the MAP 1173/10C Summary. When MAP 1173/10C Summary is not available, a written document must be provided to the engineer containing the information described in instruction 3.8.6C.

3.8.5 Change of Crew - Determining Condition of Brakes

A. Prior to change of engine crews, inbound engineer will complete the appropriate portion of Summary MAP 1173, adjusting for any equipment added (multiple MAP 1173/10C Summary forms may exist) or removed as follows:

1. Locomotive/Cab Car numbers.
2. Date.
3. Time.
4. Number of Cars –Total number of cars in the train.
5. For Non-Passenger Trains, the total train length and weight.
6. For Non-Passenger Trains, any special weight distribution requiring special train handling.
7. Condition of Brakes:
    - **a.** Passenger Trains: Acceptable – at least 85% operative brakes.
    - **b.** Passenger Trains: Unacceptable - less than 85% operative brakes – trains in Passenger service proceed per instruction 2.19.3C.
    - **c.** Non-Passenger trains must not proceed with less than 86% operative brakes.
8. Communication Signal:
    - **a.** Operative – An operative 2-way radio is considered as an operative communication signal.
    - **b.** Inoperative – Any inoperative condition noted.
9. Engineer's Signature.

B. Whenever a Class IA Brake Test is performed, the following information must be noted on "Condition En Route" section of the MAP 1173/10C Summary: Class IA Brake Test Performed, Date, Time, Location, and Initials of QP or QMP.

C. Prior to change of engine crew, inbound engineer will indicate on "Condition En Route" section of MAP 1173/10C Summary the car numbers and number of axles cut out of any equipment with brakes cut out.

D. After change of engine crew, outbound engineer will review "Condition En Route" portion of ALL MAP 1173/10C Summary forms to determine whether any brakes are cut out. If it is determined that any brakes have been cut out, notify the train dispatcher and CNOC mechanical desk as soon as possible without delaying train, communicating car number/s and number of axles cut out. CNOC may be contacted either directly at 1-800-424-0217 or through the train dispatcher.

E. With Face-to-Face relief, outbound engineer will ascertain condition of brakes and perform a Running Brake Test.

F. Without Face-to-Face relief, outbound engineer will determine condition of brakes by reviewing MAP 1173/10C Summary, perform a Class II Passenger Brake Test , and perform a Running Brake Test.

DRAFT

G. After change of engine crew, outbound engineer will review "Conditions En Route" portion of ALL MAP 1173/10C Summary forms to determine if brake pipe cutoff valve/switch on the controlling locomotive is in the "FRT" position.

H. For Non-Passenger Trains, the outbound Engineer and Conductor taking charge of a train will ascertain from incoming engineer and conductor, either personally or by MAP 1173/10C Summary or other written document, that the Class I brake test has been performed and the condition of the brakes.

I. For Non-Passenger Trains, prior to change of engine crew, inbound Engineer will indicate on "Condition En Route" portion of MAP 1173/10C Summary or written document the car numbers and number of control valves/trucks cut out of any equipment with brakes cut out.

3.8.6 Non-Passenger Train Notification of Completion of Class I Air Brake Test

A. The Engineer and Conductor will be notified that required air brake test and inspection is complete.

B. Notification must be made by a QMI or QP who participated in the test and inspection.

C. Notification of Class I brake test must be provided to the locomotive engineer on the MAP 1173/10C Summary. When MAP 1173/10C Summary is not available, a written document must be provided to the engineer containing the following information concerning the Class I brake test:

1. All locomotives
2. Date.
3. Time.
4. Number of cars inspected.
5. Name of the Qualified Person who performed the test.
6. Location where test was performed.
7. Total Train Weight and Length.
8. Any special weight distribution requiring special train handling.
9. EOT Tested.

NOTE: Total Train Weight and Length; Any special weight distribution requiring special train handling must be entered in the "Conditions En Route" portion of the MAP 1173/10C Summary or other written document.

D. The notification of Class I brake test, (either MAP 1173/10C Summary or other written document) once completed, is valid until a train completes its trip.

E. In no case will a train be started until Engineer and Conductor are notified that air brake test and inspection is complete.

F. The Air Brake Inspection and Test Certificate remains valid if any one, or more than one, of the following train consist changes occur:

1. Adding or removing a block of cars from the head end or rear end of train.
2. Changing motive power, changing controlling cabs with MU'ed locomotives, changing cabs on locomotives with double end control, changing ends on push-pull trains or running around train with locomotive(s).

G. If the controlling locomotive changes and Air Brake and Test Certificate otherwise remains valid, a QMI or QP will "Line Out" the previous controlling locomotive number and write in the new controlling locomotive number.

3.8.7 Train Air Brake and Inspection Documentation on Trains Originating in Canada

A. On trains originating in Canada and entering the United States, Amtrak crews will accept Canadian issued train brake test and inspection documents in place of standard Amtrak documentation (MAP 1173). In order to be valid, the Canadian documentation must be dated the current day or the previous calendar day.

B. After entering the United States, if a MAP 1173 is issued, it will become the Summary MAP 1173. The information required by instruction 3.9.5 will be transferred to the Summary MAP 1173 from the Canadian documentation.

3.9 Train Brake Tests & Mechanical Inspection

3.9.1 Passenger Train Class I Brake Test / HST Departure Test

A. Class I Brake Test Requirements

1. Commuter & Short-Distance Intercity Passenger Trains:
   - **a.** Once each calendar day that the train is placed or continues in passenger service.
   - **b.** If a train has not been inspected today and will be in passenger service past 11:59pm tonight a Class I brake test and mechanical inspections are required before 11:59pm tonight.
2. Long-Distance Intercity Passenger Train:
   - **a.** Prior to train's departure from originating/initial terminal, and
   - **b.** Every 1,500 miles or once each calendar day, whichever occurs first, that the train remains in continuous passenger service.
3. When Class I brake test has expired proceed per instruction 2.19.3E.

DRAFT

B. Class I Brake Test Procedure (Engineer may participate in test by manipulating ABV handle, performing leakage and alerter test.

1. Apply proper Blue Signal protection.
2. Secure equipment per instruction 2.14.
3. Fully apply locomotive independent brake.
4. Electro-pneumatic brake disabled/turned off, if equipped.
5. Angle cocks / cutout cocks and retaining valve handles must be properly positioned.
6. Each brake disc is free of any condemnable defect.
7. Charge train to required pressure. Check state of charge by cutting out the pressure-maintaining feature. If brake pipe pressure drops within 5 seconds, the train is not fully charged, or excessive leakage exists. Find and correct any source of leakage. Before proceeding with test, be sure to cut in the pressure-maintaining feature.
8. Await signal to apply.
9. When signal is given to apply, make 20 psi brake pipe reduction.
10. After exhaust has stopped, cut out pressure-maintaining feature.
11. Wait 45 seconds.
12. Check brake pipe leakage-must not exceed 5 psi per minute.
13. Determine that brakes are applied on each car and all brake shoes / pads are firmly seated against the wheel or disc.
14. Each brake shoe or pad is not below the minimum thickness (varies depending on length of trip).
15. Each brake shoe or pad is securely fastened and correctly aligned in relation to the wheel / disc.
16. Brake rigging does not bind or foul.
17. Piston travel is within prescribed limits.
18. Brake indicators operate as intended (indicate brakes applied).
19. The communication of brake pipe pressure changes at the rear of the train is verified (by an application and release of the brakes on the last car in the train).
20. Await signal to release automatic brake.
21. When signal to release is given, release automatic brake.
22. Cut in pressure-maintaining.
23. Determine that all brakes release on each car. Ensure proper shoe / pad clearance exists.
24. Brake rigging must not bind or foul.
25. Brake indicators must operate as intended. (indicate brakes released)
26. Await signal to enable / turn on electro-pneumatic brake, if equipped.
27. When signal is given enable / turn on electro-pneumatic brake.
28. Test EP brake in accordance with local railroad procedures.
29. Make a walking inspection of electro-pneumatic application and release.
30. Communicating (Conductor's) Signal System must be tested and known to be operating as intended. A tested and operating two-way radio system meets this requirement.
31. MU equipment - Emergency Brake application, Alerter, Dead Man Pedal, or other emergency control devices must be tested if not indicated on the MAP 100. (Locomotives, MU equipment, and Cab Cars).

C. HST Departure Test Requirements

NOTE: The High-Speed trainset Class I Brake Test is a combination of a Class I and Locomotive Brake Test.

1. Prior to train's departure from originating/initial terminal, and
2. Every 1,500 miles or once each calendar day, whichever occurs first, that the train remains in continuous passenger service.
3. A High Speed Trainset that misses a scheduled HST Departure test due to delay en route may continue in service to the location where the inspection was scheduled to be performed.

NOTE: Locomotives, including Power Cars must be inspected and tested per Instructions 3.1 and 3.2 each calendar day, regardless if train was delayed en route.

D. HST Departure Test Procedure

1. HST Departure Test will be performed by a Tier II QMP in accordance with Standard Maintenance Procedure.

3.9.2 Non-Passenger Train Class I Brake Test

A. Test Requirements

1. Where train is originally assembled (initial terminal).
2. Where train consist is changed except as indicated below (3.9.2A.3).
3. Test is NOT required when:
   - **a.** Adding previously tested solid block of cars that remains in the same relative order that has NOT been OFF AIR for more than 4 hours.
   - **b.** Removing a car or solid block of cars.
   - **c.** Changing motive power
   - **d.** Removing or changing rear car.

DRAFT

e. Removing car(s) with air brake defects (inoperative brakes or excessive piston travel).

f. Any combination of the above occurs.

B. Charging and Inspection - Inspect train brake system to determine that:

1. Apply proper blue signal protection or roadway worker protection (RWP). Secure equipment per instruction 2.14.
2. Charge system to the pressure which the train will be operated, and the pressure of the rear of the train shall be within 15 psi of the pressure the train will be operated but not less than 75 psi as indicated by an accurate gauge or EOT unit at the rear.
3. All air hoses are coupled and in suitable condition for service.
4. Angle cocks, cutout cocks, retaining valves and retaining valve pipes (if equipped) are properly positioned and in proper condition for service. All retaining valves must be set in "Direct Exhaust "position during initial terminal brake test.
5. Reservoir drain cocks are closed.
6. Necessary repairs are made to reduce leakage to a minimum.
7. Brake rigging does not bind or foul and all parts of equipment are properly secured.
8. Hand/parking brakes are released unless required.
9. If equipped with operational electro-pneumatic brake, brake circuit cables are properly connected.
10. Each brake disc is free of condemnable defects.

C. Class I Train Brake Test

1. Charge system to the pressure which the train will be operated, and the pressure of the rear of the train shall be within 15 psi of the pressure the train will be operated but not less than 75 psi as indicated by an accurate gauge or EOT unit at the rear.
2. Brake test procedures.
   - **a.** Await signal to apply.
   - **b.** Make 20 psi brake pipe reduction.
   - **c.** After exhaust has stopped, cut out pressure-maintaining feature.
   - **d.** Wait 45 seconds.
   - **e.** Check brake pipe leakage-not to exceed 5 psi per minute.
   - **f.** Inspector (QP) shall take a position on each side of each car to examine and observe the functioning of all moving parts of the brake system of each car.
   - **g.** Brake rigging shall be secure and not bind or foul.
   - **h.** Determine that brakes apply on each car.
   - **i.** Check piston travel on each car.
   - **j.** Await signal to release.
   - **k.** Release automatic brake.
   - **l.** Cut in pressure maintaining.
   - **m.** Determine that brakes release on each car. A "Roll By" inspection may be used to determine brake release but not exceeding 10 mph.
   - **n.** Qualified Person performing "Roll By" must communicate results of inspection to the engineer.

D. Class I Train Retest Procedure After Class I Brake Test

1. A car found to have brakes that do not apply during the Class I Brake Test may be retested.
2. Retest brakes per instruction 3.9.2C, except brakes must remain applied for no less than 3 minutes on cars being retested.

E. Piston Travel

1. Cars equipped with 8 ½ inch or 10 inch diameter brake cylinders, piston travel shall be within 6 to 9 inches. If piston travel is less than 6 inches or more than 9 inches, it must be adjusted to 7 ½ inches.
2. For cars not equipped with brake cylinders as described above, piston travel shall be within the piston travel stenciled or marked on the car or badge plate.
3. Truck mounted brake cylinders must provide sufficient brake shoe clearance when brakes are released.

3.9.3 Passenger Train Class IA Brake Test

NOTE: This test does NOT apply to High Speed Trainsets.

A. Class IA Brake Test Requirements

1. When adding Passenger Equipment En Route per instruction 2.19.1.
2. When Commuter or Short-Distance Intercity Passenger Train equipment has not been used in passenger service for more than 12 hours since the last Class I brake test, unless MAP 1173/10C Summary indicates that Class IA brake test has been performed.
3. When equipment has been off a source of compressed air for more than four hours since the last Class I brake test.
4. When equipment will be moved between the maintenance facility and originating passenger terminal without a MAP 1173/10C Summary per Definition "Passenger Equipment" and instruction 3.9.4D.
5. When required by instruction 2.19.2E.

DRAFT

6. Whenever a Class IA brake test is performed, the following information must be noted on "Condition En Route" section of the Summary MAP 1173/10C Summary: Class IA Brake Test Performed, Date, Time, Location, and Initials of QP or QMP.

B. Class IA Brake Test Procedure

1. Fully apply locomotive independent brake.
2. Angle cocks, cutout cocks, and retaining valve handles must be properly positioned.
3. Charge train to required pressure. Check state of charge by cutting out the pressure-maintaining feature. If brake pipe pressure drops within 5 seconds, the train is not fully charged, or excessive leakage exists. Find and correct any source of leakage. Before proceeding with test, be sure to cut in the pressure-maintaining feature.
4. Await signal to apply.
5. Make 20 psi automatic brake reduction.
6. After exhaust has stopped, cut out pressure-maintaining feature.
7. Wait 45 seconds.
8. Check brake pipe leakage – must not exceed 5 psi per minute.
9. Determine that brakes are applied on each car and all brake shoes/pads are firmly seated against the wheel or disc.
10. Brake indicators may be used instead of directly observing the brake application/release at each car ONLY if a QP determines that direct observation poses a safety hazard. See definition of Brake Indicator.
    - **a.** When using brake indicators, employees must position themselves in each car or as close as possible to each car to accurately observe each indicator.
    - **b.** When using brake indicators to determine application/release at each car, indicators must change during application and release (plungers-in/out; lights-amber/green).
11. Await signal to release.
12. Release automatic brake.
13. Cut in pressure-maintaining feature.
14. Verify that brakes release on each car by walking train to directly observe release.
15. Communicating (conductor's) signal system must be tested and known to be operating as intended. A tested and operating two-way radio system meets this requirement.
16. For MU locomotives that utilize an electric signal to communicate a service brake application and only a pneumatic signal to propagate an emergency brake application, the emergency brake application functions as intended.
17. Verify communication of brake pipe pressure changes at the rear of the train by use of gauge, Two-Way End of Train Device, or observe application and release of brakes on rear unit.

3.9.4 Passenger Train Class II Brake Test

A. Class II Brake Test Requirements

1. Whenever control stand is changed or air brake computer is de-energized (circuit breaker turned off).
2. When previously tested and inspected cars/locomotives that received a Class I brake test within the previous calendar day and have not been removed from a source of compressed air for more than 4 hours are added to a passenger train.
3. When cars or equipment are removed from the train.
4. When Engineer first takes charge of train except for Face-to-Face relief.

NOTE: When any of the following occurs, it is considered FACE-TO-FACE RELIEF:

- **a.** When the inbound Engineer does not leave the equipment unattended and communicates with the outbound Engineer the condition of the brakes and the status (location) of the MAP 1173/10C Summary.
- **b.** When the inbound Conductor or Assistant Conductor does not leave the equipment unattended and communicates with the outbound Engineer the condition of the brakes and the status (location) of the MAP 1173/10C Summary.
- **c.** When a mechanical department employee who is a QMP or QP who participated in the required brake test does not leave the equipment unattended and communicates with the outbound Engineer the condition of the brakes and the status of the MAP 1173/10C Summary (located on the locomotive, or in possession of conductor, etc.).

5. When train is equipped with ECP Brake, Class II Brake Test is required to be done in ECP mode after a successful Class I Brake Test is completed in Emulation Mode.
6. After any emergency brake application.
7. Where indicated by rule or special instructions.
8. When control valve or brakes are cut out.
9. After determining cause for brake pipe continuity loss, make Class II brake test using Two-Way End-of-Train device.
10. Any point where a brake pipe angle cock has been turned except when performing the Two-Way-End-Of-Train device emergency function test or when adding a Back-up hose per instruction 2.17.2A.

DRAFT

NOTE: Passenger trains must not depart a terminal or yard, which is a repair point, where a Class II brake test has been performed with brakes cutout, inoperative or defective. To determine a repair point for a particular train, contact CNOC mechanical desk either directly at 1-800-424-0217 or through the train dispatcher.

B. Class II Brake Test Procedure for Other Than High Speed Trainsets

1. Charge system to required pressure.
2. Await signal to apply.
3. 20 psi automatic brake reduction.
4. Brakes apply on rear passenger equipment. It is permissible to verify application at the rear most wheel set/axle. Brake shoe/pad must be firmly seated against the wheel or disc.
5. Await signal to release.
6. Brakes release on rear passenger equipment. It is permissible to verify release at the rear most wheel set/axle. Brake shoe/pad clearance must be observed.
7. For MU locomotives that utilize an electric signal to communicate a service brake application and only a pneumatic signal to propagate an emergency brake application, the emergency brake application functions as intended.
8. When rear passenger equipment is equipped with a device (gauge or EOT unit) capable of indicating/displaying brake pipe pressure, device **must** be used to determine application and release of brakes on rear passenger equipment.
    a. When using the gauge on a locomotive or cab car, in addition to observing brake pipe pressure, QP or QMP must verify that the Brake Cylinder pressure goes to zero when brakes are released.
9. When rear passenger equipment is not equipped with a device (gauge or EOT unit) capable of indicating/displaying brake pipe pressure, brake indicators may be used instead of directly observing the brake application/release at rear car ONLY if a QP determines that direct observation poses a safety hazard. See definition of Brake Indicator.
    a. When using brake indicators, employees must position themselves in the rear car or as close as possible to the rear car to accurately observe each indicator.
    b. When using brake indicators to determine application/release at the rear car, indicators must change state during application and release (plungers-in/out; lights-amber/green).
10. Communicating signal and/or two-way radio system tested and operating.

C. Class II Brake Test Procedure for High Speed Trainsets

1. Engineer or QMP will apply Parking Brake.
2. Engineer or QMP will charge system to required pressure.
3. Engineer or QMP will open CB74 “EP Assist” circuit breaker on lead power car located on electrical locker No. 3.
4. Conductor, Assistant Conductor, QP or QMP will give signal to apply air brakes.
5. Engineer, QP or QMP will make a 20 psi automatic brake reduction.
6. Conductor, Assistant Conductor, QP or QMP observes 20 psi brake pipe pressure drop on MFD-2 of rear power car.
7. Conductor, Assistant Conductor, QP or QMP will give signal to release air brakes.
8. Conductor, Assistant Conductor, QP or QMP observes brake pipe pressure restored on MFD-2 of rear power car.
9. Engineer or QMP will close CB74 “EP Assist” circuit breaker on lead power car located on electrical locker No. 3.
10. Conductor, Assistant Conductor, QP or QMP will give signal to apply air brakes.
11. Engineer, QP or QMP will make a 20 psi automatic brake reduction.
12. Conductor, Assistant Conductor, QP or QMP observes 20 psi brake pipe pressure drop on MFD-2 of rear power car.
13. Conductor, Assistant Conductor, QP or QMP will give signal to release air brakes.
14. Conductor, Assistant Conductor, QP or QMP observes brake pipe pressure restored on MFD-2 of rear power car.
15. Engineer, Conductor, Assistant Conductor, QP or QMP will ensure that two-way radio system is tested and operating.

NOTE: When MFD-2 on the rear power car is inoperative, Conductor, Assistant Conductor, QP, or QMP will go to the MFDB screen in the Conductor’s office to observe the rear Power Car brake application and release. Simultaneously, a second employee assisting with the brake test (Conductor, Assistant Conductor, QP, or QMP) must observe the brake indicators (RED) on the rear Power Car for application and release of the brakes.

D. Class II Brake Test Procedure for ECP Brake

1. ECP Brake is on and in Run Mode.
2. Await signal to apply.
3. Move ABV to make a 70% Train Brake Command.
4. Brakes apply on rear passenger equipment. It is permissible to verify application at the rear most wheel set/axle. Brake shoe/pad must be firmly seated against the wheel or disc.
5. Await signal to release
6. Brakes release on rear passenger equipment. It is permissible to verify release at the rear most wheel set/axle. Brake shoe/pad clearance must be observed.

DRAFT

7. When rear passenger equipment is equipped with a ECP display capable of indicating/displaying ECP Train Brake Command, device **must** be used to determine application and release of brakes on rear passenger equipment.
8. When rear passenger equipment is not equipped with an ECP Display capable of indicating/displaying ECP Train Brake Command, brake indicators may be used instead of directly observing the brake application/release at rear car ONLY if a QP determines that direct observation poses a safety hazard. See definition of Brake Indicator.
    - **a.** When using brake indicators, employees must position themselves in the rear car or as close as possible to the rear car to accurately observe each indicator.
    - **b.** When using brake indicators to determine application/release at the rear car, indicators must change state during application and release (plungers-in/out; lights- amber/green).
9. Communicating signal and/or two-way radio system tested and operating.

3.9.5 Non-Passenger Train Class II Brake Test

A. Class II Brake Test Requirements

1. Other than where train is originally assembled (initial terminal).
2. Test is required when:
    - **a.** Adding car or solid block of cars that has not previously received a Class I brake test, or
    - **b.** Adding car or solid block of cars that has been OFF AIR for more than 4 hours.

B. Class II Brake Test

1. Charge system to the pressure which the train will be operated, and the pressure of the rear of the train shall be within 15 psi of the pressure the train will be operated but not less than 75 psi as indicated by an accurate gauge or EOT unit at the rear.
2. Brake test procedures.
    - **a.** Await signal to apply.
    - **b.** Make 20 psi automatic brake reduction.
    - **c.** After exhaust has stopped, cut out pressure-maintaining feature.
    - **d.** Wait 45 seconds.
    - **e.** Check leakage-not to exceed 5 psi per minute.
    - **f.** Determine that brakes apply on each added car.
    - **g.** Await signal to release.
    - **h.** Release automatic brake.
    - **i.** Cut in pressure maintaining.
    - **j.** Determine that brakes release on each added car. A “Roll By” inspection may be used to determine brake release but not exceeding 10 mph.
    - **k.** Qualified Person performing “Roll By” must communicate results of inspection to the engineer.
    - **l.** Ensure brake pipe pressure is being restored at rear of train.

C. Retest Procedure After Class II Brake Test

1. A car found to have brakes that do not apply during the Class II Brake Test may be retested.
2. Retest brakes per instruction 3.8.5B, except brakes must remain applied for no less than 3 minutes on cars being retested.

D. Class III brake test may be made at same time added cars are tested.

E. Cars added to the train which have not received a Class I brake test must receive a Class I brake test at the next forward location where facilities are available.

3.9.6 Non-Passenger Train Class III Brake Test

A. Class III Brake Test Requirements

1. When locomotive, control stand, caboose, or block of cars are cut off or changed.
2. After coupling to a previously inspected and tested train which has not been off air for more than 4 hours.
3. After any emergency brake application.
4. When indicated by rule or Special Instruction.
5. When control valve or brakes are cut out.
6. After determining cause for brake pipe continuity loss (see instruction 2.20.2F), make a Class III brake test using Two-Way End-Of-Train device, if equipped.
7. Any point where a brake pipe angle cock has been turned except when performing the Two-Way-End- Of-Train device emergency function tests.

B. Class III Brake Test Procedure

1. Charge system to the pressure which the train will be operated, and the pressure of the rear of the train shall be within 15 psi of the pressure the train will be operated but not less than 75 psi as indicated by an accurate gauge or EOT unit at the rear.
2. Await signal to apply.
3. 20 psi automatic brake reduction.
4. Brakes apply on rear car.

DRAFT

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

5. Await signal to release.
6. Brakes release on rear car.
7. When rear car is equipped with a device (gauge or EOT unit) capable of indicating/displaying brake pipe pressure, device **must** be used to determine application & release on rear car.
    a. When using the gauge on a locomotive or cab car, in addition to observing brake pipe pressure, QP or QMP must verify that the Brake Cylinder pressure goes to zero when brakes are released.

3.9.7 Non-Passenger Train Transfer Train Brake Test

A. Movements Not Exceeding 20 Miles
1. Couple all hoses between all cars.
2. Charge brake system to not less than 60 psi as indicated by a gauge or EOT unit at the rear.
3. Make 20 psi automatic brake reduction.
4. Determine that brakes apply on each car.
5. Determine that brakes release on each car.

B. Retest Procedure After Transfer Train Brake Test
1. A car found to have brakes that do not apply during the Transfer Train Brake Test may be retested.
2. Retest brakes per instruction 3.9.7A, except brakes must remain applied for no less than 3 minutes on cars being retested.

C. Movements Exceeding 20 Miles
1. Perform Class I brake test.

3.9.8 Train Running Brake Test

A. Running Brake Test Requirements
1. After leaving initial terminal.
2. Any point where motive power, engine crew or train crew has been changed.
3. Any point where a brake pipe angle cock or end cock has been turned.
4. After any standing brake test has been made.
5. After striking debris or unknown object(s) on tracks. For the purpose of performing a Running Brake Test, debris is defined as:
    a) An object hung up or dragging from the train; or,
    b) An object that causes damage to the brake system or MU hoses; or,
    c) An object that causes a drop in Brake Pipe pressure.
6. Electro-pneumatic brake circuit cables between power units and/or cars are disconnected.
7. Periodically, when communication of the two-way end of train device fails en route.
8. When indicated by Special Instructions.
9. When inadequate brake performance is detected per instruction 2.18.2.
10. After test of back-up hose/valve.

B. Running Brake Test Procedure
1. Must be made as soon as speed of train permits but not exceeding 20 mph. A Running Brake Test may be made at speeds greater than 20 mph after striking debris, when communication of two-way end of train device fails en route or indicated by special instruction.
2. During test, locomotive and/or dynamic brake MUST NOT be permitted to apply except when locomotive and/or dynamic brake cannot be released due to equipment configuration.
3. Apply train air brakes with sufficient force to ascertain whether or not brakes are operating correctly.
4. If air brakes do not operate properly, train must be stopped, perform walking inspection of a brake application, cause of failure ascertained, corrected, Class II and Running Brake test repeated.

NOTE: Conductors and Engineers must communicate that each running brake test per instruction 3.9.8 has been performed.

3.9.9 Passenger Train Class I Test from Yard Plant

A. Engineer's brake valve or standard test device must be used.
B. Test device must be connected to end which will be nearest controlling locomotive.
C. Brake system must be charged, tested, and inspected per Class I brake test requirements listed in instruction 3.9.1.
D. When road power is coupled, make a Class II brake test before proceeding.
E. If air supply is disconnected for more than 4 hours, train must again be given a Class I brake test per instruction 3.9.1
F. Yard test device must charge the brake pipe / train brake system to the pressure listed in instruction 1.2 (Standard Air Pressures).
G. Mechanical yard air test devices and gauges must be calibrated every 92 days.
H. Electronic yard air test devices and gauges must be calibrated annually.
I. If used to test a train, a yard air test device and any yard air test equipment shall be accurate and function as intended.

DRAFT

3.9.10 Non-Passenger Train Class I Test from Yard Plant

A. Engineer's brake valve or standard test device must be used.
B. Test device must be connected to end, which will be nearest controlling locomotive.
C. Brake system charged, tested and inspected per Instructions 3.9.2B, C, D, E.
D. When road power is coupled, perform a Class III before proceeding.
E. If air supply is disconnected for more than 4 hours, train must again be tested per instructions 3.9.2B, C, D, E.
F. If yard test device is less than 80 psi, then a brake pipe leakage test must be conducted when locomotive(s) are coupled per instruction 3.9.2C Item 2.
G. Mechanical yard air test devices and gauges must be calibrated every 92 days.
H. Electronic yard air test devices and gauges must be calibrated annually.
I. If used to test a train, a yard air test device and any yard air test equipment shall be accurate and function as intended.

3.9.11 Trainman Test Gauges

A. While on duty, train service, mechanical and engineering employees will have access to a trainman test gauge for determining brake pipe pressure at the rear of a train.
B. Use of trainman test gauge is required when rear car is not equipped with a device (gauge or EOT) capable of indicating/displaying brake pipe pressure.
C. Employees will verify the accuracy of trainman's test gauge each day, prior to its use, by one of two methods as follows:

1. **Locomotive method:**
   - **a.** Close angle cock between locomotive and train.
   - **b.** Determine locomotive brake pipe pressure setting from employee operating the controls of the locomotive.
   - **c.** Connect trainman test gauge to end of locomotive not coupled to train and slowly open angle cock.
   - **d.** Verify that pressure indicated by trainman test gauge is within 3 psi of locomotive brake pipe pressure setting.
   - **e.** When trainman test gauge does **NOT** indicate pressure within 3 psi of locomotive brake pipe pressure setting, gauge must be removed from service and replaced.
   - **f.** Accuracy of replacement trainman test gauge must be verified by either the Locomotive or Train Brake Test method.
2. **Train Brake Test method:**
   - **a.** Determine locomotive brake pipe pressure setting from employee operating the controls of the locomotive prior to opening angle cock between controlling locomotive and train.
   - **b.** Open angle cock between locomotive and train.
   - **c.** Connect trainman test gauge to rear car of train and slowly open angle cock.
   - **d.** **FULLY** charge train until pressure indicated by trainman test gauge is within 3 psi of locomotive brake pipe pressure setting.
   - **e.** When train is **FULLY** charged and trainman test gauge does **NOT** indicate pressure within 3 psi of locomotive brake pipe pressure setting, retest gauge using Locomotive method above.
   - **f.** When trainman test gauge is within 3 psi of locomotive brake pipe pressure setting, proceed with required train brake test.

D. Trainman test gauges that have been damaged must be replaced and verified for accuracy.

3.9.12 Exterior Calendar Day Mechanical Inspection

A. Inspection Requirements
1. Performed by a QMP once each calendar day on passenger equipment in accordance with Amtrak Standard Maintenance Procedures and inspections.
2. A Long-Distance Intercity passenger train that misses a scheduled Exterior Calendar Day Mechanical Inspection due to delay en route may continue in service to the location where the inspection was scheduled to be performed.
3. A High Speed Trainset that misses a scheduled Exterior Calendar Day Mechanical Inspection due to delay en route may continue in service to the location where the inspection was scheduled to be performed.

B. Inspection Procedure
1. Use tables below to determine Running gear and/or Non-Running gear defects and necessary action to be taken.

3.9.13 Interior Calendar Day Mechanical Inspection

A. Inspection Requirements
1. Other than High Speed Trainsets - Performed by QMP or QP once each calendar day on passenger carrying cars in accordance with Amtrak Standard Maintenance Procedures and inspections.
2. High Speed Trainsets - Performed by QMP once each calendar day in accordance with Amtrak Standard Maintenance Procedures and inspections.
3. A Long-Distance Intercity passenger train that misses a scheduled Interior Calendar Day Mechanical Inspection due to delay en route may continue in service to the location where the inspection was scheduled to be performed.

DRAFT

4. A High Speed Trainset that misses a scheduled Interior Calendar Day Mechanical Inspection due to delay en route may continue in service to the location where the inspection was scheduled to be performed.

B. Inspection Procedure for Other Than High Speed Trainsets

1. Use the following table to determine Non-Running gear defects and necessary action to be taken.

C. Inspection Procedure for High Speed Trainsets

1. Performed by QMP in accordance with Standard Maintenance Procedures.

EXTERIOR CALENDAR DAY MECHANICAL INSPECTION DEFECT/ACTION AT TIME OF INSPECTION		
Defect Type	**Defect Description**	**Action**
Running Gear	• Suspension Components (including Air Bellows) • Draft System Components • Trucks and Components (including Bolster Anchor Radius Rods) • Wheels and Components (including hot journals and locomotive support bearings)	1. Repair 2. Move for repair in a non-revenue train not in passenger service, or 3. Set Out
Non-Running Gear	• Exhaust gases released inside cab or other compartments. • Batteries not properly vented. • Jumper cables – hanging free, exposed wire, broken plugs, or receptacles. • High voltage safety labels for exterior doors and cover plates missing • Buffer plates not in place. • Diaphragms not in place or not aligned	• May be moved for repair, in passenger service provided: 1. QMP determines that it is safe to do so including all movement restrictions, and 2. Car is locked out and empty. 3. Car may be occupied by crewmember only in the performance of duty
INTERIOR CALENDAR DAY MECHANICAL INSPECTION DEFECT/ACTION AT TIME OF INSPECTION		
Defect Type	**Defect Description**	**Action**
Non-Running Gear	• Exposed moving parts and electrical equipment not equipped with guards. • Floors that contain oil, water, waste, or any obstruction • Manual door releases not in place. • Emergency equipment… as applicable, missing.	• May be moved for repair, in passenger service provided: 1. QP or QMP determines that it is safe to do so, and 2. Car is locked out and empty. 3. Car may be occupied by crewmember only in the performance of duty.
	• Safety related signage missing or not legible. • High voltage safety labels for interior doors and cover plates missing • Emergency brake valves not stenciled.	• May remain in passenger service until the next interior calendar day inspection, provided QP or QMP determines: 1. That the repairs cannot be made, and 2. Equipment is safe to move.
	• Trap doors that do not safely operate or securely latch.	• May remain in passenger service until the next interior calendar day inspection, provided QP or QMP determines: 1. That the repairs cannot be made, and 2. Equipment is safe to move. 3. Defective trap doors must be secured by locking out door for which it is used.
	• Vestibule steps that are not illuminated.	• May remain in passenger service until the next interior calendar day inspection, provided QP or QMP determines: 1. That the repairs cannot be made, and 2. Equipment is safe to move. 3. Vestibule may be used solely at high platforms when steps are non-illuminated
	• End doors and side doors that do not operate safely or as intended.	• May remain in passenger service until the next interior calendar day inspection, provided QP or QMP determines: 1. That the repairs cannot be made, and 2. Equipment is safe to move. 3. At least one operative and accessible door must be available on each side of car. A notice must be displayed directly on each defective door
	• Seats or attachments broken or loose.	• May remain in passenger service until the next interior calendar day inspection, provided QP or QMP determines: 1. That the repairs cannot be made, and 2. Equipment is safe to move. 3. Broken or loose seats or seat attachments must be rendered unusable and display a notice indicating defect directly on seat.

Train Control Systems Section

DRAFT

4.0 Train Control Systems

- 4.1 General
- 4.2 Automatic Train Control System (ATC)
- 4.3 Automatic Train Stop (ATS); Intermittent Inductive Train Stop (IITS)
- 4.4 Advanced Civil Speed Enforcement System (ACSES)
- 4.5 Incremental Train Control System (ITCS) & Grade Crossing – ITCS (X-ITCS)
- 4.6 Interoperable – Electronic Train Management System (I-ETMS)
- 4.7 Speedometer Overspeed System
- 4.8 Multiple Penalty Brake Device (MPBD)

4.0 Train Control Systems

4.1 General

NOTE: When MAP 100 is referenced in the following instructions, Metrolink Locomotives and Cab Cars will use Metrolink Calendar Day Inspection Form SMP 100; MARC Locomotives and Cab Cars will use MARC Locomotive Calendar Day Inspection Form ECR 100.

NOTE: When CNOC mechanical desk is referenced in the following instructions, Metrolink T&E employees will contact Metrolink MOC at 1-909-593-0661; MARC T&E employees will contact the Amtrak Commuter Operations Center at 202-906-2772.

4.1.1 Trains/Locomotives must not enter any Train Control System Territory with defective or cut out Train Control System or "Acknowledger" unless relieved by Rule, Special Instruction, General Order, Bulletin Order, or other directive.

NOTE: If the train control system was cut out due to an on-board locomotive failure in accordance with applicable operating rules, the "Failure" box of the MAP 100 must be checked. If the train control system was cut out for any reason other than on-board locomotive failure, the "Temporary Operating Exception" box of the MAP 100 must be checked. This includes wayside PTC equipment failure of cutting out the train control system due to a temporary suspension of PTC operating rules. All other operating rules regarding reporting a cutout PTC system still apply. Checking the proper box will help the mechanical department to better identify the cause and may reduce the amount of time a locomotive spends at a repair facility.

4.1.2 If equipped, the "Acknowledger" must be tested prior to entering any Train Control System territory. Perform test by briefly depressing the "Acknowledger" to verify sounding of the audible alarm.

NOTE: On locomotives equipped with ACSES, the alarm has 2 distinct tones. The first tone is the ACSES alarm. The second tone is the ATC alarm. If ACSES is cut out, the alarm will be silent for approximately 3 seconds before sounding. On HST and HHP-8 Locomotives the acknowledger will need to be depressed for 3 seconds before the audible alarm will sound.

4.1.3 Valid Train Control System Departure Test(s) is required on all locomotives which will enter train control system territory. Test(s) will be verified by reviewing completed MAP 100. The start date and time of the 24-hour time period will be found in box 18 of the MAP 100. Boxes 19-23 will indicate who performed the work as indicated and must be filled out for any Train Control System Departure Test(s) to be valid.

4.1.4 Applicable Train Control System Departure Test (ATC, ATS (IITS), ACSES, ITCS, X-ITCS, I-ETMS) is required 24 hours or less before locomotive departs its initial terminal. Once locomotive departs initial terminal, Train Control System Departure Test (ATC, ATS (IITS), ACSES, ITCS, X-ITCS, I-ETMS) is valid until the final destination of the train unless failure en route occurs.

A. Mechanical forces will perform ATC, ATS (IITS), ACSES, ITCS, X-ITCS and I-ETMS Departure Test at locations where mechanical forces are available.

B. Engineer will perform On-Board Self-Test as outlined in appropriate instruction when mechanical forces are not available.

C. If this is the initial terminal for the train, check each MAP 100 in locomotive consist to determine that departure test(s) has been completed within 24 hours.

D. If a departure test has NOT been made within 24 hours, a new Train Control System Departure Test (ATC, ATS (IITS), ACSES, ITCS, X-ITCS, I-ETMS) is required.

E. When ATC, ATS (IITS), ACSES, ITCS, X-ITCS or I-ETMS Departure Test is performed at the same time as the Locomotive Calendar Day Inspection, record the required information on the same MAP 100 used for the Locomotive Calendar Day Inspection.

NOTE: When Train Control System Departure Test update is required, complete an additional MAP 100 to be left with the current MAP 100 on each locomotive tested. Supervisor/QMP Verifying All Work Completed and Approving Unit for Service section must be completed.

F. When engineer performs On-Board Self-Test (ATC, ATS (IITS), ACSES, ITCS, X-ITCS, I-ETMS), as soon as possible but before end of tour of duty, contact Train Dispatcher and CNOC mechanical desk at 1-800-424-0217 to report that test has been performed and whether any defects were noted.

DRAFT

G. Trains which will operate through ITCS/X-ITCS territory must, prior to departing originating passenger terminal, ensure that the correct train type is selected by observing the CLD. Change train type by using the SCROLL button on the CLD. A new system departure test is NOT required provided previous departure test remains valid. Train type is selected based on maximum allowed consist train speed.

2. ITCS: PSGR125, PSGR110, PSGR100, PSGR 90, and LT ENG.
3. X-ITCS: PSGR 110, PSGR90, PSGR79.

4.1.5 Any time a Train Control seal is broken the following information must be entered on MAP 100:

A. Select reason for cutting out (Failure or Temporary Operating Exception).
B. Train Control System(s) cut out.
C. Geographic location(s) where cut out and cut in.
D. To whom report was made.

4.1.6 If a Train Control system is cut out using the electrical cutout switch due to a Temporary Operating Exception, a Train Control System Departure Test is required at the next scheduled Calendar Day Inspection.

4.1.7 The Train Control System is required to have a MAP 8 Periodic Inspection performed if the system was cut out due to an On-Board Failure.

4.2 Automatic Train Control System (ATC)

4.2.1 ATC Equipment

A. Acknowledger

1. Switch/Button used by the engineer to acknowledge a more restrictive ATC condition.

B. Audible Alarm – Sounds when ATC operating conditions change.

C. Territory Switch

1. Locomotives are equipped with a two position Territory Switch with “OUT” and “IN” positions.
2. “OUT” Position is used:
   a. In non-ATC territory
   b. In ATC territory, when running against the current of traffic.
   c. In ATC territory, when ATC rules are out of service (suspended).
   d. In ATC territory, when wayside signals are out of service (signal suspension).

NOTE: When entering ATC territory and cab signal aspect is more favorable than restricting, switch must be moved from “OUT” to “IN” position within 8 seconds to prevent a penalty brake application.

NOTE: When Cab Territory Switch is in the “OUT” position with ATC cut in, equipment overspeed is enforced at 79 mph.

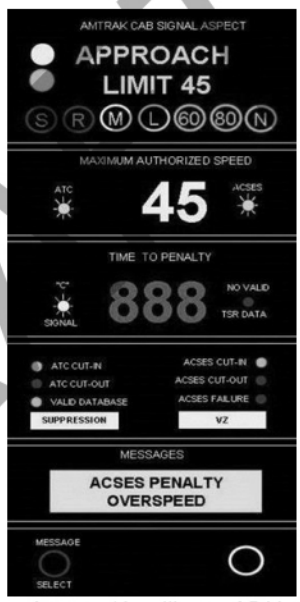
NOTE: When Cab Territory Switch is in the “OUT” position, some ADUs will be extinguished as indicated in TABLE 1.

3. “IN” POSITION is used in ATC territory for normal operation.
4. An ATC system Departure Test **IS NOT** required when the Cab Territory switch is moved from “OUT” to “IN” position.

D. ATC Cutout Switches/Cocks

1. Speed Control cut out switch
   a. Cuts out the ATC speed control system.
   b. Some Amtrak locomotives are not equipped with a Speed Control cutout switch.
   c. An ATC system departure test **IS NOT** required when the Speed Control cutout switch is cut in after being cut out.
2. ATC Electric cutout switch
   a. Cuts out the ATC system electrically
   b. Some Amtrak locomotives are not equipped with an ATC Electric cutout switch.
   c. An ATC MAP 8 Periodic Inspection **IS** required when the switch is cut in after being cut out due to system failure. Otherwise, ATC MAP 8 Periodic Inspection **IS NOT** required.
3. ATC Pneumatic cutout cock/switch
   a. Cuts out the ATC system pneumatically
   b. All Amtrak locomotives which operate in ATC territory An ATC MAP 8 Periodic Inspection IS required when the ATC Pneumatic cutout switch/cock is cut in after being cut out.
4. Cab Signal Transfer Switch (If equipped)

DRAFT



a. Selects the Train Control System to be used on the locomotive (either ATC or IITS).
b. An ATC system departure test IS required when the switch is moved to the “CAB SIGNAL” position after having been in the “IITS” position and equipment will be operated in ATC territory.
c. Aspect Display Unit (ADU)
d. Amtrak locomotives are equipped with four (4) aspect or nine (9) aspect / Intelligent display units (all cab signal aspects must be tested).
e. ADU displays cab signal aspect corresponding to code from receiver bars.
f. Are equipped an ATC Pneumatic cutout cock/switch.

5. Amtrak/MNRR Territory Switch
a. Select the method (Automatic or Manual) the ATC/ACSES system will change between Amtrak and Metro-North territories.
b. AUTO will read the ACSES transponder information and enforce MNRR or Amtrak territory ATC speeds. This is the normal position of the switch.
c. If ACSES is cut-out, the Amtrak/MNRR Territory Switch must be positioned manually when crossing the boundary between MN and Amtrak.
d. If ACSES fails to change modes to the correct railroad after passing the first interlocking on the other side of the boundary or one (1) mile, whichever is less, the Engineer will need to stop the train and manually change the mode by moving the switch to the correct territory position.

NOTE: After manually changing the Amtrak/MNRR Territory Switch and the corresponding cab signal aspects are not correctly displayed, the ATC system must be cut-out and considered failed.

4 Aspect Display Unit

9 Aspect / Intelligent ADU

E. ATC (Cab Signal) Receiver Bars

1. Bars are attached to the front or both ends of the locomotive close to the rail in front of the leading wheels in order to receive cab signal code from the rails.

P-42 ATC Receiver Bars

4.2.2 ATC Operation

A. Leading locomotive or unit of consist must be set up in the following manner:

1. Cab Signal Transfer switch, if equipped, must be in the "CAB SIGNAL" position whenever operating in ATC territory.
2. Territory Switch must be in the "IN" position on both ends, if so equipped, at all times while on track where ATC (cab signal) rules are in effect for direction of movement.
3. Speed Control Cutout Switch, if equipped, must be sealed in the "IN" position.
4. ATC Cutout Cock/Switch must be sealed in the "IN" position.

B. Speed Limits

1. Speed control imposes limits according to cab signal indication.
2. When cab signal changes to a more restrictive indication, corresponding speed is enforced.

C. Suppression of Penalty Application

1. Acknowledgement is required when cab signal changes more restrictive aspect and speed is at or below limit imposed by cab signal indication and audible alarm sounds.
2. Sounding of alarm when speed is above limit imposed by cab signal requires acknowledgment and positioning ABV handle to "SUPPRESSION" within 8 seconds.
3. Brakes may be released when cab signal speed is achieved and overspeed light goes out.

D. Recovery from Penalty Application

1. When a penalty application occurs, acknowledge and place ABV handle in "LAP" or "SUPPRESSION" position.
2. Ensure throttle/controller is in "IDLE" or "OFF" position.
3. When PCS/Penalty indication turns off, penalty application may be recovered.
4. Penalty application may be recovered while moving provided there is sufficient time to recharge train before next brake application is required.

4.2.3 ATC (Cab Signal) Departure Test

A. ATC (Cab Signal) Daily Departure Test

1. Test must be performed in non-coded territory.
2. Locomotive must be stopped.
3. Apply independent brake if equipped. If not, apply hand/parking brake (HHP-8/HST parking brake must be applied).
4. The velocity zero (VZ) light must be illuminated on the ADU.

EXCEPTION: On HST power cars, HHP-8 locomotives and 9800 Series cab cars the POD must display a "No Motion" indication, or the MFD-2 status of the ATC, Speed Sensing, and ACSES "No Motion" light must be illuminated.

5. If equipped, inspect that the Cab Signal Transfer Switch is in the "CAB SIGNAL" position and sealed.
6. Inspect to determine that the following devices are cut in and sealed:
   a. ATC Pneumatic cutout cock/switch
   b. ATC Electric cutout switch
   c. Speed Control cutout switch or Speedometer (Overspeed) cutout pneumatic cock/switch
7. Visually inspect cab signal receiver (pickup) bars for proper alignment. Also inspect for exposed wires and junction box damage.
8. Position reverser in "FORWARD" or "REVERSE" for corresponding cab signal receiver bars to be tested. If locomotive will be used in both directions both F-End and R-end receivers must be tested.
9. Territory switch must be cut in.
10. Move ABV handle to "RELEASE".
11. Activate On-Board Self-Test with toggle switch, button, or display screen soft keys.
12. Audible alarm will sound, and aspect display unit will go through self-test of ADU lamps. No action is required.
13. The self-test will then progress upward through the cab signal aspects, checking overspeed setting and alarm for each aspect. No acknowledgment is required.
14. When the least restrictive aspect ("CLEAR" on 4 ADU; "CLEAR, 150" on 9 ADU, and Intelligent ADU) is displayed, cab signal audible alarm will sound, and a penalty application will occur. **The penalty brake application must occur less than eight (8) seconds after audible alarm begins.** PCS/Penalty indication will illuminate, and brake pipe will reduce at a service rate at least 26 psi.
15. Move ABV handle to the "SUPPRESSION" or "LAP" position. Penalty will reset and PCS/Penalty indication will turn off.
16. MOVE ABV handle to "RELEASE".
17. ATC (Cab Signal) test continues with downward aspect changes.
18. Acknowledge each downward change, except for change from "Approach" to "Restricting".
19. On downward change from "Approach" to "Restricting", without acknowledging, move ABV handle to "SUPPRESSION" position to forestall penalty application. Penalty must not occur.

DRAFT

NOTE: On GP38H-3, GP38-2, and GP-15 locomotives the cab signal self-test toggle switch must be held in the "UP" position during the entire cab signal self-test with one exception, when the cab signal changes from "Approach" to "Restricting", the cab signal self-test toggle switch must be released.

20. Without acknowledging, move ABV handle to "RELEASE" position. Penalty brake application must occur with PCS/Penalty indication illuminated and a service brake pipe reduction of at least 26 psi will occur.
21. Acknowledge and move ABV handle to "SUPPRESSION" position. Penalty will reset and PCS/Penalty indication will turn off.
22. Move ABV handle to "RELEASE" position to ensure that brakes release.
23. When ATC (Cab Signal) System Departure Test is successful complete MAP 100 as follows:
    a. Enter seal numbers (boxes 17) for electrical switch and pneumatic cutout.
    b. Enter "Date" and "Time" of test (boxes 18)
    c. Complete "Train Control Test" portion of the MAP 100; fill out "Signature"' "Occupation", "Location", "Date" and "Time" boxes. (boxes 19-23)
    d. Check mark "F-End", "R End", or both (boxes 15 and 16).

B. ATC (Cab Signal) System Departure Test will be considered as failed when any of the following conditions/faults are discovered during the test.

NOTE: ATC (Cab Signal) may be re-tested no more than 2 times to ensure test passed.

1. Visible damage to cab signal track receivers.
1. Audible alert does not function.
2. Acknowledger does not function.
3. All lamps not functioning on Aspect Display Unit.
4. Test overspeed condition at "Clear 150" on 9 Aspect/Intelligent Display Unit does not initiate a penalty application of the brakes within 8 seconds.
5. Test overspeed condition at "Clear" on 4 Aspect Display Unit does not initiate a penalty application of the brakes within 8 seconds.
6. Penalty application cannot be suppressed using the ABV handle in "SUPPRESSION" position.
7. Penalty application does not occur within 8 seconds during step 4.2.3A.20 above.
8. Penalty application cannot be recovered after 4.2.3A.20 above.
9. Velocity Zero Light or No Motion light is not illuminated after test is complete.

4.2.4 Criteria for Determining ATC (Cab Signal) En Route Failure

A. Damage or fault occurs to any part of the ATC system

B. Cab Signal Failure

1. Cab Signal fails to conform at 2 fixed signal locations in succession.
2. When approaching a fixed signal displaying "Approach" or more favorable aspect in ATC territory without fixed automatic block signals, the cab signal displays "Restricting" and fails to conform after passing the fixed signal.
3. When approaching a fixed signal displaying "Slow Clear", "Slow Approach", "Stop and Proceed", "Restricting", or "Stop Signal" and the cab signal displays an aspect more favorable than "Approach".

EXCEPTION: This procedure does not apply when fixed signal being approached is imperfectly displayed.

C. Speed Control Failure

1. Cab signal aspect allows a greater speed than aspect authorizes.
2. Cab signal aspect enforces a lower speed than aspect authorizes.
3. Overspeed indication remains illuminated and penalty application occurs on a downward change of cab signal aspect when engineer fulfills the following:
    a. Acknowledge within 8 seconds
    b. "SUPPRESSION" position of ABV handle
    c. Authorized speed achieved
4. Unrecoverable penalty brake application.
5. Velocity Zero (VZ) Light remains illuminated when speed is above 12MPH.
6. "NO MOTION" light on HST power cars and HHP-8 locomotives remain illuminated when locomotive speed is above 3MPH.

D. Automatic Train Stop (ATS) Failure

1. The audible indicator fails to sound when the cab signal changes to more restrictive aspect.
2. The audible indicator continues to sound even though the cab signal change was acknowledged, and the speed of the train was reduced to the speed required by the cab signal indication.

DRAFT

NOTE: When necessary to correct a fault by opening the battery switch, the ATC (cab signal) system DOES NOT have to be retested.

4.2.5 Automatic Train Control (ATC) Cutout Procedures

A. Follow instructions in TABLE 1.

B. If ATC Pneumatic cutout cock is cut out the ATC system is required to have a MAP 8 Periodic Inspection performed.

C. Record on MAP 100 Failure En Route section.

1. Select reason for cutting out (Failure or Temporary Operating Exception).
2. Train Control System(s) cut out.
3. Geographic location(s) where cut out and cut in.
4. To whom report was made.

D. Notify Train Dispatcher promptly and CNOC mechanical desk at 1-800-424-0217 as soon as possible but before end of tour of duty.

E. Proceed according to applicable operating rule(s).

4.3 Automatic Train Stop (ATS); Intermittent Inductive Train Stop (IITS)

4.3.1 ATS (IITS) Equipment

A. Acknowledger

1. Switch/Button used by the engineer to acknowledge a more restrictive ATS (IITS) condition.

B. Audible Alarm – Sounds when ATS operating conditions change.

C. Territory Switch

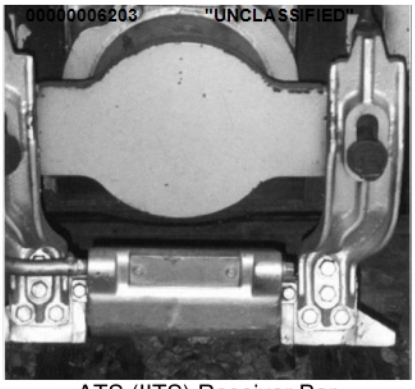
1. Some locomotives are equipped with a two position Territory Switch with “OUT“ and “IN“ positions.
2. “OUT” Position is used in non-ATS (IITS) territory. Territory Switch must remain in the “OUT” position until the train enters ATS (IITS) territory.
3. “IN” Position is used in ATS (IITS) territory for normal operation
4. An ATS (IITS) System Departure Test **IS NOT** required when the Cab Territory switch is moved from “OUT” to “IN” position.

D. ATS (IITS) Cutout Switches/Cocks

1. ATS Pneumatic cutout cock/switch
   a. Cuts out the ATS system pneumatically
   b. All Amtrak locomotives which operate in ATS (IITS) territory are equipped an ATS Pneumatic cutout cock/switch.
   c. An ATS (IITS) System Departure Test **IS** required when the ATS Pneumatic cutout switch/cock is cut in after being cut out.
2. Cab Signal Transfer Switch (If equipped)
   a. Selects the Train Control System to be used on the locomotive (Either ATC or IITS).
   b. An ATS (IITS) System Departure Test **IS** required when the switch is moved to the “IITS” position after having been in the “CAB SIGNAL” position and equipment will be operated in ATS (IITS) territory.

E. ATS (IITS) Indicator Light

1. Illuminates when an ATS (IITS) operating condition exists which requires acknowledgement.



P-42 IITS Indicator Light

F. ATS (IITS) Receiver Bar

1. Receiver Bar is attached to the right front of the locomotive close to the rail in order to be activated when passing over a wayside inductor.

DRAFT

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

ATS (IITS) Receiver Bar

4.3.2 ATS (IITS) Operation

A. Leading locomotive MUST be set up in the following manner:

1. Cab Signal Transfer switch, if equipped, must be in the "IITS" position whenever operating in ATS (IITS) territory.
2. Cab Territory Switch must be in the "IN" position, if so equipped, at all times while on track where ATS (IITS) rules are in effect.
3. ATS (IITS) Pneumatic Cutout Cock/Switch must be sealed in the "IN" position.

B. Suppression of Penalty Application

1. After passing signal or wayside inductor, the audible alarm will sound and visual indication lights.
2. Acknowledgment must be made within 8 seconds to prevent a penalty application.

C. Recovery from Penalty Application

1. Ensure combined power handle/throttle is in "IDLE" or "OFF".
2. Place ABV handle to "SUPPRESSION" or "LAP" position.
3. Depress and hold the acknowledgment button for approximately 2 seconds.
4. Depress and hold the ATS reset button for approximately 2 seconds.
5. Release the brakes after penalty messages clear and the PCS light goes out.

4.3.3 ATS (IITS) System Departure Test

A. On-Board Self-Test

1. Test must be performed in non-coded territory.
2. Locomotive must be stopped.
3. If equipped, inspect that the Cab Signal Transfer Switch is in the "IITS" position and sealed.
4. Inspect to determine that the ATS (IITS) Pneumatic Cutout Cock/Switch is cut in and sealed.
5. Visually inspect ATS (IITS) receiver (pickup) bars for proper alignment and height. Also inspect for exposed wires and junction box damage.
6. Equipped with two buttons marked "90" and "60" located on right-hand side of the box.
7. Push and release the "90" button. System simulates train passing inductor. No action is required.
8. Push and release the "60" button. Alarm will sound.
9. Without acknowledging, move the ABV handle to "Suppression" position within 8 seconds in order to forestall the penalty.
10. Without acknowledging, move the ABV handle to "RELEASE". A penalty brake application must occur.
11. Recover from penalty application. Acknowledge and move ABV handle to "SUPPRESSION" position. Penalty will reset and penalty indication will turn off.
12. When ATS (IITS) System Departure Test is successful, complete MAP 100 as follows:
    a. Enter seal numbers (boxes 17) for electrical switch and pneumatic cutout.
    b. Enter "Date" and "Time" of test (boxes 18)
    c. Complete "Train Control Test" portion of the MAP 100; fill out "Signature"' "Occupation", "Location", "Date" and "Time" boxes. (boxes 19-23)
    d. Check the End(s) that were successfully inspected and tested. (boxes 15 and 16).

B. ATS (IITS) System Departure Test Using Wayside Inductors

1. If equipped, inspect that the Cab Signal Transfer Switch is in the "IITS" position and sealed.
1. Inspect to determine that the ATS (IITS) Pneumatic Cutout Cock/Switch is cut in and sealed.
2. Pass over the first inductor. Acknowledge audible alarm within 8 seconds. No penalty should occur.
3. Pass over second inductor. When alarm sounds move ABV handle to "SUPPRESSION" position within 8 seconds without acknowledging, avoiding penalty application.
4. Without acknowledging, move the ABV handle to "RELEASE". A penalty brake application must occur.

DRAFT

36-FOI-00415 000000006203 "UNCLASSIFIED" 4/30/2026

5. Recover from penalty application. Acknowledge and move ABV handle to "SUPPRESSION" position. Penalty will reset and penalty indication will turn off.
6. When ATS (IITS) System Departure Test is successful, complete MAP 100 as follows:
   a. Enter seal numbers (boxes 17) for electrical switch and pneumatic cutout.
   b. Enter "Date" and "Time" of test (boxes 18)
   c. Complete "Train Control Test" portion of the MAP 100; fill out "Signature"' "Occupation", "Location", "Date" and "Time" boxes. (boxes 19-23)
   d. Check the End(s) that were successfully inspected and tested. (boxes 15 and 16).

4.3.4 Criteria for ATS (IITS) En Route Failure

1. ATS (IITS) will be considered as having failed with two (2) consecutive malfunctions when passing over inert inductors, or
2. When passing a signal within ATS (IITS) limits whose aspect requires acknowledging and any one of the following occurs:

A. ATS (IITS) alarm light does not illuminate.
B. Audible alarm does not sound.
C. Failure to acknowledge warning results in no penalty application.

1. When operating rule or special instruction defines failure other than that listed above.

4.3.5 Cut Out Procedure

A. Follow instructions in TABLE 2.
B. If ATS failure, an ATS MAP 8 Periodic Inspection is required.
C. Record on MAP 100 Failure En Route section.
D. Select reason for cutting out (Failure or Temporary Operating Exception).
E. Geographic location(s) where cut out and cut in.
F. To whom report was made.
G. Notify Train Dispatcher promptly and CNOC mechanical desk at 1-800-424-0217 as soon as possible but before end of tour of duty.
H. Proceed according to applicable operating rule(s).

4.4 Advanced Civil Speed Enforcement System (ACSES)

4.4.1 ACSES Equipment

A. Acknowledger – Switch/Button used by the engineer to acknowledge a more restrictive ACSES condition.
B. Audible Alarm – Sounds when ACSES operating conditions change.
C. ACSES Cutout Switches/Cocks

1. ACSES Electric cut out switch
   a. Cuts out the ACSES system electrically
   b. An ACSES System Departure Test **IS** required when the switch is cut in after being cut out due to system failure. Otherwise, ACSES System Test **IS NOT** required.
2. ACSES Pneumatic cutout cock/switch
   a. Cuts out the ACSES system pneumatically
   b. An ACSES System Departure Test **IS** required when the ACSES Pneumatic cock/switch is cut in after being cut out.
3. Train Type Selector Switch (If Equipped)
   a. Selects one of either train type B, C, D or E as defined by Rule, Special Instruction, General Order, Bulletin Order, or other directive.
   b. An ACSES System Departure test **IS** required when different train type is selected and equipment will be operated in ACSES territory.

D. Aspect Display Unit (ADU)

1. Amtrak locomotives are equipped with nine (9) aspect display units.
2. The ACSES civil and temporary speed restrictions are displayed in the ACSES portion of the ADU.

E. ACSES Scan Antenna

1. Antenna is attached under the front or both ends of the locomotive between the rails.
2. The antenna receives speed and location information from transponders located between the rails.

F. Data Radio Equipment

1. Wayside and on-board equipment which transmits and receives speed, signal, and WIU information.

DRAFT

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

4.4.2 ACSES Operation

A. All trains operating in ACSES territory must be equipped with ACSES apparatus unless authorized by Special Instructions to operate non-equipped.

B. ACSES must be cut in before entering ACSES territory.

C. When ACSES is cut IN and ATC is cut OUT:

1. The cab signal portion of the Aspect Display Unit is dark.
2. The ACSES portion of the Aspect Display Unit indicates "– –" .

D. Speed Limits

1. ACSES enforces speed and speed restrictions, both temporary and permanent, according to timetable speed tables.

E. ACSES is direction dependent and requires the reverser to be in forward or reverse. If the reverser is centered in ACSES territory, a penalty application will occur.

F. ACSES determines direction of travel by passing transponders. If direction of reverser is changed, the ACSES portion of the Aspect Display Unit will indicate "– –". After the change of direction, the first set of transponders passed will cause the ACSES portion of the Aspect Display Unit to change from "– –" to the current track speed.

G. ACSES may not indicate current track speed when:

1. Entering ACSES territory at a hand operated switch until passing over the next set of transponders.
2. Diverting at an interlocking until passing over the next set of transponders on the exit track from the interlocking.
3. A locomotive passes over transponders at less than 3 mph (missing transponder indication is displayed "– –").

H. Permanent (Civil) Speed Restriction Enforcement.

1. ACSES will enforce all permanent speeds based on the train type as set by the Train Type Selector Switch.

NOTE: HST train type is automatically set.

2. When approaching a speed restriction and train speed is less than the restriction, the audible alert sounds and the ACSES portion of the Aspect Display Unit changes to the lower speed at the location where the speed changes. Engineer must acknowledge the audible alert within 8 seconds to avoid a penalty.
3. When approaching a speed restriction and train speed exceeds that allowed by the braking curve, the audible alert sounds and the ACSES portion of the Aspect Display Unit changes to the lower speed prior to reaching the restriction. Engineer must acknowledge and initiate braking with the ABV handle within 8 seconds to avoid a penalty.

NOTE: When ATC is cut out, the ACSES portion of the ADU displays "– –" instead of the enforced speed .

4. When enforced speed increases after a permanent or temporary restriction, a short audible alert sounds to inform the engineer of the speed increase. Acknowledgement is not required.

NOTE: The ACSES audible tone is different from the ATC audible tone.

I. If reverser position is changed, the Aspect Display Unit will display "– –" continuously.

J. When direction of travel is changed, the current TSR information is no longer enforced and the Aspect Display Unit No Valid TSR DATA LED will illuminate. As soon as new TSR information is received for the current direction of travel, (usually in the vicinity of the next interlocking) the Aspect Display Unit No Valid TSR DATA LED will extinguish and enforce TSR speeds normally.

K. If data radio communication is lost approaching an Interlocking Area, TSRs on adjacent tracks may be displayed and enforced.

L. Interlocking Route Speed Enforcement.

1. ACSES will enforce route speeds through the entire interlocking in the same manner as Permanent Speed Restrictions described in instruction 4.4.2H.

EXCEPTION: When Data Radio is not functioning, ACSES will not enforce route speeds at interlockings (ATC will continue to enforce route speeds at interlockings).

NOTE: When ATC is cut out, the ACSES portion of the Aspect Display Unit remains at "– –" .

M. ACSES Positive Stop

1. Positive Stop Enforcement
   a. ACSES will enforce a positive stop at Interlocking and CP signals displaying STOP SIGNAL.

DRAFT

EXCEPTION: When Data Radio is not functioning a positive stop may be enforced at signals displaying other than STOP SIGNAL.

b. When train speed is greater than allowed by the braking curve, the audible alert sounds, the cab signal immediately changes to STOP SIGNAL and a penalty application is applied.

NOTE: When speed is reduced below the braking curve, the cab signal **MAY** change to a more favorable aspect, allowing recovery of the penalty.

c. An ACSES Positive Stop penalty application cannot be recovered until:
   1. Cab Signal changes to a more favorable aspect, or
   2. The Stop Bypass button is pressed.

NOTE: If a cab signal flip occurs while approaching an interlocking/CP, an ACSES Positive Stop may be enforced with a penalty brake application. These occurrences must be reported to the Train Dispatcher and note on MAP 100.

2. When the Stop Bypass button is pressed:
   a. Cab Signal will change to RESTRICTING, and
   b. ACSES enforces 15 mph speed until locomotive clears interlocking or CP.

N. Suppression of Penalty Application

1. Sounding of alarm when speed is above limit imposed by ACSES requires acknowledgement and positioning ABV handle to "SUPPRESSION" position within 8 seconds.
2. Brakes may be released when target speed is achieved and overspeed indication goes out.

O. Recovery from Penalty Application

1. When a penalty application occurs, acknowledge and place ABV handle in "LAP" or "SUPPRESSION" position.
2. Ensure throttle/controller is in "IDLE" or "OFF" position.
3. When PCS/Penalty indication turns off, penalty application may be recovered.
4. Penalty application may be recovered while moving provided there is sufficient time to recharge train before next brake application is required.

P. Construction Zone

1. If the "Construction Zone" text message on the ADU remains displayed after clearing the limits of the Construction Zone, ACSES must be recycled as follows:
   a. Stop the train as soon as safe train handling will permit, clear of tunnels and interlocking limits,
   b. Place ABV handle in "SUPPRESSION",
   c. Open ACSES circuit breaker and wait 30 seconds,
   d. Close ACSES circuit breaker,
   e. Perform ACSES On-Board Self-Test per instruction 4.4.3.

NOTE: Trains may stop to recycle the ACSES system within Interlocking limits while making a station stop or when authorized by the Train Dispatcher.

DRAFT

4.4.3 ACSES On-Board Self-Test

A. Once initial departure test has been performed, ACSES system must remain cut in, unless train does not enter ACSES territory or is exempt per Special Instruction

B. The independent brake must be fully applied and the automatic brake must be released. On the HST power car, the parking brake must be applied.

C. Visually inspect the ACSES antenna for exposed wires and junction box damage.

D. Inspect that the ACSES Pneumatic cutout cock in cut in and sealed.

E. On a locomotive equipped with a train type selector switch, verify that the blinking light on the switch panel represents the proper train type **(B, C, D, or E)**. If not, move the selector knob to the train type required. Completing the ACSES Departure test will lock in the type of train selected.

F. On a locomotive equipped with a train type selector switch, recycle the ACSES circuit breaker.

G. Activate the ACSES On-Board Self-Test by using either a push-button, on screen buttons or spring-loaded toggle switch.

H. On the ACSES Message Display of the Aspect Display Unit (ADU), a letter **B, C, D, or E** will appear. This letter verifies the train type your locomotive is set up for. On HHP-8 locomotives or HST power cars, no train type is illuminated on the ADU.

I. Actuate the cab signal acknowledger.

J. Observe that all LED segments are lit on the ACSES ADU, and that the number "188" is illuminated.

K. In four to five seconds, the audible alarm for ACSES will sound. This will result in a penalty application of the brakes.
L. Move the ABV handle to “SUPPRESSION” position.
M. Acknowledge.
N. This will silence the alarm.
O. Wait for PCS to reset. On HHP-8 locomotive and HST power car, wait for penalty application light to reset.
P. Move ABV handle to “RELEASE” position.
Q. Acknowledge.
R. In two to three seconds a penalty application will occur. This will change the cab signal aspect to “STOP SIGNAL”. This is applicable only where a combined cab signal and ACSES ADU is used.
S. Move the ABV handle to “SUPPRESSION” position.
T. Acknowledge and silence the audible alarm.
U. ADU Message Display will have “DEPARTURE TEST PASSED” and the ACSES ADU is indicating "– –." This completes the test.
V. When ACSES On-Board Self-Test is successful complete MAP 100 as follows:

a. Circle ACSES Train Type **(A, B, C, D, & E)**
b. Enter seal numbers (boxes 17) for electrical switch and pneumatic cutout.
c. Enter “Date” and “Time” of test (boxes 18)
d. Complete “Train Control Test” section of the MAP 100; fill out ”Signature”’ “Occupation”, “Location”, “Date” and “Time” blocks. (boxes 19-23)
e. Check mark “F-End”, “R End” or both (boxes 15 and 16).

Step	Operation	Action
1	TRAIN TYPE CHECK: The speed limit portion of the ADU shows a letter indication the current train type	Observe and verify correct train type is displayed on the ADU – PRESS ACKNOWLEDGE
2	TRAIN TYPE ACCEPTED:	No action – The speed limit will display “188”
3	ANTENNA CHECK: Power is applied to the Transponder Antenna and on-board BIT test verifies antenna sub-system is working properly. If the test passes the power will turn off and proceed to step 4	No action – If this test fails it remains suspended at this step; ACSES power must be cycled before any other functions operate
4	PENALTY OUTPUT AND PERMANENT SUPPRESSION CHECK: ACSES de-energizes its penalty magnet valve to create a penalty brake application. The alarm is continuously activated	The operator must achieve Permanent Suppression and press acknowledge to silence alarm and proceed to next step
5	PERMANENT SUPPRESSION CHECK: ACSES re-energizes its penalty output to clear a penalty brake application	The operator must recover the brakes and release the brake to remove Permanent Suppression. Press acknowledge to proceed to next step
6	POSITIVE TRAIN STOP CHECK: ACSES sends PTS request to the ATC system. Under Restricting signal the ATC system responds to the PTS request by immediately de-energizing its own Penalty Output	The ATC aspect displays STOP. With Permanent Suppression on, press acknowledge to revoke the PTS request
7	RADIO CHECK: ACSES interrogates the health of the MCM radio link	If the test remains suspended at this step longer than 2 minutes, ACSES power must be cycled.
8	Departure Test completed successfully	ADU displays “Departure Test Passed”

DRAFT

4.4.4 ACSES Cut Out Procedures

A. If ACSES displays anything other than the Missing Transponder Symbol in territory where ACSES is not in effect, the ACSES electric cutout switch located on the side of the ACSES equipment box must be placed in the “cut out” position. Once ACSES has been electrically cut out in this manner, HSTs and HHP-8s will display “ACSES Cut Out” in the alarm box of the MFD1 screen. On other ACSES equipped engines, the red “Track Speed Cut Out” light will illuminate. Prior to entering ACSES equipped territory, ACSES must be cut back in without delay to the train. An ACSES On-Board Self-Test is **not** required when the system is cut out and cut in electrically unless a failure is declared.
B. Follow instructions in TABLE 3.
C. If ACSES failure, an ACSES MAP 8 Periodic Inspection is required.
D. Record on MAP 100 Failure En Route section.
E. Select reason for cutting out (Failure or Temporary Operating Exception).

F. Geographic location(s) where cut out and cut in.

G. To whom report was made.

H. Notify Train Dispatcher promptly and CNOC mechanical desk at 1-800-424-0217 as soon as possible but before end of tour of duty.

I. Proceed according to applicable operating rule(s).

4.5 Incremental Train Control System (ITCS) & Grade Crossing – Incremental Train Control System (X-ITCS)

4.5.1 ITCS/X-ITCS Equipment

A. Acknowledger

1. Switch/Button used by the engineer to acknowledge a more restrictive ITCS/X-ITCS condition.

B. Audible Alarm – Sounds when ITCS/X-ITCS operating conditions change.

C. ITCS/X-ITCS In/Out Switch

1. Locomotives are equipped with a two position ITCS In/Out Switch with “OUT” and “IN” or “NORMAL” positions.
2. Switch must remain in the “OUT” position until the train enters ITCS/X-ITCS territory.
3. “IN” or “NORMAL” Position is used in ITCS/X-ITCS territory for normal operation
4. An ITCS/X-ITCS System Departure Test **IS NOT** required when the ITCS/X-ITCS In/Out Switch is moved from “OUT” to “IN” or “NORMAL” position.

D. ITCS/X-ITCS Cutout Switches/Cocks

1. ITCS/X-ITCS Pneumatic cutout cock/switch.
   a. Cuts out the ITCS/X-ITCS system pneumatically
   b. All Amtrak locomotives which operate in ITCS/X-ITCS territory are equipped an ITCS/X-ITCS Pneumatic cutout cock/switch.
   c. An ITCS/X-ITCS System Departure Test **IS** required when the ITCS/X-ITCS Pneumatic cut out switch/cock is cut in after being cut out.

E. ITCS/X-ITCS Compact Locomotive Display (CLD)

1. ITCS/X-ITCS speed restrictions, time to penalty and distance to target are displayed by the CLD.

ITCS/X-ITCS Compact Locomotive Display (CLD)

4.5.2 ITCS/X-ITCS Operation

A. Prior to entering ITCS/X-ITCS territory, Engineer must verify that correct engine type has been selected and displayed on ITCS/X-ITCS Compact Locomotive Display (CLD).

B. Leading locomotive must be set up in the following manner:

1. ITCS/X-ITCS “IN” or “NORMAL/OUT” switch must be placed in the “IN” or “NORMAL” position when prompted.
2. X-ITCS Pneumatic Cut Out Switch/Cock must be sealed in the “CUT IN” position.

C. Entering and Leaving ITCS/X-ITCS Territory

DRAFT

1. When entering a track on which ITCS/X-ITCS rules are in effect for the direction of movement, ITCS/X-ITCS IN/OUT Switch or "NORMAL/OUT" switch must be moved to the "IN" or "NORMAL" position within 8 seconds after prompt.
2. In ITCS/X-ITCS territory, after CLD (Compact Locomotive Display) indicates "ITCS OUT", move ITCS/X-ITCS IN/OUT Switch or "NORMAL/OUT" switch to the "OUT" position within 8 seconds to avoid a penalty application.

D. Suppression of Penalty Application

1. Sounding of alarm when speed is above limit imposed by ITCS/X-ITCS requires acknowledgement.
2. Speed must be reduced prior to "Time-To-Penalty" indication reaching "0" using the ABV handle.

E. Recovery from Penalty Application

1. When a penalty application occurs, acknowledge and place ABV handle in "LAP" or "SUPPRESSION" position.
2. Ensure throttle/controller is in "IDLE" or "OFF" position.
3. When PCS/Penalty indication turns off, penalty application may be recovered.
4. Penalty application may be recovered while moving provided there is sufficient time to recharge train before next brake application is required.

4.5.3 ITCS/X-ITCS Departure Test

A. Prior to initiating ITCS/X-ITCS Departure Test, ensure that:

1. Lead locomotive is at zero speed.
2. Reverser handle is centered.
3. Independent brake is fully applied.
4. On-Board Computer (OBC) power is ON.
5. Generator field switch/breaker is ON.
6. Automatic brake valve is cut in.

NOTE: If ITCS departure test is to be performed during a station stop within ITCS territory, no more than a 15 psi reduction is to be maintained on equipment. If ITCS Departure Test fails to initiate a brake application, contact the conductor to determine if safe to release train brakes. If safe to release train brakes, move ABV handle to "RELEASE" position and restart Departure Test.

NOTE: X-ITCS/ITCS Departure Tests can only be performed at Initial terminals where ITCS departure test servers are located (Chicago, St. Louis, Port Huron, Pontiac). The system cannot pass a departure test in any other location. See appropriate General Order for information.

7. Engine isolation switch is in RUN position.

B. Initiate the Departure Test by pressing and releasing the Departure Test button on the ITCS/X-ITCS Compact Locomotive Display unit. The Departure Test will consist of an ITCS/X-ITCS Compact Locomotive Display Unit Verification test, Operational verification tests, TD220 Radio tests, GPS Location test, and Transfer Data Recorder Log.

C. TD220 Radio Tests.

1. Observe TD220 radio tests. While the test is processing, the LCD indicator displays ***TESTING***.
2. Observe the target type display change from TRMRCV to DBLOAD to WAY REV.
3. If the departure test is being performed in an area that the TD220 radio cannot communicate with a local departure test server, the target type will display F-RAD 0 or LOOPBAK. If no loop back signal is received, the target type display changes to TIMEOUT and after a short time, the departure test proceeds to the next test.

D. ITCS/X-ITCS Compact Locomotive Display Unit Verification Test – Verify and indicate individual ITCS/X-ITCS display unit tests passed or failed by pressing and releasing either the:

- SELECT Pushbutton for PASS, or
- SCROLL Pushbutton for FAIL

1. Verify and indicate the LED TEST / passed or failed.
2. Verify and indicate the LED DIMMING TEST / passed or failed.
3. Verify and indicate the LCD TEST / passed or failed.
4. Verify alerter sounds for 1 second / passed or failed.
5. PUSHBUTTON TEST / press and release each pushbutton when prompted.
6. X-ITCS Displayed / passed or failed.

E. Operational Verification Tests

1. Verify and indicate software version / passed or failed.
2. Enter and/or verify the engine type. (Press and release the SCROLL button to change engine type. Press and release the SELECT button to enter engine type. Press and release SELECT button again to save.)

DRAFT

26-FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

3. Enter and/or verify the train type. (Press and release the SCROLL button to change train type. Press and release the SELECT button to enter train type. Press and release SELECT button again to save.)
4. Enter and/or verify the Train ID. (Press and release the SELECT button to set the Train ID. Press and release the SCROLL button to change the assigned digits.)
5. Move the reverser handle when prompted to confirm hood selection. (This portion of the test is only available if freight locomotive type is selected.)
6. Enter and/or verify the vehicle unit number (VUN). (Press and release the SELECT button to set the VUN. Press and release the SCROLL button to change the assigned digits.)
7. Observe speed sensor tests.
8. Observe speed simulation tests.
9. Observe speed warning tests.
10. Observe over-speed tests.
11. BRK ON test - When prompted, press and release Acknowledge button.
12. SIGNAL downgrade test - When prompted, press and release Acknowledge button.
13. Observe HOME signal test.
14. When prompted, place ITCS/X-ITCS IN/OUT Switch in the “IN” or “NORMAL” position.
15. When prompted, place ITCS/X-ITCS IN/OUT Switch in the “OUT” position.
16. When prompted, move reverser handle to proper position.

F. GPS Location Tests

1. Observe test of A and B GPS receivers.

G. ITCS/X-ITCS Departure Test – PASSED

1. Record successful completion of the Departure Test on the MAP 100 as follows:
   a. Enter seal numbers (boxes 17) for electrical switch and pneumatic cutout.
   b. Enter “date” and “Time” of test (boxes 18)
   c. Complete “Train Control Test” portion of the MAP 100; fill out ”Signature”’ “Occupation”, “Location”, “Date” and “Time” blocks. (boxes 19-23)
   d. Check mark “F-End”, “R-End”, or both (boxes 15 and 16).
2. Report time Departure Test performed and results to the Train Dispatcher.

H. Transfer Data Recorder Log

1. After the ITCS/XITCS departure test passes, the target type indicator displays SENDLOG as the OBC transmits the data recorder logs to the terminal server. No action is required. Locomotive can be operated while SENDLOG is displayed.

I. ITCS/X-ITCS Departure Test – FAILED

1. Press SCROLL to identify failure(s).
2. Record Departure Test failure(s) on MAP 100.
3. Report time Departure Test performed and failure(s) to the Train Dispatcher.

4.5.4 ITCS/X-ITCS Cutout Procedures

A. Follow instructions in TABLE 4.
B. If ITCS/X-ITCS fails, an ITCS/X-ITCS MAP 8 Periodic Inspection is required.
C. Record in the MAP 100 Failure En Route section:
D. Select reason for cutting out (Failure or Temporary Operating Exception).
E. Geographic location(s) where cut out and cut in.
F. To whom report was made.
G. Notify Train Dispatcher promptly and CNOC mechanical desk at 1-800-424-0217 as soon as possible but before end of tour of duty.
H. Proceed according to applicable operating rule(s).

4.6 Interoperable – Electronic Train Management System (I-ETMS)

4.6.1 I-ETMS Equipment

A. Audible Alarm – Sounds when I-ETMS operating conditions change.
B. I-ETMS Cut Out Switch and Breaker

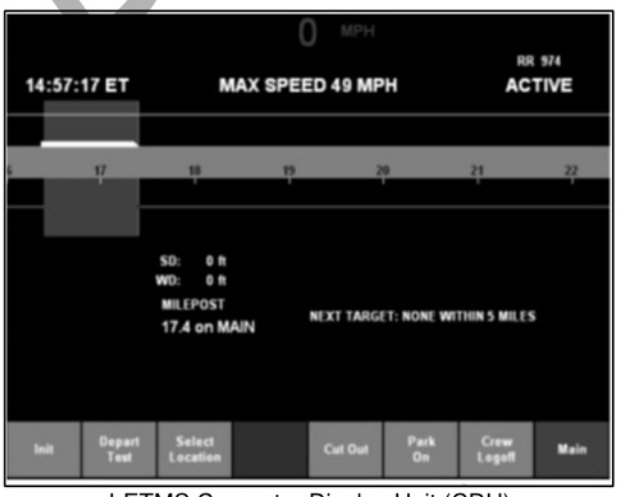
1. I-ETMS Pneumatic Cutout switch/valve
   a. Pneumatically cuts out the I-ETMS system.
   b. All Amtrak locomotives which operate in I-ETMS territory are equipped an I-ETMS Pneumatic Cutout switch/valve.

DRAFT

c. An I-ETMS Departure Test **IS** required when the I-ETMS Pneumatic Cutout switch is transitioned from the cutout position to the cut in position.

2. I-ETMS Circuit Breaker
   a. Turns power ON or OFF to the I-ETMS System.
   b. All Amtrak locomotives which operate in I-ETMS territory are equipped an I-ETMS Circuit Breaker.
   c. An I-ETMS Departure Test **IS** required when the I-ETMS Circuit Breaker is transitioned from the "OFF" position to the "ON" position.
3. I-ETMS System Cutout Toggle Switches (Hard Cutouts)
   a. Emergency Cutout – Cuts out the emergency brake application function.
   b. Penalty Cutout – Cuts out the penalty brake application function.
   c. Horn Cutout – Cuts out the automatic horn actuation function.

I-ETMS System Cutout Switches (Hard Cutouts)



NOTE: Changing the position of the electrical or pneumatic switches may require an I-ETMS Departure Test.

C. I-ETMS Departure Test – PASSED

1. Record successful completion of the Departure Test on the MAP 100 as follows:
   a. Enter seal numbers (boxes 17) for electrical switch and pneumatic cutout.
   b. Enter "date" and "Time" of test (boxes 18)
   c. Complete "Train Control Test" portion of the MAP 100; fill out "Signature"' "Occupation", "Location", "Date" and "Time" blocks. (boxes 19-23)
   d. Check mark "F-End", "R-End" or both (boxes 15 and 16).

D. I-ETMS Computer Display Unit (CDU)

1. I-ETMS system states, track line, grade profile, permanent and temporary speed restrictions, Restricted Speed targets, Stop targets, warning time to penalty braking and distance to target are displayed by the Computer Display Unit (CDU). In addition, the CDU is used to initialize the I-ETMS system for operation and acknowledge target prompts.

I-ETMS Computer Display Unit (CDU)

DRAFT

FOI-00415 00000006203 "UNCLASSIFIED" 4/30/2026

4.6.2 I-ETMS Operation

A. Leading locomotive must be set up in the following manner:

1. I-ETMS Pneumatic Cutout switch/valve must be sealed in the IN position.
2. I-ETMS Circuit Breaker must be positioned to the “ON’ position.
3. I-ETMS 220 Mhz Data Radio Circuit Breaker must be positioned to the “ON” position.
4. I-ETMS System Cutout switches:
   a. Emergency Cutout – Cut “IN” and sealed
   b. Penalty Cutout – Cut “IN” and sealed
   c. Horn Cutout – Cut “IN” and sealed

B. Entering and Leaving I-ETMS Territory

1. I-ETMS territory must not be entered without I-ETMS in ACTIVE state unless system has failed and authority to proceed has been received in accordance the rules.
2. When approaching “PTC Entry” track to I-ETMS territory, engineer must select the track on which the train is operating using the CDU.
3. When leaving I-ETMS territory, engineer must acknowledge the “Leaving System Coverage” prompt using the CDU.

C. Suppression of Penalty and Emergency Brake Applications

1. Sounding of alarm when speed is above limit imposed by I-ETMS DOES NOT require acknowledgement.
2. Speed must be reduced prior to system initiating Penalty or Emergency brake application.

D. Recovery from Penalty and Emergency Brake Applications

1. When a penalty application occurs, place ABV handle in “SUPPRESSION” position.
2. Ensure throttle is in “IDLE” position.
3. When PCS/Penalty indication turns off and train has stopped, penalty application may be recovered.

4.7 Speedometer Overspeed System

4.7.1 Amtrak locomotives are equipped with a speedometer overspeed system used outside of Train Control System territory.

4.7.2 These locomotives are equipped with a pneumatic cutout to be used in the event that the system becomes defective.

4.7.3 The system will be considered defective when an overspeed condition is enforced more than 5 mph less than the maximum authorized speed. (Example: enforcement at 73 mph when maximum speed is 79 mph).

4.7.4 Speedometer overspeed equipped locomotives include: P-32BWH, P-32ACDM, P-40, P-42, GP-38-2, GP-38-3, MP15, 9600 series cab cars, NPCU and Surfliner Cab Cars.

4.7.5 All Siemens Charger Diesel locomotives, except MARC locomotives, are equipped with a sealed Overspeed Selector switch which must be set for the proper train type and the seal number must be recorded on the MAP 100.

Train Type	E	D	CC	CC	CC	C	C	C	C	B	B	B	B
ATC IN/OUT										CUT-OUT	CUT-OUT	CUT IN	CUT IN
ACSES IN/OUT										CUT-IN	CUT-OUT	CUT-OUT	CUT-IN
ITCS IN/OUT Switch						IN	IN	OUT	OUT

Charger Overspeed Logic Table

DRAFT

4.8 Multiple Penalty Brake Device (MPBD)

4.8.1 A Multiple Penalty Brake Device has been installed on Diesel Locomotives with multiple Train Control Systems. This MPBD is not part if the train control system and will not initiate a Penalty Brake Application but will assist the engineer in determining which Train Control System did.

4.8.2 The following components are part of the MPBD:

Display Unit located in the locomotive cab.

Remote Cutout Box

4.8.3 The seal numbers will be recorded on the MAP 100.

5.1.10 Brake Pipe Equalization Pressure For Freight Type Control Valves

Brake Pipe Pressure (PSI)	Brake Pipe Full Service Reduction (PSI)	Service Equalization Pressure (PSI)	Emergency Equalization Pressure (PSI)
90	26	64	76
100	29	71	84
110	32	78	93

5.1.11 FREIGHT LOCOMOTIVES IN PASSENGER SERVICE

When a freight locomotive is the only source of compressed air and will be used to haul a passenger train, brake pipe pressure must be increased to not more than 15 psi below the minimum main reservoir pressure of that locomotive before coupling to the train. Brake pipe pressure must not exceed 110 psi:

- If minimum main reservoir pressure is 120 psi, brake pipe pressure must be increased to 105 psi.
- If minimum main reservoir pressure is 130 psi, brake pipe pressure must be increased to 110 psi.

When a power unit, crane, or other piece of machinery will be used to haul non-passenger cars with freight type brake equipment, the maximum brake pipe pressure shall not be greater than15 psi less than the air compressor starting or loading pressure set on the power unit, crane, or other piece of machinery.

TABLE C

Passenger Standing Air Brake Test Table

Train Air Brake Test instructions apply to all movements which are considered Train Movements (see definition)

Train Movements Definitions	Class I	Class IA	Class II	Notes
• Commuter and Short Distance Intercity passenger trains - Once each calendar day.	X			-
• Long Distance Intercity passenger trains - Prior to departure at initial/originating terminal.	X			-
• Long Distance Intercity passenger trains - Every 1500 miles or once each calendar day, whichever occurs first.	X			-
• Commuter and Short Distance Intercity passenger trains which have not been used in passenger service for more than 12 hours since the last Passenger-Class I brake test, unless MAP 1173 indicates that Class IA brake test has been performed.		X		-
• When instructed to add (pick up) Passenger Equipment without an accompanying MAP 1173.		X		Not necessary to perform Class IA test on entire train; only added equipment. Class II test is required on entire train. Both tests may be performed at the same time.
• When instructed to add (pick up) Passenger Equipment accompanied by a MAP 1173 and it cannot be determined whether equipment has been "Off Air" for more than 4 hours.		X		Not necessary to perform Class IA test on entire train; only added equipment. Class II test is required on entire train. Both tests may be performed at the same time.
• When equipment will be moved between the maintenance facility and originating terminal without a MAP 1173.		X		-
• When Class I Brake Test has expired on a Commuter or Short Distance Intercity passenger train and Mechanical Department personnel are not available to perform test.		X		Train may only be moved in passenger service to the next location where passengers can be safely detrained.
• When instructed to add (pick up) Passenger Equipment accompanied by a MAP 1173 and it is known that equipment was connected to a source of compressed air within the last 4 hours.			X	-
• Whenever the control stand or controlling locomotive is changed.			X	When controlling locomotive is changed, perform required Locomotive Brake Test.
• When the Engineer first takes charge of the train without face-to-face relief.			X	-
• When cars or equipment are removed from a passenger train.			X	-
• After any emergency application of the brakes on a passenger train, except when testing the back-up hose.			X	-
• After determining cause for brake pipe continuity loss. Use EOT to perform test.			X	-
• When control valve or brakes are cut out			X	-
• When indicated by rule or special instruction			X	-
• At any point where a brake pipe angle cock has been turned except when performing the two-way-end-of-train device emergency function test.			X	-

DRAFT

MS 1.0 Piston Travel- Shoe/Pad Clearances

NOTE: These instructions apply to mechanical employees only.

Piston Travel- Shoe/Pad Clearances	
MS1.1 Amtrak Required Piston Travel for Locomotives / NPCU Cab Cars:	
F-40, GP-40, GP-15, GP-38, F-59, Dash - 8, NPCU.	2-1/2" – 3-1/2"
A. Amtrak required tread brake unit and disc pad clearances for locomotives:	
HHP-8 and ACS-64 Disc Brake.	Approximately 1/32" to 3/16"
HHP-8 Tread Brake Units.	Approximately 1/4"to 1/2"
P40BH, P-42, and P32ACDM (Genesis Series) Tread Brake Units.	1/4" to 3/8"
MS1.2 Piston Travel Shoe/Pad Clearances – All Cars:	
A. For vehicles equipped with nominal 12 inch stroke (8-1/2 or 10 inch diameter) car body mounted brake cylinders, piston travel shall be within 6 to 9 inches. If piston travel is found to be less than 6 inches or more than 9 inches, it must be adjusted to nominally 7-1/2 inches.	
B. For vehicles equipped with ***other than*** nominal 12 inch stroke (8-1/2 or 10 inch diameter) car body mounted brake cylinders, piston travel shall be adjusted per the brake cylinder piston travel stencil, decal, badge plate, or sticker located on the car.	
C. Amtrak Required Piston Travel for Passenger Cars	
Heritage Fleet / Truck Mounted Tread Brakes	3-1/2" to 4"
Bi-Level Auto Carriers	7" to 7-1/2
D. Amtrak Required Tread Brake Unit Maximum Clearance for Passenger Cars	
Amfleet I, Amfleet II, 1500/1600 MHC, Viewliner II, and Surfliner with Wabtec GB - 4-1/2 Tread Brake Unit.	3/4"
Capitoliner Cab Cars. with Wabtec GJ - 5 Tread Brake Unit	3/4"
Superliner I, Knorr or SAB Tread Brake Units	5/8"
Horizon, Viewliner I, and Superliner II with Knorr TBU-264-SPF Tread Brake Unit	3/8"
E. Amtrak Required Disc Pad Clearance for Passenger Cars	
Capitoliner Cab Cars, Amfleet I, Amfleet II, Viewliner I, Viewliner II, Horizon, 1500 MHC, and Superliner.	Approximately 1/4"
MS1.3 Inspection for Proper Release	
Proper release of the brakes can be determined by observation of the clearance between the brake shoe and the wheel or between the brake pad and the brake disc. (Manual inspection may be required).	

DRAFT

MS 2.0 Passenger Car Tread Brake Unit Slack Adjuster Inspection Procedure

MS2.1. This procedure is to be used upon replacement of brake shoes or upon excessive brake shoe clearance found on inbound inspection.
MS2.2 Apply proper Blue Signal Protection.
MS2.3 Secure Equipment per instruction 3.5 before going under or fouling car and then release the handbrake. Ensure brakes are released.
MS2.4 Visually inspect the following tread brake units for brake shoe clearance greater than listed in the MS Table A.

A. If necessary, measure clearance at top of shoe and at bottom of shoe. Actual clearance will be the average of these two values.

MS TABLE A - MAXIMUM BRAKE SHOE CLEARANCE		
Car Type	**Tread Brake Unit Type**	**Maximum Brake Shoe Clearance**
Amfleet I & II, Viewliner II, Surfliner,1500 Series MHC, and MW 16800 - 16808	Wabtec GB - 4-1/2"	3/4 "
Capitoliner Cab Cars (9600 series).	Wabtec GJ - 5	3/4 "
Horizon, Viewliner I, and Superliner II	KNORR 264 SPF	3/8 "
Superliner I (See instruction MS2.8).	KNORR or SAB	5/8 "

MS2.5 If the tread brake units are in excess of the dimensions listed in MS Table A, perform the following inspection procedure:

A. Inspect brake rigging and handbrake for binding. Confirm loose play of the brake rigging by shaking the handbrake linkage on top of the tread brake unit.

B. This operation is performed using the following wrench/socket sizes as shown in MS Table B.

MS TABLE B - WRENCH / SOCKET SIZES		
Car Type	**Tread Brake Unit Type**	**Wrench / Socket**
Viewliner II	Wabtec GB – 4-1/2"	1 1/2"
Amfleet I & II, Surfliner, 1500 series MHC, MW 16800 - 16808	Wabtec GB – 4-1/2"	1 1/8" & 1 1/2"
Capitoliner Cab Cars (9600 series).	Wabtec GJ - 5	9/16"
Horizon, Viewliner I, Superliner II	KNORR 264 SPF	1 5/8"

C. Rotate the slack adjuster nut clockwise and counterclockwise (You must depress to engage the adjuster nut on GJ-5 tread brake units before rotating the nut).

1. The nut should move freely with no binding. Counterclockwise rotation should move the brake head toward the wheel and clockwise rotation should retract the brake head away from the wheel.

D. Rotate the slack adjuster nut until the brake shoe fully contacts the wheel. Now rotate slack adjuster nut to obtain proper brake shoe clearance as listed in MS Table C.

E. If the slack adjuster nut does not rotate freely or adjustment cannot be made, then the unit is defective. Report defective unit to your supervisor.

MS TABLE C - BRAKE SHOE CLEARANCES		
Car Type	**Tread Brake Unit Type**	**Brake Shoe Clearance**
Amfleet I, II, Viewliner II, Surfliner, 1500 series MHC	Wabtec GB 4 - 4.5"	1 1/2" – 5/8"
Capitoliner Cab Cars (9600 series)	Wabtec GJ - 5	1/2" – 5/8"
Horizon, Viewliner I, Superliner II	KNORR 264 SPF	1/4" – 1/8"

MS2.6 Once the unit is adjusted, apply the brake and ensure effective brake shoe force by shaking the brake head or tapping on the wheel.
MS2.7 Release the brake and ensure brake shoe clearance complies with MS Table C.
MS2.8 Superliner I Knorr and SAB tread brake units do not have manual adjustment nuts. Perform the following procedure:
MS2.8.1 Pry back the brake head.
MS2.8.2 Apply the brakes and ensure effective brake shoe force by shaking the brake head or tapping on the wheel.
MS2.8.3 Release the brakes and inspect brake shoe clearance not to exceed 5/8"maximum.

ACS-64, SC-44, ALC-42		70-75
New Acela		
Parking Brake		**Pressure**
DASH-8,P32ACDM		100
Capitoliner Cab Car (9600 Series)		52-56
New Acela		
Service Brake Cylinder		**Pressure**
DASH-8, P32ACDM		58-62
26L and 26LIC Brake Equipment		58-62
HHP-8, HST Power Cars?		58-62
ACS-64,SC-44, ALC-42		62-70
Capitoliner Cab Cars (9600 Series)		36-42
NPCU Cab Cars (“Cabbage Cars”).		46-48
New Acela		
Emergency Brake Cylinder		**Pressure**
DASH-8,P32ACDM Locomotives		88-94
26L Brake Equipment: 110 psi Brake Pipe or 130 – 140 psi Auxiliary reservoir.		88-94
26L Brake Equipment: 90 psi Brake Pipe with Brake Pipe Fed (90 psi) Auxiliary Reservoir.		84-86
26LIC Brake Equipment		72-76
HHP-8 , HST Power Cars?		69-71
ACS-64 ,SC-44, ALC-42		74-82
Capitoliner Cab Cars (9600 Series)		45-50
NPCU Cab Cars (“Cabbage Cars”).		68-70
New Acela		
Safety Valves	**Location**	**Pressure**
Control & Distributing Valves	Control Valve	60
Locomotive Main Reservoir / Tier I Equipment	Under Loco with Main Reservoir piping / Equipment Room	150-155
Locomotive Main Reservoir / Tier II (HST) Equipment	Equipment Room	160
Locomotive Air Compressor Intercooler	On Locomotive Compressor	65
Discharge Pipe (where equipped)	On Locomotive Compressor	185
Dead Engine Feature - Service Portion must *be in Direct Release*		**Pressure Settings**
26L Equipment		25 psi
DASH-8, Genesis		45 psi
HHP-8 and HST Power Cars		45 psi (adjustable).
ACS-64, SC-44, ALC-42		84 psi
Capitoliner Cab Cars (9600 Series)		40 psi
New Acela?		
Location of Dead Engine cutout cocks		
GP-38, DASH-8, NPCU Cab Car, Switcher Type Locomotives are located under the floor of the cab on engineer’s side. Access from outside panel (engineer’s side).		
Genesis Locomotives are located under the floor panel behind the engineer’s seat. Access is through floor or outside panel (engineer’s side).		
ACS-64, SC-44, ALC-42, HHP-8, HST Power Cars, New Acela? and 9600 Series Cab Cars are located in the equipment room on the air rack. **NOTE:** Dead Engine feature on 9600 Series Cab Car is in the air brake enclosure in the coach area.

MS 6.0 Mechanical Department Periodic Brake Maintenance Requirements

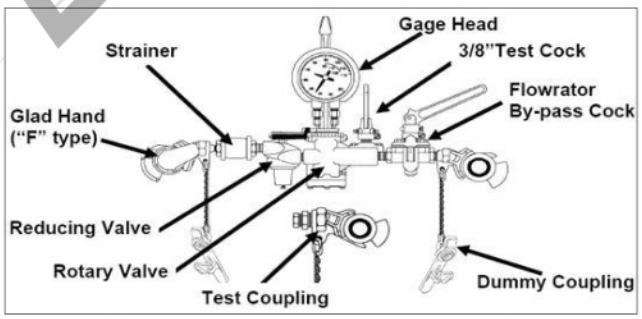
MS 6.1 Periodic Brake Maintenance Requirements for Equipment in Passenger Service

MS 6.1.1 Single Car Test Requirements

A. A Single Car Brake test may only be performed by a Qualified Maintenance Person (QMP).

B. A Single Car Brake Test is required when any of the conditions listed below are discovered:

1. A car found with one of the following defects:
   - **a.** Build up tread
   - **b.** Slid flat wheel
   - **c.** Thermal crack
   - **d.** Overheated wheel
   - **e.** Shelling



NOTE: A railroad need not perform the single car test required in this paragraph if the wheel defect is other than a built up tread and is due to a cause other than a defective brake system on the car.

2. One or more of the following conventional air brake equipment items is removed, replaced, or repaired.
   - **a.** Service Portion
   - **b.** Pipe Bracket
   - **c.** Emergency Portion or,
   - **d.** Relay Valve
3. A car or vehicle is placed in service after having been out of service for 30 days or more. (Private cars are exempt except for private cars leased by Amtrak).

C. If one or more of the following conventional air brake equipment items is removed, replaced or repaired, only that portion which is renewed or replaced must be tested:

1. Brake Reservoir
2. Brake Cylinder
3. Piston Assembly
4. Vent Valve
5. Quick service valve
6. Brake cylinder release valve
7. Modulating valve or slack adjuster
8. Angle cock or cutout cock

D. If the single car test cannot be made at the point where repairs are made, the car may be moved in passenger service to the next forward location where the test can be made. A railroad may move a car in this fashion only after visually verifying an application and release of the brakes on both sides of the car that was repaired, and provided that the car is appropriately tagged to indicate the need to perform a single car test. The single car test shall be completed prior to, or as a part of, the car's next calendar day mechanical inspection.

Passenger Type Single Car Test Device

MS 6.1.1 Passenger Service Periodic Brake Equipment Maintenance (CFR 49 Part 238.309 & 229.29)

Passenger Service Periodic Brake Equipment Maintenance Chart	
Passenger coaches and other un-powered vehicles	
AB Type Equipment	2,208 days
26C Type Equipment or equivalent	1,476 days
Equipment other than AB, ABD, ABDW, ABDX, 26C or equivalent systems	1,104 days
Conventional Locomotives	
26L or equivalent systems	1,104 days
26L or equivalent systems equipped with air dryer	1,472 days
Other than 26L or equivalent	736 days
CCBI (Amtrak Owned)	FRA-2005-21613
CCBII (Amtrak Owned)	FRA-2005-21613
HHP-8 Locomotives	FRA-2008-0065
CCB-1 and CCB-2 (except Amtrak locomotives), CCB-26, EPIC 1, EPIC 3102D2, EPIC 2, KB-HS1 and Fast Brake Systems	1,840 days
Cab Cars	
That portion of the brake system that uses brake valves identical to the 26C passenger coach brake system.	1,476 days
That portion of the brake system that uses brake valves identical to the 26L locomotive brake system.	1,104 days
That portion of the brake system that uses brake valves identical to the 26L locomotive brake system and is operated with locomotives equipped with Air Dryers	1,472 days
CCB-1 and CCB-2 (except Amtrak Cab Cars), CCB-26, EPIC 1, EPIC 3102D2, EPIC 2, KB-HS1 and Fast brake systems	1,840 days
CCB-2 (Amtrak Owned)	FRA-2005-21613
All other types of cab car brake valves.	736 days
9644 and 90200 Fast Brake	FRA-2005-21613
MU Locomotives	
Locomotive is part of a fleet that is not 100 percent equipped with air dryers.	736 days
Locomotive is part of a fleet that is 100 percent equipped with air dryers and equipped with PS-68, 26C, 26L, PS-90, CS-1, RT-2, RT-5A, GRB-1, CS-2, or 26R brake systems.	1,104 days
Locomotive is part of a fleet that is 100 percent equipped with air dryers and equipped with KB-HL1, KB-HS1 and KBCT1 brake systems	1,840 days
All other MU locomotives.	736 days

DRAFT

MS 6.1.2 Records of Periodic Maintenance

A. The date and place of the cleaning, repairing, and testing required by this section shall be recorded on Blue Form/MAP 816 or a similar form developed by the railroad containing the same information, and the person performing the work and that person's supervisor shall sign the form, if possible. Alternatively, the railroad may stencil the vehicle with the date and place of the cleaning, repairing, and testing and maintain an electronic record of the person performing the work and that person's supervisor.

B. A record of the parts of the air brake system that are cleaned, repaired, and tested shall be kept in the railroad's files, the cab of the locomotive, or a designated location in the passenger car until the next such periodic test is performed.

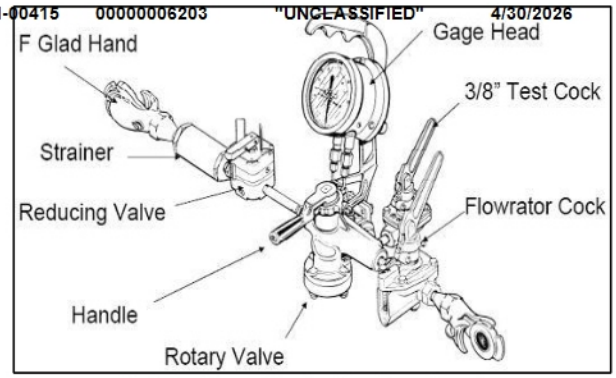
MS 6.2 Periodic Brake Maintenance Requirements for Equipment in Freight or Non Passenger Service

MS 6.2.1 Repair Track Brake Test (CFR 49 Part 232.305)

A. A Repair Track Brake Test may only be performed by a Qualified Person (QP).
B. A Repair Track Air Brake Test is required anytime a car is on a shop or repair track.
C. Any car that fails the repair track brake test must receive a single car test (CFR 49 Part 232.305).
D. Repair Track Test Procedure

NOTE: An approved test device maintained in accordance with CFR 49 Part 232.309 must be used.

1. Apply proper Blue Signal protection.
2. Secure equipment per instruction 3.5.
3. Inspect the following components on the car:
   - **a.** The brake pipe and any other pneumatic trainlines must be securely clamped.
   - **b.** Angle cocks are properly located with suitable clearance and properly positioned to allow maximum airflow.
   - **c.** Valves, reservoirs, and cylinders are tight on supports and securely attached to the car.
   - **d.** Hand brakes are tested, inspected and operate as intended.
   - **e.** Brake indicators on cars so equipped are accurate and operate as intended.
4. Charge air brake system to 90 psi.
5. Release hand brake.
6. Reduce brake pipe pressure 30 psi.
7. Reduction must not result in an emergency brake application. Brake must apply. Inspect car to make sure all brake shoes are firmly seated against their braking surfaces. Brake rigging must not bind or foul.
8. Check piston travel.
   - **a.** Cars with 8.5 inch or 10 inch diameter brake cylinders; piston travel shall be within 6 to 9 inches. If travel is less than 6 inches or more than 9 inches, piston travel must be adjusted to nominally 7.5 inches.
   - **b.** For cars not equipped with 8.5 inch or 10 inch diameter brake cylinders, piston travel must be adjusted to the limits stenciled on the car or badge plate marking.
9. Move test device to “Release” position.
   - **a.** Brake must fully release. There must be adequate clearance between all brake shoes and their braking surfaces. Brake rigging must not bind or foul.



MS 6.2.2 Single Car Brake Test Requirements

A. A Single Car Brake Test may only be performed by a Qualified Person (QP).
B. A single car brake test is required when any of the conditions listed below are discovered:

1. A car is found with one of the following wheel defects:
   - **a.** Thermal cracks
   - **b.** Slid flat wheel (unless known to be caused by hand brake left applied).
   - **c.** Built up tread (unless known to be caused by hand brake left applied).
2. One or more of the following conventional air brake equipment items is removed, repaired, or replaced:
   - **a.** Brake reservoir
   - **b.** Control valve mounting gasket
   - **c.** Pipe bracket stud
   - **d.** Service portion
   - **e.** Emergency portion or;
   - **f.** Pipe bracket
3. A car has its brakes cut out or inoperative when removed from a train or when placed on a shop or repair track.
4. A car is on a shop or repair track for any reason and has not received a single car test within the previous 12-month period.
5. Each car (except for cars subject to paragraph 6) shall receive a single car test no less than every five years.
6. New or rebuilt cars shall receive a single car test no less than eight years from the date the car was built or rebuilt.
7. New or rebuilt cars shall receive a single car test before the car is placed in revenue service.
8. A car is found with missing or incomplete single car test information.

"certified car inspector" means a person who is trained and qualified to perform safety inspections of passenger cars pursuant to subsection 6.1;

"qualified person" means, in respect of a specified duty, a person who, because of his/her knowledge, training and experience is qualified to perform that duty safely and properly;

«inspecteur de wagons autorisé» désigne une personne qui a reçu la formation nécessaire et qui est qualifiée pour faire les inspections de sécurité des voitures voyageurs conformément à l'article 6.1 ;

«personne qualifiée» désigne, par rapport à une tâche précise, une personne qui, grâce aux connaissances, à la formation et à l'expérience qu'elle possède, est qualifiée pour exécuter la tâche correctement et de façon sécuritaire ;

RO @ 125° C - 170.85 OHMS (± .75 OHMS)
RT CURVE - 5K UNI - CURVE

2 - INSULATION RESISTANCE :
1000 MEGOHMS @ 200 VOLTS DC

3 MAXIMUM TEMPERATURE :
THE MAXIMUM TEMPERATURE IN AREA FROM HEX TO SENSING TIP SHALL BE 150° C. THE BALANCE OF THE SENSOR SHALL NOT SEE A TEMPERATURE GREATER THAN 110° C.

4 - STABILITY :
THE STATED TOLERANCE FOR RO @ 125° C PERTAINS ONLY IF THE SENSED TEMPERATURE DOES NOT EXCEED 150° C FOR 2 HOURS.

5 - LEAD OUT :
LEAD OUT TO BE 2 CONDUCTORS, 18 GA TPR WITH OUTER PROTECTIVE STAINLESS STEEL FLEX TUBE MOLDED INTO A WATERPROOF EZ - CHANGE® CONNECTOR (PER DWG). CABLE / CONN ASSY TEMP RATING = 105° C OR GREATER.

6 - VIBRATION :
ASSEMBLY SHALL PASS THE REQUIREMENTS OF MIL - STD - 202, VIBRATION TEST METHOD 204, TEST CONDITION D.

7 - INSTALLATION :
MAXIMUM INSTALLATION TORQUE NOT TO EXCEED 48 INCH POUNDS.
RECOMMENDED THREAD LUBRICATE : MOLY LUBE COAT.

8 - CONNECTOR PINS :
CONNECTOR PIN SOCKETS WILL BE GOLD PLATED, PER QQS - 365 TYPE II GRADE A, AND WILL PASS 40 LB. PUSH TEST (MINIMUM).

9 - DIELECTRIC : 500 VOLTS RMS AT 60 HZ.

10 AMTRAK & MANUFACTURERS P / N' S AND DATE CODE TO BE PERMANENTLY MARKED ON HEAT SHRINK LABEL.

Amtrak
Rolling Stock Equipment

AMTRAK
Shunt Enhancement Device

Specification No. 1118
Revision No. 0

1.0 Scope

This Specification defines the vendor's general technical requirements applicable for the design, purchase and installation of locomotive or passenger vehicle shunt improvement device(s), component(s), assembly or equipment on Amtrak's Fleet.

The intent of this specification is to provide a scope of requirements which meet or exceeds the Railroad Shunting and/or Wayside Signal Standards as these requirements specifically noted below:

Expected Shunt Level or Wayside Signal standards:

1. Ohmic value should be less than 10 milli-Ohms (0.000 to 0.010 Ohms) of Resistance over the vehicle from rail to rail. This can be accomplished by a device that:
    a. Mechanically contacts the rails directly
    b. Mechanically contacts the wheels, provided necessary resistance is made to rail
    c. Is contactless via antenna or equivalent device

Given the lighter and shorter locomotive and car consists normally operated by Amtrak, Rolling Stock Equipment (RSE) is requiring a simple, efficient, inexpensive and effective method to improve all Shunting or Wayside Signal paths caused by the nature or configuration of our equipment consists as they travel during normal passenger operations.

DRAFT

1.1 General

This Specification is intended to be used in conjunction with any associated Amtrak drawings and/or CADD models, the Amtrak Procurement Department purchase orders, and other contractual documents issued to the vendor. It is Amtrak's intention that all components supplied under this Specification, unless improvements are otherwise identified, be functionally interchangeable with those currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation. Any food service, sanitation or other public health items supplied under this Specification must comply with the applicable requirements of the Food and Drug Administration (FDA) of the US Department of Health and Human Services, and also the National Sanitation Foundation (NSF).

As basic work under this Specification, each item produced must be completely functionally tested, cleaned, sanitized as required, properly packaged for shipment to Amtrak, and have documentation submitted. Amtrak will perform a series of First Article Inspections on the first item

produced by a vendor, in order to verify that the process and materials used are in compliance with this Specification and drawings.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to the Amtrak Contracting Agent in a timely manner for mutual investigation and satisfactory resolution, with any revision approved in writing by the Amtrak Contracting Agent. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions. Wherever possible, this Specification has been developed on the basis of equipment performance required, rather than specific hardware to be provided. Where specific hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Amtrak Engineer, in order to allow vendors to employ innovation and advanced technology, where appropriate. Preference, to the extent practicable and economically feasible, will be given for products and services that conserve natural resources, protect the environment and are energy efficient.

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term "or approved equal" if not written thereafter shall be implied. Any reference to a particular manufacturer's product, either by trade name or limited description, is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term "or approved equal" means any other manufactured product or article which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak's written opinion as to whether the proposed alternate is equal to the specified items for Amtrak's specified use and purposes shall be final and conclusive. The vendor shall not subcontract the design and manufacturing work under this Specification without the written authorization of the Amtrak Contracting Agent. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak.

DRAFT

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted vendor Technical Proposal, but are necessary for the completion of the item being supplied, shall be considered a part of the scope of supply. In this Specification, all references to "number of days" shall mean calendar days unless otherwise stated.

Safety shall be of primary importance in the design of any items being supplied. They shall present a safe, hazard-free environment to the extent practical. No sharp edges or corners or pinch points shall occur where any personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize injury.

1.2 Amtrak Ownership Rights

Unless specifically waived in writing by the Amtrak Contracting Agent, all drawings, bills of materials, catalog lists, mockups, CAD models, documentation and all other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection or other process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

1.3 Vendor's Technical Proposal

As a condition of contract award unless otherwise indicated in the Amtrak Procurement documents, the vendor must submit a written and detailed Technical Proposal to the designated Amtrak Contracting Agent. This Technical Proposal must identify the vendor's interpretation of what it considers to be the scope of Basic Work to be performed, present a complete technical description of the components to be supplied, fully describe the operation and maintenance requirements of the components, include a copy of the vendor's Quality Assurance program, describe any Design Review process, present a step-by-step work plan for construction, include a project schedule by major events starting from the Notice to Proceed, and a Bill of Material of all components to be supplied.

1.4 Exceptions

The vendor shall explicitly identify to the Amtrak Contracting Agent any exceptions being taken to this Specification, referencing the Specification Section number and the exact wording in question. It will otherwise be assumed by Amtrak that the vendor takes no exception to this Specification and is completely compliant with all Specification requirements.

1.5 Legal Requirements

All items being supplied under this Specification must comply with all applicable Federal government requirements, in particular those identified in 36 CFR Part 1192, Subpart F (ADA Requirements for InterCity Rail Cars), 49 CFR Part 223 (Glazing Standards), 49 CFR Part 229 (Locomotive Safety Standards) and 49 CFR Part 238 (Passenger Equipment Safety Standards), among others. This shall include all design aspects, as well as required submittals for approval. It is mandatory that all required materials used by the vendor for application in passenger cars or the cab interior of passenger service locomotives comply with the flammability and smoke emissions requirements of the latest edition of 49 CFR Parts 238.103 (a)(2) and (b)(2), and the Appendix B requirements (including referenced notes) for the category and function of material so listed. Prior to the First Article Inspection and any delivery of material, the vendor must supply the Amtrak Contracting Agent with a report by a recognized third-party independent testing laboratory certifying that all required materials used comply with the 49 CFR Part 238 Appendix B flammability requirements, if applicable.

1.6 Engineer

The Engineer or Amtrak Engineering, as referenced in this Specification or any drawings, is defined as the Senior Manager of Equipment Engineering within its Mechanical Department, or its written designee. The vendor may be submitting items for the Engineer's approval as required by the Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to all of the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submissions shall contain sufficient detail to confirm that Specification requirements are being met. However, the vendor shall use judgment as to what level is appropriate and shall communicate with the Engineer when guidance is needed on a case-by-

DRAFT

case basis. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible.

1.7 Cost Items

Any individual extra work items regarding the items being supplied shall be handled in accordance with the purchase order and other contractual documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Contracting Agent, and not solely the Engineer, regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Contracting Agent in accordance with the contract documents.

1.8 Vendor Quality Assurance Program

The vendor is required to have in place a documented Quality Assurance Program that is modeled after an established industry quality standard, such as the ISO, AAR, or other organization. The vendor's facility is required to be equipped with equipment, personnel and management completely sufficient to assemble, inspect and test each item being supplied under this Specification. The vendor shall have suitable equipment to diagnose any failure mode, and perform all adjustments and tests required to confirm proper operation. The vendor's Quality Assurance staff shall be active participants in the assembly, inspection, testing and documentation phases of the work. The vendor is required to submit a copy of its Quality Assurance Program as part of its Technical Proposal, as explained in Section 1.3. While it not a mandatory requirement under this Specification, it is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000 or an equivalent recognized standard.

Amtrak Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. The vendor shall fully cooperate in such audits. Specific attention shall be paid to the areas of management responsibility, quality system, contract review, design control, document control (including drawings), purchasing, purchaser-supplied product, product traceability and identification, process control (including procedures, testing and equipment), inspection and testing, measuring and test equipment (including calibration programs), control of nonconforming products (applied controls), corrective and preventative actions, handling, storage, packaging and delivery, quality records, internal quality audits, training, servicing and statistical techniques.

1.9 Critical to Quality (CTQ) Part Criteria

It is mandatory that the vendor comply with Amtrak procedure PD 3.7.4.02, Critical to Quality (CTQ) Part Criteria, which applies to all products identified by either the Engineer or the designated Amtrak Contracting Agent that Amtrak considers to have aspects identified that are Critical To Quality (CTQ). CTQs shall be Critical to Quality (CTQ) characteristic are defined as "Those characteristics of an item which, if non-conforming, may prevent or seriously affect the unit performance, reliability, producibility, or customer satisfaction of a component." This

DRAFT

26-PDF-0041-5 0000000006204 UNCLASSIFIED 4/30/2026

procedure defines the methodology when qualifying parts or processes to assure that the critical to quality product criteria meet Amtrak requirements by:

- Implementing a rigorous Part/Process qualification to ensure the participation, communications of all related departments and the quality acceptance.
- Support the Quality process by involving the vendor early in the project/design process.
- Assure that the vendor is supplying materials that meet the quality, cost, delivery and reliability requirements.

1.10 Components

The vendor shall use only new parts for all components, unless otherwise specified on the drawings or contract documents. It is Amtrak's desire that all materials, to the greatest extent possible, be of commonly available commercial items and hardware. The vendor shall maintain drawings for each component, and where necessary, patterns, jigs and fixtures, to assure identical manufacture. All elastomers used shall have a design life of 10 years in service unless otherwise approved by the Engineer.

1.11 Conducting Tests

The vendor shall be equipped and responsible to fully test the items being supplied in accordance with this Specification and any referenced drawings as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended by the apparatus supplier, and the vendor shall maintain documentation of such calibrations.

DRAFT

1.12 Workmanship

All workmanship shall be of high grade and shall conform to the best of manufacturing practices. Skilled, qualified, well motivated personnel, with appropriate experience, training and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in its facility this Specification, and all other referenced drawings and documents.

1.13 Documentation Records

The vendor shall maintain an electronic database and/or approved logbook of information regarding all components supplied to Amtrak under this Specification. At a minimum, records shall identify the Amtrak purchase order number, any serial number of the assembly, Amtrak "SAP" internal catalog number (if known), copies of any written authorizations by the Amtrak Contracting Agent, inspection and test data, shipping date and shipping location. In addition, it shall include a copy of the flammability and smoke emission laboratory certification report, if required, under 49 CFR Part 238 Appendix B for the components being supplied. The vendor shall include any applicable fire safety analysis and all certifications such as by the U.S. Public

Health Service, the U.S. Food and Drug Administration, Underwriters' Laboratories and the National Sanitation Foundation.

1.14 Referenced Documents

The latest revision level of all referenced drawings and documents are to be considered to be the applicable version.

- AAR S-9409 Railway Electronic Environmental Requirements
- ISO 9001:2000, Quality Management Systems - Requirements
- Amtrak drawings and models provided with the bidding and contract documents.

2.0 General Requirements

2.1 Design Considerations

Any components being supplied under this Specification shall be designed and manufactured to perform satisfactorily for a minimum design life of 10 years, unless otherwise specified. To the extent possible, only readily available components, hardware and fasteners shall be used. Any assembly hardware visible to passengers shall be recess mounted stainless steel.

The design and components shall comply with the flammability, smoke emissions and toxicity requirements of Amtrak Specification 352. Any water systems being supplied shall comply with the design requirements of Amtrak Specification 339. All water and waste systems shall have freeze protection systems provided in compliance with Amtrak Specification 531. All wire and cable shall comply with Amtrak Specification 323. All materials and workmanship shall comply with the requirements of Amtrak Specification 328. Components shall be selected for maximum endurance between inspections, and for ease and quickness of inspection. All items of electronic hardware and software proposed by the vendor to control or monitor any safety functions must have a safety program meeting the requirements of 49 CFR Part 238.105 submitted to the Engineer for approval and compliance along with all other applicable regulations to the device.

As appropriate, the overheating of apparatus and overall fire safety design shall be addressed by use of thermal cutouts, selection and use of materials meeting flammability, smoke generation and toxicity requirements, and by means of fire detection and suppression. All food service galley systems and auxiliary equipment shall be equipped with overheat sensors and thermal cutouts.

DRAFT

Any items being supplied under this Specification for use either by passengers or train crew staff shall be designed to provide maximum comfort and safety as dictated by ergonomic requirements. All items shall be designed utilizing Universal or Transgenerational design, considering the needs of a broad range of users and citizens. This is particularly critical for the very young and the elderly who, while not considered "disabled" are often less stable or lack strength in situations considered "normal" by manufacturers. Applying these concepts need not complicate or add expense to the component but einsure its continued utility and safety over time regardless of the demographics of the service area. Special attention shall be given to passengers with reduced visual acuity by providing them with visual cues as required. Floor support surfaces should have high contrast colors in this regard, and high contrast signage and striping patterns shall be provided where necessary, as approved by the Engineer.

All apparatus being supplied which requires inspection or maintenance must be readily accessible and replaceable, and shall be arranged to provide simple, easy access. Special attention shall be given such that opened covers, access doors, etc., provide sufficient room for a maintainer to easily gain access to equipment within lockers or enclosures. Secondary safety latches shall be used for all overhead ceiling covers, and any car exterior enclosure cover. In general, frequency of required service shall determine the degree of equipment accessibility.

For newly designed systems being supplied under this Specification, the vendor shall prepare for Engineer approval a Maintainability Analysis for the components being supplied. The analysis shall be the basis for development of maintenance tasks procedures, methods, and techniques. This analysis shall establish the maintenance concepts to be incorporated in the design, taking into consideration the requirements for safety, reliability, accessibility of apparatus, and the skills available for performing maintenance. Maintainability Analysis shall include all tasks required at each level of maintenance (daily, periodic, annual and overhaul), the task frequency, the time required, required labor resource, skill levels, and the necessary tools and support equipment. The Maintainability Analyses shall be a continuing effort during design and shall provide data for consideration in the review of the design.

DRAFT

2.2 Environmental Conditions

Any components being supplied under this Specification shall be designed to comply with the conditions listed in Amtrak Specification 963, Environmental and Operating Conditions, and must be suitable for use up to 10,000 feet elevation above sea level. They shall also be designed and mounted to have structural integrity and be operationally reliable for the vibration environment at the point of attachment, and shall prevent unacceptable vibration inputs to the attachment structure. The component structure and mounting shall be designed to prevent amplification through component resonance beyond a level twice that of the attachment point. The vibration force output of any rotating component shall not exceed the vibration environment specified for the component.

All carbody mounted equipment shall be designed to withstand continuous vibrations of at least 0.2 g at frequencies up to 100 Hertz in all directions, as well as randomly orientated shock loads of at least 5 g's longitudinally, 3 g's vertically and 3 g's laterally. Truck components located above the primary suspension shall be designed to withstand continuous vibrations of at least 6 g's at frequencies up to 100 Hertz in all directions, as well as randomly orientated shock loads of at least 8 g's. Truck components directly carried on the axles shall withstand continuous vibrations of at least 50 g's up to 100 Hertz in all directions, as well as randomly oriented daily shock loads

26-PDF-0041-5 0000000204 UNCLASSIFIED 4/30/2026

of at least 200 g's. Vibration resistance shall be verified by analysis, to the satisfaction of the Engineer.

2.3 Interchangeability

All similar parts on each item being supplied, and among all other assemblies and their spare parts, shall be designed and manufactured to be identical, both as individual parts and as subassemblies. All assemblies shall mount to the vehicle without modification. Model numbers for identical components shall be identical. Replaceable components of any such apparatus shall be fully interchangeable, without adjustments to any part being necessary.

2.4 Dimensions

All designs, components, dimensions and fasteners used on the components being supplied under this Specification, unless otherwise stated in the bidding and contract documents, shall be of United States inch-standards. Due to potential compatibility issues with existing Amtrak rolling stock, any components and fasteners using metric dimensions shall not be supplied unless approved in writing by the Engineer.

The vendor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value. Drawings prepared by the vendor shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views. Dimensional tolerancing shall be appropriately applied for the part being manufactured.

DRAFT

2.5 Cleaning and Maintenance

All components being supplied under this Specification shall be easy to clean and maintain. They shall not require maintenance or adjustments at internals of less than four years, unless approved in writing by the Engineer. Pockets where dirt and debris can collect shall be minimized; those that exist shall be made easy to clean with standard vacuum cleaner equipment. Light fixtures shall be fully gasketed, including diffuser covers, to prevent dirt entry into the fixtures. Where possible, components requiring maintenance or replacement at overhaul shall be replaceable as individual units. The design shall ensure that items that require repair and or service are easily accessed, removed and replaced and that this is possible with the use of standard hand tools. Variations of fastener thread size, thread length and head style shall be minimized to ease overhaul and regular maintenance. The number of fasteners shall be kept to a minimum. All paints, coatings and corrosion protection shall meet the requirements of Amtrak Specification 328.

2.6 Interference and Transient Suppression

All electrical components and wiring being supplied shall be carefully planned and selected to avoid electrical interference in the operation of train crew and maintenance department portable radios, public address and any other frequency sensitive systems. Likewise, these components shall be immune to the EMI/RFI effects of electrical interference from Amtrak's electrically and diesel-electrically propelled trainsets, passenger cars and locomotives. The vendor shall include

the use of shielded cables, chokes, filters, and capacitors, as required by good design standards, to avoid possible interference with these systems. Adequate voltage transient suppression shall be provided for the protection of circuitry involving semiconductor devices. Low voltage circuits shall be capable of withstanding 1.5 joules, unless otherwise approved by the Engineer.

Apparatus creating EMI emissions shall be designed to contain these emissions within their package area. Suppressors shall be incorporated across inductive devices to minimize switching transients. All suppression devices shall be selected on the basis of their ability to absorb the amount of energy available in the connected circuit, for the number of cycles of operation expected in service, without requiring replacement prior to scheduled overhaul. All magnet valves and relay/contactor coils shall have free-wheeling diode or metal-oxide varistor voltage spike suppression, or other suppression means, except where this results in deterioration of performance. Coil suppression devices shall be located physically on or as close as possible to the coil it protects (preferably directly at the coil terminal). Wherever possible, the suppression of transients shall be at the source. Provided device must comply with North American rail environment operations including signal and wayside interference with the onboard technology.

3.0 Specific Requirements

As a requisite of any pre-bid proposal, the vendor(s) shall be required to provide to Amtrak Engineering, a concept of the prototype device that demonstrates that the prototype will improve the ability of the Amtrak's fleet to exceed all shunting and wayside signal requirements. It is expected that this proposal includes theory, application, material requirements, installation method/guidelines expected cost of installation and maintenance of provided device. The device must have a design life of a minimum of 10 years with no less than 6 months between required changeout of wear components.

The vendor shall provide a concept prototype device prior to production that will improve the ability of the Amtrak equipment to meet all shunting and wayside signal requirements outlined within this specification.

Safety shall be of primary importance in the design of any items being supplied. All equipment shall present a safe, hazard-free environment to the extent practical. No sharp edges or corners or pinch points shall occur where any personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize injury.

Amtrak Engineering will perform a series of First Article Inspections on the prototype item produced by a vendor in order to verify that the process and materials used are in compliance with this specification and drawings. In addition, supplier will provide all support necessary – including but not limited to engineering resources, materials, specialized tooling and or equipment – to ensure testing of the device meets the Amtrak specification and complete combability with the North America railroad network and operating environment.

The vendor shall provide in its technical proposal and at its own expense, all design concepts, drawings, technical data and schematics, installation, shipment and delivery, planned production, method of installation and expected lead times for all required materials and costs.

It is Amtrak's intention that all components supplied under this Specification, unless improvements are otherwise identified, be functionally interchangeable with those currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation.

DRAFT

As basic work under this Specification, the vendor shall be responsible for the concept and prototype device design and manufacture for evaluation and testing to prove the performance, durability, practicality, usefulness, maintainability, ease of installation and performance of the prototype Locomotive Shunt Improvement Device and the devices ability to improve and provide the Amtrak equipment to meet and exceed this requirements in this Specification.

Should any part of the proposed device contact any moving part of the Locomotive or Passenger Car or Rails/Track that the Locomotive rides upon, care must be taken to eliminate any possible resulting source of possible undesirable interaction, snag, impediment, operational obstacle, thermal "hot spot", thermal elevation of device or development or potential spark generation, shock, or possible sources of ignition that may be generated or develop during the operation and testing of the device.

Should any part of the device contact any moving part of the Locomotive or Rails, no sparks or possible sources of ignition may be generated or develop during the testing and operation of the device.

All prototype devices used to improve the performance of Locomotive shunting must be able to be applied without operational compromise to Amtrak's current safety, electrical, mechanical, environmental or government requirements and systems on the Amtrak Fleets. All devices must meet or exceed all existing Amtrak operating requirements, clearances, equipment allowances and constraints or federal regulations.

The vehicle onboard device should, at a minimum, be capable of:

Maximum Speed Range	90 MPH
Rail to Rail Resistance over Vehicle	0.010 Ohms
Rail Gauge	4 ft 8.5 in.
Minimum Horizontal Curve	250 ft radius horizontal curve (23 degree curve) for coupled locomotives and for a locomotive coupled to an 85 ft car. No. 8 crossovers per Amtrak Drawing No. AM 73195-A on 12-foot track centers. No. 7 crossovers on 13-foot track centers; Facing No. 8 turnouts per Amtrak Drawing No. AM 73195-A arranged to form a "S" curve with a minimum of 5 feet of tangent between switch points; Two 400-foot radius reverse curves with zero tangent in-between. No. 6.5 turnout with 12' track center
Minimum vertical curve	1000 ft radius (concave or convex) for coupled locomotives and for a locomotive coupled to an 85 ft car.
Maximum Track Super Elevation	7 in.
Possible Vehicle Cant Deficiency	6 in.
Onboard Device Clearance	Amtrak D-05-1355

DRAFT

Environmental Conditions	Amtrak Specification 963
Locomotive Wheel Diameter	40" to 44"
Car Wheel Diameter	33" to 36"
Wheel Profile	Amtrak NRCC6
Power Options	72V DC Low Voltage Power Supply; Max Current Draw 10 Amps
	90 PSI pneumatic supply with regulator; Max CFM 10

Activation of this device should be provided by means in the locomotive operator cab (remote), manually on/at the device (local) or automated logic onboard the vehicle to be determined in design reviews as approved by Amtrak.

Note: if 480 volts 60HZ from the locomotive is used to power the device; there must be phase balance load between all 3 phases"

The contractor shall implement a weight optimization program in order to produce the lightest device consistent with the requirements of this Specification.

Amtrak will provide vehicle arrangement drawings as necessary to design mounting applications.

The Contractor is responsible for ensuring that all applicable published regulations, standards and Specifications are followed when complying with the requirements of this document. Various industry standards such as those published by AAR, APTA, ASME, ASTM, ANSI, IEC and IEEE documents mentioned in this Specification are examples acceptable to Amtrak. Material standards and Specifications which are used by the Contractor, unless otherwise approved by Amtrak, shall be of those organizations which are based in the United States, or are generally used on a commercial basis in the United States. The specified standards of this Specification may be replaced with Amtrak approved equivalent standards proposed by the Contractor after Notice to Proceed (NTP). The Contractor shall be required to establish the equivalency and to obtain explicit approval from Amtrak for any substituted documents.

Nothing in this Specification shall relieve the Contractor from ensuring that all applicable regulations, standards and Specifications are followed. The Contractor shall provide proof of compliance for those items so governed before the first device is accepted. The Contractor shall provide a compliance matrix for all applicable CFRs. Note that Amtrak will work with Contractor for necessary regulation waivers for such instances as CFR 229.71 and top-of-rail clearance for designed device if necessary.

4.0 Packaging and Shipment

For all components produced, following all assembly the vendor is required to perform and fully document a complete verification test and evaluation of each component being supplied, prior to shipment to Amtrak. The results of this final testing shall be recorded in the documentation record. When successfully completed, the vendor may be directed by the Engineer to apply a permanent Engineer-approved identification label in an inconspicuous agreed-upon area, which shall include the name and location of the vendor, any serial number used by the vendor, any Amtrak "AAMPS" internal catalog number, and the date of manufacture.

DRAFT

All packaging and shipping requirements shall be performed by the vendor. It is required that the vendor properly prepare all components being supplied under this Specification for shipment to Amtrak so that they are ready to install following unpacking. Any food service item being supplied shall be completely cleaned and sanitized in accordance with all requirements of the latest edition of the Food Code, issued by the Food and Drug Administration (FDA) of the US Department of Health and Human Services.

All components being supplied prior to shipping shall be completely winterized and drained by the vendor of all internal water, so as to be undamaged by freezing temperatures. The vendor shall package the components, unless otherwise instructed by the Amtrak Contracting Agent, to be suitable for continuous storage prior to unpacking in unheated (subfreezing), dusty indoor storage conditions. Fabric and soft goods shall be wrapped in plastic for protection against water exposure. Components shall be appropriately packaged for their weight and size. Special efforts must be used to protect unusually fragile or plastic items from damage during shipping and handling. Large and bulky items shall be secured to a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling.

The shipping package shall have an identification label. This label shall include the vendor's name and address, purchase order number, date released for shipment, Amtrak "AAMPS" internal catalog number, and any component assembly serial number. This information shall also appear in the vendor's invoice, and be included in the documentation record.

The vendor shall retain a copy of the shipping documentation record, and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Contracting Agent (or as otherwise designated in the purchase order), and the third copy shall be sent to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

DRAFT

5.0 Product Support

5.1 Program Schedule

If required by the contract documents, any vendor-produced Program Schedule shall include all program milestones, design reviews, production schedule, delivery schedule, and any other pertinent information that will assist with tracking program progress. Any requested changes to the Program Schedule must be presented to the Amtrak Contracting Agent for review and approval.

5.2 First Article Inspections

To verify that any components being supplied under this Specification meet all Specification and drawing requirements, and are truly interchangeable with existing components, Amtrak will conduct a series of two (initial and as-installed) First Article Inspections (FAI) on the first complete assembly manufactured by a vendor, prior to allowing unrestricted manufacturing work to start. It is the intention of the FAI process that every function and feature of the items being supplied under this Specification be fully exercised and tested for proper operation under all normal,

26-PBI-00415 0000006204 UNCLASSIFIED 4/30/2026

abnormal and fault conditions, both in the vendor's workshop and as applied on the vehicle.

The initial FAI shall consist of a pre-shipment inspection and testing of a prototype assembly at the vendor's facility. This shall be an active test, and the vendor shall provide all mounting fixtures, electrical and pneumatic power, etc, as required to fully functionally exercise all components and features. A complete range of operating voltages, currents, pressures, loads, etc. shall be applied to simulate both normal and abnormal conditions, and the response of the components to these conditions.

Once this FAI is successfully completed at the vendor's facility, the vendor shall ship the same assembly to the Amtrak maintenance facility identified by the Amtrak Bidding and Contract Documents or the Engineer, where Amtrak will install the assembly onto an Amtrak vehicle. A second "as-installed" FAI shall then be performed to verify proper operation of the assembly in the "as-installed" configuration. This shall in particular verify all component interface conditions with the vehicle.

Each FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. They shall include, but not be limited to, a mechanical and electrical inspection to determine compliance with the specifications and the drawings, complete testing of the functionality of the component, demonstration of maintainability and troubleshooting, and verification of proper operation and complete compatibility/interoperability when installed on a vehicle. Approval by the Engineer following successful completion of the FAI process, as communicated through the Amtrak Contracting Agent, shall constitute final system approval.

DRAFT

5.3 Delivery of All CAD Models and Drawings

Following the successful completion of the First Article Inspections, and as a precondition to permit production delivery of material to commence, the vendor must supply to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, an electronic set of every fully-developed CAD model and dimensioned drawing and Bill of Material which may have been created for every individual part used for the manufacture of all items being supplied under this Specification. All models and drawings shall comply with Amtrak Specifications 866 and 867. Refer to Section 5.4 for additional details. Any later modifications as a result of warranty or other actions must include the affected models and drawings being revised as necessary and resubmitted to Amtrak.

5.4 Production Changes Require Engineer Approval

Once final system approval is granted by the Engineer and production has commenced, the vendor is forbidden to make any changes in the design, material or configuration of the items being supplied, unless approved in writing by the Amtrak Contracting Agent as per Amtrak Procedure PD 3.7.3.01, Design Review and Control Procedure. This shall include any modifications required as a result of warranty actions, so as to provide complete documentation.

5.5 Spare Parts List

The vendor shall supply to the Engineer, via the Amtrak Contracting Officer, a Microsoft Excel

26-PDI-00415 0000000204 UNCLASSIFIED 4/30/2026

spreadsheet list in Engineer approved format of any spare or consumable parts which are recommended to be stocked by Amtrak for maintenance of the components being supplied. Such lists shall contain for each item an item number, the spare part name (in noun, adjective format), the name of the Original Equipment Manufacturer (OEM), the OEM part number, approximate cost for each item, and recommended stocking quantity. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

5.6 CAD Models, Drawings, Manuals and Parts Lists

All CAD models and drawings prepared by the vendor under this Specification shall be in full compliance with Amtrak Specification 866, CAD Model Standards and Amtrak Specification 867, Amtrak Drawing Standards for CAD. All CAD models and drawings shall be in Engineer-approved formats, and shall include a complete set of all "as-built" drawings of every part, component and assembly used for all items being supplied to Amtrak of all levels, not only the top assembly level. All CAD models shall identify all materials, surface finish and fasteners. Each drawing shall include a complete Bill of Material, providing quantities, original component manufacturer name and part number of the actual supplier of the part. Every part on the Bill of Material must be fully identified regarding its characteristics including material, plating, finishing, heat treatment, secondary operations, etc. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The drawing package shall also include drawings of every special tool, jig or fixture required to install, maintain or overhaul the assembly, and if referenced in any of the maintenance manuals. The final CAD models shall be delivered as 3 sets of DVDs or CDs in SolidWorks 2004 or above. The as-built drawings shall be delivered as 3 sets of DVDs or CDs of all drawings in electronic format in SolidWorks 2004 or above (DXF and AutoCAD 2000 format files shall be accepted only with prior approval of the Engineer) along with 3 sets of CDs of all drawings in Adobe Acrobat read-only PDF file format. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

One set of software (including any diagnostic tester software) used for any microprocessor system being supplied under this Specification shall be included with each assembly, with an additional complete set on CDs or DVDs to be provided to the Engineer via the Amtrak Contracting Agent. Amtrak shall be identified as the license holder for any commercial software used. Complete operations, programming, and diagnostic tester documentation shall be provided to the Engineer, including procedures for Amtrak to revise all user-changeable software settings. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

The vendor shall also submit in electronic format to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, a complete set of all documentation including the operating manual, maintenance manual, and parts list. All documentation data must be compatible with Microsoft Office 2000 or newer applications. The parts list shall identify all individual parts used (in noun, adjective format) in the items being supplied under this Specification, and must include the original equipment manufacturer (OEM) name and part number; use of an intermediate supplier or distributor's name or part number is not acceptable. The parts list shall indicate quantities for each item within each assembly, use exploded isometric-view parts diagrams if possible, use separate pages for parts diagrams and tabular data if possible, and be sufficiently complete to permit Amtrak to order individual replacement spare parts direct from the actual parts manufacturer. The maintenance manual shall include complete information from installation, through troubleshooting, repair and complete overhaul. The manuals shall include maintenance and parts information for every special tool, jig, fixture or

DRAFT

26-FQ-00415 0000005204 UNCLASSIFIED 4/30/2026

diagnostic test equipment used to repair or overhaul the assembly. The vendor shall also supply in electronic format all other manuals and other support documentation it has available for the components being supplied under this Specification. All documentation data must be delivered as 3 sets of CDs in Adobe Acrobat read-only PDF file format, distilled in Acrobat 5.0 or higher, and in addition 3 sets of CDs in its original Microsoft Office applications format, for internal use by Amtrak for future revision of the data. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

All PDF files (other than drawings) shall be distilled from the authoring documents, resulting in PDF documents that can be indexed and searched. All authoring electronic data files making up the manuals shall be delivered formatted such as to not cause pagination errors during the PDF distillation process. The PDF file produced from the distillation process shall match any published version of the authoring document. All files shall be editable by Amtrak for future document maintenance. All columnar data found within word processing files shall be presented in a table format. Any fonts used on the creation of authoring and/or PDF files shall be embedded and not restricted for use. PDF documents with definable chapters, sections and/or subsections shall be linked to their individual locations with bookmarks internal to the file in the fashion of a hierarchical format such as a Table of Contents. Creation of PDF files from scanned images only, resulting in non-searchable or non-indexable documents, will be restricted to only those allowed by the Engineer. Scanned information in the form of document attachments may be allowed to be imported into an existing PDF file that is searchable and capable of indexing, if the information is supplemental to context to the file and not the primary means of communicating the subject's information. If documents are scanned, careful attention will be taken to not allow misalignment of the pages. Opening options in the PDF file format should be set to show bookmarks and page, with magnification at "Set Width" and "Continuous Page" settings. Distillation settings shall be "E Book" or "Print", with DPI settings set to produce quality printing from a desktop printer without overly increasing the size of the file.

DRAFT

5.7 Training

If required by the Bidding and Contract Documents, following the successful conclusion of the First Article Inspection, the vendor shall provide complete on-site training at the Amtrak maintenance location identified in the Bidding and Contract Documents. The training shall highlight both the operation, maintenance and calibration procedures for the components being supplied. This shall include a minimum of 8 hours of classroom time and "hands-on" training, to be scheduled as mutually agreed between the vendor and the Engineer. The training program shall be presented in written format and shall include the written manuals that are provided for operation and maintenance.

5.8 Failure Analysis

A Failure Analysis to determine the cause and frequency of defects occurring during the warranty shall be performed by the vendor and submitted to the Engineer and the Amtrak Contracting Agent for concurrence. Such analysis shall be performed and reported within 30 days from the date of each failure.

6.0 Source Inspection

6.1 Purpose

Amtrak will perform periodic source inspection of vendor materials and components being supplied. The following is intended to be used as an outline defining activities and responsibilities of the vendor performing the source inspections.

6.2 Professionalism

All inspections, test observations, and other activities performed in the fulfillment of the contract are to be conducted in a professional and ethical manner. The vendor is representing Amtrak in the performance of the contract and therefore must remain courteous, conscientious and professional under all circumstances arising from performance of the contract.

6.3 Scope of Work

Amtrak has implemented a multi-faceted supplier management program of which source inspection is an integral part. Amtrak identifies vendors and materials/components through various methods which will be subject to source inspection. By performing source inspections, Amtrak expects to benefit by use of vendor facilities, measuring and testing equipment to verify materials/components, through rejecting noncompliant materials/components before shipment and receipt by Amtrak, presence of Amtrak representative periodically to ensure continuing good performance, and assist to communicate Amtrak intentions and interpretations of specifications and resolve issues. The vendor will conduct inspection or verify through observation, product compliance with drawings, specifications, standards or Amtrak contract documents and report findings of said inspections to Amtrak.

DRAFT

6.4 Services

6.4.1 Scheduling Inspections

The vendor shall conduct observations and verifications on Amtrak identified materials and components produced by the vendors for Amtrak. Inspections must be scheduled to coincide with final inspection of said materials/components due for shipment to Amtrak. The vendor may use random sampling where large quantities of material are subject to shipment and note sampling method in associated reports. The vendor must perform all dimensional and operational inspections in accordance with the Quality Plan prior to source inspection, and make all inspection records available for review by the Amtrak source inspector, with focus on CTQ items.

6.4.2 Dimensional Inspection

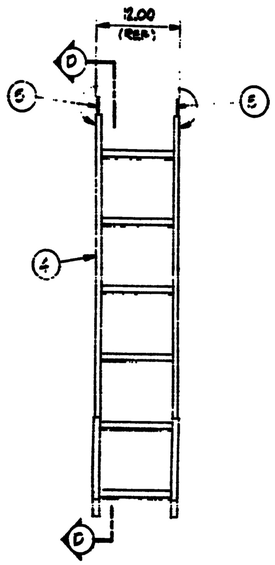
The vendor must witness and verify conformance with dimensional characteristics per drawings

26-PBI-00415 0000000204 UNCLASSIFIED 4/30/2026

identified in the Amtrak contract documents. The vendor must witness and verify conformance with regulatory standards and requirements including material certification as cited in specification or other reference documents identified in Amtrak contract documents.

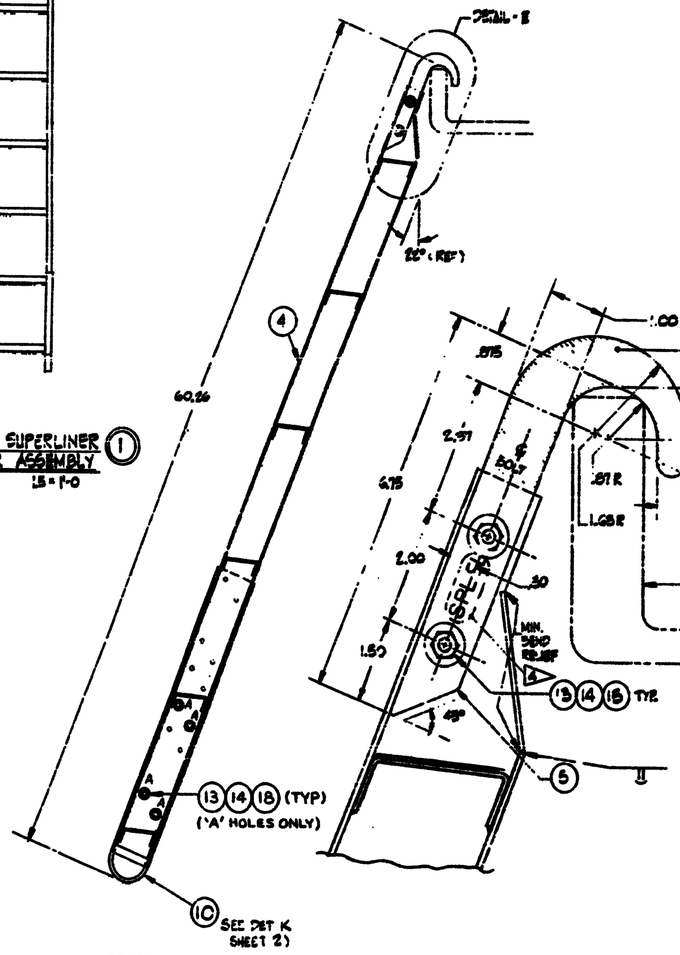
6.4.3 Operational Inspection

The vendor must witness and verify conformance with operational tests as cited in specifications, operators manual or other reference documents identified in Amtrak contract documents.



6.4.4 Inspection Reports

The vendor must provide a report documenting the vendor source inspection and the inspection results. The report must include the name of the vendor, the date of the inspection, the material or component name, Amtrak (AAMPS) ID number(s) for items inspected, the quantities of each item inspected, the inspection results, and the actions taken where nonconforming materials/components are found. Reports should reference appropriate drawings, specifications, standards, requirements, or Amtrak contract document as appropriate.



6.5 Qualification of Personnel

It is the responsibility of the vendor to provide personnel with adequate training and experience to perform all the activities of the source inspections described above. Personnel must also conduct their activities with professionalism.

DRAFT

FOR STOPPING DISTANCES:

A) SELECT INITIAL SPEED IN MPH COLUMN
B) FIND DISTANCE TO STOP ON SAME LINE IN STOP COLUMN

FOR REDUCING DISTANCES:

A) SELECT INITIAL SPEED IN MPH COLUMN
B) FIND DISTANCE ON SAME LINE IN IRED COLUMNS
C) SELECT FINAL SPEED IN MPH COLUMN
D) FIND DISTANCE ON SAME LINE IN FRED COLUMN
E) SUBTRACT IRED DISTANCE FROM FRED DISTANCE FOR REDUCING DISTANCE

NOTES:

1) CURVE FACTORS:
   1°CURVE = 0.05% UPGRADE
   2°CURVE = 0.10% UPGRADE
   10°CURVE = 0.50% UPGRADE

2) ACTUAL DISTANCES ARE DETERMINED AS FOLLOWS:

EQUATED ASCENDING = ACTUAL X $\frac{4+\%G}{4}$

EQUATED DESCENDING = ACTUAL X $\frac{4-\%G}{4}$

NOTES:

1) CURVE FACTORS:
   1 CURVE = 0.05% UPGRADE
   2 CURVE = 0.10% UPGRADE
   10 CURVE = 0.50% UPGRADE
2) ACTUAL DISTANCES ARE DETERMINED AS FOLLOWS:

ACTUAL ASCENDING = EQUATED X $\frac{4}{4+\%G}$

ACTUAL DESCENDING = EQUATED X $\frac{4}{4-\%G}$

Sheet No. 4 OF 12

26-FOI-00415 00000006217 "UNCLASSIFIED" 4/30/2026

AEM-7 BRAKING DISTANCE CURVES FOR ALL PASSENGER TRAINS LISTED IN THE SPECIAL INSTRUCTIONS OF THE TIMETABLE WHOSE SPEEDS ARE MORE THAN 110 MPH

DRAFT

CURVES:

⑤ STOPPING DISTANCE (25.0% SAFETY FACTOR + 8 SECS. DELAY TIME FOR CAB SIGNALS)

⑥ AVERAGE PERFORMANCE DISTANCE (NO SAFETY FACTOR, CLEAN AND DRY RAIL, ALL BRAKES FUNCTIONING AND AIR BRAKES ONLY)

⑦ INITIAL REDUCING DISTANCE (12.5% SAFETY FACTOR + 8 SECS. DELAY TIME FOR CAB SIGNALS)

⑧ FINAL REDUCING DISTANCE (12.5% SAFETY FACTOR)

STOPPING DISTANCE EQUATIONS

⑤ $S_{SD} = 0.6279V_I^2 + 11.7336V_I$

⑥ $S_A = 0.5023V_I^2$

REDUCING DISTANCE EQUATIONS

⑦ $S_{IRED} = 0.5651V_I^2 + 11.7336V_I$

⑧ $S_{FRED} = 0.5651V_F^2$

FOR STOPPING DISTANCES:

A) SELECT INITIAL SPEED IN MPH COLUMN
B) FIND DISTANCE TO STOP ON SAME LINE IN STOP COLUMN

FOR REDUCING DISTANCES:

A) SELECT INITIAL SPEED IN MPH COLUMN
B) FIND DISTANCE ON SAME LINE IN IRED COLUMNS
C) SELECT FINAL SPEED IN MPH COLUMN
D) FIND DISTANCE ON SAME LINE IN FRED COLUMN
E) SUBTRACT IRED DISTANCE FROM FRED DISTANCE FOR REDUCING DISTANCE

NOTES:

1) CURVE FACTORS:
   1°CURVE = 0.05% UPGRADE
   2°CURVE = 0.10% UPGRADE
   10°CURVE = 0.50% UPGRADE

2) ACTUAL DISTANCES ARE DETERMINED AS FOLLOWS:

EQUATED ASCENDING = ACTUAL X $\frac{5.31+\%G}{5.31}$

EQUATED DESCENDING = ACTUAL X $\frac{5.31-\%G}{5.31}$

NOTES:

1) CURVE FACTORS:
   1°CURVE = 0.05% UPGRADE
   2°CURVE = 0.10% UPGRADE
   10°CURVE = 0.50% UPGRADE

2) ACTUAL DISTANCES ARE DETERMINED AS FOLLOWS:

EQUATED ASCENDING = ACTUAL X $\frac{5.31}{5.31+\%G}$

EQUATED DESCENDING = ACTUAL X $\frac{5.31}{5.31-\%G}$

Sheet No. 8 OF 12

ACELA BRAKING DISTANCE CURVES FOR ALL PASSENGER TRAINS LISTED IN THE SPECIAL INSTRUCTIONS OF THE TIMETABLE WHOSE SPEEDS ARE MORE THAN 125 MPH

CURVES:

⑨	STOPPING DISTANCE	(25.0% SAFETY FACTOR + 8 SECS. DELAY TIME FOR CAB SIGNALS)
⑩	AVERAGE PERFORMANCE DISTANCE	(NO SAFETY FACTOR, CLEAN AND DRY RAIL, ALL BRAKES FUNCTIONING AND AIR BRAKES ONLY)
⑪	INITIAL REDUCING DISTANCE	(12.5% SAFETY FACTOR + 8 SECS. DELAY TIME FOR CAB SIGNALS)
⑫	FINAL REDUCING DISTANCE	(12.5% SAFETY FACTOR)

STOPPING DISTANCE EQUATIONS

⑨ $S_{SD} = 0.5447V_I^2 + 11.7336V_I$

⑩ $S_A = 0.4357V_I^2$

REDUCING DISTANCE EQUATIONS

⑪ $S_{IRED} = 0.4902V_I^2 + 11.7336V_I$

⑫ $S_{FRED} = 0.4902V_F^2$

DRAFT

FOR STOPPING DISTANCES:

A) SELECT INITIAL SPEED IN MPH COLUMN
B) FIND DISTANCE TO STOP ON SAME LINE IN STOP COLUMN

FOR REDUCING DISTANCES:

A) SELECT INITIAL SPEED IN MPH COLUMN
B) FIND DISTANCE ON SAME LINE IN IRED COLUMNS
C) SELECT FINAL SPEED IN MPH COLUMN
D) FIND DISTANCE ON SAME LINE IN FRED COLUMN
E) SUBTRACT IRED DISTANCE FROM FRED DISTANCE FOR REDUCING DISTANCE

NOTES:

1) CURVE FACTORS:
   1°CURVE = 0.05% UPGRADE
   2°CURVE = 0.10% UPGRADE
   10°CURVE = 0.50% UPGRADE

2) ACTUAL DISTANCES ARE DETERMINED AS FOLLOWS:

EQUATED ASCENDING = ACTUAL X $\frac{6.12+\%G}{6.12}$

EQUATED DESCENDING = ACTUAL X $\frac{6.12-\%G}{6.12}$

Amtrak

Bureau Of Rolling Stock Engineering

Specification for **Thermally Actuated Automatic Drain Valve for Freeze Protection on Passenger Cars**

Specification No. 1004

Initial Issue

1.0 Scope

1.1 Purpose

This Specification defines the vendor general design criteria requirements applicable for the manufacture of an *Thermally Actuated Automatic Drain Valve for Freeze Protection* used on Amtrak rail passenger cars. This Specification is intended to be used in conjunction with the Amtrak Procurement Department contract documents, purchase orders and other contractural documents issued to the vendor. It is Amtrak's intention that any new Thermally Actuated Automatic Drain Valve for Freeze Protection be functionally interchangeable with the Thermally Actuated Automatic Drain Valve for Freeze Protection currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to Amtrak in a timely manner for mutual investigation and satisfactory resolution. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions. Wherever possible, this Specification has been developed on the basis of car performance required, rather than specific hardware to be provided. Where specific hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Engineer. This approach will allow vendors to employ innovation and advanced technology where appropriate.

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term “or approved equal” if not written thereafter shall be implied. Any reference to a particular manufacturer’s product either by trade name or limited description is only for the purpose of setting a standard of performance , quality, composition, construction or size. The term “or approved equal” means any other manufactured product or article which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak’s opinion as to whether the proposed alternate is equal to the specified items for Amtrak’s specified use and purposes shall be final and conclusive.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted Technical Proposal, but are necessary for the completion of the diaphragm and faceplate assembly, shall be considered a part of the scope of supply. In this Specification all references to "number of days" shall mean calendar days unless otherwise stated.

Safety shall be of primary importance in the design of the items being supplied. They shall present a safe, hazard-free environment to passengers and the operating and maintenance personnel to the extent practical. No sharp edges or corners or pinch points shall occur where

DRAFT

passengers, crew, or maintenance personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize passenger injury.

1.2 Exceptions

The vendor shall explicitly identify to the Amtrak Procurement officer any exceptions being taken to this Specification, referencing the Specification paragraph and exact wording in question.

1.3 Scope of Work

It is the vendor's responsibility under this Specification, and fully expected by Amtrak, to supply a *Thermally Actuated Automatic Drain Valve for Freeze Protection* consisting of all new materials. It is Amtrak's desire that all materials, to the greatest extent possible, be of commonly available commercial items and hardware. All drawings, bills of materials, catalog lists, documentation and other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

As basic work under this Specification each item produced must be completely functionally tested, cleaned and properly packaged for shipment to Amtrak, and documentation submitted. Amtrak will perform a series of First Article Inspections on the first item manufactured by a vendor, in order to verify that the process and materials used are in compliance with this Specification and drawings.

DRAFT

1.4 Legal Requirements

It is mandatory that all materials used by the vendor in the item being supplied to Amtrak must comply with the flammability and smoke emissions requirements of the latest edition of 49 CFR Parts 238.103 (a)(2) and (b)(2), and also its Appendix B requirements (including all referenced notes) for all material types listed. All components being supplied must also comply with all applicable requirements identified in 49 CFR Part 238.

It is required that prior to the First Article Inspection and any delivery of material, the vendor must supply the Amtrak Procurement officer with: i) a report by a recognized independent testing laboratory certifying that all materials used comply with the 49 CFR Part 238 Appendix B requirements, if applicable, and ii) certification by the vendor that all components being supplied also comply with all applicable requirements identified in 49 CFR Part 238.

1.5 Engineer

The Engineer, as referenced in this Specification, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. During the course of the project the vendor may be submitting items for the Engineer's approval as required by the Contract and Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. All material being submitted shall have been reviewed by qualified vendor personnel and judged to be suitable for submission prior to doing so, and this shall be so stated in the letter of transmission or on the document, particularly as regards material passed through from subcontractors. Test results shall receive vendor staff

review and signature prior to submission. Submissions found to be deficient with regard to any of the above shall be immediately returned without review to the vendor.

Submissions shall contain sufficient detail to confirm that specification requirements are being met. However, the vendor shall use judgment as to what level is appropriate and shall communicate with the Engineer when guidance is needed on a case-by-case basis. Documents with levels of detail and information considered to be beyond what is needed or is time-effective to confirm compliance shall be given cursory review by the Engineer and considered as background information and shall not receive formal approval. Individual submissions shall not contain material from multiple subsystems or subcontractors and such submissions will be returned without review to the vendor.

Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible. However, the vendor shall consider the 30 days criteria and the time requirements involved for mailing when scheduling submittals. The days used by the Engineer in Design Review meetings or in travel to or from such meetings shall not be included in the 30 days figure. Delays caused by the Engineer's failure to review and approve drawings or schedules in a timely fashion as listed above shall be treated as an excusable delay, provided that the vendor can demonstrate to the satisfaction of the Amtrak Procurement officer that actual production delays have been caused by the Engineer and there is no other concurrent cause for delay.

1.6 Cost Items

Any individual extra work items regarding the items being supplied shall be handled in accordance with the contract and purchase order documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Procurement officer regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Procurement officer in accordance with the contract documents.

1.7 Vendor Quality Policy

It is mandatory under this Specification that the vendor have established and maintain a Quality policy system. The vendor's shop is required to be equipped with equipment, personnel and management completely sufficient to assemble, inspect and test each item being supplied under this Specification. The shop shall have suitable equipment to diagnose any failure mode, and perform all adjustments and tests required to confirm proper operation. The vendor's Quality Assurance staff shall be active participants in the assembly, inspection, testing and documentation phases of the work. It is required that the vendor have a quality assurance program deployed that, at a minimum, be modeled after an established quality standard. It is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000, or an equivalent recognized standard.

Amtrak Quality Assurance personnel will conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. The vendor shall fully cooperate in such audits. Specific attention shall be paid to the areas of management responsibility, quality system, contract review, design control, document control (including drawings), purchasing, purchaser-supplied product, product traceability and identification, process control (including procedures, testing and equipment), inspection and testing, inspection, measuring and test equipment (including calibration programs), control of

DRAFT

26-FOI-00415 00000006218 "UNCLASSIFIED" 4/30/2026
nonconforming products (applied controls), corrective and preventative actions, handling, storage, packaging and delivery, quality records, internal quality audits, training, servicing and statistical techniques.

1.8 Components

The vendor shall use only new parts for all components. Unless stated otherwise in this Specification, all threaded fasteners shall be vibration-proof stainless steel fasteners using selflocking
Nylon insert nuts. Stainless steel washers shall be used under the head of all bolts and nuts. The vendor shall maintain drawings for each component, and where necessary, patterns, jigs and fixtures, to assure identical manufacture. All elastomers used shall have a design life of 10 years in service unless otherwise approved by the Amtrak Procurement officer.

1.9 Conducting Tests

The vendor shall be equipped to fully test the items being supplied in accordance with this Specification and any referenced drawings as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended by its supplier.

1.10 Workmanship

All workmanship shall be of high grade and shall conform to the best of manufacturing practices. Skilled, qualified, well motivated personnel, with appropriate experience, training and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in his facility for reference this Specification and all referenced Amtrak drawings.

1.11 Documentation Records

The vendor shall maintain a logbook of information regarding all components manufactured by it for Amtrak. As a minimum, records shall identify the Amtrak purchase order number, serial number of the assembly, copies of any written authorizations by the Amtrak Procurement officer, inspection and test data, shipping date and shipping location. In addition, it shall include a copy of the flammability and smoke emission laboratory certification report if required under 49 CFR Part 238 Appendix B for the components being supplied.

1.12 Rights to Technical Data

Amtrak shall be granted by the vendor full delivery and ownership rights of all drawings, documentation, parts information, test data, etc. associated with this Specification. In addition, the vendor and its subcontractors shall grant to Amtrak in connection with this Specification and any Contract the right to use, duplicate or disclose, in whole or in part and without charge, all technical data required by Amtrak to install, operate, understand, maintain, modify, replace, test, repair or overhaul the components being supplied. Amtrak shall not disclose proprietary information and data being supplied under this Specification and any Contract except for the limited purpose of obtaining individual part repairs or specialized testing or repair services outside the ability of its Shops, and then only on a confidential basis. Technical data means information of a scientific or engineering nature, regardless of form or characteristics, to be furnished by the vendor pursuant to this Specification and any Contract. Examples are research and engineering data, engineering drawings and associated lists, specifications, standards, process sheets, manuals, technical reports, catalog item identifications or related information.

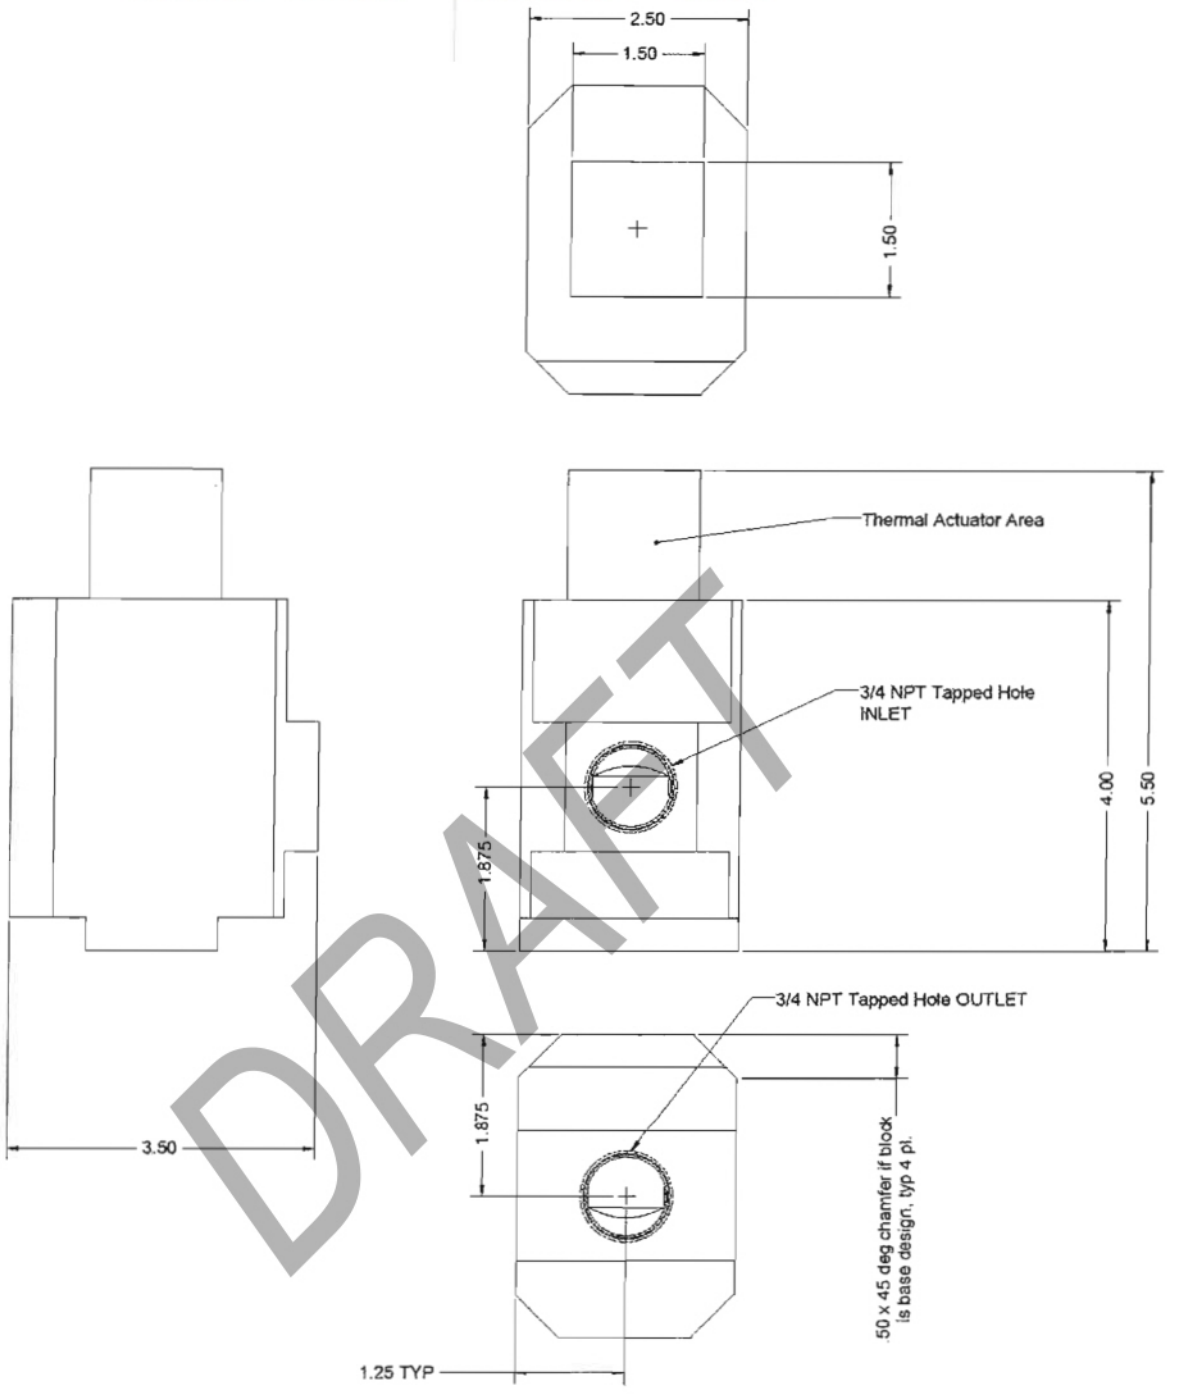
DRAFT

26-FOI-00415 000000006218 "UNCLASSIFIED" 4/30/2026

This shall not include financial information or information of a contract administrative nature. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak, as per Federal procurement regulations.

1.13 Referenced Documents

Code of Federal Regulations 49 CFR Part 238
ISO 9001:2000, Quality Management Systems - Requirements
Spec ?? - Quality and Workmanship



2.0 General Requirements

2.1 Design Considerations

The *Thermally Actuated Automatic Drain Valve for Freeze Protection* shall incorporate into its design or meet the following design criteria:

1. Must not have dead end seat that can be damaged or take set in extended high temperature conditions. (ex. 140 degree F with heater active)
2. Housing must be made out of brass or stainless steel.
3. Must have an external heated override that prevents valve from opening.
4. Thermal Actuator must fit the standard Ogontz Corporation 120 VAC, model 2265020/3/08 heating element . (The heater maximum temperature in ambient air is 150 degrees F +/- 5 degrees. Temperature on valve is approximately 126 degrees F.). Alternate heater maybe acceptable but must be approved by Amtrak Rolling Stock Engineering (RSE).
5. Installation of heater cannot prevent ambient sensing of actuator.
6. Maximum housing size must fit into the envelope shown in Figure 1.
7. Inlet and outlet must be in the positions shown in Figure 1.
8. Valve must operate in ambient temperature range of -30 degree F to +140 Degree F with Ogontz Corp. heater or Amtrak RSE approved alternate in place and active.
9. Valve life is expected to be 10 years, continuous operation, with no failures under normal operation. All components shall be designed to withstand different conditions of potable water. No internal components shall cease even with the calcification build-up.
10. Valve must work as designed through pressure ranges from 0 psig to 60 psig.
11. Valve should be able to be rebuilt, while installed, with a manufacturer's kit and simple tools by Amtrak personnel.
12. Flats measuring maximum 1-5/8 inches across must be incorporated into housing at inlet and outlet openings to assist during installation.
13. Valve to begin opening at 43 degrees F +/- 2.
14. Valve to flow full capacity at 35 degrees F +/- 1.
15. Valve must provide ability to test in place by maintenance personnel.
16. Valve actuator to sense ambient temperature not internal water temperature.
17. Maintenance personnel should be able to detect leaking seal on valve under normal operating conditions.

DRAFT

DRAFT

Figure 1
Outline dimensions of the freeze protection valve without heater attached.

2.2 Vibration

All carbody mounted equipment shall be designed to withstand continuous vibrations of at least 0.2 g at frequencies up to 100 Hertz in all directions, as well as randomly orientated shock loads of 5 g's longitudinally, 3 g's vertically and 3 g's laterally.

2.3 Interchangeability

All similar parts on each item being supplied, and among all other assemblies and their spare parts, shall designed and manufactured to be identical, both as individual parts and as subassemblies. All assemblies shall mount to the car without modification. Model numbers for identical components shall be identical. Replaceable components of any such apparatus shall be fully interchangeable, without adjustments to any part being necessary. Specific approval shall be obtained from the Engineer for each part whose replacement may require an adjustment, and such approval may be granted only where it can be shown to be absolutely necessary.

2.4 Inch-Standard

The vendor is advised that the existing passenger cars used by Amtrak are entirely composed of inch-standard components and fasteners. All designs, components, dimensions and fasteners used on the components being supplied under this Specification shall be of United States inch-standards, unless otherwise approved in writing by the Engineer.

2.5 Design Life

The components being supplied under this Specification shall be designed and manufactured to perform satisfactorily for a minimum design life of 10 years, 12 years preferred.

2.6 Dimensions

The vendor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value, and unless otherwise noted and approved drawings shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views.

2.7 Cleaning and Maintenance

The components being supplied under this Specification shall be easy to clean and maintain. They shall not require maintenance or adjustments at internals of less than four years. To the extent possible, only readily available components, hardware and fasteners shall be used. Any assembly hardware visible to passengers shall be recess mounted stainless steel. There shall not be any sharp or exposed edges in the entire assembly which could cause injury to passengers or workmen, or snag passenger's clothing.

Pockets where dirt and debris can collect shall be minimized; those that exist shall be easy to clean with standard vacuum cleaner equipment. Design shall ensure that items that require repair and or service are easily accessed, removed and replaced and that this is possible with the use of standard hand tools. Variations of fastener thread size, thread length and head style shall be minimized to ease overhaul and regular maintenance. The number of fasteners shall be kept to a minimum.

2.8 Manufacturing

All finished assemblies and individual components shall be of high quality workmanship and free of burrs and debris. Sharp edges shall be eliminated except where necessary for specific workings or design criteria.

DRAFT

The vendor is required as basic work to perform and fully document a complete verification test and evaluation of each component being supplied under this Specification, prior to shipment to Amtrak. The results of this final testing shall be recorded in the documentation record. When successfully completed, the vendor shall apply a metalized identification label in an inconspicuous area, generally as identified in the drawings, providing as a minimum the name and location of the vendor, any serial number used by the vendor, and the date of manufacture.

4.0 Packaging and Shipment

All packaging and shipping requirements shall be performed as basic work by the vendor. It is required that the vendor properly prepare all components being supplied under this Specification for shipment to Amtrak so that they are ready to install following unpacking. Items shall be appropriately packaged for their weight and size, such as using a cardboard enclosure within a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling. For large or bulky items enclosed in a container, the top of the item shall be indicated on the package as appropriate.

The vendor shall apply an identification label on the shipping package. This label shall include the vendor's name and address, telephone number, name of contact person, purchase order number, date released for shipment, Amtrak "AAMPS" (internal catalog) number, and the component assembly serial number. This information shall also appear in the vendor's invoice, and be included in the vendor's documentation record.

The vendor shall retain a copy of the shipping documentation record, and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Procurement officer (or as otherwise designated in the purchase order), and the third copy shall be mailed to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

5.0 Product Support

5.1 First Article Inspections

To verify that the components being supplied under this Specification meet all Specification and drawing requirements, and is truly interchangeable with existing components, Amtrak will conduct a series of two First Article Inspections (FAI) on the first complete assembly manufactured by a vendor, prior to allowing unrestricted manufacturing work to start. It is the intention of the FAI process that every function and feature of the items being supplied under this Specification be fully exercised and tested for proper operation under all normal, abnormal and fault conditions, both in the vendor's workshop and as applied on the vehicle. This shall consist of a pre-shipment inspection and witnessing of the specified final testing of a prototype manufactured assembly performed at the vendor's facility. This shall be an active test, and the vendor shall provide mounting fixtures, electrical and pneumatic power, etc, as appropriate to fully functional exercise all components and features.

Once this is successfully completed at the vendor's facility, the vendor shall then ship this assembly to the Amtrak maintenance facility identified by the Engineer, where Amtrak will install the assembly onto an Amtrak vehicle. A second "as-installed" inspection and test FAI shall then be performed to verify proper operation of the assembly in the "as-installed" configuration.

Each FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. These First Article Inspections shall include, but not be limited to, a

DRAFT

20-FOIA-00415 09090096218 "UNCLASSIFIED" 4/30/2026

mechanical and electrical inspection to determine compliance with the specifications and the drawings, complete testing of the functionality of the component, demonstration of maintainability and troubleshooting, and verification of proper operation and complete compatibility/interoperability when installed on a car. Approval by the Amtrak Rolling Stock Engineering following successful completion of the two phases of First Article Inspections, as communicated through the Amtrak Procurement officer, shall constitute final system approval. No vendor changes shall be made in the configuration of the items being supplied following final approval unless approved in writing by the Amtrak Procurement officer. If desired, the vendor may conduct an informal Hardware Review prior to the first formal FAI at its facility, to review design, manufacturing and test issues.

5.2 Drawings, Manuals and Parts List

Following the successful completion of the First Article inspections, and as a precondition to permit production delivery of material to commence, the vendor shall supply to the Amtrak Bureau of Rolling Stock Engineering via the Amtrak Procurement officer an electronic set of every dimensioned drawing and bill of material for every individual part used for the manufacture of all items being supplied under this Specification. Drawings shall be in Engineer-approved formats, and shall include a complete set of "as-built" drawings of every part, component and assembly used for all items being supplied to Amtrak. Each drawing shall include a complete Bill of Material, providing original component manufacturer name and part number of the actual supplier of the part. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The drawing package shall also include drawings of every special tool, jig or fixture required to install, maintain or overhaul the assembly, and if referenced in any of the maintenance manuals. The as-built drawings shall be delivered as 3 sets of CDs of all drawings in electronic format in DXF, AutoCAD 2000 and SolidWorks 2004 or above; and 3 sets of CDs of all drawings in electronic format in Adobe read-only PDF files.

The vendor shall also submit in electronic format to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Procurement officer, a maintenance manual as well as a parts list of all individual parts used in the items being supplied under this Specification, which shall include the actual component manufacturer (OEM) name and part number; use of an intermediate supplier or distributor's name or part number is not acceptable. The parts list shall be sufficiently complete to permit Amtrak to order individual replacement spare parts direct from the actual parts manufacturer. The maintenance manual shall include complete information from installation, through troubleshooting and complete overhaul. The vendor shall also supply in electronic formal all operators manuals and other support documentation it has available for the components being supplied under this Specification. All documentation shall be delivered as 3 sets of CDs.

DRAFT

6.0 Warranty

Warranty shall be provided as per the terms of the Amtrak Procurement documents.

26-FOI-00415 00000006219 "UNCLASSIFIED" 4/30/2026

1. OVERVIEW

1.1 Scope

This document describes the physical and electrical properties for 110°C rated wire and cable, multi conductor cable and high temperature wire used on Amtrak Rolling Stock.

1.2 Purpose

The purpose is to establish a standard for general purpose car and locomotive wire.

2. GENERAL

All wire and cable procured under this specification must exhibit the properties outlined in the specification and must either be on Amtrak's approved source list, (paragraph 7.0) or must be approved, in writing, by Amtrak Design Engineering Department.

3. WIRE CONSTRUCTION

Conductor:	Soft Annealed Copper
Coating:	Tin
Stranding:	Per AAR 589 (See paragraph 5.0)
Insulation:	Crosslinked Polyolefin

4. PROPERTIES

4.1 Applicable Documents

The wire and cable manufactured under this specification shall be tested and inspected in accordance with the latest issues of the following standards, as applicable or as modified herein:

ASTM B-33	Tinned Soft or Annealed Copper Wire
ASTM D-149	Test for Dielectric Breakdown Voltage and Dielectric Strength of Electrical Insulating Materials at Commercial Power Frequencies
IPCEA S-19-81	Rubber Insulated Wire & Cable
IPCEA S-66-524	Cross-Linked-Thermosetting-Polyethylene Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy
UL 44	Standard for Rubber Insulated Wire and Cable

DRAFT

26-FOI-00415 00000006219 "UNCLASSIFIED" 4/30/2026

IEEE Std.383-1974 Type Test of Class 1E Electrical Cable, Field Splices & Connectors for Nuclear Power Generating Stations

4.2 Electrical

-Dielectric Strength per ASTM D-145	700V/Mil Minimum
-Insulation Resistance	5000 megohms Minimum
-Insulation Resistance K	17,500 Minimum
-Accelerated Water Absorption:	
Gravimetric 7 days @ 70°C	8mg/in 2 Maximum
Electrical SIC 24 hours @ 75°C	6.0 Maximum
Increase in Capacitance	
1-14 Days (% of Original)	7.5 Maximum
7-14 Days (% of Original)	1.5 Maximum
Stability Factor after 14 days	1.0

4.3 Physical

-Unaged	
Tensile Strength, Min PSI	2000 Minimum
Elongation at Rupture, Min. %	250 Minimum
-Aged	
After air oven 7 days @ 158°C ±2°C	
Tensile Strength (% of original)	90 Minimum
Elongation (% of original)	55 Minimum
-Heat Distortion, 1 hour @ 200°C Clause 4.3.6.1 CSA Std. C22.2 No. 0.3	20 Maximum
-Cold Bend, 120 hours @-55°C	* 6KV-5 Minutes
-Cold Bend, 2 inch Mandrel – 85°F (per Paragraph 4.7.4.15 MIL-C-22759)	* Pass

* Must Not Exhibit Cracking

4.4 Qualification

Tension Set:
Test per-IPCEA-S-66-524, Paragraph 6.4.11.4 (.Except with gauge marks 4" apart).

DRAFT

Requirement: 30% Maximum

Ozone Resistance:
After 24 hours exposure to an ozone concentration of 0.03% by volume at 90°C ±2%, there shall be no insulation cracks.

Flammability Requirements:
Insulated conductors shall pass the flame tests described in Paragraph 6.19.6 of IPCEA S-19-81 and the VW-1 vertical flame test described in UL Subject 44. The maximum afterburn after each flame application shall be no greater than 3 seconds.

Corrosion Tests:

A. Copper Mirror
(Ref. ASTM 2671) A 0.4 gram sample of insulation shall be placed in the bottom of a 1/2 inch 12 inch test tube. A copper-coated glass mirror shall be suspended 6 inches over the sample by a thin copper wire. The lower two inches of the test tube shall be heated to 175°C for 16 hours.
Requirements: Shall not remove more than 5% of the copper film.

B. Acid Gas Detection
A 1.0 mg sample shall be heated to combustion in a closed quartz tube. The resulting gases shall be drawn through a detector tube (MSA #91636) using a special air sampling pump manufactured by Mine Safety Apparatus Company. The amount of acid gas shall be determined by measuring the length of the color change in the detector tube.
Requirement: 300 ppm/mg maximum average. (350 ppm/mg maximum any single sample).

DRAFT

Oil Resistance:
Hot Oil Swell Tests - Insulated wires shall be pre-measured and immersed in a hot oil bath. After the required exposure time, they shall be removed and measured for the amount of swell.
Requirement:

A.	ASTM No. I-Oil 100 Hours @150°C Max. % Swell	20
B.	ASTM No. 2-Oil 100 hours @150°C Max. % Swell	40
C.	ASTM No. 3-Oil 100 hours @150°C Max. % Swell	50
D.	Diesel Oil 120 hours @60°C Max. % Swell	15

Note: When tested in accordance with AAR589 (ASTM =2 oil at 121°C for 18 hours) the retention of tensile and elongation shall be: Tensile - 70% Minimum, Elongation 90% Minimum.

Smoke Emission: The test shall be performed in an N.B.S. Smoke Chamber using #l2 AWG wire insulated with 45 mils of insulation. The procedures shall be per NFPA Standard 258 in the

flaming (F) and non-flaming (N) modes.

	Dm	T16	T.9DM
(F) Flaming plus Radiant Furnace	447	1.05	7.15
(N) Non-Flaming Radiant Furnace	199	11.6	27.1

Dm = Max. Specified Optical Density
T16 = Time to reach critical Ds (Specified Optical Density)
T.9DM = Time to reach 90% of Dm

Abrasion Resistance:
Rotating Scrape Abrader (Ref. Mil-C-915). A 24 inch specimen shall be draped over an 8 inch rotating drum with two (2) 90° vee edge abrading tools 180° apart. Failure shall be detected by electrical contact between abrading tool and conductor. The cable shall be weighted with a 450 gram mass.
Requirement: 2500 cycles minimum.

Cut-Through Penetration:
Specimen of insulated wire shall be preconditioned at 125°C for 1 hour. While at this temperature, a weighted (1000 gm) 90°C chisel cutting edge shall be applied perpendicular to the longitudinal axis of the specimen. Detection of cut-through shall be monitored with a 12 volt lamp circuit connected in series with the plunger and conductor in the specimen.
Requirement: 10 minutes minimum.

Crush Resistance:
A wire sample shall be placed between two (2) parallel flat plates and compressed until electrical contact is detected across conductor to the plate.
Requirement: 7500 lbs. minimum.

Amtrak

Bureau of Rolling Stock Engineering

Specification for Rail Passenger Car Diaphragm and Face Plate

Specification No. 332
Revision 4

1.0 Scope

1.1 Purpose

This Specification defines the vendor general design criteria requirements applicable for the manufacture of the diaphragm and faceplate assembly (Amtrak drawing D-00-2031, revision I or later issue) used on Amtrak rail passenger cars. This Specification is intended to be used in conjunction with the Amtrak Procurement Department contract documents, purchase orders and other contractual documents issued to the vendor. The diaphragm and faceplate assembly is installed at each end of each car and completely encloses the intercar walkway, in order to provide maximum passenger safety, to protect from weather and noise, and provide a positive seal between cars. It is Amtrak's intention that any new diaphragm and faceplate assembly be functionally interchangeable with the diaphragm and faceplates currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to Amtrak in a timely manner for mutual investigation and satisfactory resolution. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions. Wherever possible, this Specification has been developed on the basis of car performance required, rather than specific hardware to be provided. Where specific hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Engineer. This approach will allow vendors to employ innovation and advanced technology where appropriate.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted Technical Proposal, but are necessary for the completion of the diaphragm and faceplate assembly, shall be considered a part of the scope of supply. In this Specification all references to "number of days" shall mean calendar days unless otherwise stated.

Safety shall be of primary importance in the design of the diaphragm and faceplate assembly. They shall present a safe, hazard-free environment to passengers and the operating and maintenance personnel to the extent practical. No sharp edges or corners or pinch points shall occur where passengers, crew, or maintenance personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize passenger injury.

1.2 Exceptions

The vendor shall explicitly identify to the Amtrak Procurement officer any exceptions being taken to this Specification, referencing the Specification paragraph and exact wording in question.

DRAFT

1.3 Scope of Work

It is the vendor's responsibility under this Specification, and fully expected by Amtrak, to supply a completely equipped diaphragm and faceplate assembly consisting of all new materials. It is Amtrak's desire that all materials, to the greatest extent possible, be of commonly available commercial items and hardware. All drawings, bills of materials, catalog lists, documentation and other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

As basic work under this Specification each diaphragm assembly produced must be completely functionally tested, cleaned and properly packaged for shipment to Amtrak, and documentation submitted. Amtrak will perform a series of First Article Inspections on the first diaphragm assembly manufactured by a vendor, in order to verify that the process and materials used are in compliance with this Specification and drawings.

1.4 Legal Requirements

It is mandatory that all elastomer materials used by the vendor in the diaphragm assembly must comply with the flammability and smoke emissions requirements of the latest edition of 49 CFR Parts 238.103 (a)(2) and (b)(2), and also its Appendix B requirements (including all referenced notes) for elastomers.

It is required that prior to the First Article Inspection and any delivery of material, the vendor must supply the Amtrak Procurement officer with: i) a report by a recognized independent testing laboratory certifying that all elastomer materials used comply with the 49 CFR Part 238 Appendix B requirements, and ii) certification by the vendor that the buffer plate and diaphragm, when properly installed on a car, will be in place and properly aligned in accordance with 49 CFR Parts 238.303 (e)(13) and (e)(14).

1.5 Engineer

The Engineer, as stated in this Specification, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. During the course of the project the vendor will be submitting items for the Engineer's approval as required by the Contract and Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to the requirements of the specifications, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. All material being submitted shall have been reviewed by qualified vendor personnel and judged to be suitable for submission prior to doing so, and this shall be so stated in the letter of transmission or on the document, particularly as regards material passed through from subcontractors. Test results shall receive vendor staff review and signature prior to submission. Submissions found to be deficient with regard to any of the above shall be immediately returned without review to the vendor.

Submissions shall contain sufficient detail to confirm that specification requirements are being met. However, the vendor shall use judgment as to what level is appropriate and shall communicate with the Engineer when guidance is needed on a case-by-case basis. Documents with levels of detail and information considered to be beyond what is needed or is time-effective

DRAFT

to confirm compliance shall be given cursory review by the Engineer and considered as background information and shall not receive formal approval. Individual submissions shall not contain material from multiple subsystems or subcontractors and such submissions will be returned without review to the vendor.

Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible. However, the vendor shall consider the 30 days criteria and the time requirements involved for mailing when scheduling submittals. The days used by the Engineer in Design Review meetings or in travel to or from such meetings shall not be included in the 30 days figure. Delays caused by the Engineer's failure to review and approve drawings or schedules in a timely fashion as listed above shall be treated as an excusable delay, provided that the vendor can demonstrate to the satisfaction of the Engineer that actual production delays have been caused by the Engineer and there is no other concurrent cause for delay.

1.6 Cost Items

Any individual extra work items regarding the diaphragm assembly shall be handled in accordance with the contract and purchase order documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Procurement officer regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Procurement officer in accordance with the contract documents.

1.7 Vendor Quality Policy

It is mandatory under this Specification that the vendor has established and maintains a Quality policy system. The vendor's shop is required to be equipped with equipment, personnel and management completely sufficient to assemble, inspect and test each diaphragm assembly, including meeting or exceeding all performance parameters specified on Amtrak drawing D-00-2031, revision I or later issue. The shop shall have suitable equipment to diagnose any failure mode, and perform all adjustments and tests required to confirm proper operation. The vendor's Quality Assurance staff shall be active participants in the assembly, inspection, testing and documentation phases of the work. It is required that the vendor have a quality assurance program deployed that, at a minimum, be modeled after an established quality standard. It is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000, or an equivalent recognized standard.

Amtrak Quality Assurance personnel will conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. The vendor shall fully cooperate in such audits. Specific attention shall be paid to the areas of management responsibility, quality system, contract review, design control, document control (including drawings), purchasing, purchaser-supplied product, product traceability and identification, process control (including procedures, testing and equipment), inspection and testing, inspection, measuring and test equipment (including calibration programs), control of nonconforming products (applied controls), corrective and preventative actions, handling, storage, packaging and delivery, quality records, internal quality audits, training, servicing and statistical techniques.

DRAFT

26-FOI-00415 00000006220 "UNCLASSIFIED" 4/30/2026

1.8 Components

The vendor shall use only new parts for all components. All exposed metal components shall be stainless steel, and all threaded fasteners shall be vibration-proof stainless steel fasteners using self-locking Nylon insert nuts. Stainless steel washers shall be used under the head of all bolts and nuts. The vendor shall maintain drawings for each component, and where necessary, patterns, jigs and fixtures, to assure identical manufacture. The diaphragm material shall have a weatherproof elastomeric upper and lower face, with a fabric core reinforcement. Exposed elastomer surfaces shall be colored black. The elastomer used in the face and the core fabric and number of plies shall be selected to meet the flammability and smoke emission requirements discussed in Legal Requirements, and to obtain the mechanical stiffness characteristics discussed in Final Testing. Radiused sections of the diaphragm at the upper corners shall be die-formed of this material and vulcanized to the straight portions. Foam filler may be used within the diaphragm cross section as required to obtain the desired mechanical stiffness characteristics of the diaphragm assembly. All elastomers used, including diaphragm and shear mounts, shall have a design life of 10 years in service unless otherwise approved by the Amtrak Procurement officer.

As information, the current diaphragm elastomer is a Nylon-fiber reinforced chloroprene (Neoprene) material of 0.30 inch overall thickness, with a minimum tensile strength of 1,700 pounds/square inch, a minimum elongation of 300 percent in 2 inches, an average durometer (Shore A) of 62 and an average density of 1.33 grams/cubic centimeter.

1.9 Conducting Tests

The vendor shall be equipped to fully test the diaphragm faceplate loading forces specified in Amtrak drawing D-00-2031, revision I or later issue, as part of the final assembly basic work. Testing apparatus shall be calibrated on a periodic basis as recommended by its supplier.

1.10 Workmanship

All workmanship shall be of high grade and shall conform to the best of manufacturing practices. Skilled, qualified, well motivated personnel, with appropriate experience, training and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and are fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in his facility for reference this Specification and all referenced Amtrak drawings.

1.11 Documentation Records

The vendor shall maintain a logbook of information regarding all diaphragm assemblies manufactured by it for Amtrak. As a minimum, records shall identify the Amtrak purchase order number, serial number of the assembly, copies of any written authorizations by the Amtrak Procurement officer, inspection and test data, shipping date, shipping location, and a copy of the elastomer flammability and smoke emission laboratory certification report.

1.12 Rights to Technical Data

Amtrak shall be granted by the vendor full delivery and ownership rights of all drawings, documentation, parts information, test data, etc. associated with this Specification. In addition,

DRAFT

the vendor and its subcontractors shall grant to Amtrak in connection with this Specification and any Contract the right to use, duplicate or disclose, in whole or in part and without charge, all technical data required by Amtrak to install, operate, understand, maintain, modify, replace, test, repair or overhaul the components being supplied. Amtrak shall not disclose proprietary information and data being supplied under this Specification and any Contract except for the limited purpose of obtaining individual part repairs or specialized testing or repair services outside the ability of its Shops, and then only on a confidential basis. Technical data means information of a scientific or engineering nature, regardless of form or characteristics, to be furnished by the vendor pursuant to this Specification and any Contract. Examples are research and engineering data, engineering drawings and associated lists, specifications, standards, process sheets, manuals, technical reports, catalog item identifications or related information. This shall not include financial information or information of a contract administrative nature. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak, as per Federal procurement regulations.

1.13 Referenced Documents

Amtrak drawing D-00-2031, revision I or later issue, Diaphragm & Faceplate Assembly
Code of Federal Regulations 49 CFR Part 238
ISO 9001:2000, Quality Management Systems - Requirements

2.0 General Requirements

2.1 Design Considerations

The diaphragm and faceplate assembly must not be damaged by, or cause damage to, an opposing diaphragm or locomotive buffer under any normal operating conditions. The diaphragm assembly shall make a tight seal with an opposing diaphragm under all conditions of track curvature, turnouts and crossovers, both in draft and in buff, under any normal operating conditions. The spring force on the diaphragm assembly faceplate shall comply with all Amtrak drawing requirements. In order to minimize the use of any sealants at the time of car installation, the vendor shall provide a self-adhesive sponge seal gasket on the rear mounting plate, with gasket dimensions to be a minimum 0.375 inch thick by the width of the mounting plate or as approved by the Engineer, to provide a weatherseal between the mounting plate and the carbody. When in use the diaphragm assembly shall not vibrate. Where possible, components requiring maintenance or replacement at overhaul shall be replaceable as individual units.

The diaphragm and faceplate assembly shall be designed to provide maximum passenger comfort and safety as dictated by ergonomic requirements. Special attention shall be given to passengers with reduced visual acuity by providing them with visual cues as required. Floor support surfaces should have high contrast colors in this regard, and high contrast signage and striping patterns shall be provided where necessary, as approved by the Engineer.

2.2 Interchangeability

All similar parts on each diaphragm and faceplate assembly, and among all other assemblies and their spare parts, shall be designed and manufactured to be identical, both as individual parts and as subassemblies. All assemblies shall mount to the car without modification. Model numbers for identical components shall be identical. Replaceable components of any such

DRAFT

26-FOI-00415 00000006220 "UNCLASSIFIED" 4/30/2026

apparatus shall be fully interchangeable, without adjustments to any part being necessary. Specific approval shall be obtained from the Engineer for each part whose replacement may require an adjustment, and such approval may be granted only where it can be shown to be absolutely necessary.

2.3 Inch-Standard

The vendor is advised that the existing passenger cars used by Amtrak are entirely composed of inch-standard components and fasteners. All designs, components, dimensions and fasteners used on the new diaphragm and face plate assembly shall be of United States inch-standards.

2.4 Design Life

The diaphragm and faceplate assembly shall be designed and manufactured to perform satisfactorily for a minimum design life of 10 years, 12 years preferred. Each Amtrak passenger car will typically receive an annual inspection, and a four year light overhaul cycle.

2.5 Dimensions

The vendor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value, and unless otherwise noted and approved drawings shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views.

2.6 Cleaning and Maintenance

The diaphragm and faceplate assembly shall be easy to clean and maintain. It shall not require maintenance or adjustments at intervals of less than four years. To the extent possible, only readily available components, hardware and fasteners shall be used. Any assembly hardware visible to passengers shall be recess mounted stainless steel. There shall not be any sharp or exposed edges in the entire assembly which could cause injury to passengers or workmen, or snag passenger's clothing. Pockets where dirt and debris can collect shall be minimized; those that exist shall be easy to clean with standard vacuum cleaner equipment. Design shall ensure that items that require repair and or service are easily accessed, removed and replaced and that this is possible with the use of standard hand tools.

The diaphragm and faceplate assembly design shall include provisions for lifting from overhead with overhead conveying devices such that the assembly remains balanced and upright. This will facilitate handling during overhaul. Variations of fastener thread size, thread length and head style shall be minimized to ease overhaul and regular maintenance. The number of fasteners shall be kept to a minimum.

2.7 Manufacturing

Any heat used to assemble the diaphragm shall be sufficiently low to not result in damage to the stainless steel components. The components of the diaphragm and faceplate assembly exposed to passenger view, either inside or outside the car, shall be either black or natural stainless steel in color. Stainless steel shall not be painted. The diaphragm and faceplate

DRAFT

assembly upon shipment shall be in a ready to install condition without any additional work required by Amtrak.

3.0 Final Testing

Following all assembly, the vendor is required as basic work to perform and fully document a complete verification test and evaluation of each diaphragm assembly. Inspect and document all interface dimensions for conformance with Amtrak drawing D-00-2031, revision I or later issue. Perform and document a load test of the complete assembly. The diaphragm assembly must meet the load requirements at points A and B as shown on Amtrak drawing D-00-2031, Note 5. These loading requirements are functions both of the stiffness of the diaphragm fabric, and of the shear mounts. Particular attention must be given to the selection of the characteristics of these components, in order to develop the specified loading characteristics of the completed assembly.

The results of this final testing shall be recorded in the documentation record. When successfully completed, the vendor shall apply a metalized identification label in an inconspicuous area, generally as identified in the drawings, providing as a minimum the name and location of the vendor, any serial number used by the vendor, and the date of manufacture.

4.0 Packaging and Shipment

All packaging and shipping requirements shall be performed as basic work by the vendor. It is required that the vendor properly prepare the diaphragm and faceplate assembly for shipment to Amtrak so that it is ready to install following unpacking. The assembly shall be packaged into a cardboard enclosure within a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling. The top of the diaphragm assembly shall be indicated on the package.

The vendor shall apply an identification label on the shipping package. This label shall include the vendor's name and address, telephone number, name of contact person, purchase order number, date released for shipment, applicable Amtrak "AAMPS" (internal catalog) number, and the diaphragm assembly serial number. This information shall also appear in the vendor's invoice, and be included in the vendor's documentation record.

The vendor shall retain a copy of the diaphragm assembly documentation record, and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Procurement officer (or as otherwise designated in the purchase order), and the third copy shall be mailed to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address for the diaphragm assembly.

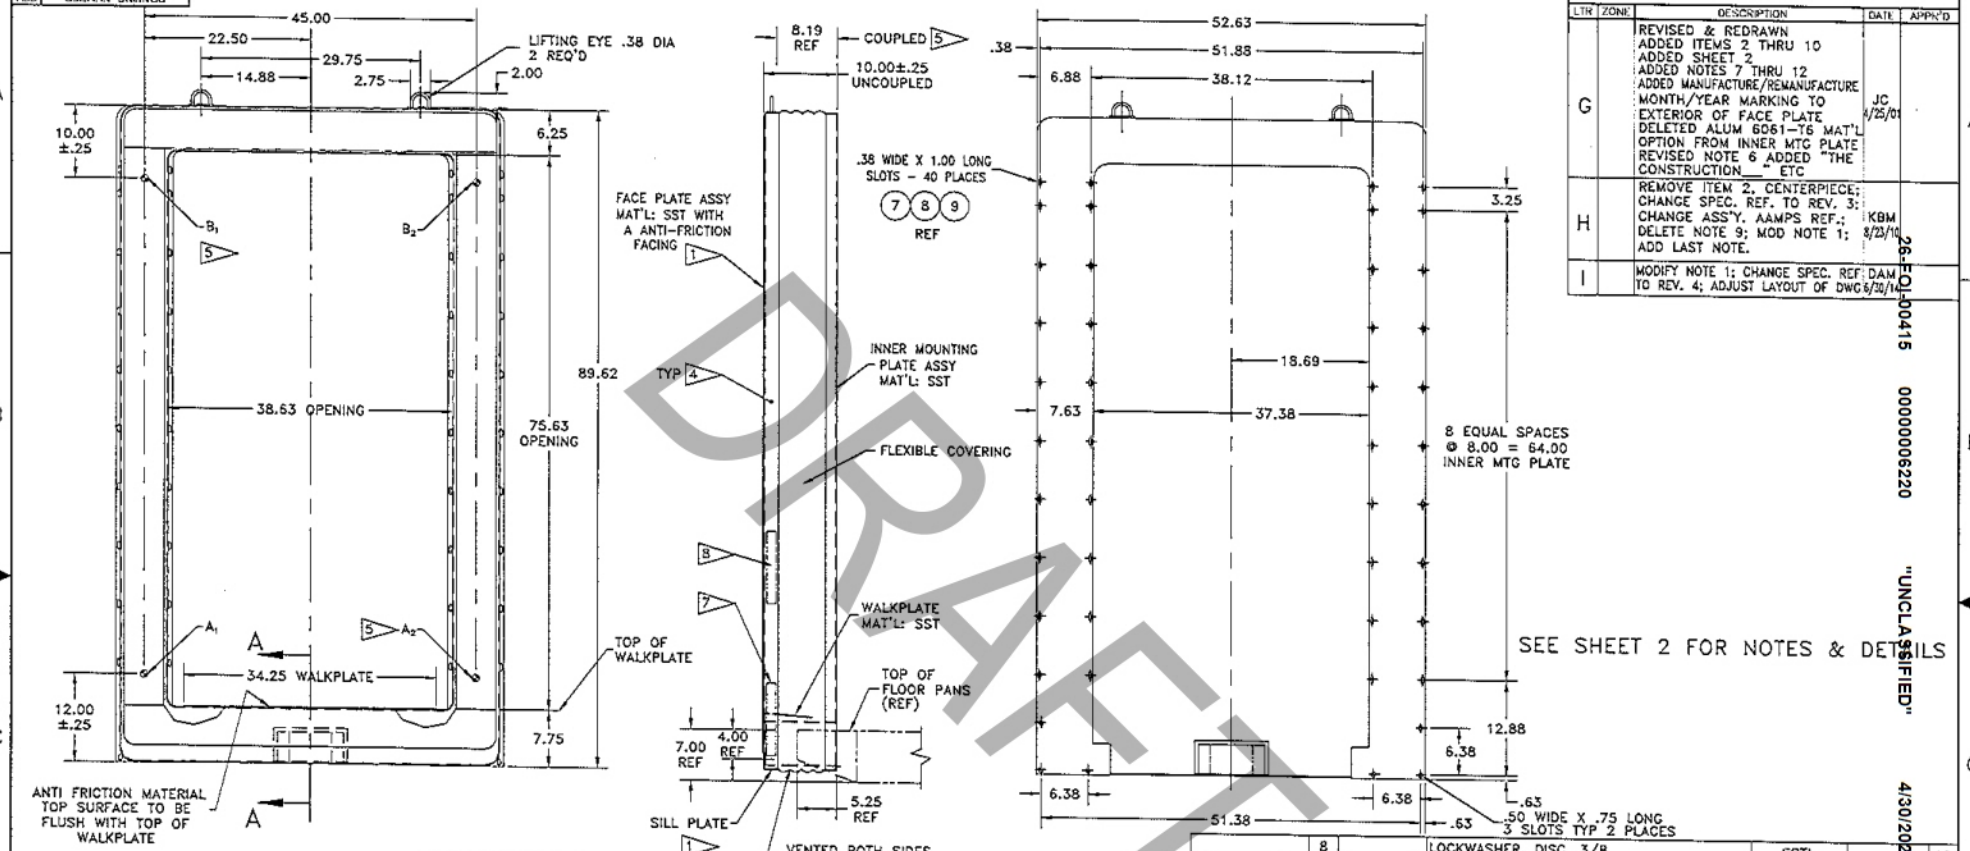
5.0 Product Support

5.1 First Article Inspections

To verify that the diaphragm and faceplate assembly meets all Specification and drawing requirements, and is truly interchangeable with existing diaphragms, Amtrak will conduct a series of two First Article Inspections (FAI) on the first diaphragm assembly manufactured by a

DRAFT

vendor, prior to allowing unrestricted manufacturing work to start. This shall consist of a pre-shipment inspection and witnessing of the specified final testing of a prototype manufactured diaphragm assembly performed at the vendor's facility. Once this is successfully completed, the vendor shall then ship this diaphragm assembly to the Amtrak maintenance facility selected by the Engineer where Amtrak will install the assembly onto a car. A second "as-installed" inspection and test FAI shall then be performed to verify proper operation of this car while coupled to another car and negotiating minimum radius curvature. Particular emphasis shall be placed on verifying that the faceplate loading forces are balanced between the two diaphragms while in contact with one another.



Each FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. These First Article Inspections shall include, but not be limited to, a mechanical inspection to determine compliance with the specifications and the drawings, performance of a load test and verification of proper operation when installed on a car. Approval by the Amtrak Bureau of Rolling Stock Engineering following successful completion of the two phases of First Article Inspections, as communicated through the Amtrak Procurement officer, shall constitute final system approval. No vendor changes shall be made in the configuration of the diaphragm and faceplate assembly following final approval unless approved in writing by the Amtrak Procurement officer. If desired, the vendor may conduct an informal Hardware Review prior to the first formal FAI at its facility, to review design, manufacturing and test issues.

5.2 Drawings, Manuals and Parts List

Following the successful completion of the First Article inspections, and as a precondition to permit production delivery of material to commence, the vendor shall supply to the Amtrak Bureau of Rolling Stock Engineering via the Amtrak Procurement officer an electronic set of every dimensioned drawing and bill of material for every individual part used for the manufacture of the diaphragm assembly. Drawings shall be in Engineer-approved formats, and shall include a complete set of "as-built" drawings of every part, component and assembly used for the complete diaphragm and faceplate assembly. Each drawing shall include a complete Bill of Material, providing original component manufacturer name and part number of the actual supplier of the part. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The drawing package shall also include drawings of every special tool, jig or fixture required to install, maintain or overhaul the assembly, and, if referenced, in any of the maintenance manuals. The as-built drawings shall be delivered as 3 sets of CDs of DVDs of all drawings in electronic format that is compatible with Solidworks 2013 or above; and 3 sets of CDs or DVDs of all drawings in electronic format in Adobe read-only PDF files.

The vendor shall also submit in electronic format a maintenance manual as well as a parts list of all individual parts in the diaphragm and faceplate assembly, which shall include the actual component manufacturer name and part number. The parts list shall be sufficiently complete to permit Amtrak to order individual replacement spare parts direct from the actual parts manufacturer. This documentation shall be delivered as 3 sets of CDs.

③ SHEAR MOUNT ASSY – DIAPHRAGM

NOTES

1. FACE PLATE ASSY TOLERANCES & FINISH:
   FACE PLATE ASSY MUST BE FLAT WITHIN 0.10" TOTAL WHEN CHECKED ON A SURFACE PLATE.
   FOR THE ANTI-FRICTION PLATES:
   ROUGHNESS: 125 MU IN (MICRO INCHES) MAX.
   WAVINESS: .002" IN 2"
   STRAIGHTNESS: .060" MAX DEFLECTION ACROSS MAX. HEIGHT.
   .015" MAX DEFLECTION ACROSS MAX. WIDTH.
2. ALL RELIEF CUTS TO BE WELDED 100 PERCENT PENETRATION.
3. WELD AREAS TO BE FLUSH ON BOTH SIDES – GRIND IF NECESSARY. 100 PERCENT PENETRATION IS REQUIRED.
4. FINISH: U.S.S. #3 (100 GRIT) ON ALL EXPOSED SURFACES.
5. MAXIMUM ALLOWABLE FORCES AS MEASURED AT POINTS A & B WHEN COMPRESSED TO 8.38 ±.25 DIMENSION ARE:
   $\Phi A_1 + \Phi A_2 =$ 800 LB – 1050 LB
   $\Phi B_1 + \Phi B_2 =$ 200 LB – 300 LB
6. THE CONSTRUCTION OF THE DIAPHRAGM SHALL PRECLUDE THE ENTRY OF WATER AND DIRT INTO THE DIAPHRAGM & PASSAGEWAY, AS WELL AS INTO THE ASSEMBLY ITSELF.
7. MANUFACTURE DATE (MONTH/YEAR), VENDOR I.D., PART NUMBER & SERIAL NUMBER AND AMTRAK PART NO. 24 457 00709 TO BE STAMPED ON THE FLANGE OF THE FACE PLATE WHERE INDICATED, IN 1/4" HIGH NUMERALS.
8. WHEN REMANUFACTURED VENDOR TAG TO BE APPLIED WHERE INDICATED (NOT TO DISTURB ORIGINAL LABEL).
   THE PERMANENT LABEL WILL INCLUDE:
   SHOP NAME
   LOCATION
   TYPE OF REPAIR: REPAIR OR OVERHAUL
   DATE OF REPAIR (DAY, MONTH, YEAR)
9. ENVIRONMENTAL NOTE:
   SEE AMTRAK SPEC. 429 PARTS 1, 2, 3.1, 3.1.2 (VITAL), 3.2 & 3.2.1.
10. ALL DISSIMILAR METAL JOINTS SHALL USE SUITABLE TECHNOLOGIES TO PREVENT CORROSION.
11. ALL MATERIALS USED MUST MEET AMTRAK SPECIFICATION #352 LATEST REVISION.
12. SEE OEM DRAWINGS FOR ASSEMBLY DETAILS

Amtrak
Rolling Stock Equipment

Specification for
Passenger Vehicle Sash and Glazing Materials

Specification No. 336
Revision No. F

1.0 General

1.1 Purpose

This Specification defines the third-party vendor general requirements for sash assemblies and glazing material used on Amtrak railroad passenger car windows, including side passenger windows, door windows, and car end facing windows. This Specification is to be used in conjunction with the Amtrak Procurement Department contract documents, purchase orders and other contractual documents issued to the vendor. It is Amtrak's intention that any new sash and glazing materials be functionally interchangeable with those currently in use at Amtrak in terms of form, fit, function, general appearance and operation.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to Amtrak in a timely manner for mutual investigation and satisfactory resolution. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions. Wherever possible, this Specification has been developed based on car performance required, rather than specific hardware to be provided. Where specific hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Engineer. This approach will allow vendors to employ innovation and advanced technology where appropriate.

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term “or approved equal” if not written thereafter shall be implied. Any reference to a particular manufacturer’s product either by trade name or limited description is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term “or approved equal” means any other manufactured product or article, which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak’s opinion as to whether the proposed alternate is equal to the specified items for Amtrak’s specified use and purposes shall be final and conclusive.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted Technical Proposal but are necessary for the completion of the sash assemblies and glazing materials, shall be considered a part of the scope of supply. In this Specification all references to "number of days" shall mean calendar days.

The vendor shall not subcontract the design and manufacturing work under this Specification without the written authorization of the Amtrak Contracting Agent. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak.

DRAFT

The vendor shall explicitly identify to the Amtrak Contracting Agent any exceptions being taken to this Specification, referencing the Specification Section number and the exact wording in question. It will otherwise be assumed by Amtrak that the vendor takes no exception to this Specification and is completely compliant with all Specification requirements.

Safety shall be of primary importance in the design of the items being supplied. They shall present a safe, hazard-free environment to passengers and the operating and maintenance personnel to the extent practical. No sharp edges or corners or pinch points shall occur where passengers, crew, or maintenance personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize passenger injury and the collection of dust and dirt.

1.2 Vendor's Technical Proposal

As a condition of contract award, the vendor must submit a written and detailed Technical Proposal to the designated Amtrak Contracting Agent. This Technical Proposal must identify the vendor's interpretation of what it considers to be the scope of Basic Work to be performed, present a complete technical description of the components to be supplied, fully describe the operation and maintenance requirements of the components, include a copy of the vendor's Quality Assurance program, describe the Design Review process, present a step-by-step work plan for construction, include a project schedule by major events starting from the Notice to Proceed, and a Bill of Material of all components to be supplied.

1.3 Cost Items

Any extra work items beyond the scope of this Specification regarding the supply of sash, gaskets and glazing materials shall be handled in accordance with the contract and purchase order documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Contracting Agent regarding all such issues. The vendor agrees that Amtrak will make no payment for any additional work outside the scope of the contract documents unless such work is first preapproved in writing by the Amtrak Contracting Agent in accordance with the contract documents.

1.4 Legal Requirements

It is mandatory that all materials used by the vendor in the item being supplied to Amtrak must comply with all applicable Federal requirements identified in 49 CFR Part 223 for passenger cars, and also in 49 CFR Part 238 for Tier I passenger equipment. All components being supplied must also comply with the flammability and smoke emissions requirements of the latest edition of 49 CFR Parts 238.103 (a)(2) and (b)(2), and also its Appendix B requirements (including all referenced notes) for all material functions listed. It is required that prior to the First Article Inspection and any delivery of material, the vendor must supply the Amtrak Procurement officer with: i) certification by the vendor that all components being supplied comply with all applicable requirements identified in 49 CFR Parts 223 and 238, and ii) a report by a recognized independent testing laboratory certifying that all materials used comply with the 49 CFR Part 238 Appendix B requirements.

DRAFT

1.5 Engineer

The Engineer, as referenced in this Specification, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. During the course of the project the vendor may be submitting items for the Engineer's approval as required by the Contract and Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received. Delays caused by the Engineer's failure to review and approve drawings or schedules in a timely fashion as listed above shall be treated as an excusable delay, provided that the vendor can demonstrate to the satisfaction of the Amtrak Procurement officer that actual production delays have been caused by the Engineer and there is no other concurrent cause for delay.

1.6 Vendor Quality Assurance Program

The vendor is required to have in place a documented Quality Assurance Program that is modeled after an established industry quality standard, such as the ISO, AAR, or other organization. The vendor's facility is required to be equipped with equipment, personnel and management completely sufficient to assemble, inspect and test each item being supplied under this Specification. The vendor shall have suitable equipment to diagnose any failure mode, and perform all adjustments and tests required to confirm proper operation. The vendor's Quality Assurance staff shall be active participants in the assembly, inspection, testing and documentation phases of the work. The vendor is required to submit a copy of its Quality Assurance Program as part of its Technical Proposal, as explained in Section 1.2.

While it not a mandatory requirement under this Specification, it is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000 or an equivalent recognized standard.

Amtrak Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. The vendor shall fully cooperate in such audits. Specific attention shall be paid to the areas of management responsibility, quality system, contract review, design control, document control (including drawings), purchasing, purchaser-supplied product, product traceability and identification, process control (including procedures, testing and equipment), inspection and testing, measuring and test equipment (including calibration programs), control of nonconforming products (applied controls), corrective and preventative actions, handling, storage, packaging and delivery, quality records, internal quality audits, training, servicing and statistical techniques.

1.7 Critical to Quality (CTQ) Part Criteria

It is mandatory that the vendor comply with Amtrak procedure PD 3.7.4.02, Critical to Quality (CTQ) Part Criteria, which applies to all products identified by either the Engineer or the designated Amtrak Contracting Agent that Amtrak considers to have aspects identified that are Critical To Quality (CTQ). CTQs shall be Critical to Quality (CTQ) characteristic are defined as

DRAFT

"Those characteristics of an item which, if non-conforming, may prevent or seriously affect the unit performance, reliability, producibility, or customer satisfaction of a component." This procedure defines the methodology when qualifying parts or processes to assure that the critical to quality product criteria meet Amtrak requirements by:

- Implementing a rigorous Part/Process qualification to ensure the participation, communications of all related departments and the quality acceptance.
- Support the Quality process by involving the vendor early in the project/design process.
- Assure that the vendor is supplying materials that meet the quality, cost, delivery and reliability requirements.

1.8 Components

The vendor shall use only new parts for all components. The vendor shall maintain drawings for each component, and where necessary, patterns, jigs and fixtures, to assure identical manufacture. All elastomers used shall have a design life of 10 years in service unless otherwise approved by the Amtrak Procurement officer.

1.9 Conducting Tests

The vendor shall be equipped to fully test the items being supplied in accordance with this Specification and any referenced drawings as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended by its supplier.

1.10 Workmanship

All workmanship shall be of high grade and shall conform to the best of industry manufacturing practices. Skilled, qualified, well-motivated personnel, with appropriate experience, training and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in his facility for reference this Specification and all referenced Amtrak drawings.

1.11 Documentation Records

The vendor shall maintain an electronic database and/or approved logbook of information regarding all components supplied to Amtrak under this Specification. At a minimum, records shall identify the Amtrak purchase order number, serial number of the assembly, Amtrak "SAP" internal catalog number, copies of any written authorizations by the Amtrak Contracting Agent, inspection and test data, shipping date and shipping location. In addition, it shall include a copy of the test certification required by 49 CFR Part 223, and the flammability and smoke emission laboratory certification report under 49 CFR Part 238 Appendix B for the components being supplied.

1.12 Amtrak Ownership Rights

Unless specifically waived in writing by the Amtrak Contracting Agent, all drawings, bills of materials, catalog lists, mockups, CAD models, documentation and all other engineering and

DRAFT

design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection or other process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

1.13 Interchangeability

All similar parts on each item being supplied, and among all other assemblies and their spare parts, shall be designed and manufactured to be identical, both as individual parts and as subassemblies. All assemblies shall mount to the vehicle without modification. Model numbers for identical components shall be identical. Replaceable components of any such apparatus shall be fully interchangeable, without adjustments to any part being necessary.

1.14 Dimensions

All designs, components, dimensions and fasteners used on the components being supplied under this Specification, unless otherwise stated in the bidding and contract documents, shall be of United States inch-standards. Due to potential compatibility issues with existing Amtrak rolling stock, any components and fasteners using metric dimensions shall not be supplied unless approved in writing by the Engineer.

The vendor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value. Drawings prepared by the vendor shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views. Dimensional tolerancing shall be appropriately applied for the part being manufactured.

2.0 Design Requirements

All designs and all components shall comply with the environmental requirements identified in Amtrak Specification 429. The emergency window components shall be designed utilizing Universal or Transgenerational design, considering the needs of a broad range of users and citizens. This is particularly critical for the very young and the elderly who, while not considered "disabled" are often less stable or lack strength in situations considered "normal" by manufacturers. Applying these concepts need not complicate or add expense to the component but insure its continued utility and safety over time regardless of the demographics of the service area.

In addition to compliance with the Federal flammability requirements in Section 1.4, all materials must also comply with the flammability, smoke emissions and toxicity requirements of Amtrak Specification 352 with the following additional criteria:

a) The minimum combustion temperature shall be 1000°F (538°C) as tested to ASTM D 1929 criteria.

b) The burn rate shall meet the criteria of ASTM D 635 classification CC-1.

c) The smoke density shall be less than 75 when tested to ASTM D 2843 using a XP-2 smoke chamber.

DRAFT

2.1 Glazing Material

2.1.1 Polycarbonate

All non-glass glazing material shall be mar-resistant, transportation grade polycarbonate and approved by the Engineer, provided in nominal thicknesses of 0.250" and 0.460", and conforming to the following requirements:

a) Light Transmittance (±5%): 0.250" thick Tinted = 27%
0.250" thick Clear = 80%
0.460" thick Tinted = 27%
0.460" thick Clear = 75%

b) Solar Transmittance: 0.250" thick Tinted = 37%
0.460" thick Tinted = 37%
0.460" thick Clear = 81%

c) Solar Shading Coefficient: Clear 0.250" thick = 1.02
Tinted 0.250" thick = 0.60
Clear 0.460" thick = 0.96
Tinted 0.460" thick = 0.60

d) U-Value: 0.250" thick = 0.90 BTU/Hour/Square Foot (Summer Heat Gain)
0.250" thick = 0.96 BTU/Hour/Square Foot (Winter Heat Loss)
0.460" thick = 0.77 BTU/Hour/Square Foot (Summer Heat Gain)
0.460" thick = 0.82 BTU/Hour/Square Foot (Winter Heat Loss)

e) Sound Transmittance (STC Rating): 0.250" thick = 31
0.460" thick = 34

f) Impact Resistance

0.250 inch thick polycarbonate sheet shall withstand an impact of 200 foot-pounds with no visible loss of structural integrity. See Section 4.3 for additional criteria.

g) Tinting

The material shall be supplied either as clear (untinted), or as tinted. All 0.250 inch thick tinted material shall be identical in appearance to "Lexan Bronze" GE #51076 or approved equal. All 0.460 inch thick tinted material shall be identical in appearance to "Lexan Bronze" GE #51077 or approved equal. Tinted material shall be integrally tinted with no appreciable variation in color over the entire area of each glazing and between panel of like color designation and thickness. Measurements for determining color shall be taken with a spectrometer.

h) Protective Coating

A permanent protective abrasion resistant coating shall be applied to the surfaces of all glazing material. The purpose is to significantly improve the abrasive resistant qualities of the glazing to abrasive materials, natural atmospheric acids, strong cleaning chemicals, and cleaning brushes encountered during normal operating and cleaning conditions.

DRAFT

i) Extruding Marks

The extruding marks shall run horizontally for both the inner and outer glazing as installed in the vehicle.

2.1.2 Safety Glass

Safety glass may only be used in certain applications such as Talgo equipment, Surfliner side windows and curved glass applications such as Superliner Lounges, as approved by the Engineer.

Safety glass shall meet the requirements under Item 1, Table 1 of ANSI Z26.1, "American National Standard for Safety Glazing Materials for Glazing Motor Vehicles and Motor Vehicle Equipment Operating on Land Highways - Safety Code" and FRA Type I or II as approved by the Engineer. Glass shall meet the following requirements:

a) All safety glass shall be of the laminated sheet type.

b) When an individual pane of glass is laid on a truly flat surface, such as a surface plate, the glass shall not indicate a bow of more than 0.030 inch per linear foot.

c) The overall dimensions of individual panes as supplied shall be held within 0.060 inch of the dimensions ordered.

d) The overlap of one laminate of the pane with respect to the other at an edge shall not exceed 0.030 inch. Corners and burrs shall be ground smooth and all edges shall be treated in accordance with ANSI Z26.1, Section 6.

e) The color of the glass shall be as identified in Section 2.1.1-g. When new, there shall be no more than ± 4% variation in the color of individual panes of laminated sheet glass when examined over a white background.

f) All the laminates of the safety glass shall be so nearly free from haze that the glass shall have approximately the same clarity as a pane of the same nominal thickness of plate glass when viewed against a north light.

g) Occasional specks of foreign material and scratches are permissible, provided such specks do not exceed 0.020 inch in greatest dimension and scratches do not exceed a total of 3 inches in length and neither are within the central three-quarters area of the pane.

h) The bond between two sheets of glass and the membrane shall be of such quality that when the glass is broken by twisting or by direct impact, there will be no separation between the glass sheets. Glass panes that contain unbonded areas (let-go's) shall not be used.

2.1.3 Side Passenger Windows - Polycarbonate

The side passenger windows shall be a sealed unit constructed of an outer sheet of 0.250" ± 0.005" thick tinted polycarbonate, and an inner sheet of 0.250" ± 0.005" thick clear polycarbonate as described in Section 2.1.1. The two pieces of glazing shall be separated by a

DRAFT

nominal 0.250 inch air gap. A black, 0.25 inch self-adhesive sealant/spacer bar filled with a desiccant, Edgetech Superspacer Premium Plus or Engineer approved equal, shall be placed within the air gap, parallel and adjacent to the edges of the plastic material. A secondary sealant of either hot melt butyl or RTV silicone sealant shall be applied along the entire perimeter, filling all voids. Butyl and silicone shall not be used in the same assembly to avoid reactivity. Two mil (.002") thick soft aluminum tape with acrylic adhesive shall be applied along the perimeter of the assembly. Refer to Amtrak drawing 00-8417, revision M or newer for additional details. The glazing assembly must meet all applicable requirements of 49 CFR Part 223.

In some instances, such as privacy windows which use a privacy film, the inner polycarbonate sheet may be 0.236 inch thick clear transportation grade FRA compliant polycarbonate. Such instances will be specifically called out on the appropriate glazing drawings.

2.1.4 Side Passenger Windows – Glass / Polycarbonate

When specified in particular Amtrak drawings, 0.75" thick glazing assemblies shall be constructed with the outer glazing layer of tinted safety glass. Unless otherwise specified on the part drawing, the assembly shall be constructed in the same fashion as described in Section 2.1.3. All materials must comply with 49 CFR Part 223.

2.1.5 Door Windows

All door windows shall consist of a single 0.460" (+.005", -.020") thick piece of polycarbonate as described in Section 2.1. End door windows shall be clear. Side door windows shall be tinted as described in Section 2.1. All door glazing shall meet all applicable requirements of 49 CFR Part 223.

2.2 Frame

2.2.1 Side Passenger Windows

The window frame shall be constructed from extruded aluminum 6063-T5 alloy. The extrusion cross section shall conform to Amtrak drawing B-00-2063, latest revision. Most windows include two panes divided by a mullion; some windows employ a single pane Refer to Amtrak drawing 00-8417, revision M or newer for additional details.

2.2.2 Doors

All door frames shall be an integral part of the door structure. They shall be capable of retaining the window in the door opening when subjected to the both the impact requirements applicable to the window location described in 49 CFR Part 223 and also Section 3.2.2.

2.3 Glazing Retention

2.3.1 Side Passenger Windows

A rubber extrusion, as shown on Amtrak drawing C-00-2064, latest revision, shall be used to retain the glazing material in the frame. A "pound-in" gasket shall secure the glazing from the

DRAFT

inside of the car (Amtrak drawing 0062489 for emergency windows and the same profile for non-emergency windows). A "locking strip" (Amtrak drawing 0059785) on the outside section of the rubber extrusion shall allow installation and/or removal of the main rubber extrusion from the carbody frame. This arrangement shall be designed to allow the glazing pane to be removed from the inside of the car, and the entire window assembly to be removed from the outside the car.

2.3.2 Door Windows

All door windows shall be retained in the door frame by use of a rubber extrusion and "zip strip" (Amtrak drawing 0059864) combination which will allow installation and removal of the glazing from either side of the door. Structural requirements for the end door must meet the impact requirements of 49 CFR Part 223. Side door windows must also meet the requirements of Section 3.2.2.

2.4 Emergency Handles

Certain windows shall be designated as Emergency Windows on the drawings and contract documents. These Emergency Windows are similar to the side passenger windows, but shall also include one emergency handle set, provided on one interior pane assembly. The handle set shall be composed of two separate handles - an extruded aluminum handle for the glazing rubber gasket and a stainless steel glazing handle. The rubber gasket handle is to remove the glazing rubber gasket ("pound-in" rubber) from inside the car. The glazing handle is used to remove the glazing unit from the sash during emergencies. The glazing handle assembly shall wrap over and capture both pieces of the assembled glazing pane to ensure that the glazing assembly remains intact during the removal. All handles shall be smoothly finished. Refer to the appropriate contract drawings for the quantity and locations of emergency windows, and the handle locations.

2.4.1 Glazing Handle

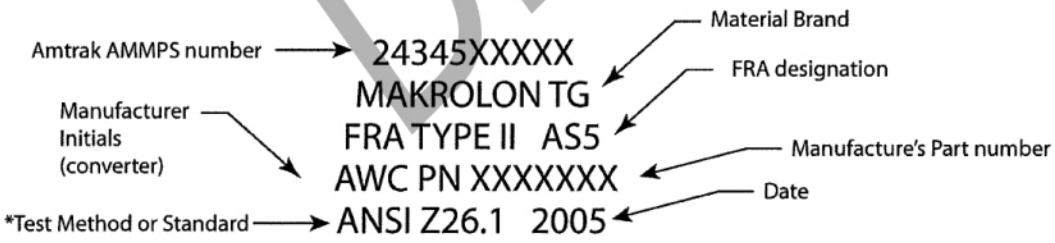
The glazing handle shall be stainless steel with a nominal thickness of 0.0355", configured to wrap over and capture both glazing sheets (Amtrak drawing 069-0101). The handle shall have black lettering reading "PULL GLASS" on a HPPL photoluminescent substrate in right-reading and inverted (Amtrak drawing 106-00096-I-NS Rev. E or later). The handle shall be secured to the assembly using 3M VHB #5925 adhesive. The surface of the polycarbonate window must be properly prepared to locally remove any coating. The glazing and handle surfaces must be properly cleaned to remove residue or oils prior to applying the adhesive using the following procedure:

Sand, using 120 grit paper, the interior clear polycarbonate in the area where the handle contacts the window. Apply a 3" long strip of acrylic foam tape to this area. Install handle & clamp with minimum of 15 lbs. to bleed out the adhesive. Cure the window assembly for a minimum of 72 hours in a temperature-controlled room. Note – The emergency handle must be free of all machining oils by cleaning thoroughly with denatured alcohol or approved Amtrak equivalent.

Refer to Amtrak drawing 00-8417, revision M or newer for additional details.

DRAFT

2.4.2 Rubber Gasket Handle



The rubber gasket handle shall be of extruded aluminum using a 6063-T5 alloy with a baked red paint finish to match color to Federal Standard FS 11105 or Pantone PMS 186C. The handle shall be attached to the rubber gasket (strip) according to Amtrak drawing 0060753. All parts shall be applied to ensure that the gasket applied properly into the window frame and to ensure the removal of the strip when the handle is pulled. The handle shall have Amtrak sign 428NS applied reading "EMERGENCY EXIT. Pull Handle. Remove Rubber" applied in the right-reading orientation for the particular application. Other methods of attachment must satisfy at least 200 lbs pulling force without breakage and must be approved by the Amtrak Engineer. For full gasket assemblies see Amtrak drawing 0062489.

2.5 Markings

2.5.1 Glazing Material

Each piece of glazing material shall have an Amtrak Engineering approved permanent marking on an inside surface as installed, in accordance with the Appendix A requirement of 49 CFR Part 223. The FRA requires FRA type designation, material manufacturer and brand name. Additionally, the marking shall include the glazing assembly manufacture's name, part number, Amtrak SAP part number, date of manufacture (at minimum "year") and test methods used*. The identification markings shall be applied and located in two opposed corners so that one label will be legible following installation regardless of how the window is installed in the car. Location of these markings must be visible for identification after installation. Abbreviations may be used to reduce the overall size of the marking. Vendors should provide samples of the intended marking for approval by the Engineer prior to commencing production. See the sample below:

(*Test method marking may be omitted if it is included as part of FRA compliance or compliance to Amtrak's specification. See the sample below.)

Typical window marking

2.5.2 Protective Covering

Protective plastic sheeting shall be applied to both sides of the completed sash assembly to protect the unit until its installation in the car. All tinted glazing material shall be clearly marked on this removable protective sheeting with 1" letters "THIS SIDE OUT", to indicate correct orientation of glazing with respect to its installation (i.e. tinted side toward outside).

DRAFT

2.5.3 Emergency Pull Handle (Rubber Gasket Handle)

The vendor shall permanently mark on the inner (hidden from passenger view) face of the handle the month and year of manufacture of the glazing rubber handle assembly. Refer to Amtrak drawing 0060753, latest revision for additional details.

2.6 Rubber Gasket Material

2.6.1 Durometer

Gasket material shall be 60-70 durometer

2.6.2 UV Performance

Gasket material shall be formulated or otherwise manufactured to resist ultraviolet degradation in North America for at least 10 years with no cracks or other defects that affect the performance of the gasket. In no case shall the gasket develop cracks exceeding 0.25 inch from the edge.

2.6.3 Workmanship

The following workmanship standards shall be followed:

a) Splices limited to the minimum required to produce a continuous gasket.

b) All mechanical alterations of the gasket must be made so that they cannot precipitate damage to the gasket.

c) Corners and splices must be vulcanized or otherwise permanently joined.

3.0 Performance

3.1 Materials

All sash and glazing materials shall withstand the testing specified in Section 4 and shall show no physical damage or degradation of optical qualities when exposed to the environment encountered in rail passenger service for a minimum period of six years. This shall include, but shall not be limited to:

a) Daily washing with alkaline/acid detergents and exposure to rotary car wash brushes.

b) Exposure to industrial strength cleaning agents, body oils and chemicals use in personal cosmetics (i.e., hair dressings, lipsticks, etc.).

c) Prolonged exposure to ultraviolet radiation in all geographic areas of the U.S.

d) Exposure to the conditions identified within Amtrak Specification 429 "Environmental Operating Conditions", with ambient temperature variations of minus 40 to 120 degrees F and humidity of 5 to 100 percent.

DRAFT

3.2 Glazing Rubber

3.2.1 Removal

The design of the glazing rubber shall allow removal of the entire window assembly from the outside the car by technical or emergency personnel (police, fire departments, etc.), see Section 2.3.1 for additional information.

3.2.2 Retention

The frame and glazing rubber of the side passenger window and side door window shall be so designed that the glazing material shall be securely held in place and withstand the air pressure differences caused when two trains operating at high speed (135 mph) pass each other in opposite directions (closing speed 270 mph) with the trains spaced 2 feet apart.

3.2.3 Leakage

The glazing assembly (including frame, rubber and glazing material) shall not leak during carbody water tests.

3.2.4 Water Retention

The Sash Assembly shall be designed so that water will not be retained in the frame or gaskets. and shall drain to the exterior of the car.

4.0 Testing

The manufacturer shall perform all tests specified herein. The description of equipment for the abrasion test is included as a guide. Actual equipment used by the manufacturer must be approved by the Engineer prior to testing. Results of these tests shall be documented per Section 5.1.

4.1 Abrasion Test

4.1.1 Abrasion Test Equipment

The abrasion test cell shall be constructed as follows:

a) Drum

An 18.85 foot circumference revolving steel drum shall be used and positioned in a manner to allow the drum to rotate at a controllable speed and in contact with the brush (See Figure 1 for general configuration). 2" wide test panel supports shall be installed horizontally around the periphery of the drum at a center to center distance of 9". The 12" by 20" test specimens shall be mounted vertically on the drum and secured at 4 corners, maintaining a 1" edge distance. The additional supports are used to maintain rotational speed as the brush rotates the drum.

DRAFT

b) Brush

The brush shall meet the requirements of Amtrak Specification 76. The brush fibers shall be type No. 1.

c) Chemical

The test car wash chemical shall be Lexol OE or Engineer approved equivalent. The chemical shall be introduced to the test fixture at a ratio of (1) part chemical to ten (10) parts water.

4.1.2 Procedure

A minimum of two production material samples selected at random shall be used in the test. Tests shall not be conducted using laboratory sample materials. Amtrak has the option of reviewing the production facilities of any manufacturer submitting glazing material for Amtrak approval. Each panel tested shall receive 500 hours high intensity UV energy exposure as outlined in ASTM G 26, method #1 before abrasion testing commences. Haze readings of the virgin samples shall be taken. A minimum of 2 samples shall be used in the test.

4.1.3 Testing

Using the test fixture outlined in Section 4.1.1, adjust the brush to overlap the test panels by 3.5" and the power unit to rotate the drum at 14 RPM. Introduce the wash chemical through a 1:10 chemical-to-water ratio. The solution shall be directed slightly above the brush/glazing interface. Every 75 cycles introduce a mixture of dirt and fine metallic particles (approximately a 50:1 weight ratio) into the brush-glazing interface.

The samples shall be periodically checked for haze development and coating adhesion. After 3000 cycles, if all the requirements for haze development and coating adhesion are met, (less than 5% haze), the test samples shall be subjected to an additional 1000 hours of high intensity UV energy exposure as outlined in ASTM G 26, method #1. Haze reading shall be recorded before and after the 1000-hour exposure.

The test shall continue for 48,000 cycles, or until the haze development exceeds 5% of the original unabraded value, or until the first indication of coating adhesion failure, whichever occurs first.

DRAFT

4.2 Adhesion of Coating Material

The glazing abrasion resistant coating material shall retain adhesion to the substrate material when subjected to a 100 foot-pounds impact as specified in Section 4.3. The coating must pass the standard cross-cut adhesion test. This test consists of scribing a grid of four horizontal and four vertical 1" long lines through the coating with a sharp steel blade. Pressure sensitive tape is then pressed over the scribed area and is then pulled away at a 90-degree angle to the sample sheet. The coating shall pass the test if no coating is removed from the substrate material.

4.3 Weathering

Material shall withstand exposure for a total of 1500 hours of high intensity UV energy testing per ASTM G 26, method #1 (500 hours as indicated in Section 4.1.2, and 1000 hours as

indicated in Section 4.1.3). The material shall not show any loss of impact qualities or change in percentage haze exceeding 5 (ASTM D 1003) after completion of the weathering cycle. The sample size shall not be smaller than 12" by 20" with a thickness of 0.470".

Prior to weathering, two 12" by 20" samples shall be subjected to a falling dart test similar to ANSI Z26.1 Test No. 9 with the exception that the dart weigh 5 pounds and the height be 20 feet. The size of the test specimen shall be as listed above. This procedure will be repeated after weathering and on the samples used in the abrasion test after conclusion of that test. No failure (penetration) of the material is allowed. Surface cracking will be reviewed by the Engineer and evaluated with other test results.

4.4 Flammability

Third-party testing laboratory reports shall be submitted to verify the flammability requirements of Sections 1.4 and 2.0.

4.5 Chemical Resistance

Samples shall be prepared and tested according to Test 19, Article 5.19, of ANSI Z26.1. The exposed fabricated edges of the test samples may be coated with the same material as the face surfaces by the manufacturer. In addition to those chemicals specified in this test, the test shall also include, but not be limited to, such car cleaning solutions as 1/2 strength Neleco Products Subway Soil Solvent Parts 1 and 2 and Electrosol. The exposure time of the test shall be increased to one hour of intimate contact with the test chemicals. Any tackiness, crazing or apparent loss of transparency shall be cause for rejection. After immersion, a change in percent haze greater than 5, as measured by ASTM D 1003, shall be cause for rejection.

To produce the specified one-half strength solution of Subway Soil Solvent, mix parts 1 and 2 in the following ratio:

Part 1 - One (1) gallon (U.S.) liquid - acid solution as received.

Part 2 - Two (2) lbs. of the crystalline and catalyst mix dissolved in ten (10) gallons of water.

4.6 Impact and Ballistic

The sash and glazing material, as an assembly, shall be tested and meet all applicable impact and ballistic requirements of Appendix A of 49 CFR Part 223.

5.0 Product Approval

5.1 First Article Inspections

The vendor, unless otherwise specified in the bidding and contract documents, is responsible for the performance of all inspection requirements in this Specification. Except as otherwise specified, the vendor must utilize independent commercial laboratory third-party facilities approved by the Engineer. All testing shall be submitted in report form to the Amtrak Contracting Agent a minimum of 10 days prior to the First Article Inspection.

DRAFT

To verify that the sash and glazing material components being supplied under this Specification meet all Specification and drawing requirements, and is truly interchangeable with existing components, Amtrak will conduct a series of two First Article Inspections (FAI) on the first complete sash assembly of each type manufactured by a vendor, prior to allowing unrestricted manufacturing work to start. It is the intention of the FAI process that every function and feature of the items being supplied under this Specification be fully exercised and tested for proper operation under all normal, abnormal and fault conditions, both in the vendor's workshop and as applied on the vehicle. This shall consist of a pre-shipment inspection and witnessing of the specified final testing of a prototype manufactured assembly performed at the vendor's facility. The vendor shall provide measurement devices as required to perform the tests and inspections. Such inspections shall include, but not be limited to, the following:

a) Dimensional Tolerances: The length and width overall dimensions of individual units as supplied shall be within plus or minus 0.03 inch of the dimension shown on the drawings unless otherwise specified. Glazing material thickness shall be per Section 2.1.

b) Flatness: When an individual pane is placed on a truly flat surface, the material shall not indicate a bow of more than L/100 measured in length and width, in full-size as-manufactured sheet.

c) Edge Work: All edges of the plastic material shall be straight and perpendicular to the face surface and shall be sawed or routed and free of burrs.

d) Optical Quality or Visibility Distortions: Optical quality of the plastic glazing materials shall be in accordance with Test No. 15, Article 5.15.2.2, of ANSI Z26.1. Under the specified procedure, no light and patches, existent over the entire area, shall appear in the shadow of the unmasked area of the specimen before the specimen shall have been moved a distance of at least 14 inches from the screen. Optical quality shall be equivalent to a piece of safety plate glass rated AS-2 per ANSI Z26.1 and shall produce no visible distortion in either horizontal or vertical planes when viewed at an angle of 30 degrees from the plane of the window.

e) Scratches shall be cause for rejections of the material. Fine scratches which are detectable only when viewed in bright back lighting are acceptable to the extent that they do not penetrate completely through the mar-resistant coating.

f) Sash assemblies shall comply with all testing requirements identified in this Specification.

g) Color Verification: Color match shall be verified when compared to Amtrak's master color sample.

Once this initial FAI is successfully completed at the vendor's facility, the vendor shall then ship this assembly to the Amtrak maintenance facility identified by the Engineer, where Amtrak will install the assembly onto an Amtrak vehicle. This second "as-installed" inspection and test FAI shall verify proper fit, water tightness, and operation of emergency windows.

Each FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. Approval by the Amtrak Bureau of Rolling Stock Engineering following successful completion of the two phases of First Article Inspections, as communicated through the Amtrak Contracting Agent, shall constitute final system approval. No vendor changes shall be made in the configuration of the items being supplied following final approval unless

DRAFT

approved in writing by the Amtrak Contracting Agent. If desired, the vendor may conduct an informal Hardware Review prior to the first formal FAI at its facility, to review design, manufacturing and test issues.

5.2 Delivery of all CAD Models and Drawings

Following the successful completion of the First Article Inspections, and as a precondition to permit production delivery of material to commence, the vendor must supply to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, an electronic set of every fully-developed CAD model and dimensioned drawing and Bill of Material created for every individual part used for the manufacture of all items being supplied under this Specification. All models and drawings shall comply with Amtrak Specifications 866 and 867. Refer to Section 5.5 for additional details. Any later modifications as a result of warranty or other actions must include the affected models and drawings being revised as necessary and resubmitted to Amtrak.

5.3 Production Changes Require Engineer Approval

Once final system approval is granted by the Engineer and production has commenced, the vendor is forbidden to make any changes in the design, material or configuration of the items being supplied, unless approved in writing by the Amtrak Contracting Agent as per Amtrak Procedure PD 3.7.3.01, Design Review and Control Procedure. This shall include any modifications required as a result of warranty actions, so as to provide complete documentation.

5.4 Failure Analysis

A Failure Analysis to determine the cause and frequency of defects occurring during the warranty shall be performed by the vendor and submitted to the Engineer and the Amtrak Contracting Agent for concurrence. Such analysis shall be performed and reported within 30 days from the date of each failure.

5.5 Drawings and Parts List

Drawings shall be in Engineer-approved formats and shall include a complete set of "as-built" drawings of every part, component and assembly used for all items being supplied to Amtrak. Each drawing shall include a complete Bill of Materials, providing the original component manufacturer name and part number of the actual supplier of the part. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The drawing package shall also include drawings of every special tool, jig or fixture required to install, maintain or overhaul the assembly, and if referenced in any of the maintenance manuals. The as-built drawings shall be delivered in electronic format in DXF or other Solidworks 2017 compatible file formats and in Adobe PDF files.

The vendor shall also submit in electronic format to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, a maintenance manual as well as a parts list of all individual parts used in the items being supplied under this Specification, which shall include the actual component manufacturer (OEM) name and part number; use of an intermediate supplier or distributor's name or part number is not acceptable. The parts list shall be sufficiently complete to permit Amtrak to order individual replacement spare parts direct from the actual parts manufacturer. The maintenance manual shall include complete information from

DRAFT

installation, through troubleshooting and complete overhaul. The vendor shall also supply in electronic formal all operators' manuals and other support documentation it has available for the components being supplied under this Specification. All documentation shall be delivered as PDF files.

6.0 Applicable Documents

The following documents of latest issue shall form part of this Specification:

- American National Standards Institute No. Z26.1, "Safety Code for Glazing Materials for Glazing Motor Vehicles Operating on Land Highways," Item #4, Test #2, #9, #19, #20, and #21
- ASTM D 2565 - Standard Recommended Practice for Xenon Arc-Type (water-cooled) Light and Water Exposure Apparatus for Exposure of Plastics
- ASTM D 1003-61 (Re-approved 1977) - Standard Method of Test for Haze and Luminous Transmittance of Transparent Plastics
- Amtrak Specification 352 - Flammability, Smoke Emission and Toxicity
- FRA Regulations - 49 CFR Parts 223 and 238
- Amtrak Specification 327 - General Vendor Requirements
- Amtrak drawing C-00-2064, Window Sash Retaining Rubber
- Amtrak drawing B-00-2063, Window Sash Frame Rail
- Amtrak drawing 00-8417 Rev. M, Glazing, Double Flat
- ASTM G 26 - Standard Practice for Operating Light-Exposure Apparatus (Xenon-Arc Type) With and Without Water for Exposure of Nonmetallic Materials
- Amtrak drawing 00-8461 Rev. E, Side Privacy window, Viewliner
- Amtrak drawing D-035-00219 Rev. D, Glazing Double Flat, Surfliner
- Amtrak drawing 0059785, Window Gasket Locking Strip Profile
- Amtrak drawing 0059864, Locking Strip Profile. End, Side and Collision Doors
- Amtrak drawing 0060753, Emergency Window Handle Attachment Assembly
- Amtrak drawing 0062489, Emergency Window Gasket
- Amtrak drawing 106-00096-I-NS Rev. E, Pull Glass Decal
- Amtrak drawing 069-0101 Rev. A, Handle Emergency Window Universal

DRAFT

7.0 Warranty

Warranty shall be provided for a period of 6 years following delivery in accordance with Section 3.1 requirements, as per the terms of the Amtrak Procurement documents. Warranty shall be provided for a 2-year period against water incursion due to seal failure on properly installed units.

8.0 Packaging and Shipment

For all components produced, following all assembly the vendor is required to perform and fully document a complete inspection and evaluation of each component being supplied, prior to shipment to Amtrak. The results of this final inspection shall be recorded in the documentation record.

All packaging and shipping requirements shall be performed by the vendor. It is required that the vendor properly prepare all components being supplied under this Specification for shipment

to Amtrak so that they are ready to install following unpacking. The vendor shall package the components to be suitable for continuous storage prior to unpacking in unheated (subfreezing), dusty indoor storage conditions. Components shall be appropriately packaged for their weight and size, and special efforts must be used to protect components from damage during shipping and handling. Large and bulky items shall be secured to a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling.

The shipping package shall have an identification label. This label shall include the vendor's name and address, purchase order number, date released for shipment, Amtrak SAP internal catalog number, and any component assembly serial number. This information shall also appear in the vendor's invoice and be included in the documentation record.

The vendor shall retain a copy of the shipping documentation record and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Contracting Agent (or as otherwise designated in the purchase order), and the third copy shall be sent to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

9.0 Source Inspection

9.1 Purpose

Amtrak will perform periodic source inspection of vendor materials and components being supplied. The following is intended to be used as an outline defining activities and responsibilities of the vendor performing the source inspections.

9.2 Professionalism

All inspections, test observations, and other activities performed in the fulfillment of the contract are to be conducted in a professional and ethical manner. The vendor is representing Amtrak in the performance of the contract and therefore must remain courteous, conscientious and professional under all circumstances arising from performance of the contract.

9.3 Scope of Work

Amtrak has implemented a multi-faceted supplier management program of which source inspection is an integral part. Amtrak identifies vendors and materials/components through various methods which will be subject to source inspection. By performing source inspections, Amtrak expects to benefit by use of vendor facilities, measuring and testing equipment to verify materials/components, through rejecting noncompliant materials/components before shipment and receipt by Amtrak, presence of Amtrak representative periodically to ensure continuing good performance, and assist to communicate Amtrak intentions and interpretations of specifications and resolve issues. The vendor will conduct inspection or verify through observation, product compliance with drawings, specifications, standards or Amtrak contract documents and report findings of said inspections to Amtrak.

DRAFT

9.4 Services

9.4.1 Scheduling Inspections

The vendor shall conduct observations and verifications on Amtrak identified materials and components produced by the vendors for Amtrak. Inspections must be scheduled to coincide with final inspection of said materials/components due for shipment to Amtrak. The vendor may use random sampling where large quantities of material are subject to shipment and note sampling method in associated reports. The vendor must perform all dimensional and operational inspections in accordance with the Quality Plan prior to source inspection and make all inspection records available for review by the Amtrak source inspector, with focus on CTQ items.

9.4.2 Dimensional Inspection

The vendor must witness and verify conformance with dimensional characteristics per drawings identified in the Amtrak contract documents. The vendor must witness and verify conformance with regulatory standards and requirements including material certification as cited in specification or other reference documents identified in Amtrak contract documents.

9.4.3 Operational Inspection

The vendor must witness and verify conformance with operational tests as cited in specifications, operator's manual or other reference documents identified in Amtrak contract documents.

9.4.4 Inspection Reports

The vendor must provide a report documenting the vendor source inspection and the inspection results. The report must include the name of the vendor, the date of the inspection, the material or component name, Amtrak (SAP) ID number(s) for items inspected, the quantities of each item inspected, the inspection results, and the actions taken where nonconforming materials/components are found. Reports should reference appropriate drawings, specifications, standards, requirements, or Amtrak contract document as appropriate.

9.5 Qualification of Personnel

It is the responsibility of the vendor to provide personnel with adequate training and experience to perform all the activities of the source inspections described above. Personnel must also conduct their activities with professionalism.

DRAFT

1.0 SCOPE

1.1 Purpose

This specification defines the design, performance, and acceptance criteria for convertible seating used in various sleeping rooms of passenger rail equipment. The seats provide reclining passenger seating during waking time and convert into a lower berth for sleeping.

The seats shall be ergonomically designed to provide maximum passenger comfort, safety, and convenience with ease of operation, maximum reliability and ease of maintenance as primary considerations.

1.2 Vendor Responsibilities

This specification is subordinate to Specification # 327 "General Vendor Responsibilities" and Specification # 340 "Car Interiors General Requirements." Vendor shall comply with all provisions therein. For Viewliner-2, instead of # 327 and 340, this specification is subordinate to Amtrak Specification 769 and the Vendor is responsible to adhere to the requirements of Specification 769B as it relates to Upper Berth Assemblies.

2.0 GENERAL

2.1 Safety Standards

The seats shall comply with 49CFR238. The seats shall be absolutely free of sharp edges, protrusions, or any element that would potentially cause injuries to passengers, crews or maintenance personnel.

2.2 Features and Dimensions

Passenger comfort, safety, enduring appearance, rugged construction, ease of installation, maintenance, and parts interchangeability shall be basic considerations.

There shall be three basic seat applications:

(1) In the Superliner "Double Roomette", the configuration shall consist of two identical seat assemblies facing each other. Both shall be easily converted by the passenger or crew from the two seat configuration into a single berth with each seat forming half of the berth.

(2) In the Viewliner "Double Roomette", the configuration shall consist of two seat assemblies of different width facing each other. The seat adjacent to the toilet and sink (sink only on Viewliner II) will be narrower while the opposite seat will be the same as those used on Superliners and Viewliner II. Both shall be easily converted by the passenger or crew from the two seat configuration into a single berth with each seat forming half of the berth.

(3) The Bedrooms and Accessible Bedroom sleeper seat shall consist of two identical seat

DRAFT

assemblies mounted side by side which form a sofa-like seat. The seats shall recline independently with each seat forming half of the lower berth

3.0 DESIGN CONSIDERATIONS

3.1 Design Objectives

The supplier shall furnish two sleeper seat configurations: (1) "Double Roomette" seat assembly, and (2) a "Bedroom" or "Accessible Bedroom" seat assembly, each as generally defined in paragraph 2.2.

It is the supplier's responsibility to standardize hardware and tooling to maximize parts interchangeability between the seat designs. The "Deluxe Bedroom" seat assembly and seat cushions, excluding the headrest shall, by "form, fit and function", be interchangeable with the Amtrak Superliner car counterpart. The "Double Roomette" seat assemblies and cushions where applicable shall interchangeable, for use in the Viewliner I, Superliner I and II cars.

Design and manufacture of the sleeper seat and its securement to the carbody shall ensure they survive 8/4/4g loading without breaking free from carbody.

Except for cushions, seat and mechanisms and components shall be designed to withstand normal passenger use-period of thirty (30) years.

DRAFT

4.0 SUBSYSTEMS

4.1 Seat Frame

The sleeper frame assembly shall be a steel construction. All exposed metal parts, not subject to wear, shall be primed and painted with DuPont Corlar epoxy. All exposed metal parts, subject to wear, shall be stainless steel with a 180 grit brush finish. The seat frame shall have a wall bracket from carbody structure and a pedestal on free end.

All operating mechanisms shall be integrally designed as part of the frame assembly. Wear components and surfaces shall be renewable.

4.1.1 Deluxe and Accessible Bedroom Seat

The Bedrooms and Accessible Bedroom sleeper seat shall consist of two identical seat assemblies mounted side by side which form a sofa-like seat. The seats shall recline independently with each seat forming half of the lower berth. Each seat frame shall allow for passenger baggage under the seat in any position. Headrests shall be a separate unit securely mounted on the room partition while giving the appearance of being integral part of the seat.

4.1.2 Double Roomette "Twin Seat" Arrangement

Roomette sleeper seats for Viewliners shall consist of two seat assemblies of unequal width mounted facing each other. Roomette sleeper seats for Superliners shall consist of two seat assemblies of equal width mounted facing each other The seats shall recline independently with each seat forming half of the full length lower berth. Each seat frame shall allow for passenger baggage under the seat in any position. Headrests shall be a separate unit securely mounted on the room partition while giving the appearance of being integral part of the seat.

4.1.3 Recline

Each seat shall include a variable mechanical recline mechanism. The seat bottom shall slide forward and the seat back shall thereby be reclined to a maximum of 25 degrees. The recline control shall be located at the front edge of, and under, the seat bottom cushion to be easily operable by a seated passenger. The seat/ berth latch mechanism shall automatically and definitively latch the seat/ berth in the selected position. The design shall ensure that the mechanism requires no adjustments for at least 5 years.

4.1.4 Bed Mode

A passenger operated mechanism shall allow converting the seat from sitting to bed mode. This control shall be separate and distinct from the recline control. The bed mode control shall be located at the front edge of and under the seat bottom cushion, on the inboard side of the seat and shall be easily operated by the passenger's hand or foot pressure. To aid in the berth-to-seat transition, the seat back shall automatically rise at least 12" from the berth position when the release control is activated. (You do not need to pull up the seat back to convert the berth back into a seat.) A method of grabbing the seat back frame to aid in raising the back during this conversion shall be available in case the back resists rising.

4.1.5 Storage Provisions

Each seat frame shall allow for passenger storage under the seat, with unrestricted under-seat clearance of min 9-1/2" over entire open area beneath seat, regardless of seat/ berth position. The space provided shall permit easy storage and removal as a minimum, of a 22.00 inch x 26.00 inch x 9.50 inch piece of luggage, in any recline position. No protrusion, sharp edges, or any element that may damage the luggage will be permitted.

4.2 Headrests

The headrests shall be a separate unit securely mounted on the room partition while giving the appearance of being integral with the seat. The headrest foam and cover shall be per paragraph 4.3.

4.3 Cushions

The seat cushions (bottoms and backs) are to be flexible cellular foam meeting the criterion of Amtrak Specifications #665 The covers for both cushions shall be wool nylon fabric. Both cushion covers for each seat shall be one piece.

Cushion covers shall be pullover type with zipper or hook & loop type closures and shall be capable of

DRAFT

replacement in ten (10) minutes for each seat (back and bottom) by one person.

The seat back and bottom cushions shall be held in proper position utilizing hook & loop strips and retained by positive fastening devices, not visible to the passenger, to prevent cushion slippage or unauthorized removal. Seat cushion assemblies are to be supplied by the seat manufacturer complete. Change out time for upper and lower cushion to sleeper seat shall not exceed 2 minutes, including removal of original back and bottom and installation and complete securement of replacement back and bottom. FAI will include demonstration of time of both operations.

4.4 Seat Mounting System

The seat structure shall be designed for mounting with a floor pedestal and sidewall bracket for direct bolt down installation. Miscellaneous sidewall mounting bracket and floor pedestal hardware shall be furnished by the seat manufacturer. Structural requirements for seat, cushions and the attachment to the carbody shall be designed to withstand peak accelerations of 8g longitudinally (along the train principal axis), 4g laterally and 4g vertically.

5.0 TESTING

Seats shall be tested as appropriate to APTA SS- C&S-016-99.
The following tests shall be conducted with no fracture or failure of any seating system component and no permanent deformation which could affect the operation of the seats. A stress analysis shall be made available to Amtrak at the same time that prototype seats are available for inspection

5.1 Backrest Test

5.1.1 Dynamic Test

Swing a 200 pound, 11 inch diameter steel ball from a 96 inch arm oriented so as to impact the centerline of the backrest at a point 2 inches below the top of seat back structure on the cushioned side of the seat. The pivot of the arm will be located at a point 96 inches above and in vertical alignment with the impact point. The horizontal distance of the swing shall be 18 inches. This test shall be conducted on the seat while the unit is attached to a test fixture simulating a carbody installation. This test shall also be performed impacting the back of the seat using the same impact point.

5.1.2 Pull Test

A pull of 300 pounds force shall be applied at the center top of backrest in both directions, fore and aft. This test shall be conducted on the seat units while seat units are attached to the test fixture.

5.2 Bottom Cushion Tests

A 300 pound weight shall be placed on the geometric center of each bottom cushion and left in place for a minimum of 24 hours. The cushion shall return completely to original shape upon removal of weight.

When cushions are in the bed mode, there shall be no more than a .25 inch deflection at the interface of

DRAFT

the seat bottoms when a 200 pound weight is placed on the center of the bed.

5.3 Floor and Sidewall Attachment Test

The seats and their attachments, when installed in [various arrangements] shall be capable of withstanding a horizontal impact of 185 pound load possessing 1,700 foot lbs. of kinetic energy. The seat shall be occupied by as many 185 pound weights as the passenger capacity of the particular seat is designed for. The point of impact shall be on the seat base, 6 inches inboard of the edge of the seat furthest from the sidewall attachment. This test shall be repeated with only one 185 pound weight located in the seat furthest from the sidewall attachment. There shall be no failure of the seat or its attachments. Seat belts and FAA type body blocks shall be used in these tests.

This test shall also be performed by subjecting the seat and its attachments to a 4g vertical acceleration with the seat loaded in the above-mentioned manner.

5.4 Seat Mechanism Tests

The seat mechanisms for recline and for conversion of seats into bed mode shall be tested to simulate five (5) years of operation in a railroad environment. These tests shall include, but not be limited to, a minimum of 20,000 cycles for the recline mechanism and 5,000 cycles for the bed mode conversion mechanism.

5.5 Seat Frame Test

The seat frames shall be capable of withstanding a force equivalent to that produced by dropping a fully assembled unit, i.e., frame with shell and cushions attached, from a height of 24 inches as measured vertically from the bottom of the pedestal with seat rotated to an angle of 20 degrees from horizontal, to the floor. The point of impact shall be the seat pedestal. No fracture, yielding of material, or any failure of the seat frame or pedestal shall result from the test.

DRAFT

6.0 SYSTEM APPROVAL

6.1 General

The complete sleeper seat system shall be subject to Amtrak approval. All major components shall be submitted for Amtrak approval.

6.2 Design Reviews

At least three design reviews shall be held at times mutually agreed upon between Amtrak and the manufacturer; such reviews are intended to convey design concepts not readily shown on drawings.

6.3 Documentation

For approval, the manufacturer shall submit, as a minimum, the following drawings and documents:

6.3.1 Component (Assembly) Drawings

6.3.2 Mounting Interface Drawings

6.3.3 Qualification Test Plan (one time)

6.3.4 Acceptance Test Plan (Quality Control - all units)

Amtrak reserves the right to request additional drawings and documents as required for system approval.

6.3.5 Stress Analysis

6.4 First Article Inspection

Prior to the delivery of the first production assembly, a production assembly shall be subjected to a first article inspection. Such inspection shall include, but not be limited to:

6.4.1 A mechanical inspection to determine compliance with the specification and the approved drawings.

6.4.2 Demonstration of cushion change-out time, both to/from seat and removing/ installing foam in cushion.

6.4.3 The performance of an Acceptance Test.

6.4.4 The performance of the Qualification Test. Successful completion of the first article inspection shall constitute final system approval.

DRAFT

7.0 PRODUCT SUPPORT

7.1 Drawings

All assembly, subassembly, and arrangement drawings shall include a complete bill of material and parts list on the field of the drawing describing all items, including vendor's parts and material description, which form a part of the assembly. Amtrak shall reserve the right to review and approve all drawings prior to construction.

AMTRAK shall be supplied, upon completion of the system design, with one set of printed drawings and electronic files in accordance with section 3.5 of Amtrak Specification 769B.

7.2 Operating Instructions, Maintenance and Parts Manuals

The equipment manufacturer shall provide manual data in accordance with Amtrak Specification #353.

ABSTRACT

This document identifies requirements for two and four person booth seat units for food service cars for Amtrak. This document defines both single sided (two-person) and double sided (four-person) fiberglass booth units with hardware to accommodate application to Amfeet I & II, Superliner I & II, Horizon Cars and Viewliner Single Level cars.

1.0 SCOPE

1.1 Purpose

This specification defines the design, performance, and acceptance criteria for two and four person booth seat for dining and lounge booth seating used on passenger rail equipment. Both single sided (two-person) and double sided (four-person) are included as well as hardware to accommodate application to Amfeet I & II, Superliner I & II, Horizon Cars and Viewliner Single Level cars.

The seats shall be ergonomically designed to provide maximum passenger comfort, safety, and convenience. The seats shall be designed as a component system with the versatility of being installed in a variety of interior arrangements. The seat assembly, including options, shall be designed for maximum reliability and ease of maintenance as primary considerations.

1.2 Vendor Responsibilities

This specification is subordinate to Amtrak Specification 769 . The Vendor is responsible to adhere to the requirements of Specification 769 as it relates to Upper Berth Assemblies.

2.0 GENERAL

2.1 Safety Standards

2.1.1 Mechanical Safety

The seats shall comply with 49CFR 238. The seats shall be absolutely free of sharp edges, protrusions, or any element that would potentially cause injuries to passengers, crews, or maintenance personnel.

2.1.2 Sanitation

The seats shall be designed to prohibit harborage or rodents. The seat shall be designed for easy cleaning with all inside corners configured for easy wiping. The seat base shall not have any perforation or penetrations that might allow spilled liquids to flow into the underside of the seat structure.

2.1.2 Fire Safety

In addition to the requirements of Amtrak Specification 352 All materials used in the booth seat construction, except for materials used in small parts (such as knobs, rollers, fasteners, clips, grommets, and small electrical parts) that would not contribute significantly to fire propagation or to smoke or toxic gas generation, shall be tested for toxicity using Boeing Specification Support Standard BSS-7239. Materials shall meet the following maximum toxic gas release limits (ppm) as determined per BSS-7239.

Carbon Monoxide (CO)	3500 ppm
Hydrogen Fluoride (HF)	200 ppm
Nitrogen Dioxide (NO_2)	100 ppm
Hydrogen Chloride (HCL)	500 ppm
Hydrogen Cyanide (HCN)	150 ppm
Sulfur Dioxide (SO_2)	100 ppm

DRAFT

The tests shall be run in the flaming mode after 240 seconds using the NBS Smoke Density Chamber for sample combustion. The gas sampling may be conducted during the smoke density test. The test report shall indicate the maximum concentration (ppm) for each of the above gases at the specified sampling time.

2.2 Features and Dimensions

Passenger comfort, safety, enduring appearance, rugged construction, ease of installation, maintenance, and parts interchangeability shall be basic considerations. In addition, seating bases shall not inhibit access to the floor heat grilles, which shall be removable without disturbing the seating

The booth seat assemblies shall be of high quality design and manufacture. A properly installed seat shall not produce rattles, vibration, or independent motion apart from the carbody when operated in new or existing passenger rail cars under the most severe track conditions.

3.0 DESIGN CONSIDERATIONS

3.1 Design Objective

Booth seat assemblies by design shall be interchangeable, via mounting bracket replacements, with all Amtrak carbody configurations. The seat assembly and subassemblies shall by function, form and fit be completely interchangeable as furnished with existing Amtrak equipment.

Design and manufacture of the seat, cushions and its securement to the carbody shall ensure they survive 8/4/4g loading without breaking free from carbody.

Except for cushions, the seat shall be designed to withstand normal passenger use-period of thirty (30) years.

DRAFT

4.0 SUBSYSTEMS

4.1 Single Seat Shell (Two Passenger)

The single seat shell shall be a fiberglass construction with a high gloss gel coat finish. The booth shell primary structure shall be constructed of steel or FRP. The exposed fiberglass shall have either a laminate or high-gloss gel finish. The primary structure shall be clad with panels of upholstered or laminated surfaces. The seat back shall be completely finished. A separate fiberglass or formed metal cap shall be employed to hide the cushion mounting fasteners and provide a visually appealing finish to the top of the seat back. A combination of mechanical fasteners and Velcro shall be utilized to retain cushions firmly in position.

26-FOI-00415 00000006223 "UNCLASSIFIED" 4/30/2026

4.2 Double Seat Shell (Four Passenger)

The double seat shell shall be a fiberglass construction with a high gloss gel coat finish. The booth shell primary structure shall be constructed of steel or FRP. The exposed fiberglass shall have either a laminate or high-gloss gel finish. The primary structure shall be clad with panels of upholstered or laminated surfaces. A separate fiberglass cap shall be employed to hide the cushion mounting fasteners and provide a visually appealing finish to the top of the seat back. The shell seat and backrest areas shall be designed to employ stretched Dymatrol fabric as the cushion support. A combination of mechanical fasteners and Velcro shall be utilized to retain cushions firmly in position. Double seat shells shall have provisions for underseat storage.

4.3 Cushions

Seat cushions and backs shall be upholstered in vinyl, woven fabric or leather; and be constructed in accordance with Amtrak Specification # 665. The seat bottom cushion shall be secured to the booth frame with a U-channel in the back and using a heavy-duty hook and loop arrangement in the front. Likewise, the seat back shall be secured to the booth frame with a U-channel on the top and using a heavy-duty hook and loop arrangement at the bottom. The seat back cushion shall be mounted flush to the seat bottom cushion without a gap to ensure a secure attachment and ease of cleaning. Cushions shall be attached to the primary seat structure so that they retain their proper shape and are easily removable for repair, cleaning or replacement. Cushion assemblies shall be attached so that they will not detach in an accident whether empty or fully loaded

Seats shall be designed so that at overhaul, all cushions and decorative treatments can be renewed without removing the seat from the car.

Removal of a back and bottom cushion and their installation with a replacement shall be possible in less than two minutes total for the process, including engagement of all attachments. A demonstration of this for each unique booth configuration shall be included in the booth FAI.

Cushion covers shall be pullover type with zipper or hook & loop type closures and shall be capable of replacement in ten (10) minutes for each seat by one person. A demonstration of this for each unique booth configuration shall be included in the booth FAI.

Final color and material for the seat shall be made in accordance with Amtrak Specification 769.

4.4 Seat Mounting System

The seat structure shall be designed for mounting with a floor pedestal and sidewall bracket for direct bolt-down installation or attachment to seat tracks, whichever is appropriate for the car type. Access to mounting hardware shall be from inside seat base frame. Sidewall mounting bracket and floor pedestal fittings shall be furnished by the seat manufacturer.

Each aisle pedestal shall be furnished with cut-outs drilled for future application of aisle lighting. Attractive

DRAFT

cover plates matching the pedestal shall be furnished attached to the pedestal covering the cut-out and mounting holes. Fasteners shall be captive stainless steel machine screws, mating with weld-nuts or tapping plates on pedestal.

5.0 TESTING

Seats shall be tested as appropriate to APTA SS- C&S-016-99.

The following tests shall be conducted with no fracture or failure of any seating system component and no permanent deformation which could affect the operation of the seats when installed in any of the planned seating arrangements. A stress analysis and test report shall be made available to Amtrak at the same time that prototype seats are available for inspection.

5.1 Backrest Test

5.1.1 Dynamic Test

Swing a 200 pound, 11 inch diameter steel ball from a 96 inch arm oriented so as to impact the centerline of the backrest at a point 2 inches below the top f seatback structure on the cushioned side of the seat. The pivot of the arm will be located at a point 96 inches above and in vertical alignment with the impact point. The horizontal distance of the swing shall be 18 inches. This test shall be conducted on the seat while the unit is attached to a structural mounting base simulating a carbody installation. This test shall also be performed impacting the back of the seat using the same impact point.

5.1.2 Pull Test

A pull of 300 pounds force shall be applied at the center top of backrest in both directions, fore and aft. This test shall be conducted on the seat units while seat units are attached to a structural base mounting.

5.2 Bottom Cushion Tests

A 300 pound weight shall be placed on the geometric center of each bottom cushion and left in place for a minimum of 24 hours in place. The cushion shall return completely to original shape upon removal of weight.

5.3 Floor and Sidewall Attachment Test

The seats and their attachments, when installed in (various arrangements) shall be capable of withstanding a horizontal impact of 185 pound (84 kg) load possessing 1,700 foot lbs. The seat shall be occupied by as many 185 pound (84 kg) weights as the passenger capacity of the particular seat is designed for. The point of impact shall be on the seat base, 6 inches (152 (mm) inboard of the edge of the seat furthest from the sidewall attachment. This test shall be repeated with only one 185 pound (84 kg) weight located in the seat furthest from the sidewall attachment. There shall be no failure of the seat or its attachments. Seat belts and FAA type body blocks shall be used in these tests.

DRAFT

This test shall also be performed by subjecting the seat and its attachments to a 4G vertical acceleration with the seat loaded in the above-mentioned manner.

5.4 Seat Frame Test

The seat frames shall be capable of withstanding a force equivalent to that produced by dropping a fully assembled unit, i.e., frame with shell and cushions attached, from a height of 24 inches as measured vertically from the bottom of the pedestal with seat rotated to an angle of 20 degrees from horizontal, to the floor. The point of impact shall be the seat pedestal. No fracture, yielding of material, or any failure of the seat frame or pedestal shall result from the test.

6.0 SYSTEM APPROVAL

6.1 General

The complete booth seat system shall be subject to Amtrak approval. All major components shall be submitted for Amtrak approval.

6.2 Design Reviews

At least three design reviews shall be held at times mutually agreed upon between Amtrak and the manufacturer; such reviews are intended to convey design concepts not readily shown on drawings.

6.3 Documentation

For approval, the manufacturer shall submit, as a minimum, the following drawings and documents:

6.3.1 Component (Assembly) Drawings

6.3.2 Mounting Interface Drawings

6.3.3 Qualification Test Plan (one time)

6.3.4 Acceptance Test Plan (all units)

Amtrak reserves the right to request additional drawings and documents as required for system approval.

6.3.5 Stress Analysis

6.3.6 Test Report

DRAFT

26-FOI-00415 00000006223 "UNCLASSIFIED" 4/30/2026

6.4 First Article Inspection

Prior to the delivery of the first production assembly, a production assembly shall be subjected to a first article inspection. Such inspection shall include, but not be limited to:

6.4.1 A mechanical inspection to determine compliance with the specification and the approved drawings.

6.4.2 Demonstration of cushion change-out time, both to/ from seat and removing/ installing foam in cushion

6.4.3 The performance of an Acceptance Test.

6.4.4 The performance of the Qualification Test. Successful completion of the first article inspection shall constitute final system approval.

7.0 PRODUCT SUPPORT

7.1 Drawings

All assembly, subassembly, and arrangement drawings shall include a complete bill of material and parts list on the field of the drawing describing all items, including vendor's parts and material description, which form a part of the assembly. Amtrak shall reserve the right to review and approve all drawings prior to construction of a prototype system.

AMTRAK shall be supplied, upon completion of the system design, with one set of printed drawings and electronic files in accordance with section 3.5 of Amtrak Specification 769

7.2 Operating Instructions, Maintenance and Parts Manuals

The equipment manufacturer shall provide manual data in accordance with Amtrak Specification #353.

Appendix A: Amtrak Electronic Parts and Service Catalog Specification

DRAFT

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

1. SCOPE

1.1 Purpose

This document defines vendor responsibility and requirements to provide product maintenance/ part manuals to Amtrak or a car builder. It describes the content and timing of deliverables as well as the review and approval process. This is done in an effort to provide a timely delivery of complete and accurate manuals.

The manuals described here may be provided directly to Amtrak as self-contained books for equipment purchased by Amtrak, or they may be provided to a builder for his insertion into the Vehicle Maintenance Manual family. The companion document #354 "Builder Operating & Maintenance Manual Family" describes the latter situation.

1.2 Function

The maintenance/ part manuals will provide Amtrak with the information necessary to properly operate and provide all maintenance functions for the given system or equipment.

2. REFERENCES

All references listed below shall be the latest revision.

Amtrak Specifications:
354 Builder Operator and Maintenance Manual Family

3. DEFINITIONS

Builder
The prime contractor solely responsible to Amtrak for the construction, quality and proper functioning of the complete car and its components.

Supplier or Vendor
The provider to Amtrak or a Builder of any services or material for incorporation into the vehicle design, construction, spare parts, manuals or other contract deliverables.

4. GENERAL REQUIREMENTS

4.1 Vendor Approval

Subcontractors used to develop the manuals described in this specification shall be subject to Amtrak approval. The supplier shall provide sample work of the proposed subcontractor for Amtrak review in advance of approval.

4.2 Considerations and Content

DRAFT

4.2.1 Considerations

The manual shall be written with the following as primary considerations:

- Safety
- Clarity
- Conformance to Amtrak Operating and Maintenance practices
- Content written in a system consistent with user, i.e., suitable technical level

The subject material shall be prepared and presented in such a manner as to encourage the use of the Manuals.

Where applicable, the manuals shall highlight the precautions to be taken by operating, service, maintenance personnel to ensure safety while performing the procedures described in these manuals.

4.2.2 Content

The Manual(s) shall include all systems and components requiring maintenance or servicing. Manual(s) shall be supplied that contain information required for effectively understanding operation of the system or equipment as well as performing scheduled maintenance including general servicing, lubrication and inspections, system/ equipment testing, troubleshooting and adjustments, and repair/replacement. These needs include information to safely and properly conduct:

- Operation
- Service and inspection
- Trouble shooting
- Running maintenance (performed with the vehicle “in line” or in a shop; typically only about a day duration)
- Heavy repair/ overhaul (system/ component level) (performed at car heavy repair facility or in a component overhaul shop, on or off site)
- Part identification
- Wreck repairs: some equipment only, such as trucks (welding procedures, structural methods, such as Huck bolting, etc.)

DRAFT

The entire manual is to be held to the same level of quality- whether written by the vendor or by a component supplier. No matter who is the technical provider, the supplier shall be responsible for delivering a complete and quality product.

Amtrak will not accept “The component supplier did not provide that information.” or “The supplier manual did not cover that.” as excuses for inadequate manual content.

Supplier manuals shall be provided electronically in an Amtrak approved language. The manuals will be used electronically in Amtrak’s Work Management System; the builder shall work with Amtrak to ensure successful implementation of this.

The part portion of the manual shall be provided to Amtrak in LinkOne format, in accordance with Appendix A, in addition to the hard-copy and electronic format forms.

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

All components/ systems must be defined to the lowest repairable level, which includes all parts bought by the system supplier.

Electronic Equipment
Unless contractually specified otherwise by Amtrak, the supplier shall provide maintenance information to allow Amtrak to repair Printed Circuit Boards in-house. This includes for each PC board:

- PCB component layout
- part list
- PCB schematic
- PCB foil layout
- software

4.3 Audience

Manuals will be used by the following personnel:

Maintenance Department

- Reference for daily Service & Inspection
- Reference for daily maintenance work and repairs
- Reference for performing heavy repair/ overhaul
- To initiate procedures for the implementation of planned preventative maintenance, service routines, car record keeping procedures, scheduled overhauls, and scheduled heavy overhauls.
- Reference for creating standard maintenance procedures.

Equipment Engineering

- To assist in the day to day analysis of field problems and course of action for equipment service and repair.
- As Reference for future equipment design and specifications.

Technical Training

- Teaching aid for new employees, and to introduce new equipment to existing maintenance staff
- As information in refresher courses for maintenance staff.

Quality Control

- As reference and background to determine adequacy of repair and maintenance work

Material Control and Purchasing

- To identify parts required for maintenance inventory.

Supplier Field Service

- For reference in performing field assistance.

4.4 Manual Development Plan

DRAFT

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

4.4.1 Manual Plan

In an effort to clearly understand the expectations for the manual right from the beginning, the supplier shall provide a Manual Plan and Schedule for Amtrak approval. The manual plan shall be submitted to Amtrak for review and approval within 90 days of Notice to Proceed and revised within 30 days of any change in the plan.

4.4.2 Manual Development

To ensure that manual is being developed concurrently with the equipment, the Supplier shall provide the following deliverables:

- breakdown of the chapter organization
- organization of the chapter: introduction, system description, controls, etc
- detailed table of contents, showing divisions and subdivisions of each chapter

4.5 Manual Availability

The Supplier shall develop the manual for review by Amtrak during the time between preliminary and final design reviews of the system design.

A draft version of the manual shall be drafted and submitted to Amtrak for comment and/or approval thirty (30) days following the final design review for the respective system(s).

Since an approved manual is required in advance of putting the first system in service, it is essential that the draft version of this document be provided in a timely fashion. This will allow appropriate Amtrak review as well as time for the Supplier to address any deficiencies noted.

The status of the manual shall be updated monthly and presented as an attachment to the program meeting minutes.

DRAFT

4.6 Document Progression

The Supplier manuals shall be written jointly by the supplier engineering and technical writing departments. They shall be thoroughly reviewed to ensure compliance with the requirements of this as well as the system specifications and shall then be submitted to Amtrak for approval.

It is the supplier's responsibility to integrate his and the subcontractor information to ensure every device and all functions of all equipment are adequately described.

Discussion of the manual approach and content with Amtrak Equipment Engineering during development is encouraged to expedite the approval process.

For manuals provided directly to Amtrak, the supplier shall develop the manual and then employ the following review process:

1. tech writer develops the manual
2. supplier engineer responsible for that equipment reviews the manual, whether written internally or by someone else, indicating necessary revisions to tech writer
3. tech writer corrects document accordingly, returns to engineer
4. engineer reviews and approves draft-level document
5. manual submitted to Amtrak for review

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

6. Amtrak reviews and provides comments to supplier
7. supplier engineer reviews Amtrak comments, forwarding necessary guidance info to tech writer
8. process repeats within supplier organization.

The process for supplier manuals provided to a builder is described in Amtrak specification #354, section 4.6.

4.7 Approval Process

Manuals, including both those provided directly to Amtrak as well as those to the Builder by suppliers, shall be submitted for Amtrak approval. If deficiencies are identified, the manuals shall be revised and resubmitted for approval. If, in Amtrak's sole judgment, the manual is still deficient, the revision and resubmittal processes shall be repeated until the requirements are met. Primary points of evaluation include, but are not limited to:

- Safety
- Completeness of subject
- Inclusion of all equipment
- Conformance to standard organization Outline
- Compatibility with Amtrak shops and standard practices
- Suitability for the end user

Normally, the process has three iterations between the supplier or builder and Amtrak: draft, preliminary and final. However, should a manual be missing sections, those sections are still subject to the 3 pass process. **Amtrak will not accept as final any manual that contains new sections of material.** Each submittal shall include a sign-off sheet, including the name of the author, the name of the engineer responsible for the review and review date.

DRAFT

Submittals:

Draft Submittal

This is the first iteration from the supplier to the customer. It is expected to be > 60% complete.

Preliminary Submittal

This is the second iteration from the supplier and is expected to be >95% compete.

Final Submittal

This is the final iteration from the supplier and is expected to be >99% complete. As noted above, a manual submitted with new sections at this time is **NOT** defined as "final". Should the document not yet be sufficient, or be otherwise inadequate, **as determined solely by Amtrak**, additional iterations will be required before the contractual requirements are met.

Approval of the draft maintenance manual is a prerequisite for product First Article Inspection approval.

4.8 Revision Process

Should any changes to the system, its components or maintenance requirements occur during the

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026
warranty period, manual updates shall be provided by the supplier to update/ revise the manual accordingly.

4.9 Product Support
The supplier shall provide Amtrak in a timely manner with corrections and updates to the maintenance manual as required to keep the manual current with equipment. Service bulletins shall also be provided as may be required by Amtrak.

5. DESIGN DETAILS

5.1 Section Numbering System
For manuals supplied directly to Amtrak, manual content shall conform in principle to Figure 1. Some minor adjustments to the outline may be required to customize the manual content to the particular equipment; such proposed changes require Amtrak approval.

Manuals provided to the builder for inclusion into vehicle-level manual may require different manual organization, though the content requirement is similar. Refer to Amtrak specification #354, sections 6 & 7 for those requirements.

5.2 Page Numbering System, Headers & Footers
Paragraph numbering
Paragraphs are numbered with the chapter as the first digit(s), followed by the section and subsection: "5.3.1"

Figures and tables
These are numbered with the chapter as the first digit(s), with the items then numbered sequentially.

Page numbering
Pages are numbered with the chapter as the first digit(s), then a dash followed by the page number of the chapter:
"6 – 3"

Each page of the manual will be numbered. Blank pages shall be so indicated either through the use of the work "blank", or by double numbering the preceding page, such as for foldouts.

Headers
A header will be used on the top of each page, including:
"Amtrak"
Equipment name, such as "Amfleet" (if manual for use by carbuilder) or "battery charger" (if vendor manual)
Chapter #, Chapter name

Footers
A footer will be used on the bottom of each page, including:
Manual type, such as "Running Maintenance" (if more than one type is supplied)

DRAFT

Revision letter and date
Page number as above

Revision indication
When a page is revised, the changed section text shall be identified in the margin, along with the revision letter associated with it, such as "B". Only the changes from the latest revision will be identified.

5.3 Configuration: 8-1/2 x 11" Pamphlet

Smaller manuals may take the form of a pamphlet, as follows:

Cover
The cover shall be cardboard or plastic. It will be labeled with the following information at a minimum:

- "Amtrak"
- Equipment name such as "Amfleet I"
- Vehicle number series / model number
- Name of book: Running Maintenance, etc, as applicable
- Supplier (or Builder)

Paper
The manual will be black print on white, 60-pound paper, printed by lithograph-offset method. Printing will be on both sides of the paper.

5.4 Configuration: 8-1/2" x 11" Binder Type Manuals

Larger manuals shall be provided, in loose-leaf binders, in 8-1/2 x 11" format, as follows:

Binder
The binder shall be a 3-ring heavy-duty type, with tab-locked rings (so they won't open accidentally). It shall include clear front and spine pockets for display of printed manual designation inserts. The ring shape will be such that the binder can be opened flat, and remain opened to the selected page. Ring spacing shall be 4-1/4 center-to- center.

Binder size shall be 3-1/4" spine or less, and shall allow for 10% expansion in number of pages.

The binder shall be labeled on the spine and cover with the following information at a minimum:

- "Amtrak"
- Equipment name such as "Amfleet I"
- Vehicle number series / model number
- Name of book: Running Maintenance, etc, as applicable
- Supplier (Builder)

Tabs
Manuals shall be subdivided using plastic-edge tabs. The tabs will be labeled with section name and number.

Paper

DRAFT

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

The manual will be black print on white 8-1/2 x 11", 60-pound paper, printed by lithograph-offset method. Printing will be on both sides of the paper, except drawings, which will be on one side of the paper only. Paper will be punched with 3 - 3/8" holes on 4-1/4" centers. Suitable hole reinforcement shall be provided to resist page tear out for all foldout and any schematics and part pages. Reinforcement shall be no thicker than an average page.

Assembly

Manuals shall be shipped with the binders empty, but packaged with binders and paper for a complete set in the same shipping container. All material shall be complete with tabs, and collated with colored printer's blank separators used to separate each complete volume of data.

6. MANUAL CONTENT AND ORGANIZATION

The general content of the manuals supplied directly to Amtrak shall conform to Figure 1. Amtrak will consider alternative formats for approval, such as for “off the shelf” manuals, however the content must meet the all the items identified in the Amtrak outline.

Manuals supplied to builders must include the same content, however organization must meet the requirements of the builder as well as those of Amtrak specification #354.

1. Introduction to System

1.1 Scope

Brief description of purpose of maintenance manual, system it describes, i.e., "This maintenance manual describes maintenance and repair requirements for the ACME-1234 HVAC unit, as used on Amtrak Viewliner equipment".

1.2 Component Description

(include photos/illustrations, envelope drawings with dimensions)

- Function
- Size
- Weight
- Mechanical, electrical, etc., connections

1.3 Specifications

(reference Amtrak specification number if applicable).

Complete equipment specifications covering performance, function, materials, rating, power consumption by individual rating, motors, heaters, etc., capacity, air and water flow rates.

2. Installation/ Removal

2.1 Installation/ Removal

Description of how to handle and install and remove the equipment, including special precautions for human safety, as well as to prevent equipment damage. Include in here such

information as brazing procedures, types of copper tubing, cleaning out procedures, etc., as may apply. Installation drawings may be required.

2.2 Installation tests and adjustments

Provide complete procedures for adjusting all components, proper fluid levels, etc., as may be required for initial operation. Tests should include step-by-step procedure to check complete operation of equipment - all features: all controls, all valves, control devices, floats, solenoids, etc. It should also include list of defects to watch for, such as over-under charging of a refrigeration system.

2.3 Initial Operation

This section should include procedure and observations personnel should make to ensure equipment operates properly during and after break-in period. It should also include any adjustments that may be required, and appropriate warnings: "If pressure exceeds 450 PSI, shut unit off immediately", etc.

DRAFT

3. Operation

This section describes how the equipment is controlled and operates in normal operation, from the viewpoint of the user.

3.1 Description of Operation - Controls and Indicators

This section should describe each switch, selector, etc., its function, and what the equipment does in each switch position. Each indicator should be described, and the meaning of the indication explained. Include illustrations of control panels.

3.2 Operating Instructions

Explain how to operate the equipment, including any specific procedures as might be required. For equipment, which uses a portable test unit (laptop), such as wheel slide controller, event recorder, etc, operating instructions explaining the features and use of the software for these units shall be provided.

3.3 Typical Operating Characteristics

This section should describe all normal operating modes of the equipment - say for an air conditioning system, the general series of events the system undergoes as the car interior temperature drops and rises. This description should be reasonably non-technical, but still describe normal characteristics - say battery charger output voltage. Include operating charts, such as temperature chart for temperature control system, typical pressures, timing, etc.

4. Theory of Operation

4.1 Theoretical

Describe technically how the equipment works - for example, the refrigerant cycle in a refrigeration system. For an electronic system, the operating concept, say the controlled phase rectifier battery charger.

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

4.2 How it's applied here

Describe how the theory of 4.1 is used in the actual system. For electronic equipment, describe the blocks of the circuit.

4.3 Technical Description of System

This section provides system details, such as on a battery charger - typical circuit waveforms, voltage levels at test points, etc.

4.4 Component descriptions

In a complicated system, such as refrigeration, this section would describe each section - evaporator with defrost function, condenser unit, enclosure environmental control, etc.

5. Schematics and Connection Drawings

5.1 Schematics

This section shall include a full-system schematic, and schematics of each complete subassembly. Each circuit board shall have its own schematic. Wire and terminal names shall be included. All devices shall be labeled, including switch positions, activation pressures for pressure switches, thermostat settings, float switch settings, etc. Electronic schematics will show appropriate wave forms, nominal operating voltages/currents at all test points. Air and fluid schematics shall show pressure settings and normal operating pressures. Electrical schematics shall include maximum and normal operating currents.

5.2 Connections

This section will include connection diagrams both internal and external for water, air, electric, refrigerant, etc. Each subassembly shall have its own connection diagram. Diagrams shall include wire and terminal designations. These drawings shall be sufficient to completely rewire (re-pipe, etc.) the given unit.

DRAFT

6. Periodic Maintenance

Amtrak periodic maintenance is generally performed on the following basis, however these intervals are subject to change:

- Trip (every day or two, minor inspections, servicing; primarily a check that all equipment operates)
- 180 (?)Day (car is removed from service for several days and serviced in the shop. A reasonably thorough inspection is made, repairs and adjustments performed.)
- 4 (?)Year Overhaul (medium overhaul)
- 8 (?) Year Overhaul (major overhaul, all mechanical systems removed from car, overhauled or replaced).

6.1 Inspections and Servicing

The manual should provide sufficient information for Amtrak to set up a schedule for servicing and inspection; including a list of tasks to be performed. Inspection schedules planned for these vehicles should be in the form of tables and include:

- Inspections
- Lubrication and lubricant changes
- Filter changes
- Adjustments
- Basic functional tests

Trip Inspection and Service

Show items requiring inspection, cleaning, resupplying, replacement (consumables), and testing or checking prior to placing car in service for that trip.

180 Day Inspection and Service

Show items requiring inspection, replacement, testing, lubricating, etc. on a 180 day basis; especially those items of safety which may be required by F.R.A. rules. Specific location for lubrication should be identified on a photograph or illustration. Also include such items as normal operating pressure, current, etc.

4-Year Overhaul

Show items requiring inspection, service and overhaul. (Also refer to section 10 of index).

8-Year Overhaul

Show items requiring inspection, service and overhaul. (Also refer to section 10 of index).

DRAFT

6.2 Tests

This section should include step-by-step tests as may be required to periodically confirm system performance on a trip, 180 day, 4 year and 8 year basis.

6.3 Service Procedures

This section defines step-by-step periodic service procedures - such as lubrication (where, what type, how much), cleaning, etc; requiring explicit instructions.

7. Trouble Shooting

Troubleshooting guides, presented as a fault tree or matrix, shall consist of a listing of the most probable symptoms of degradation and/or failure of the equipment to operate or perform properly. Each symptom shall be accompanied by a number of probable causes, how to check for the cause, and how to repair and re-inspect the repaired equipment.

An important goal of troubleshooting is to allow service personnel to determine the level of the defect and whether the vehicle can be repaired “in line”, or whether it must be shopped.

- Symptoms
- Defect
- Corrective Action
- Cause of Failure

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

8. Field Repair Procedures

This section describes adjustments/ calibrations and repairs done to equipment while it is still on the car. As appropriate, the manual shall include warning against special danger, such as spilled battery electrolyte, spring-loaded parts, etc.

The Repair Process shall be described by a step- by-step adjustment/ calibration, disassembly, repair, and/or replacement process. All special requirements for bolt and fastener torques, settings and means of applying lubricants and sealants shall be included. The detail presented shall be sufficient for qualified technicians, supervisors, and inspectors to successfully complete the work. Recommendations, based upon a probable combination of symptoms, shall be included for in-place repairs and/or lubrication and adjustments, removal of subassemblies for bench testing and repair, and/or removal of major systems for disassembly, inspection, repair, reassembly, testing, and replacement.

Information describing maintenance procedures, use of diagnostic equipment, special tools to facilitate disassembly and reassembly, and advice based on the supplier's experience with similar equipment, will be included. The section shall include complete data for setting, tuning, adjusting and operating the equipment.

Each procedure will include:

1. Purpose
2. Special Tools
3. Materials
4. Precautions
5. Preparation
6. Procedure (Disassembly, Replacement of Parts, Reassembly)
7. Adjustments
8. Tests
9. Follow-Up

DRAFT

9. Shop Repair Procedures:

This section is similar to section 8 in style, but describes OFF-car repairs done with the equipment in a shop or lab. This section will include procedures to set/adjust every adjustable device on the system (those not described in 8 above), including every adjustment on each printed circuit board in the system. This section shall include procedures to fully test the operation of each control, switch sensor, etc., of the entire system.

Each procedure will include:

1. Purpose
2. Special Tools
3. Materials
4. Precautions
5. Preparations
6. Procedures (Disassembly, Replacement of Parts, Reassembly)

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

7. Adjustments
8. Tests
9. Follow-up

10. Overhaul Procedure

This section shall include sufficient information for Amtrak or another outside qualified repair shop to conduct a complete system overhaul, following a major accident, and/or for periodic overhaul. Instructions shall include: welding and torque specifications, special tooling, fixtures, test gear, plating and painting surface finish specification and part wear tolerances.

It shall include disassembly, assembly, and installation procedures necessary for repair of heavy damage and/or long-term wear and tear. The instructions shall provide for complete full load system check as well as a check of all equipment devices.

The section shall include procedures for surface cleaning & preparation, priming, surfacing and painting all equipment that is painted or powder coated. A detailed paint schedule showing the equipment to be painted, paint type and manufactures, recommended thickness and other pertinent information shall be included.

Overall, the section will include:

1. Frequency of Overhaul
2. Scope
3. Preparation for Shipment
4. External Preparation and Cleaning
5. Inspection
6. Disassembly
7. Internal Cleaning
8. Part Inspection & wear limits
9. Routine Part Renewal
10. Retrofits/Modification
11. Reassembly
12. Adjustments
13. Tests
14. Preparation for Shipment

DRAFT

11. Special Tools and Test Equipment

This section describes any special tools, fixtures or instruments required to efficiently test and/or overhaul car systems. Information shall be sufficient for Amtrak to either build or purchase this equipment.

1. Test Fixtures
2. Test Instruments

12. Drawing List and Reference

This section is a list of drawings, both supplier and Amtrak, which provide information useful to Amtrak maintenance or engineering department.

For example, supplier envelope and part list drawings are necessary, whereas manufacturing drawings are not required, in general.

1. Supplier Drawing List
2. Amtrak Drawing List

13. Factory Repairs and Warranty

This section describes vendor's warranty, service policy and procedures followed to make a warranty claim.

1. Who to Contact
2. How to Ship
3. Documentation
4. Warranty

14. Part Identification and Part List

The Parts section shall contain the information required to effectively locate, identify, and order all replaceable units **down to the lowest repairable level**, including assemblies, sub-assemblies, components, printed circuit boards and parts of the system/ component from the original equipment manufacturer. This section is intended to provide Amtrak with information to:

- Identify any user-replaceable part
- Identify Amtrak part number for it
- Plan a spare part inventory, including stocking locations

It should be organized as follows:

Introduction

- Manufacturer names, addresses and telephone numbers
- Abbreviations

Body of manual

- Part identification

Note: This section shall include **all** the information shown below in "Format"

- Numerical index
- Common commercial hardware

The manual must also identify (as applicable):

- Consumables:
  - Lamps/ light bulbs
  - Lubricants
  - Anti-seize compounds
  - Fluids
  - Brake pads, shoes
  - Wheel sets,
  - Adhesives

DRAFT

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

- Sealants
- Paints & primer
- Wire
- Electrical lugs
- Brazing alloys
- Etc.

- Gages used to check equipment
- Software and instructions for using it for portable test equipment
- Adapter cables for using portable test equipment
- Overhaul/ rebuild kits where available, not merely individual parts.

Format

The following provides details of the required content and format.

Part Identification Illustrations

Illustrations should be provided with sufficient detail to identify all listed parts, including the order of assembly. Phantom lines may be used to reference parts that are not part of the illustrated assembly, but need to be shown for clarity. Phantom lines must be used sparingly and should be lightweight so as to avoid "clutter".

Index numbers keyed to the part list and leader lines should be used to locate all listed parts.

Hardware should be exploded only when needed to show detail parts. Where attaching hardware is obvious, one leader line with stacked index numbers is used.

Subassemblies broken down within their overall assembly should be identified with an index number and note, such as "See Detail A" on the main illustration, with a separate detail showing the additional breakdown.

Part List

This section shall include a compete list of all parts identified on the illustration, in accordance with Figure 2. Part numbers for labels and instruction sheets shall be included. (These should include the part number on the label itself, as well.) Casualty parts used only in repairing severely damaged equipment (such as the main frame, structural elements, etc.) are not normally stocked and need not be identified.

The cross references provide vital information to the mechanic to easily identify the OEM number on the part, the system vendor's number and the Amtrak number. An example is a plug-in relay, which is typically not identified with the supplier's part number, but only with the OEM's.

The maximum number of parts should not exceed 25 per 8-1/2 x 11" page. To the extent possible, illustrations and the corresponding parts list should be on facing pages of the manual to avoid having to turn the page.

DRAFT

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

Numerical Index

This index lists in alphanumeric order all the part numbers in the listing. A separate column identifies the applicable figure and index number for the part.

Common Commercial Hardware

This is a list of hardware used through the system, organized by type of fastener and then size.

Samples of all the above formats should be presented at or before the first meeting discussing part manuals.

DRAFT

"UNCLASSIFIED" 4/30/2026
26-FOI-00415 0000000006224

*** Note:** Description of common commercial hardware shall be complete; for example a bolt would be defined with the following characteristics:

- Bolt
- Hex head
- Galvanized steel
- 3/8”
- 16UNC
- 2A
- 1.5” long
- Grade, as required

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

APPENDIX A

AMTRAK ELECTRONIC PARTS AND SERVICE CATALOG SPECIFICATION

The Electronic Parts and Service Book will be Published in LinkOne®. If the Builder does not have LinkOne® Software in-house, it may be necessary to subcontract the work to an Authorized LinkOne® Publisher. Information will be provided about the Distributor Publisher, who is currently contracted to Amtrak for technical support. The Builder is not limited to a sole source situation.

LinkOne® is an international graphical parts book system formerly called Mincom ImageLink. Mincom Inc.'s corporate office is located in Australia, and there is a worldwide network of Distributor Publishers. Mincom's U.S. office is located in Denver, Colorado.

To locate the Electronic Parts Catalog Exchange Standard ("EPCES"), the Builder will be required to log onto the Internet and access the NAPM Rail Industry Forum's WEB Site **www.napmrif.org/infostnd/epces/index.html**. Compliance with this standard will be required as it applies to the EPCES, Documentation Type Definition ("DTD"), defined terms and allowable graphic standards. Actual Standard Generalized Markup Language ("SGML") tagging will not be required.

DRAFT

General Information

The LinkOne® Parts Book purchased with the equipment is to include copyright privileges that will authorize Amtrak to update the Parts Book, make changes to it and any disposition of the LinkOne® Parts Book without notification or consent of the Builder.

LinkOne® Parts Books built for Amtrak will reference Builder's Part Numbers, Vendor Part Numbers, - i.e., usually the OEM - Original Equipment Manufacturer Part Numbers (applicable to all Builder purchased components) and Amtrak (AAMPS) Corporate item numbers.

The process for establishing AAMPS numbers will be as follows:

In the early stages of documenting the Parts Book, the Builder will convey applicable catalog part number information to Amtrak utilizing an Amtrak provided Excel Spread Sheet. The data to be provided to Amtrak is to include the Noun Descriptions, the identification of the applicable system on which it is used, the Builder's Part Numbers, and the OEM Part Numbers for all parts purchased by the Builder from another source. Amtrak will use this information to identify existing AAMPS numbers or to create new AAMPS item numbers when none are found to exist.

Amtrak will respond and supply the Builder with applicable AAMPS numbers within a reasonable turnaround timeframe, normally 5 working days after the Builder has provided complete, accurate data. This procedure should allow the Builder to provide the Publisher of the Source Book Data in a timely manner and expedite Publication of the LinkOne® Parts Book.

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

The Builder is solely responsible to ensure the accuracy and integrity of its supplied books. It is the responsibility of the Builder to maintain their source books through the complete manufacturing process and until the last Unit in the Contract has been delivered and accepted by Amtrak. The Builder will be obligated to provide Amtrak with updates to their original LinkOne® Parts Book whenever the Builder makes a revision or modification under warranty to the Equipment for the life of the Equipment.

A Preliminary Draft version of the LinkOne® Book must be made available within 60 days of the start of Publication to verify compliance with the Amtrak requirements. Delivery of the Preliminary and Final Versions of the Book are to be made to the Amtrak Catalog Dept. (Catalog Dept. Address and Contact Name will be furnished by Amtrak's Contract Representative upon request). Upon final version acceptance, the Builder will be notified, and the billing invoice is to be submitted for payment.

Delivery of the final version of the LinkOne® books constructed for Amtrak must include both the Target and Source Books. These books will remain the property of Amtrak.

The Builder is also required to deliver a duplicate copy of all source data used to make the LinkOne® books. The data contained on CD(s) is to be delivered to Amtrak's Catalog Department.

Amtrak reserves the right to reject any books that it deems substandard as to quality of content provided by the Builder or if the finished product of the Publisher fails to meet any part of this Specification.

DRAFT

General Description:

Format and content required in the Equipment Parts Catalog

Front Matter

Cover Page: Graphic of the Equipment Unit
Equipment Name
Equipment Model Number
Contract Information: Contract Number, with information regarding the number of units, Road Numbers, etc.

General Table of Contents, listing:
Front Cover Page
Title Page
Chapter Index
List of All Vendors
List of the Common Commercial Hardware
List of Abbreviations and Glossary
Any Other Applicable Front Matter

Chapter Index – Listing Individual Chapter Numbers and Titles
List of Vendors: With Corporate Name, Address, Phone Number, E-mail Address,

26-FOI-00415 00000006224 "UNCLASSIFIED" 4/30/2026

Contact Person and Vendor Code.

List of Common Commercial Hardware:
This should be a key list of all parts not manufactured by the Builder. The list is to be in the Builder's part numbers sequence. It is to include all common Fasteners, Electrical and Plumbing Hardware items and must be identified by:
Either A: The complete physical description required for purchase.
Or B: The OEM Names and OEM part numbers or Mil. Specs.

List of Abbreviations
Any Other Front Matter, if Applicable

Chapters

The Builder will coordinate with Amtrak's Catalog Department when determining the Book Chapter Titles and the order of sequence of Chapters. This Is required in order to assure concurrence with Amtrak's Work Management System ("WMS").

Each chapter should begin with a list of included figures, (illustrations), with titles, in numerical order. The list is to be followed by the first Figure on the list, which will contain one or more illustrations, followed immediately by an associated list of components of the illustration. The equipment shown on the first illustration will be the top-level view of an equipment system or assembly. It will be followed in logical sequence by lower-level views called the "drill down" or NLA, (next lower assembly). The figure usually will include "callout" numbers identifying sub-parts or detail parts of the Assembly. Each "callout" item number will appear on the Parts List on the following page. The Parts List is identified by the Figure number it is associated with, and the parts are identified with the "callout" numbers.

Example: Figure 1-1 may be the first figure in Chapter 1. The associated Parts List may be identified as Fig/Index No. 1-1, and the items on the parts list will follow in numerical order corresponding with the "callout" item numbers shown on the illustration.

DRAFT

Information for the LinkOne® Publisher: Include the following in the Book:

LinkOne® Book Date of Publication:_____ Date of Revision:_____

Below is the manner in which Amtrak prefers the Parts List and column headings to be listed in the LinkOne® Book.

4							

List of Vendors and Vendor Codes

Amtrak established Vendor Codes are to be used in the LinkOne® Book.

In the event any of the Equipment Builder's Vendor Codes are different from Amtrak's and this requirement poses a serious problem, it should be listed as an exception in the Equipment Builders' proposal. Amtrak will attempt to negotiate an acceptable compromise to resolve this issue.

DRAFT

Record of Revisions

Revisions prior to Revision P may not be accurate due to a change in spec template.

REV	DATE	PAGE	CHANGE
J	11/03/83		Replaced over center clamp on Figure 8 with thumb screw type.
			Replaced Figure 10 clamp thumb screw type.
			Added date code to outlet cable assembly, fixed jumper and adapter jumper.
K	11/28/84		Rewritten - major changes include: New wire/cable requirements; More definition in test section; Dimensional changes on mating surfaces on plug & receptacles & housing.
L	6/17/85	ALL	Revised to incorporate Vendor comments to Rev. K, added Sections 4.1.4, 4.2.5, replaced Figures 1-14.
M	6/30/87		Corrected index (4.1.4 & 4.2.5 were missing).
			Section 3.3 "d" was 120 MPH.
			Section 4.1.3 Added sentence "The compression nut... means". Section 4.2.1 Added sentence "As applicable... chemicals".
			Section 4.2.2 Deleted sentence "Contacts and cables... reparability". Added sentence "Contacts shall float...forces".
			Section 4.2.2 Added sentence "Cable and cord...CHEMICALS".
			Section 9 Deleted Molded Electric Products and Brad Harrison. Figure 13 - Redrawn.
N	11/04/91	2	Added "Viewliner" and "Horizon fleet" to first paragraph.
		5	Section 4.2.2 first paragraph "yellow" was "red".
			Deleted "Individual #10 conductors beyond the breakout from the cord jacket, if exposed, shall be protected from physical damage".
			Deleted "with an appropriate sealant or other Amtrak approved means". (After "shall be sealed").
		6	Section 4.2.3 2nd paragraph Deleted "shall be equipped with an approved hanging device and the". Deleted "hanging device" from the last sentence.
		7	Section 5.2 "six" was "two".

DRAFT

		8	Section 5.2.2 Added "the test... at -20°F".
		9	Section 5.2.7 Added "six" as first word. Section 5.2.8 Added "the six" in the first line.
		13	Section 8 Added "D-12-7191 Amtrak drawing".
	Drawing D-12-7191		Added 2nd boss to plug, Figure 5. Drawing number of Figure 2 was originally D-00-7080.
O	05/08/96	2	Section 3.1, 1st paragraph, Deleted "fleet". Section 3.2, Added "The integrally molded cable and connector assembly shall provide a watertight union of cable and connector at the rear end of both plug and receptacle connectors".
		4	Section 4.2.1, 1st paragraph, Added "an integrally molded". Deleted "Individual #10 conductors...Amtrak approved means".
		5	Section 4.2.1, 3rd paragraph, Deleted "or removable. If molded", and "the maximum possible clearance". Added "appropriate dielectric and heat protection". Section 4.2.1, 4th paragraph, Changed 400 lbs to 600 lbs and 40 lbs to 150 lbs. Section 4.2.2, 3rd paragraph, Changed 100 lbs to 600 lbs, and 40 lbs to 150 lbs.
		10	Section 5.2.11, Changed 450 lbs to 1200 lbs and 80 lbs to 150 lbs. Section 5.3.1, Changed 5 Ma to 1 Ma.
		12	Section 7.1 and 7.2, 2nd paragraph, Changed Amtrak Specification #Q-76-20 to Amtrak Specification #199.
		13	Section 8.0, Changed Amtrak Specification #Q-76-20 to Amtrak Specification #199. Section 9, Added "Clements National as an approved vendor. Deleted " Anderson Power Products and Power Parts" as an approved vendor.
P	3-24-20	18, 19	Corrected index, added Sections 3.4.2.6 & 3.4.2.7
		14	Section 3.2.1, Changed reference to 'Figures C & D'
		15	Section 3.3.1, Para. 3, Changed reference to "Figures C & D'
		15-18	Sec. 3.4.1.1 to 3.4.2.5, Revised Figure #'s & dates where Applicable
		16-19	Section 3.4.2 Change integrally molded plugs to pre-molded

DRAFT

	plugs
20	Section 3.5.2.5, Changed reference to Figure 'A'
21	Section 3.5.2.6, added 'power pins' & 'control pins'
33	Figure 11 changed to Figure 'A'
34	Figure 12 changed to Figure 'B'
35	Figure 13 changed to Figure 'C'
36	Figure 14 changed to Figure 'D'

Drawing: D-12-7191 Rev. K, Added Sheet 13, added Jumper Cable Ass'y (Receptacles both ends), revised figure numbers (1-13), Unified all title blocks

Drawing: D-12-7191 Rev. L, Changed integrally molded plugs to pre-molded plugs.

Drawing: D-12-7192 Added reference to standby power connections

Specification No. 223 (Formerly D-7724)

1.0 Scope

1.1 General

This Specification is intended to be used in conjunction with any associated Amtrak drawings and/or CAD models, the Amtrak Procurement Department purchase orders, and other contractual documents issued to the vendor. It is Amtrak's intention that all components supplied under this Specification, unless improvements are otherwise identified, be functionally interchangeable with those currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation

As basic work under this Specification, each item produced must be completely functionally tested, properly packaged for shipment to Amtrak, and have documentation submitted. Amtrak will perform a series of First Article Inspections on the first item produced by a vendor, in order to verify that the process and materials used are in compliance with this Specification and drawings.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to the Amtrak Contracting Agent in a timely manner for mutual investigation and satisfactory resolution, with any revision approved in writing by the Amtrak Contracting Agent. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions. Wherever possible, this Specification has been developed on the basis of equipment performance required, rather than specific hardware to be provided. Where specific hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Amtrak Engineer, in order to allow vendors to employ innovation and advanced technology, where appropriate. Preference, to the extent practicable and economically feasible, will be given for products and services that conserve natural resources, protect the environment and are energy efficient.

DRAFT

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term “or approved equal” if not written thereafter shall be implied. Any reference to a particular manufacturer’s product, either by trade name or limited description, is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term “or approved equal” means any other manufactured product or article which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak’s written opinion as to whether the proposed alternate is equal to the specified items for Amtrak’s specified use and purposes shall be final and conclusive. The vendor shall not subcontract the design and manufacturing work under this Specification without the written authorization of the Amtrak Contracting Agent. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted vendor Technical Proposal, but are necessary for the completion of

the item being supplied, shall be considered a part of the scope of supply. In this Specification, all references to "number of days" shall mean calendar days unless otherwise stated.

Safety shall be of primary importance in the design of any items being supplied. They shall present a safe, hazard-free environment to the extent practical. No sharp edges or corners or pinch points shall occur where any personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize injury.

1.2 Amtrak Ownership Rights

Unless specifically waived in writing by the Amtrak Contracting Agent, all drawings, bills of materials, catalog lists, mockups, CAD models, documentation and all other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection or other process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

1.3 Vendor's Technical Proposal

As a condition of contract award unless otherwise indicated in the Amtrak Procurement documents, the vendor must submit a written and detailed Technical Proposal to the designated Amtrak Contracting Agent. This Technical Proposal must identify the vendor's interpretation of what it considers to be the scope of Basic Work to be performed, present a complete technical description of the components to be supplied, fully describe the operation and maintenance requirements of the components, include a copy of the vendor's Quality Assurance program, describe any Design Review process, present a step-by-step work plan for construction, include a project schedule by major events starting from the Notice to Proceed, and a Bill of Material of all components to be supplied.

DRAFT

1.4 Exceptions

The vendor shall explicitly identify to the Amtrak Contracting Agent any exceptions being taken to this Specification, referencing the Specification Section number and the exact wording in question. It will otherwise be assumed by Amtrak that the vendor takes no exception to this Specification and is completely compliant with all Specification requirements.

1.5 Legal Requirements

All items being supplied under this Specification must comply with all applicable Federal government requirements, in particular those identified in 49 CFR Part 229 (Locomotive Safety Standards) and 49 CFR Part 238 (Passenger Equipment Safety Standards), among others. This shall include all design aspects, as well as required submittals for approval. It is mandatory that all required materials used by the vendor for application in passenger cars or the cab interior of passenger service locomotives comply with the flammability and smoke emissions requirements of the latest edition of 49 CFR Parts 238.103 (a)(2) and (b)(2),

1.6 Engineer

The Engineer or Amtrak Engineering, as referenced in this Specification or any drawings, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. The vendor may be submitting items for the Engineer's approval as required by the Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to all of the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submissions shall contain sufficient detail to confirm that Specification requirements are being met. However, the vendor shall use judgment as to what level is appropriate and shall communicate with the Engineer when guidance is needed on a case-by-case basis. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible.

1.7 Cost Items

Any individual extra work items regarding the items being supplied shall be handled in accordance with the purchase order and other contractual documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Contracting Agent regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Contracting Agent in accordance with the contract documents.

1.8 Vendor Quality Assurance Program

The vendor is required to have in place a documented Quality Assurance Program that is modeled after an established industry quality standard, such as the ISO, AAR, or other organization. The vendor's facility is required to be equipped with equipment, personnel and management completely sufficient to assemble, inspect and test each item being supplied under this Specification. The vendor shall have suitable equipment to diagnose any failure mode, and perform all adjustments and tests required to confirm proper operation. The vendor's Quality Assurance staff shall be active participants in the assembly, inspection, testing and documentation phases of the work. The vendor is required to submit a copy of its Quality Assurance Program as part of its Technical Proposal, as explained in Section 1.3. While it is not a mandatory requirement under this Specification, it is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000 or an equivalent recognized standard.

Amtrak Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. The vendor shall fully cooperate in such audits. Specific attention shall be paid to the areas of management responsibility, quality system, contract review, design control, document control (including drawings), purchasing, purchaser-supplied product, product traceability and

DRAFT

identification, process control (including procedures, testing and equipment), inspection and testing, measuring and test equipment (including calibration programs), control of nonconforming products (applied controls), corrective and preventative actions, handling, storage, packaging and delivery, quality records, internal quality audits, training, servicing and statistical techniques.

1.9 Critical to Quality (CTQ) Part Criteria

It is mandatory that the vendor comply with Amtrak procedure PD 3.7.4.02, Critical to Quality (CTQ) Part Criteria, which applies to all products identified by either the Engineer or the designated Amtrak Contracting Agent that Amtrak considers to have aspects identified that are Critical To Quality (CTQ). CTQs shall be Critical to Quality (CTQ) characteristic are defined as "Those characteristics of an item which, if non-conforming, may prevent or seriously affect the unit performance, reliability, , or customer satisfaction of a component." This procedure defines the methodology when qualifying parts or processes to assure that the critical to quality product criteria meet Amtrak requirements by:

- Implementing a rigorous Part/Process qualification to ensure the participation, communications of all related departments and the quality acceptance.
- Support the Quality process by involving the vendor early in the project/design process.
- Assure that the vendor is supplying materials that meet the quality, cost, delivery and reliability requirements.

1.10 Components

The vendor shall use only new parts for all components, unless otherwise specified on the drawings or contract documents. It is Amtrak's desire that all materials, to the greatest extent possible, be of commonly available commercial items and hardware. The vendor shall maintain drawings for each component, and where necessary, patterns, jigs and fixtures, to assure identical manufacture. All elastomers used shall have a design life of 10 years in service unless otherwise approved by the Engineer.

DRAFT

1.11 Conducting Tests

The vendor shall be equipped to fully test the items being supplied in accordance with this Specification and any referenced drawings as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended by the apparatus supplier, and the vendor shall maintain documentation of such calibrations.

1.12 Workmanship

All workmanship shall be of high grade and shall conform to the best of manufacturing practices. Skilled, qualified, well-motivated personnel, with appropriate experience, training and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and

professional manner. The vendor is required to have on hand in its facility this Specification, and all other referenced drawings and documents.

1.13 Documentation Records

The vendor shall maintain an electronic database and/or approved logbook of information regarding all components supplied to Amtrak under this Specification. At a minimum, records shall identify the Amtrak purchase order number, any serial number of the assembly, Amtrak "SAP" internal catalog number (if known), copies of any written authorizations by the Amtrak Contracting Agent, inspection and test data, shipping date and shipping location. In addition, it shall include a copy of the flammability and smoke emission laboratory certification report, if required, under 49 CFR Part 238 Appendix B for the components being supplied. The vendor shall include any applicable fire safety analysis and all certifications such as by the U.S. Public Health Service, the U.S. Food and Drug Administration, Underwriters' Laboratories and the National Sanitation Foundation.

1.14 Referenced Documents

The latest revision level of all referenced drawings and documents are to be considered to be the applicable version.

- Code of Federal Regulations; 49 CFR Parts 223, 229 and 238
- ISO 9001:2000, Quality Management Systems - Requirements
- D-12-7191 Amtrak 480V Trainline Jumpers, Plugs, & Receptacles (Vendor to verify latest revision.)- Amtrak drawings and models provided with the bidding and contract documents.
- Appendix A Cable and Wire Specification
-APTA PR-E-RP-018-99 “Recommended Practice for 480VAC Head End Power Jumper and Receptacle Hardware.”

DRAFT

2.0 General Requirements

2.1 Design Considerations

Any components being supplied under this Specification shall be designed and manufactured to perform satisfactorily for a minimum design life of 10 years, unless otherwise specified. To the extent possible, only readily available components, hardware and fasteners shall be used.

The design and components shall comply with the flammability, smoke emissions and toxicity

requirements of Amtrak Specification 352. All wire and cable shall comply with Amtrak Specification 323 All materials and workmanship shall comply with the requirements of Amtrak Specification 328. Components shall be selected for maximum endurance between inspections, and for ease and quickness of inspection.

As appropriate, the overheating of apparatus and overall fire safety design shall be addressed by use of thermal cutouts, selection and use of materials meeting flammability, smoke generation and toxicity requirements, and by means of fire detection and suppression

2.2 Environmental Conditions

Any components being supplied under this Specification shall be designed to comply with the conditions listed in Amtrak Specification 429, Environmental and Operating Conditions, and must be suitable for use up to 10,000 feet elevation above sea level. They shall also be designed and mounted to have structural integrity and be operationally reliable for the vibration environment at the point of attachment, and shall prevent unacceptable vibration inputs to the attachment structure. The component structure and mounting shall be designed to prevent amplification through component resonance beyond a level twice that of the attachment point. Vibration resistance shall be verified by analysis, to the satisfaction of the Engineer.

DRAFT

2.3 Interchangeability

All similar parts on each item being supplied, and among all other assemblies and their spare parts, shall be designed and manufactured to be identical, both as individual parts and as subassemblies. All assemblies shall mount to the vehicle without modification. Model numbers for identical components shall be identical. Replaceable components of any such apparatus shall be fully interchangeable, without adjustments to any part being necessary.

2.4 Dimensions

All designs, components, dimensions and fasteners used on the components being supplied under this Specification, unless otherwise stated in the bidding and contract documents, shall be of United States inch-standards. Due to potential compatibility issues with existing Amtrak rolling stock, any components and fasteners using metric dimensions shall not be supplied unless approved in writing by the Engineer.

The vendor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value. Drawings prepared by the vendor shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views. Dimensional tolerancing shall be appropriately applied for the part being manufactured.

2.5 Cleaning and Maintenance

All components being supplied under this Specification shall be easy to clean and maintain. They shall not require maintenance or adjustments at intervals of less than four years, unless approved in writing by the Engineer. Pockets where dirt and debris can collect shall be minimized; those that exist shall be made easy to clean with standard vacuum cleaner equipment. Where possible, components requiring maintenance or replacement at overhaul shall be replaceable as individual units. The design shall ensure that items that require repair and or service are easily accessed, removed and replaced and that this is possible with the use of standard hand tools. Variations of fastener thread size, thread length and head style shall be minimized to ease overhaul and regular maintenance. The number of fasteners shall be kept to a minimum. All paints, coatings and corrosion protection shall meet the requirements of Amtrak Specification 328.

2.6 Interference and Transient Suppression

All electrical components and wiring being supplied shall be carefully planned and selected to avoid electrical interference in the operation of train crew and maintenance department portable radios, public address and any other frequency sensitive systems. Likewise, these components shall be immune to the EMI/RFI effects of electrical interference from Amtrak's electrically and diesel-electrically propelled trainsets, passenger cars and locomotives.

DRAFT

3. Specific Requirements

3.1. SCOPE

This specification defines the requirements for 480 Volt, 3 Phase, 50/60 Hz pre-molded cable assemblies, outlet housings, and accessories for Amtrak head end powered equipment.

3.2. EQUIPMENT CONFIGURATION

3.2.1. General

Jumper cable assemblies and receptacles are used for transmission of 480 Volt, 3 Phase, 50/60 Hz "Head End Power" locomotive-to-locomotive, locomotive-to-car and car-to-car. In this arrangement, 4 cables are generally used in a parallel arrangement between each vehicle. Cable assemblies are also used to provide wayside power to a consist; this is generally done with 2 cables in a parallel arrangement. See Figures ‘C’ and ‘D’.

3.2.2. Ratings

All current carrying elements shall be rated at 395 amps (continuous) for each of the three power conductors and 40 amps (continuous) for each of the auxiliary conductors, all conductors operating at rating simultaneously, at 600 VAC in a 110°F ambient.

3.3. DESIGN CONSIDERATIONS

3.3.1. Usage and Compatibility

The equipment described in this specification is for new equipment and for operating and maintaining Amtrak's present locomotives and passenger cars and head end power converted conventional cars used in the Amtrak network.

All ratings and requirements of this specification (including, but not limited to, watertightness and water proofness) shall also hold when equipment supplied under this specification is utilized in conjunction with existing equipment which Amtrak is using or anticipates using.

Cable assemblies supplied under this specification will be used with housings supplied under this specification and existing components previously manufactured. This specification shall be compatible in all respects with existing equipment used for supplying 480 volt power to Amtrak's trains (See Figure 'C' and 'D').

When applied to a vehicle or standby power station, the jumper shall be the weakest link of the jumper/ receptacle marriage. The connection should separate without damage to plug or receptacle should the car be uncoupled or moved before the jumper(s) is(are) disconnected.

It is the supplier's responsibility to insure that equipment supplied under this specification is compatible in all respects with existing equipment used for supplying 480 Volt power to Amtrak trains.

DRAFT

3.3.2. Watertightness and Weatherproofness

The integrally molded collar on the receptacle body (D-12-7191, Shts. 4-5 located 3-5/8" from the front end of the connector) shall seal between the housing and the mounting surface. The housing recess which retains the receptacle body shall have a dimension slightly less than that of the collar in order that the collar be compressed and the joint be sealed after mounting. The mating of cable assemblies shall provide a weatherproof connection. With a jumper fully seated in an outlet, a watertight seal shall be provided between the mated parts. The sealing bosses at the base of each contact pin in conjunction with the sealing lip in the contact entry of the mating plug shall form the primary seal between contacts. The secondary seal shall be between the circumference of the plug body and bore of the outlet or receptacle body.

3.3.3. Mating Force

Mating forces for complete insertion and complete retraction shall be 50 ± 20 lbs.

3.4. COMPONENT DESCRIPTIONS

3.4.1. Housings

3.4.1.1. Outlet Housing

Outlet housing (D-12-7191, Sht. 1, Figure 1) shall consist of a housing body and spring loaded hinged cover. The hinged cover shall be provided with a latching boss to hold a mated plug in a retained position; the cover shall also contain a gasket to provide watertightness when the receptacle is unmated. Materials and dimension requirements shall be as shown in Figure 1.

3.4.1.2. Offset Adapter

Offset adapter (D-12-7191, Sht. 2, Figure 2) shall consist of a flange mounted housing to allow for 45 deg. connector/ cable entry when used with outlet housing defined under 3.4.1.1. A gasket shall be provided to achieve a seal at the mounting flange. Materials and dimensions shall be as shown in Figure 2.

3.4.1.3. Flange-Mounted Cable Grip

Flange-mounted cable grip (D-12-7191, Sht. 3, Figure 3) shall consist of a flange threaded body to accept a 4-hole cable sealing grommet, grommet compression nut and stainless steel cable grip. The flange portion shall be provided with a sealing gasket. The compression nut shall be secured against unintentional loosening through the use of a locking setscrew or other Amtrak-approved means. Materials and dimensions shall be as shown in Figure 3.

3.4.1.4. Fixed Jumper Mounting Adapter

Fixed jumper mounting adapter (D-12-7191, Sht. 11, Figure 11) shall consist of a flange-mounted housing with gasket. The assembly accepts the flange-mounted cable grip defined under Section 3.4.1.3. Materials and dimensions shall be as shown in Figure 11, Sht. 11.

3.4.2. Cable Assemblies

3.4.2.1. Outlet

Outlet (D-12-7191, Shts. 4 & 5, Figures 4 & 5) shall consist of a pre-molded receptacle body and contacts crimped to three 4/0 cables and each conductor of three #10 conductor cords. After all pin-cable assemblies are completed they are inserted into the receptacle body and completely potted with an insulated elastomeric molding compound. The compound shall have a dielectric strength of 950 V/mil, a thermal conductivity of 0.48 W/m-K and a temperature range at least -40ºF to 150ºF. The vendor must insure there are no internal voids or air gaps when the potting process is complete. This will be verified during the First Article Inspection by cutting the connectors into several segments 1” to 2” thick.

The receptacle body shall be made from a resilient material red in color, capable of meeting the performance requirements specified over a temperature range of -40°C to +60°C (-40°F to +140°F).). Contacts shall be copper alloy, 90% conductivity minimum; silver plated, and should be inserted with the cable attached and then secured in position with the elastomeric molding compound. The individual #10 conductor breakout from the cable jacket shall be integral to the body. The three 4/0 cables and the control cable shall have watertight bonds between the cable jacket and

DRAFT

the connector body to prevent entrance of water that may otherwise wick into the body from extended and repeated exposure to moisture - rain, snow, ice or car wash chemicals.

The engaging front end of the receptacle shall be reinforced with an integrally molded circular stiffener to resist buckling during engagement of plugs.

4/0 pin contacts shall each withstand a pull-out or push-in force of 600 lbs minimum and #10 contacts shall each withstand a pull-out or push-in force of 150 lbs minimum.

The receptacle shall withstand 1960 volts RMS 60 Hz between all contacts, and contacts and receptacle body. Materials, cable, cord and dimensions shall be as shown in Figures 4 & 5 and Appendix A, Table II.

The body shall be permanently marked with the manufacturer's name and date code (month and year, i.e., 12/08), and Amtrak SAP Number..

3.4.2.2. Portable Jumper

Portable jumper (D-12-7191, Sheets 4 & 6, Figures 4 & 6) shall consist of 2 pre-molded plug bodies and contacts crimped to three 4/0 cables and each conductor of three #10 conductor cords. After all pin-cable assemblies are completed they are inserted into the plug body and completely potted with the insulated elastomeric molding compound. The compound shall have a dielectric strength of 950 V/mil, a thermal conductivity of 0.48 W/m-K and a temperature range at least -40ºF to 150ºF. The vendor must insure there are no internal voids or air gaps when the potting process is complete. This will be verified during the First Article Inspection by cutting the connectors into several segments 1” to 2” thick.

The heat shrink tubing should be applied over the back of the plug and the cables. The plug body shall be made from a resilient material, yellow in color, capable of meeting the performance requirements specified, over a temperature range of -40°C to +60°C (-40°F to +140°F). Contacts shall be copper alloy 90% conductivity minimum, silver plated. Contacts shall "Float" within the jumper head to accommodate any pin/socket misalignment and thus maintain reasonable mating forces.

Rigid insulation shall be provided between the forward end of the socket contacts and the plug face to preclude any possible contact between any plug contact and any receptacle contact unless plugs and receptacles are properly aligned, i.e., such as might occur in standby wayside service operations.

4/0 socket contacts shall withstand a pull-out or push-in force of 600 lbs minimum and #10 contacts shall withstand a pullout or push in force of 150 lbs minimum.

The plug mating end shall effect a circumferential seal in addition to the interfacial seal when mated with a receptacle. Cable and cord entry into body shall be sealed to prevent entrance of water that may otherwise wick into body from extended and repeated exposure to moisture - rain, snow, ice or car wash chemicals.

DRAFT

The jumper shall withstand 1960 volts RMS 60 Hz between all contacts, and contacts and receptacle body. Materials, cable, cord and dimensions shall be as shown in Figures 4 & 6 and Appendix A, Table II.

The body shall be permanently marked with the manufacturer's name and date code (month and year i.e., 12/08), Amtrak SAP number and the jumper shall be color banded (See Figure 6).

3.4.2.3. Fixed Jumpers

Fixed jumpers (D-12-7191, Sheets 4 & 7, Figures 4 & 7) shall consist of a pre-molded plug body and contacts crimped to three 4/0 cables and each conductor of three #10 conductor cords. The plug body and contacts shall be the same as supplied for portable jumpers under Section 3.4.2.2.

The fixed jumper connector body shall be marked with the manufacturer's name and date code (month and year, i.e., 12/08), Amtrak SAP number Material, cable, cord and dimensions shall be as shown in Figures 4 & 7 and Appendix A, Table II.

3.4.2.4. Adapter Jumpers

Adapter jumper (D-12-7191, Sheets 4 & 8, Figure 4 & 8) shall consist of a pre-molded plug body and a pre-molded receptacle body with contacts crimped to three 4/0 cables and each conductor of three #10 conductor cords. The plug body and contacts shall be same as supplied for portable jumpers under Section 3.4.2.2. The receptacle shall be the same as supplied under Section 3.4.2.1 except the reinforcement at the mating end is replaced with a clamp assembly (Figure 8) to hold mated connectors in the secured position.

The connector body shall be marked with the manufacturer's name and date code (month and year, i.e., 12/08), Amtrak SAP number Materials and dimensions shall be as shown in Figures 4 & 8, and Appendix A, Table II.

3.4.2.5. Connector Jumper Cable

Connector jumper cable (D-12-7191, Sheets 4 & 9, Figure 4 & 9) shall consist of a double-ended pre-molded receptacle body with plastic polarizing phase pin and only one control circuit contact connected.
The adapter jumper connector bodies shall be marked with the manufacturer's name and date code (month and year, i.e., 12/08), and Amtrak SAP number. Material and dimensions shall be as shown in Figures 4 & 9, and Appendix A, Table II.

3.4.2.6. Motor Alternator Jumper Cable

Connector jumper cable (D-12-7191, Sheets 4 & 12, Figure 4 & 12) shall consist of a pre-molded receptacle body at both ends with only the control circuit contacts connected.
The connector bodies shall be marked with the manufacturer's name and date code (month and year, i.e., 12/08), and Amtrak SAP number. Material and dimensions shall

DRAFT

be as shown in Figures 4 & 12, and Appendix A, Table II

3.4.2.7. Jumper Cable

Jumper Cable (D-12-7191, Sheets 4 & 13, Figure 4 & 13) shall consist of a pre-molded receptacle body at both ends with contacts crimped to three 4/0 cables and each conductor of three #10 conductor cords. The receptacle shall be the same as supplied under Section 3.4.2.1 except the reinforcement at the mating end is replaced with a clamp assembly (Figure 13) to hold mated connectors in the secured position.

The receptacle bodies shall be marked with the manufacturer's name and date code (month and year, i.e., 12/08), and Amtrak SAP number. Materials and dimensions shall be as shown in Figures 4 & 13, and Appendix A, Table II.

3.5. TESTING

3.5.1. Qualification Test

The vendor shall submit, for Amtrak's approval, the qualification test plan (QTP). The plan shall be submitted at least 30 days prior to the manufacturer's intent to perform the test. This test is an engineering procedure, executed on sample parts to ensure compliance with specification. The test consists of two sections:

- lab tests
- one year in-service test.

The vendor shall provide Amtrak with seven working days advance notice of testing to permit Amtrak to witness tests.

DRAFT

3.5.1.1. Lab Test

The test shall, as a minimum, demonstrate the following, in order:

1. Mechanical inspection
2. Mating and unmating forces
3. Insulation resistance
4. Dielectric withstand voltage
5. Current rating/temperature rise
6. Contact resistance
7. Physical shock tolerance
8. Watertightness
9. Insulation Resistance/Dielectric Withstand
10. Contact retention force
11. Crimp tensile strength

All required testing shall be performed at no additional cost to Amtrak. The vendor shall furnish a written report of the test results.

3.5.1.2. One Year In-Service Test

Upon successful completion of the lab qualification tests, the 480V cable assemblies will be road tested for a period of one year. This test will be done, generally on ten cars, in normal revenue service.

Amtrak reserves the right to request additional tests as may be required.

3.5.2. Qualification Test Procedures

Prior to the first shipment, Amtrak shall be furnished with six production samples of each item for inspection and testing.

A production sample of all assemblies shall be given tests as follows:

3.5.2.1. Mechanical Inspection

A mechanical inspection shall be made to determine compliance with approved drawing, including a check of all dimensions, and proper level of workmanship.

3.5.2.2. Mating/Unmating Force

A check shall be made to determine that the force necessary to mate and unmate plugs and receptacles shall be as stated in this specification. A suitable measuring instrument shall be used. The test shall be conducted at 70°F, and after 8 hour minimum cold soak at -20°F.

3.5.2.3. Insulation Resistance

Using a 1000 volt megger or similar instrument, insulation resistance of the mated pair shall be measured. Measurement shall be between each contact and all other contacts, and also between contacts and the housing. At 77ºF, readings shall be a minimum of 50 Megohms.

3.5.2.4. Dielectric Withstand Voltage

A mated pair shall be high potential tested at 1960 VAC for 1 minute. There shall be no evidence of flashover or breakdown. Leakage current between any pair of contacts or between contacts and housing shall not exceed 1 mA.

3.5.2.5. Current Rating/Temperature Rise (Figure ‘A’)

A continuous current of the 395 amperes shall be applied simultaneously through each of the three power conductors. The mated assemblies (with the housing) shall be supported in still air, two feet above floor level. Temperatures shall be monitored by means of thermocouples positioned as shown on Figure ‘A’.

Temperature shall be continuously monitored and recorded at thirty minute intervals. Upon stabilization of all temperatures to within 1°F over a one hour period, temperatures shall be recorded at three minute intervals for 30 minutes. The cable assemblies will be considered acceptable if the temperature rises recorded in this test satisfactorily demonstrates to Amtrak that continuous operation at 395 amperes in an

DRAFT

ambient of 110°F will not produce temperatures in excess of the insulation materials capability.

3.5.2.6. Contact Resistance (Figure 'B')

The millivolt drop across mated male and female contacts including the cable crimps shall be measured at rated current (395 Amps - Power Pins and 40 Amps - Control Pins) to check that the voltage across the contact pair does not exceed 75 millivolts and 33 millivolts respectively for the 4/0 and #10 AWG cables. Refer to Figure 'B' for locations of the test probes. This test shall be performed before and after the Physical Shock Test described below.

3.5.2.7. Physical Shock

Six mated assemblies (less housings) shall be subjected to a physical shock test by dropping the mated assembly onto a concrete surface from an elevation of six feet. Mated assemblies shall be dropped in a horizontal position a total of eight times. After the drop test, the contact voltage drop of the mated assembly shall be measured. There shall be no change in the insertion and withdrawal force or in the voltage drop after the shock test.

3.5.2.8. Watertightness

After the drop test is complete, the six mated assemblies shall be immersed horizontally in 6 inches of tap water for 30 minutes to verify sealing between cable and connector body and primary secondary sealing of the mated pair of connectors.

3.5.2.9. Insulation Resistance/Dielectric Withstand

Following successful completion of the above test, the assemblies shall again be subjected to a megger test and a high potential test in accordance with current IEEE, ANSI, and DOT standards. The insulation resistance shall not be less than 50 Megohms.

3.5.2.10. Contact Retention Force

The contact pullout and push-in forces shall be measured for each contact type on the plug and receptacle body. Forces shall meet or exceed those required in this specification, applied at a rate of 1 ± 1/4 inch per minute.

3.5.2.11. Crimp Tensile Strength

The minimum axial load to separate the wire from the contacts either by pulling the wire out of the wire barrel or breaking the wire within the wire barrel shall not be less than shown in the table below:

DRAFT

Contact Size	Axial Load
4/0	1200 lbs.
10	150 lbs.

Contacts crimped to the cable shall be removed from the connector. The cable length shall be sufficient in length for adapting to a Tinius Olsen or similar test device. The rate of applying the load shall be 1 ± 1/4 inch per minute.

3.5.3. Acceptance Test

An Acceptance Test Plan (ATP) shall be submitted for Amtrak's approval at the same time the Qualification Test Plan is submitted. This test is a quality control procedure, executed on production run parts to ensure high manufacturing standards are maintained.

3.5.3.1. Minimum Requirements

In-process inspection shall be conducted along with product testing which shall consist at a minimum of the following tests, to be done on all cable assemblies:

1) Visual for conformance to approved product drawings.

2) High Potential - 1960V RMS 60 Hz, for 1 minute between contacts, and between contacts and ground. Leakage current to be less than 1 mA on a cable.

3) Continuity check for proper termination and cable/conductor marking.

4) Mating force check to confirm complete insertion and complete retraction forces are 50 ± 20 lbs.

DRAFT

3.6. SYSTEM APPROVAL

3.6.1. General

Samples of cable assemblies and outlet housings shall be submitted for Amtrak's approval. Documentation supporting cable qualification shall be submitted to Amtrak for approval.

3.6.2. Design Reviews

Design reviews shall be held at times mutually agreed upon between Amtrak and the manufacturer; such reviews are intended to convey design concepts not readily shown on drawings.

3.6.3. Documentation

Prior to manufacturing, three copies of each of the following shall be submitted for

Amtrak's approval.

- Assembly Drawings
- Qualification Test Plan
- Acceptance Test Plan

Amtrak's approval does not relieve the vendor of the requirements of this specification, particularly Section 3.4 (Component Descriptions). Amtrak reserves the right to request additional drawings and documents as required for system approval.

3.6.4. First Article Inspections

To verify that any components being supplied under this Specification meet all Specification and drawing requirements, and are truly interchangeable with existing components, Amtrak will conduct a series of two (initial and as-installed) First Article Inspections (FAI) on the first complete assembly manufactured by a vendor, prior to allowing unrestricted manufacturing work to start. It is the intention of the FAI process that every function and feature of the items being supplied under this Specification be fully exercised and tested for proper operation under all normal, abnormal and fault conditions, both in the vendor's workshop and as applied on the vehicle.

The initial FAI shall consist of a pre-shipment inspection and testing of a prototype assembly at the vendor's facility. This shall be an active test, and the vendor shall provide all mounting fixtures, electrical and pneumatic power, etc, as required to fully functionally exercise all components and features. A complete range of operating voltages, currents, pressures, loads, etc. shall be applied to simulate both normal and abnormal conditions, and the response of the components to these conditions.

Once this FAI is successfully completed at the vendor's facility, the vendor shall ship the same assembly to the Amtrak maintenance facility identified by the Amtrak Bidding and Contract Documents or the Engineer, where Amtrak will install the assembly onto an Amtrak vehicle. A second "as-installed" FAI shall then be performed to verify proper operation of the assembly in the "as-installed" configuration. This shall in particular verify all component interface conditions with the vehicle.

Each FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. They shall include, but not be limited to, a mechanical and electrical inspection to determine compliance with the specifications and the drawings, complete testing of the functionality of the component, demonstration of maintainability and troubleshooting, and verification of proper operation and complete compatibility/interoperability when installed on a vehicle. Approval by the Engineer following successful completion of the FAI process, as communicated through the Amtrak Contracting Agent, shall constitute final system approval.

3.6.5. Approved Products

Only products which have operated successfully in Amtrak service for one year will be considered for use in production quantities.

DRAFT

4.0 Packaging and Shipment

For all components produced, following all assembly, the vendor is required to perform and fully document a complete verification test and evaluation of each component being supplied, prior to shipment to Amtrak. The results of this final testing shall be recorded in the documentation record. When successfully completed, the vendor may be directed by the Engineer to apply a permanent Engineer-approved identification label in an inconspicuous agreed-upon area, which shall include the name and location of the vendor, any serial number used by the vendor, any Amtrak "SAP internal catalog number, and the date of manufacture.

All packaging and shipping requirements shall be performed by the vendor. It is required that the vendor properly prepare all components being supplied under this Specification for shipment to Amtrak so that they are ready to install following unpacking.

The vendor shall package the components, unless otherwise instructed by the Amtrak Contracting Agent, to be suitable for continuous storage prior to unpacking in unheated (subfreezing), dusty indoor storage conditions. Components shall be appropriately packaged for their weight and size. Special efforts must be used to protect unusually fragile or plastic items from damage during shipping and handling. Large and bulky items shall be secured to a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling.

The shipping package shall have an identification label. This label shall include the vendor's name and address, purchase order number, date released for shipment, Amtrak SAP internal catalog number, and any component assembly serial number. This information shall also appear in the vendor's invoice, and be included in the documentation record.

The vendor shall retain a copy of the shipping documentation record, and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Contracting Agent (or as otherwise designated in the purchase order), and the third copy shall be sent to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

DRAFT

5.0 Product Support

5.1 Program Schedule

If required by the contract documents, any vendor-produced Program Schedule shall include all program milestones, design reviews, production schedule, delivery schedule, and any other pertinent information that will assist with tracking program progress. Any requested changes to the Program Schedule must be presented to the Amtrak Contracting Agent for review and approval.

5.2 Delivery of All CAD Models and Drawings

Following the successful completion of the First Article Inspections, and as a precondition to permit production delivery of material to commence, the vendor must supply to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, an electronic set of every fully-developed CAD model and dimensioned drawing and Bill of Material which may have been created for every individual part used for the manufacture of all items being supplied under this Specification. All models and drawings shall comply with Amtrak Specification 867. Refer to Section 5.5 for additional details. Any later modifications as a result of warranty or other actions must include the affected models and drawings being revised as necessary and resubmitted to Amtrak.

5.3 Production Changes Require Engineer Approval

Once final system approval is granted by the Engineer and production has commenced, the vendor is forbidden to make any changes in the design, material or configuration of the items being supplied, unless approved in writing by the Amtrak Contracting Agent as per Amtrak Procedure PD 3.7.3.01, Design Review and Control Procedure. This shall include any modifications required as a result of warranty actions, so as to provide complete documentation.

DRAFT

5.4 Spare Parts List

The vendor shall supply to the Engineer, via the Amtrak Contracting Officer, a Microsoft Excel spreadsheet list in Engineer approved format of any spare or consumable parts which are recommended to be stocked by Amtrak for maintenance of the components being supplied. Such lists shall contain for each item an item number, the spare part name (in noun, adjective format), the name of the Original Equipment Manufacturer (OEM), the OEM part number, approximate cost for each item, and recommended stocking quantity. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

5.5 CAD Models, Drawings, Manuals and Parts Lists

All CAD models and drawings prepared by the vendor under this Specification shall be in full compliance with Amtrak Specification 867, Amtrak Drawing Standards for CAD. All CAD models and drawings shall be in Engineer-approved formats, and shall include a complete set of all "as-built" drawings of every part, component and assembly used for all items being supplied to Amtrak of all levels, not only the top assembly level. All CAD models shall identify all materials, surface finish and fasteners. Each drawing shall include a complete Bill of Material, providing quantities, original component manufacturer name and part number of the actual supplier of the part. Every part on the Bill of Material must be fully identified regarding its characteristics including material, plating, finishing, heat treatment, secondary operations, etc. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The final CAD models shall be delivered electronically CDs in DXF or DWG format. The as-built drawings shall be delivered as 3 sets of

all drawings in electronic format in DXF or DWG format (files) along with 3 sets of CDs of all drawings in Adobe Acrobat read-only PDF file format. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

All documentation data must be compatible with Microsoft Office 2010 or newer applications.

The vendor shall also submit in electronic format to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, a complete set of all documentation including the maintenance manual, and parts list.
The parts list shall:

- Identify all individual parts used (in noun, adjective format) in the items being supplied under this Specification, and must include the original equipment manufacturer (OEM) name and part number; use of an intermediate supplier or distributor's name or part number is not acceptable.

- Indicate quantities for each item within each assembly, use exploded isometric-view parts diagrams if possible, use separate pages for parts diagrams and tabular data if possible, and be sufficiently complete to permit Amtrak to order individual replacement spare parts direct from the actual parts manufacturer.

- Cross reference all vendor part numbers with Amtrak SAP number

The maintenance manual shall:

- Include complete information from installation, through troubleshooting, repair and complete overhaul.
- Include repair instructions, where applicable

All documentation data must be delivered as 3 sets of CDs in Adobe Acrobat read-only PDF file format, distilled in Acrobat 9.0 or higher, and in addition 3 sets of CDs in its original Microsoft Office applications format, for internal use by Amtrak for future revision of the data. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

DRAFT

All PDF files (other than drawings) shall be distilled from the authoring documents, resulting in PDF documents that can be indexed and searched. All authoring electronic data files making up the manuals shall be delivered formatted such as to not cause pagination errors during the PDF distillation process. The PDF file produced from the distillation process shall match any published version of the authoring document.
All files shall be editable by Amtrak for future document maintenance. All columnar data found within word processing files shall be presented in a table format. Any fonts used on the creation of authoring and/or PDF files shall be embedded and not restricted for use. PDF documents with definable chapters, sections and/or subsections shall be linked to their individual locations with bookmarks internal to the file in the fashion of a hierarchical format such as a Table of Contents. Creation of PDF files from scanned images only, resulting in non-searchable or non-indexable documents, will be restricted to only those allowed by the Engineer. Scanned information in the form of document attachments may be allowed to be imported into an existing PDF file that is searchable and capable of indexing, if the information is supplemental to context to the file and not the primary means of communicating the subject's information. If documents are scanned, careful attention will be taken to not allow misalignment of the pages. Opening options in the PDF file format should be set to show bookmarks and page, with magnification at "Set Width" and "Continuous Page" settings. Distillation settings shall be "E Book" or "Print", with DPI settings set

to produce quality printing from a desktop printer without overly increasing the size of the file.

5.6 Failure Analysis

A Failure Analysis to determine the cause and frequency of defects occurring during the warranty shall be performed by the vendor and submitted to the Engineer and the Amtrak Contracting Agent for concurrence. Such analysis shall be performed and reported within 30 days from the date of each failure.

6.0 Source Inspection

6.1 Purpose

Amtrak will perform periodic source inspection of vendor materials and components being supplied. The following is intended to be used as an outline defining activities and responsibilities of the vendor performing the source inspections.

DRAFT

6.2 Professionalism

All inspections, test observations, and other activities performed in the fulfillment of the contract are to be conducted in a professional and ethical manner. The vendor is representing Amtrak in the performance of the contract and therefore must remain courteous, conscientious and professional under all circumstances arising from performance of the contract.

6.3 Scope of Work

Amtrak has implemented a multi-faceted supplier management program of which source inspection is an integral part. Amtrak identifies vendors and materials/components through various methods which will be subject to source inspection. By performing source inspections, Amtrak expects to benefit by use of vendor facilities, measuring and testing equipment to verify materials/components, through rejecting noncompliant materials/components before shipment and receipt by Amtrak, presence of Amtrak representative periodically to ensure continuing good performance, and assist to communicate Amtrak intentions and interpretations of specifications and resolve issues. The vendor will conduct inspection or verify through observation, product compliance with drawings, specifications, standards or Amtrak contract documents and report findings of said inspections to Amtrak.

6.4 Services

6.4.1 Scheduling Inspections

The vendor shall conduct observations and verifications on Amtrak identified materials and components produced by the vendors for Amtrak. Inspections must be scheduled to coincide with final inspection of said materials/components due for shipment to Amtrak. The vendor may use random sampling where large quantities of material are subject to shipment and note sampling method in associated reports. The vendor must perform all dimensional and operational inspections in accordance with the Quality Plan prior to source inspection, and make all inspection records available for review by the Amtrak source inspector, with focus on CTQ items.

6.4.2 Dimensional Inspection

The vendor must witness and verify conformance with dimensional characteristics per drawings identified in the Amtrak contract documents. The vendor must witness and verify conformance with regulatory standards and requirements including material certification as cited in specification or other reference documents identified in Amtrak contract documents.

6.4.3 Operational Inspection

The vendor must witness and verify conformance with operational tests as cited in specifications, operators manual or other reference documents identified in Amtrak contract documents.

6.4.4 Inspection Reports

The vendor must provide a report documenting the vendor source inspection and the inspection results. The report must include the name of the vendor, the date of the inspection, the material or component name, Amtrak (SAP) ID number(s) for items inspected, the quantities of each item inspected, the inspection results, and the actions taken where nonconforming materials/components are found. Reports should reference appropriate drawings, specifications, standards, requirements, or Amtrak contract document as appropriate.

6.5 Qualification of Personnel

It is the responsibility of the vendor to provide personnel with adequate training and experience to perform all the activities of the source inspections described above. Personnel must also conduct their activities with professionalism.

DRAFT

APPENDIX A

ENGINEERING DESIGN PERFORMANCE SPECIFICATION
CABLE AND WIRE

1. SCOPE

1.1. This specification covers the design and performance requirements for single conductor #4/0 AWG and three conductor #10 AWG head-end power cables rated 600 volts, designed for heavy duty service where severe flexing is encountered. The normal operating temperature range is -55° to +90°C (-67°F to +194°F).

2. APPLICABLE DOCUMENTS

2.1. The following specifications or standards form a part of this specification to the extent specified herein:

- ASTM B-3 Soft or Annealed Copper Wire
- ASTM B-172 Rope-Lay-Stranded Copper Conductors Having Bunched Stranded Members, For Electrical Conductors
- UL Subject 62 Thermoplastic Wire and Cable
- I.C.E.A. S-19-81 Rubber Insulated Wire and Cable

3. REQUIREMENTS AND TEST METHODS

3.1. Conductor: The conductor shall be bare or tinned annealed copper conforming to the requirements of ASTM B-3. Stranding shall be in accordance with ASTM B-172 for Class M Rope-Lay conductor. Conductors to meet the dimensions and DC resistance specified in Table 1.

DRAFT

TABLE 1 - CONDUCTOR DATA

Conductor Size AWG	Coating	Area CMILS	No. & Size Each Wire In Strand	Strand Construction	Conductor Diameter (Max.)	D.C. Resistance @20°C(Ohms/Mft)
4/0	Bare	211,600	5320/34	19 x 7 x 40/34	.645"	.0524
10	Tinned	10,380	259/34	7 x 37/34	.132"	1.04

3.2. Primary Insulation: The primary insulation shall be an Amtrak approved single extrusion of thermoplastic elastomer (TPE) (or other material with equal or superior properties), specially compounded to have good electrical properties, flame resistance, excellent low temperature properties

and extreme flexibility. The insulation shall be tight fitting over the stranded conductors, but shall strip freely using manual mechanical stripping tools.

3.2.1. Thickness: The average insulation wall thickness and minimum insulation thickness shall be as specified in Table II.

3.2.2. Physical Properties-Unaged: When tested according to Paragraph 86.1-89.19, UL Subject 62, the minimum acceptable values shall be as follows:

- Tensile Strength, Min. PSI - 800
- Elongation, Min. Percent - 300

3.2.3. Physical Properties-Aged: When tested according to Paragraphs 82.1-89.19, UL Subject 62, insulation samples which have been aged in a circulating air oven for 168 hours at 120°C ±1°C (248°F ± 2°F) shall retain the following minimum physical property values:

- Tensile Strength - 80% of unaged value
- Elongation - 80% of unaged value

3.3. Reinforcement: A reinforcing seine twine or other Amtrak approved material shall be applied in the form of a cross wrap over the primary insulation on the 4/0 cable.

3.4. Jacket: The jacket shall be an Amtrak approved black polychloroprene (Neoprene), or other material with equal or superior properties, specially compounded for heavy duty applications. The material must be compounded to exhibit excellent resistance to: moisture, oils, and fluids, abrasion, tearing, compression, flexing, ozone, sunlight, flame, and heat. The jacket shall be extruded tightly over the primary insulation (and reinforcing twine) but adhesion between the two layers is not a requirement.

3.4.1. Thickness: The average jacket thickness and minimum jacket thickness shall not be less than specified in Table II.

3.4.2. Physical Properties-Unaged: When test according to Paragraph 6.4.14, ICEA S-19-81, the minimum acceptable values shall be as follows:

- Tensile Strength, Min. PSI - 1800
- Elongation, Min. Percent - 250

3.4.3. Physical Properties-Aged: When tested according to Paragraph 6.4.14, ICEA S-19-81, samples of the jacket material which have been aged in a circulating air oven for 168 hours at 100°C ±1°C (212°F ± 2°F) shall retain the following minimum physical property values:

- Tensile Strength - 50% of unaged value
- Elongation - 50% of unaged value

4. QUALIFICATION TESTS

4.1. Dielectric Test: One inch of insulation shall be removed from each end of a 24-inch sample of finished cable and the two ends secured together. The loop thus formed shall be immersed in tap water so that not more than 1 1/2 inches of each end of the insulation will protrude above the surface of the water for a period of 4 hours. At the conclusion of the 4 hour period of immersion and while the application of 3000V at 60 Hz between the conductor and water for a 1 minute period, there shall

DRAFT

be no rupture or puncture of the insulation or jacket.

4.2. High Temperature Tests: One inch of insulation shall be removed from each end of a 24 inch sample of finished cable. The sample shall be suspended around cylindrical mandrel 5 times the outside diameter of the cable and a 6 pound weight attached to each end of the sample. The sample on the mandrel with the weights freely suspended shall be placed in a circulating air oven maintained at a temperature of 212°F for a period of 120 hours. At the end of the conditioning period, the sample shall be removed from the oven and allowed to cool to room temperature. When cool, the weights shall be removed and the sample bent not less than 180 degrees around the mandrel in the reverse direction at a uniform rate for a complete 180 degrees in 30 seconds. The sample shall then be subjected to the Dielectric Test as specified in Paragraph 4.1.

4.3. Shock Test: An 18 inch sample of finished cable shall be conditioned in an air oven at a temperature of 71°C ±1°C (160°F ± 2°F) for a period of 72 hours. At the end of the conditioning period the sample shall be removed from the oven and allowed to remain at room temperature for 24 hours. The shock consists of dropping a 23 pound weight a distance of 6.5 inches on the center portion of the sample while it is clamped flat on a smooth metal plate. The drops shall be made at a rate of 25 per minute. There shall be a continuous current of 15 amps through the conductor and metal plate to detect open or short circuit. Failure of a sample will be considered as the time when current ceases to flow, from open or short circuit. Required: 1550 shocks, minimum.

4.4. Cold Bend: A sample of finished cable shall be placed in a cold chamber and conditioned at -54^{0}C ±2°C (-65°F ± 3°F) for 48 hours. While at this temperature the sample shall be bent around a mandrel equal to 5 times the outside diameter cable at a uniform rate of 5 turns per minute for 2 complete turns. Fracture shall constitute failure. The sample shall then be subjected to the Dielectric Test as specified in Paragraph 4.1.

4.5. Cold Impact: A sample of finished cable shall be placed in a cold chamber and conditioned at -54°C ±2°C (-65°F ± 3°F) for 48 hours. While at this temperature the cable shall be placed on a 3/8 inch steel plate and subjected to a 3 ft-lb impact by dropping a weight having a ball-shaped end with a 1/2 inch radius through a tube at right angles to the sample. Three drops shall be made at the same spot on the sample. Fracture shall constitute failure. The sample shall then pass the Dielectric Test as specified in Paragraph 4.1.

4.6. Scrape Abrasion: A 24 inch sample of finished cable shall be tested using the abrading apparatus specified in Paragraph 4.8.1.2, MIL-C-915E. The test sample shall be laid over the drum of the abrading apparatus so as to extend approximately half way around the drum. One end of the sample shall be secured to the base of the drum support, and a one pound weight fastened to the other end. The direction of rotation shall be away from the fixed end of the sample, toward the weighted end. Rate of rotation shall be approximately 17 revolutions per minute. An 11-volt potential is applied between the conductor and the abrading tool. Electrical contact between the abrading tool and the conductor constitutes failure. Required: 1300 cycles, minimum.

4.7. Flame Test: When tested according to Paragraph 18.64 of the Code of Regulations, Title 30 U.S. Bureau of Mines, the maximum flame travel shall not exceed 6 inches and the sample shall not continue to burn for more than 4 minutes after removal of the burner flame.

4.8. Fluid Immersion: Two individual samples shall have one inch of insulation removed from each end of 24 inch samples of finished cable and formed into a loop not less than 5 times the diameter of the cable. A minimum of 18 inches of the cable shall then be placed in Hydrocarbon Fluid and Isopropyl Alcohol for a 4 hour period and allowed to air dry for a 2 hour period. Upon completion of the

DRAFT

soaking and air drying, the increase in cable diameter shall be less than 15 percent. The sample shall then be subjected to the Dielectric Test as specified in Paragraph 4.1.

4.9. Insulation Resistance: A sample of finished cable shall be tested for insulation resistance after a 4 hour immersion in water. While still immersed, the conductor shall be connected to the negative terminal of the test equipment and a reading taken after an electrification period of 1 minute with a constant direct current potential of not less than 100 volts nor more than 500 volts applied. The insulation resistance in Megohms - 1000 feet at 60°F shall not be less than the value of R calculated as follows:

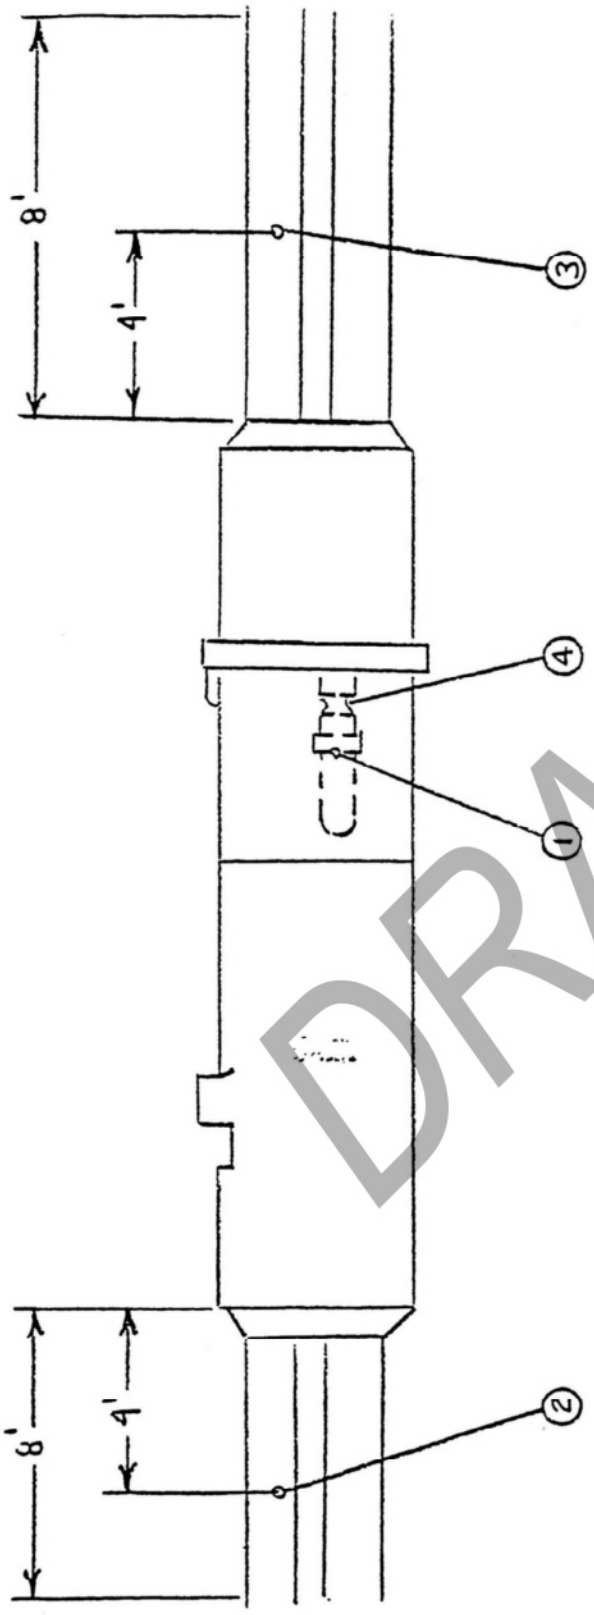
R = K Log D/d
R = Insulation resistance in Megohms - 1000 feet
K = 2000
D = Diameter over primary insulation
d = Diameter under primary insulation

If the temperature at the time of measurement differs from 60°F, the resistance shall be corrected to that at 60°F by multiplying the measured value by the proper correction factor supplied by the manufacturer.

5. IDENTIFICATION

5.1. The outer jacket shall be surface printed in white ink, at intervals not exceeding two feet, with the following information: (for single conductor #4/0 AWG) - "BRAND NAME 600 VOLT #4/0 AWG" (for three conductor #10 AWG) - "BRAND NAME 600 VOLT 3/C #10 AWG".

6. PREPARATION FOR DELIVERY



6.1. Packaging: The cable shall be shipped on sturdy non-returnable wooden reels suitably covered to protect the cable from damage during transit. Normally, only one length shall be allowed on each reel. However, if more than one length is packaged per reel, the number and quantity of each length shall be clearly marked on the outside of the reel.

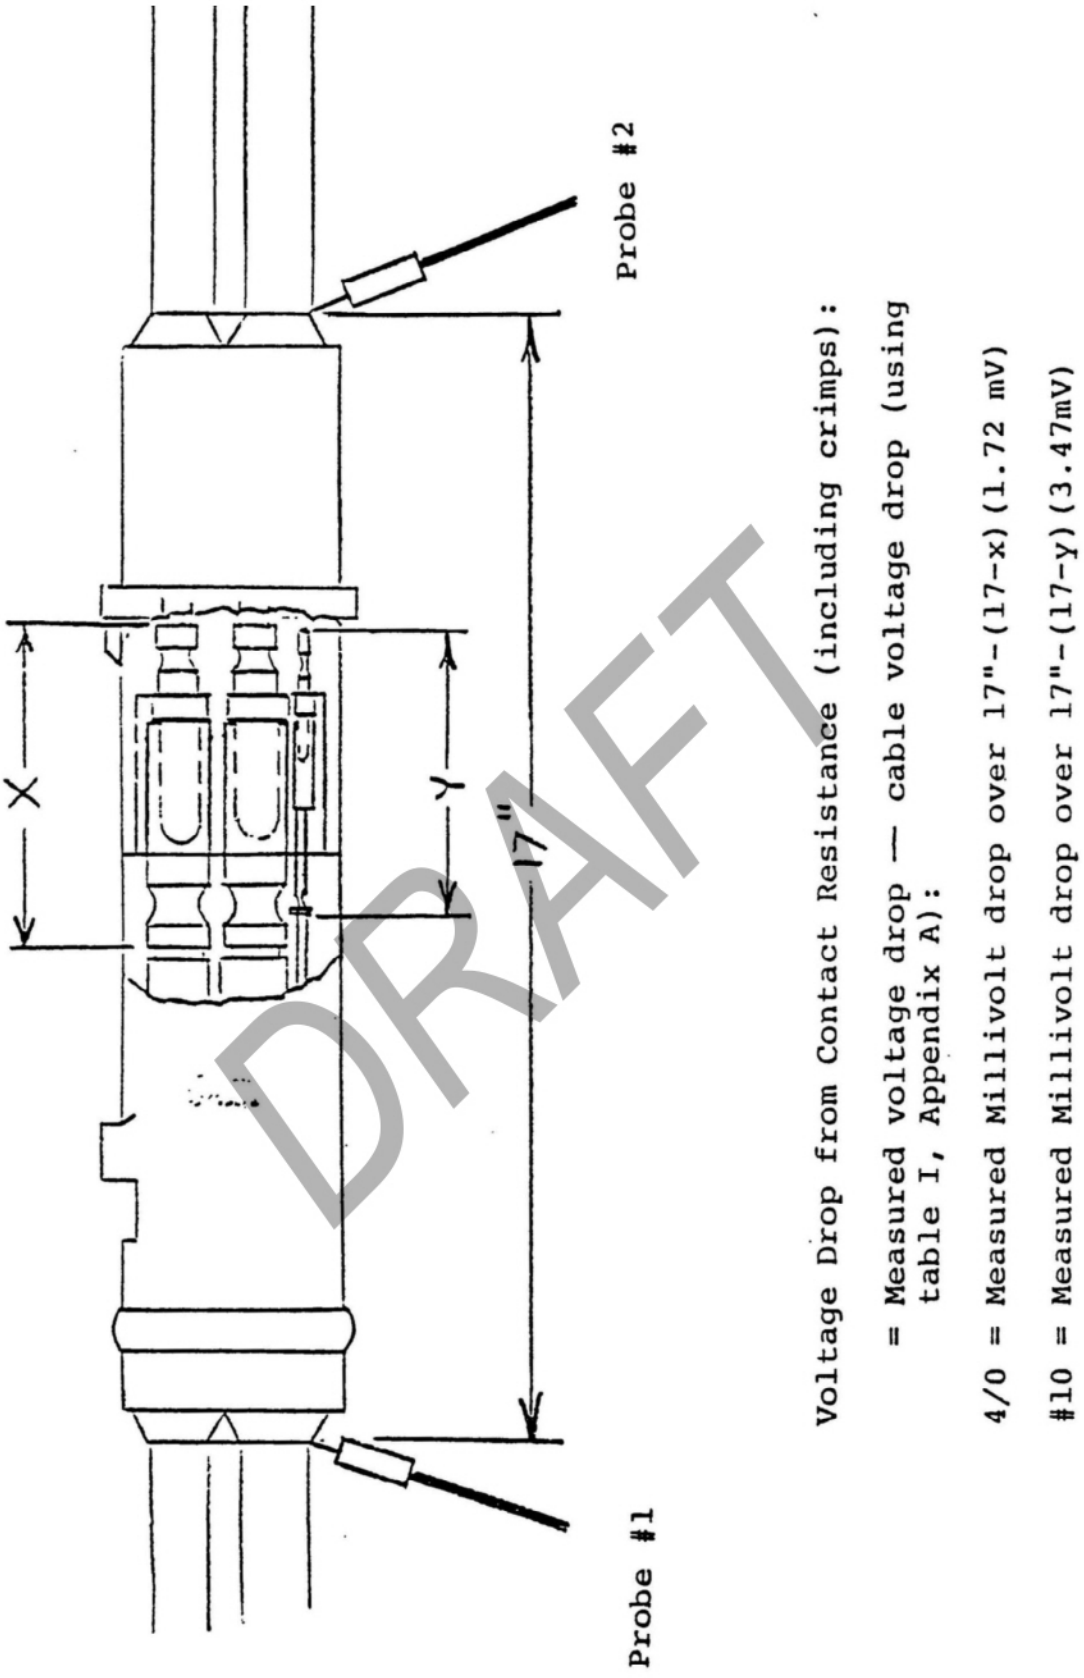
6.2. Marking: Each reel shall be plainly marked with the following information; plus any other information called out on the purchase order:

- Name of Manufacturer
- Date of Manufacture
- Customer Purchase Order Number
- Manufacturer's Order Number
- Product Description: Wire Size, 600 Volt, insulation type, etc.
- Manufacturer's Part Number
- Amtrak AMMS Number
- Lot or Serial Number
- Warning Labels as Appropriate (for shipping and storage, etc.)

Preparation for shipping shall assure arrival at the destination without degradation of the cable.

DRAFT

(1) within the outlet between the insulation material and the receptacle contact at a depth of approximately 2-1/2 inches, PIN #1 or 2.



(2) at the surface of one of the cable assembly power cables approximately four feet from the outlet.

(3) at the surface of one of the cable assembly power conductors (beneath the insulation and jacket) approximately four feet from the outlet.

(4) at the juncture of the crimp well and the body of a 4/0 socket contact, pin #1 or 2.

1.0 SCOPE

This Specification defines the design, performance, and acceptance criterion for upper berth assemblies installed in single level sleeper cars (Viewliners) for long-distance railway operation. This document defines both hinged folding berths for bedrooms and vertically sliding berths for roomettes.

The berths shall be designed to provide maximum passenger comfort, safety, and convenience using the latest agronomic design criterion. An emphasis shall also be placed on ease of operation, maximum reliability, and ease of maintenance.

1.1 Vendor Responsibilities

This specification is subordinate to Amtrak Specification 769 . The Vendor is responsible to adhere to the requirements of Specification 769 B as it relates to Upper Berth Assemblies.

2.0 GENERAL

2.1 Safety Standards

The upper berth systems shall comply with 49CFR 238. All materials used shall conform to the requirements in Section 5.0 of this specification. Certified test results from an independent testing laboratory shall be supplied prior to production of the upper berths. The berths shall be absolutely free of sharp edges, pinch points, protrusions, or any element that would potentially cause injuries to passengers, crews or maintenance personnel.

DRAFT

2.2 Features and Dimensions

Passenger comfort, safety, enduring appearance, rugged construction, ease of installation, operation and maintenance, and part interchangeability shall be basic considerations.

The berths and operating mechanism shall be so designed and manufactured to eliminate any looseness or rattling of parts. An unoccupied berth shall not have rattles, in the stowed or down position, when the railroad equipment is in operation.

The upper berths shall be easily operated by either the passenger or crew when converting the room from day to night mode or vice versa. The force required to raise or lower the upper berth shall not exceed 40 pounds with the berth loaded with its mattress, linens, blanket, pillows and lower berth mattress pad. The latch/hinge operating mechanism shall securely latch the berth in the full down "bed mode", full up "stored mode", and an intermediate "safety stop". Motions required to store or deploy shall be complimentary rather than opposing.

Clear operating instructions shall be provided for each upper berth in accordance with Amtrak specification # 697. The instruction placards shall be located near the operating handles. Appropriate safety warning

signs for counterbalance springs, or other devices shall be applied to access plates for those devices.

3.0 DESIGN CONSIDERATIONS

3.1 Design Objectives

The SUPPLIER shall furnish two (2) upper berth configurations; hinged, and horizontal "pull down". The berths shall be furnished with the mattress, safety harness, and all operating hardware (where applicable). It is the SUPPLIER's responsibility to standardize hardware and tooling to maximize part interchangeability between the two designs. The two berth configurations should be interchangeable as replacements units for the existing Viewliner I Sleepers. To the greatest extent practical, the new berths should have common hardware and wear parts with the existing Viewliner I Sleepers.

Design and manufacture of the complete berth system shall ensure the system survives 8/4/4g loading without breaking free from carbody.

The berth and mechanisms shall be designed to withstand normal passenger use for the 30 years.

It shall be possible to conduct the following repairs/ adjustments to the upper berth without the need for dismounting the berth from the room:

- Repair/ replace berth release handle
- Repair/ replace the berth latch pawls and associated linkage to the release handle
- Repair/ replace counterbalance mechanism
- Repair/ replace hinge (hinged berths only)
- Repair/ replace the keeper (holding the berth up or down, hinged berths only)
- Repair/ replace berth guides at wall tracks (roomette berths only)
- Repair/ replace wall-mounted track
- Repair/ replace mechanism that keeps the berth horizontal during up/ down motion.

DRAFT

4.0 SUBSYSTEMS

4.1 Hinged Berth

The hinged berth is located in the deluxe and handicapped bedrooms. The berth is to hinge down from the near-vertical to horizontal for use in the night mode.

The latch/hinge operating mechanism shall have an integral spring assembly that shall restrict the berth's unattended movement to approximately 40 degrees from the horizontal. The mechanism shall also definitively latch the berth in three (3) positions during operation; 1) full down or "bed mode", 2) full up or "stowed position" and 3) intermediate "safety stop". Operating mechanism shall not employ cables. The latching system shall be designed so that the berths will not passively close or open when the vehicle is exposed to 8g's longitudinally, 4g's transverse and 4g's vertically.

Latching surfaces shall be durable metal and designed so that wearing portions can be renewed. The design shall ensure that the latch, hinge or track mechanism requires no adjustments for at least 7000 cycles. This shall be demonstrated in an endurance test, cycling between all 3 positions of the berth, fully loaded. The complete berth assembly, including latches will be cycle tested through the full range of motion to 10,000 cycles.

The shell/pan assembly shall be designed and composed of materials that meet the criteria of Paragraph 5.0. Exposed surfaces shall be durable, maintenance free, and compatible with the aesthetics of the room modules. The bottom and front shall be covered with Tedlar laminate, Schneller or approved equal.

4.2 Horizontal "Pull Down" Berth

The pull down berth is located in the double roomette. The berth is stored in the horizontal position against the ceiling lining and is pulled down along a side frame track/support assembly to the bed mode position.

The latch operating mechanism shall have an integral spring assembly that shall restrict the berth unattended downward movement to approximately 76 inches above the floor. The mechanism shall also definitively latch the berth in three (3) positions during operation; 1) pull down or "bed mode", 2) pull up or "stowed position" and 3) intermediate "safety stop". Berth shall be easily operated by average passengers or train attendants. The latching system shall be designed so that the berths will not passively deploy or close when the vehicle is exposed to 8g's longitudinally, 4g's transverse and 4g's vertically.

Latching surfaces shall be durable metal and designed so that wearing portions can be renewed. The design shall ensure that the latch, hinge or track mechanism requires no adjustments for at least 7000 cycles. This shall be demonstrated in an endurance test, cycling between all 3 positions of the berth, fully loaded. The complete berth assembly, including latches will be cycle tested through the full range of motion to 10,000 cycles.

DRAFT

4.3 Safety Harness

The safety harness, furnished with the upper berth assemblies for passenger safety, and its attachments shall be in accordance with Federal Motor Vehicle Safety Standard for Seat Belt Assemblies No. 571.209. This shall include, but not be limited to, belt material, sewing, and misc. hardware.

The safety harness shall also be used as a device to secure the berth ladder in place when it is stored in the berth.

The safety restraint system shall be capable of safely restraining a 95th percentile male at 4 g's in roomettes and 8g's in the Bedrooms and Accessible Bedrooms

4.4 Mattress

Refer to Specification No. 364, Sleeping Car Mattresses.

26-FOI-00415 00000006225 "UNCLASSIFIED" 4/30/2026

5.0 TESTING

The following test shall be conducted with no fractures or failures of any system component and no permanent deformation which could affect the operation of the berth. The berth configurations shall be tested with the berth mounted/supported to simulate actual "in car" installation. A stress analysis shall be made available to AMTRAK three (3) weeks prior to "First Article Inspection".

5.1 Deflection Test

a) A 600 pound weight shall be uniformly applied over the entire mattress pan of the berth. The maximum temporary deflection at any point shall not exceed .75 inches.

b) An 18" wide, 600 pound weight shall be applied to the top of the leading edge of the berth, at its centerline. Maximum temporary deflection shall not exceed .75 inches.

5.2 Live Load Test

The purpose of the following tests are performed to simulate two and three passengers sitting on the berth at different points.

a. An 1125 pound weight shall be uniformly applied over the entire pan of the berth, and held in place for five (5) minutes. There shall be no failure, permanent set or noticeable creep.

b. An 1125 pound weight shall be uniformly applied on the entire leading edge of the berth, and held in place for five (5) minutes. There shall be no failures, permanent set or noticeable creep.

c. A 975 pound force shall be applied on the left or right hand corner, on an area covering one third the length of the leading edge and one third the width at the end, and held for 5 minutes. There shall be no failure, permanent set or noticeable creep.

The corner selected for the test shall be at the discretion of AMTRAK.

5.3 Dynamic Test

a. A 185 pound weight with an impact area no larger than 20 inches square shall be dropped from a height of 3 feet, striking the left or right leading edge of the berth at the midpoint of its length while the berth is in the down position.

b. A 185 pound weight with an impact area no larger than 20 inches square shall be dropped from a height of 3 feet, striking the center of the pan of the berth while in the down position.

c. A 185 pound weight with an impact area no larger than 20 inches square shall be impacted horizontally at the centerline (vertical and horizontal) of the leading edge of the berth at a speed sufficient to induce a 5 g load on the berth (925 pound force).

DRAFT

d. A 185 pound weight with an impact area no larger than 20 inches square shall be impacted horizontally at the centerline (vertical and horizontal) of the end of the berth at a speed sufficient to induce a 5 g load on the berth (925 Pound Force).

There shall be no damage incurred, other than local deformation at the impact area, to the berth, its attachments, or operating mechanisms after completing these tests.

5.4 Destruction Test

The purpose of the following test is to determine the "weak link" in the composite structure. At the point that failure(s) occur, all conditions of the failure(s) are to be documented. No deflection values need be taken.

a. A force of 1,400 pounds shall, be uniformly applied to the berth pan and increased in 200 pound increments until failure occurs or a 3,000 pound load is achieved.

b. If failure does not occur in test 5.4a, remove load. Then apply a 1,400 pound force uniformly on the entire length of the leading edge of the front of the berth and increase load in 200 pound increments until failure occurs, or a 3,000 pound load is achieved.

c. If failure does not occur in test 5.4b, remove load. Then apply a 1,400 pound force to either the left or right front corner covering an area of one forth the distance of each length, and increase in increments of 200 pounds until failure occurs, or a 3,000 pound load is achieved.

The site selected for the test shall be at the discretion of Amtrak.

d. If failure does not occur in test 5.4c, remove load. Then apply a 1,400 pound force to either the left or right front quadrant (25%) uniformly loaded on the pan as well as both edges, increase increments of 200 pounds until failure occurs or 3,000 pounds is achieved.

DRAFT

6.0 SYSTEM APPROVAL

6.1 General

All upper berth assemblies shall be subjected to AMTRAK approval. All major components shall be submitted for AMTRAK approval.

6.2 Design Reviews

At least three design reviews shall be held at times mutually agreed upon between AMTRAK and the manufacturer; such reviews intended to convey design concepts not readily shown on drawings.

26-FOI-00415 00000006225 "UNCLASSIFIED" 4/30/2026

6.3 Documentation

For approval, the manufacturer shall submit, as a minimum the following drawings and documents:

6.3.1 Component (Assembly Drawings)

6.3.2 Mounting Interface Drawings

6.3.3 Qualification Test Plan (one time) (Including cycle endurance tests of both types of berths)

6.3.4 Acceptance Test Plan (all units)

AMTRAK reserves the right to request additional drawings and document as required for system approval.

6.3.5 Stress Analysis

6.4 First Article Inspection

Prior to the delivery of the first production assembly, a production assembly shall be subjected to a first article inspection. Such inspection shall include, but not be limited to:

6.4.1 A mechanical inspection to determine compliance with the specification and the approved drawings.

6.4.2 Demonstration of repairs/ adjustments accessibility (Section 3.1)

6.4.3 The performance of an Acceptance Test.

6.4.4 The performance of the Qualification Test. Successful completion of the first article inspection shall constitute final system approval.

DRAFT

7.0 PRODUCT SUPPORT

7.1 Drawings

All assembly, subassembly, and arrangement drawings shall include a complete bill of material and parts list on the field of the drawing describing all items, including Vendor's parts and material description, which form a part of the assembly. AMTRAK shall reserve the right to review and approve all drawings prior to construction of a prototype system.

AMTRAK shall be supplied, upon completion of the system design, with one set of printed drawings and electronic files in accordance with section 3.5 of Amtrak Specification 769B.

7.2 Operating Instructions, Maintenance and Parts Manuals

The equipment manufacturer shall provide manual data in accordance with AMTRAK specification No. 353. The manual shall also include instructions for how to preload the counterbalance system.

8.0 APPLICABLE DOCUMENTS

Spec. No. 352 - Flammability, Smoke Emission and Toxicity
Spec. No. 328 - Material and Workmanship (For Viewliner II components see Spec 769B, Chapter 16)
Spec. No. 364 - Sleeping Car Mattresses
Spec. No. 353 - Suppliers Manual Data

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

1. SCOPE

1.1 Purpose

This specification defines Builder responsibility and requirements to provide a family of bound and loose-leaf bound maintenance and reference manuals. It describes the content and timing of deliverables as well as the review and approval process. This is done in an effort to provide a timely delivery of complete and accurate manuals. This document addresses the following:

Field Manuals

- Operator Manual-Operator (Engineer)
- Operator Manual-Conductor
- Operator Manual-Food Service
- Service and Inspection Manual
- Fuel pad Manual
- Running Maintenance Manual
- Heavy Repair/ Overhaul Manual
- Illustrated Part Manual
- Drawing Manual

Engineering Manuals

- Test Manual
- Vehicle History Book
- Equipment Plan and Data Book Sheets (loose-leaf sheets only no binder).
- Photograph Book

This specification is a companion to Amtrak specification # 353 "Vendor Maintenance Manuals, which defines the requirements for the manuals provided to the builder by the system suppliers, which will be used in these builder manuals.

DRAFT

1.2 Function

The Builder manual family is a set of manuals that will provide Amtrak with the information necessary to properly operate and provide all maintenance functions for the given fleet of vehicles.

2. REFERENCES

All references listed below shall be the latest revision.

Amtrak Specifications:
353 Vendor Maintenance Manuals

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

3. DEFINITIONS

Builder
The prime contractor solely responsible to Amtrak for the construction, quality and proper functioning of the complete car and its components.

Supplier
The provider to the Builder of any services or material for incorporation into the car design, construction, spare parts, manuals or other contract deliverables.

4. GENERAL REQUIREMENTS

4.1 Vendor Approval

Subcontractors used to develop the manuals described in this specification shall be subject to Amtrak approval. The builder shall provide samples of work done by the proposed manual subcontractor in advance of this approval.

4.2 Considerations and Content

4.2.1 Considerations

The manual shall be written with the following as primary considerations:

- Safety
- Clarity
- Conformance to Amtrak Operating and Maintenance practices
- Content written in a system consistent with user, ie., suitable technical level

The subject material shall be prepared and presented in such a manner as to encourage the use of the Manuals.

Where applicable, the manuals shall highlight the precautions to be taken by operating, service, maintenance personnel to ensure safety while performing the procedures described in these manuals.

4.2.2 Content

The Manuals shall include all systems and components requiring maintenance or servicing. Manuals shall be supplied that contain information required for effectively understanding operation of the vehicle as well as performing scheduled maintenance including general servicing, lubrication and inspections, system equipment testing, troubleshooting and adjustments, and repair/replacement. These needs include information to safely and properly conduct:

- Operation
- Service and inspection
- Trouble shooting

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

- Running maintenance (performed with the vehicle "in line" or in a shop; typically only about a day duration)
- Heavy repair/ overhaul (vehicle and system/ component level) (performed at car heavy repair facility or in a component overhaul shop, on or off site)
- Part identification
- Wreck repairs (welding procedures, structural methods, such as Huck bolting, etc.)

The entire manual is to be held to the same level of quality- whether written by the Builder or by a supplier. No matter who is the technical provider, the Builder shall be responsible for delivering a complete and quality product.

The Builder is responsible for ensuring that suppliers comply with this Specification and that they also provide the appropriate documentation. Amtrak will not accept "The supplier did not provide the manual." or "The supplier manual did not cover that." as excuses for inadequate manual content. Contracts between the Builder and suppliers shall include appropriate language to ensure these documents are provided as required. All manuals are subject to Amtrak Equipment Engineering approval prior to distribution to the field.

Builder (and Supplier) manuals shall also be provided electronically in an Amtrak approved language. The manuals will be used electronically in Amtrak's Work Management System; the builder shall work with Amtrak to ensure successful implementation of this.

All components/ systems must be defined to the lowest repairable level, which includes all parts bought by the system supplier.

Electronic Equipment
Unless contractually specified otherwise by Amtrak, the supplier shall provide maintenance information to allow Amtrak to repair Printed Circuit Boards in-house. This includes for each PC board.

- PCB component layout
- part list
- PCB schematic
- PCB foil layout
- software

DRAFT

4.3 Audience

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

Manuals will be used by the following personnel:

Maintenance Department
- Reference for daily Service & Inspection
- Reference for daily maintenance work and repairs
- Reference for performing heavy repair/ overhaul
- To initiate procedures for the implementation of planned preventative maintenance, service routines, car record keeping procedures, scheduled overhauls, and scheduled heavy overhauls.
- Reference for creating standard maintenance procedures.

Equipment Engineering
- To assist in the day to day analysis of field problems and course of action for equipment service and repair.
- As Reference for future equipment design and specifications.

Technical Training
- Teaching aid for new employees, and to introduce new equipment to existing maintenance staff
- As information in refresher courses for maintenance staff.

Quality Control
- As reference and background to determine adequacy of repair and maintenance work

Material Control and Purchasing
- To identify parts required for maintenance inventory.

Carbuilder Field Service
- For reference in performing field assistance.

DRAFT

4.4 Manual Development Plan

4.4.1 Master Manual Plan

In an effort to clearly understand the expectations for the manuals right from the beginning, the Builder shall provide a Master Manual Plan and Schedule for Amtrak approval, identifying all manuals required in the vehicle specification. The plan shall include manual sections, both from the Builder and suppliers. The plan shall be recorded in a spreadsheet form, updated periodically, showing the basic information identified on Figure 1. The manual plan shall be submitted to Amtrak for review and approval within 90 days of Notice to Proceed and revised within 30 days of any change in the plan.

4.4.2 Manual Development

To ensure that manuals are being developed concurrently with the vehicle and its systems, the Builder shall provide the following deliverables:

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

For each manual type: Operator, Service and Inspection, Running Maintenance, Heavy Maintenance, Drawing, Parts, etc:

- breakdown of the chapter organization
- organization of the chapter: introduction, system description, controls, etc
- detailed table of contents, showing divisions and subdivisions of each chapter
- explanation of how supplier information will be incorporated from each supplier
- explanation of who will provide the manual information for every system: supplier or builder's text.

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

4.5 Manual Availability

The Builder shall develop the manual family for review by AMTRAK during the time between preliminary and final design reviews of the car design.

A draft version of each manual shall be drafted and submitted to AMTRAK for comment and/or approval thirty (30) days following the final design review for the respective system(s).

Since approved manuals are required in advance of putting the first vehicle in service, it is essential that draft versions of these documents be provided in a timely fashion. This will allow appropriate Amtrak review as well as time for the Builder to address any deficiencies noted.

The status of each manual and each chapter of each major manual shall be recorded in a spreadsheet form, in accordance with Figures 2 and 3. This document shall be updated monthly and presented as an attachment to the program meeting minutes.

4.6 Document Progression

Supplier manuals are to be written by the equipment supplier, with thorough review by the Builder engineering department to ensure compliance with his requirements as well as those of this and the vehicle specifications. The manuals shall then be submitted to Amtrak for approval.

The Builder manuals shall be written jointly by the builder engineering and technical writing departments. They shall be thoroughly reviewed to ensure compliance with the requirements of this as well as the vehicle specifications and shall be then submitted to Amtrak for approval.

It is the Builder's responsibility to integrate his and the supplier manuals to ensure every device and all functions of all equipment are adequately described.

Discussion of the manual approach and content with Amtrak Equipment Engineering during development is encouraged to expedite the approval process.

As the builder develops the documents, they shall go through the following internal review process:

1. tech writer develops chapter of the document
2. Builder engineer responsible for that chapter reviews document, whether written internally or by the system supplier, indicating necessary revisions to tech writer
3. tech writer corrects document accordingly, returns to engineer
4. engineer reviews and (assuming he is satisfied) approves draft-level document
5. section submitted to Amtrak for review
6. Amtrak reviews and provides comments to builder
7. builder engineer reviews Amtrak comments, forwarding necessary guidance information to tech writer
8. process repeats within builder organization.

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

4.7 Approval Process

Manuals, including both those provided by the Builder as well as those to the Builder by suppliers, shall be submitted for Amtrak approval. If deficiencies are identified, the manuals shall be revised and resubmitted for approval. If, in Amtrak's sole judgment, the manual is still deficient, the revision and resubmittal processes shall be repeated until the requirements are met. Primary points of evaluation include, but are not limited to:

- Safety
- Completeness of subject
- Inclusion of all equipment
- Conformance to standard organization Outline
- Compatibility with Amtrak shops and standard practices
- Suitability for the end user

Normally, the process has three iterations between the builder and Amtrak: draft, preliminary and final. However, should a manual be missing sections of the chapter, those sections are still subject to the 3 pass process. **Amtrak will not accept as final any chapter which contains new sections of material.** Each submittal shall include a sign-off sheet, including the name of the author, the name of the engineer responsible for the review and review date.

Submittals:

Draft Submittal

This is the first iteration from the builder to the customer. It is expected to be > 60% complete.

Preliminary Submittal

This is the second iteration from the builder and is expected to be >95% compete.

Final Submittal

This is the final iteration from the builder and is expected to be >99% complete. As noted above, a manual submitted with new sections of the chapter at this time is **NOT** defined as "final". Should the document not yet be sufficient, or be otherwise inadequate, **as determined solely by Amtrak**, additional iterations will be required before the contractual requirements are met.

DRAFT

4.8 Revision Process

Should any changes to the vehicles, its components or maintenance requirements occur during the warranty period, manual updates shall be provided by the Builder to update/ revise the manuals accordingly.

4.9 Product Support

The builder shall provide Amtrak in a timely manner with corrections and updates to the maintenance manual as required to keep the manual current with equipment. Service bulletins shall also be provided as may be required by Amtrak.

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

5. MANUAL DESCRIPTIONS

The Builder presentations shall consist of all of the material needed to ensure that the following functions are fully covered by the information and instructional data:

Manual Types:

Field Manuals (Used in the field by operating and maintenance personnel.)
These manuals, including #5.1 through 5.6, will see wide distribution in the field.

5.1 Operator Manual Family

These manuals will provide instructions for on-board personnel on how to operate car equipment. While the intent is to keep the manual brief and non-technical, it will describe operation of all controls, and the significance of all indicators normally encountered.

These manuals will describe briefly the operation of each system, its user controls, and what action to take and not take if it does not function as expected. This trouble shooting section will address safety of passengers as well as crew.

5.1.1 Operator Manual-Operator (Engineer) See Figure 7.1
This manual describes equipment that the Operator (engineer) uses to operate the train.

5.1.2 Operator Manual-Conductor See Figure 7.2
This manual describes equipment that the Conductor uses to operate the train.

5.1.3 Operator Manual-Food Service See Figure 7.3
This manual describes equipment that the food service attendant and/ or dining car staff uses on the train.

DRAFT

5.2 Service and Inspection Manual See Figure 4

This manual will identify requirements for service and inspection of the equipment as well as cleaning instructions for the car cleaning staff. Items included are: water fill, waste drain, brake pad/ shoe wear, etc.

5.3 Fuel Pad Manual See Figure 5

This manual will identify requirements for fueling, sanding, lubricant and coolant level checks and inspection of the engines and traction equipment. It will also include engine starting and stopping, including emergency shutdown.

5.4 Maintenance Manual Family

This set of several loose-leaf binders will include maintenance instructions for all vehicle

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

equipment. It will be composed of builder-written material as well as vendor supplied maintenance manuals, written in conformance with Amtrak specification 353. For complicated systems in which several vendors provide portions, such as HVAC, the builder will provide an introduction describing the overall system operation, and then provide the various vendor manuals describing their individual components. Aside from very simple items, such as fittings, catalog cut-sheets are not acceptable as manual information.

The manuals shall contain information required for effectively understanding operation of the system and the entire vehicle, as well as how to and when to perform maintenance and repairs. Detail shall be such that any vehicle component requiring maintenance, replacement or adjustment is included.

The topics should be discussed to the level necessary for an understanding by persons unfamiliar with the vehicle or its equipment, but possessing the basic skills associated with their respective trade and good knowledge of standard railroad practices.

5.4.1 Running Maintenance Manual See Figure 6
This set of manuals identifies the equipment composing a system, theory of operation, controls & indicators and operating procedures. It shall include a maintenance schedule to identify and explain periodic maintenance requirements, such as inspections, lubrication, filter changes and basic tests. It shall also explain adjustments, installation/ removal, trouble shooting procedures as well as repairs that would typically be done in a Running Repair Shop.

5.4.2 Heavy Repair/ Overhaul Manual See Figure 7
This set of manuals identifies major work done to the vehicle and its systems which would be done in a backshop or component overhaul shop. It includes a maintenance schedule to identify and explain periodic long term maintenance requirements, such as wear limits, component changeout and basic tests.

This manual includes items such as detailed overhaul of the entire vehicle as well as system components, such as HVAC units.

DRAFT

5.5 Illustrated Part Manual See Figure 8

The Parts manual shall contain the information required to effectively locate, identify, and order all replaceable units **down to the lowest repairable level**, including assemblies, sub-assemblies, components, printed circuit boards and parts of the vehicle from the original equipment manufacturer. The manual is intended to provide Amtrak with information to:

- Identify any user-replaceable part
- Identify Amtrak part number for it
- Plan a spare part inventory, including stocking locations

The part manual shall be provided to Amtrak in LinkOne format, in accordance with Appendix A, in addition to the hard-copy and electronic format forms.

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

5.6 Drawing Manual See Figure 9

This manual will primarily provide reference material to the maintenance department for maintenance, trouble shooting and repair. The manual will include all schematic (electrical, air brake, auxiliary air, water, waste, HVAC air distribution, fuel, lubricant, as well as wiring, conduit and piping diagrams. It will include device tables/ locators. Schematics shall include those of vendor internal systems.

Engineering Manuals (Used in engineering offices as reference.)

These manuals, including #5.7 through 5.10, will be used primarily in Engineering & Mechanical Department offices as a resource.

5.7 Test Manual See Figure 10 (Also refer to the Amtrak specification for the equipment, or #366, as appropriate).

This manual will include a copy of each of the following:

- Test plan
- Text of each supplier's Acceptance test and a completed test report of each
- Text of each supplier's Qualification Test and Proof of Design test and a
- completed test report of each
- Text of each Builder's Acceptance test and a completed test report of each
- Text of each Builder's Proof of Design test and a completed test report of each
- Certification of the Qualification and Proof of Design test results by the Quality Control Department of the Builder

DRAFT

5.8 Vehicle History Book See Figure 11

This book, one for each vehicle, will include specified serial numbers, test reports, wheel press reports, etc.

5.9 Equipment Plan and Data Book Sheets See Figure 12

These sheets provide reference primarily to Mechanical Department and Management for vehicle floor plan, undercar plan and major car equipment location. The Builder will complete the blank form, and return it to Equipment Engineering for incorporation into the master book.

5.10 Photograph Book

This book contains a set of mounted color photographs, in accordance with the vehicle specification. Each photograph shall be clearly labeled as to what is shows, as well as be identified with date and negative number identification.

6. DESIGN DETAILS

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

6.1 Section Numbering System

Amtrak has adopted a standard functional numbering system that is designed to provide consistent section numbers among the following documents:

- Running maintenance manual
- Heavy repair/ Overhaul manual
- Illustrated Parts manual

For example, section 7.4 is temperature controls, regardless of which of the above documents is referenced. This allows easy cross - reference between documents. Note that the maintenance manual subdivides into smaller sections, since it use requires much more detail.

The numbering system divides the vehicle into 16 major sections:

1. General
2. Carbody
3. Truck
4. Coupler and Draft Gear
5. Brakes
6. Interior
7. Heating Ventilation and Air Conditioning
8. Lighting and Convenience Outlets
9. Communication
10. Electrical
11. Food Service
12. Water and Waste
13. Traction and Controls (complete)
14. Cab and Controls
15. Head End Power Generation
16. Fire Control & Emergency Equipment

DRAFT

Each section is then subdivided eg.:

7.Heating, Ventilation and Air Conditioning

- 7.1 Description
- 7.2 Air Distribution
- 7.3 Dampers
- 7.4 Temperature Control
- 7.5 Air Conditioning
- 7.6 Exhaust Fans
- 7.7 Heaters
- 7.8 Freeze Protection

Each subsection may be further divided: eg.

7.7 Heaters

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

7.7.1 Duct
7.7.2 Floor

The function of the equipment determines the chapter in which it is described in the Running and Heavy Maintenance manuals. For example, the brake components mounted on the trucks are described in “Brakes” rather than “Trucks”.

6.2 Page Numbering System, Headers & Footers

Paragraph numbering
Paragraphs are numbered with the chapter as the first digit(s), followed by the section and subsection: “5.3.1”

Figures and tables
These are numbered with the chapter as the first digit(s), with the items then numbered sequentially.

Page numbering
Pages are numbered with the chapter as the first digit(s), then a dash followed by the page number of the chapter:
“6 – 3”

Each page of the manual will be numbered. Blank pages shall be so indicated either through the use of the work "blank", or by double numbering the preceding page, such as for fold-outs.

Headers
A header will be used on the top of each page, including:
“Amtrak”
Equipment name, such as “Amfleet”
Chapter #, Chapter name, such as “Carbody”

Footers
A footer will be used on the bottom of each page, including:
Manual type, such as “Running Maintenance”
Revision letter and date
Page number as above

Revision indication
When a page is revised, the changed section text shall be identified in the margin, along with the revision letter associated with it, such as “B”. Only the changes from the latest revision will be identified.

6.3 Configuration: 4” x 8 ½” Binder Type Manuals

DRAFT

The following manuals shall be provided in 4"x 8-1/2" format, in loose-leaf binders:

- Operator's Manual: Operator (engineer)
- Operator's Manual: Conductor
- Operator's Manual: Food Service

Binder

The binder shall be a 6-ring type, with a flexible plastic cover, with silk-screened (or equal) graphics, with colors specified by Amtrak during manual design review. It shall allow for 10% expansion in the number of pages. The binder shall be labeled on the spine and cover with the following information at a minimum:

- "Amtrak"
- Equipment name such as "Amfleet I"
- Vehicle number series
- Name of book: Operator's Manual: Operator, etc.
- Builder

Paper

The manual will be black print on white, 60 pound paper, printed by lithograph offset method. Printing will be on both sides of the paper.

Assembly

Manuals shall be shipped with the binders empty, but packaged with binders and paper for a complete set in the same shipping container. All material shall be collated with colored printer's blank separators used to separate each complete volume of data.

DRAFT

6.4 Configuration: 8-1/2 x 11" Pamphlet

The following manuals shall be provided in 8-1/2 x 11 format, in

- Service and Inspection
- Fuel Pad

Cover

The cover shall be cardboard, with the paged secured with staples. The graphics and colors will be specified by Amtrak during manual design review. The manuals will be labeled with the following information at a minimum:

- "Amtrak"
- Equipment name such as "Amfleet I"
- Vehicle number series
- Name of book: Service and Inspection Manual, etc.
- Builder

Paper

The manual will be black print on white, 60 pound paper, printed by lithograph offset method. Printing will be on both sides of the paper.

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

6.5 Configuration: 8-1/2" x 11" Binder Type Manuals

The following manuals shall be provided in 8-1/2 x 11 format, in loose-leaf binders:

- Running maintenance
- Heavy Repair/ Overhaul
- Illustrated parts
- Test
- Vehicle history
- Photograph

Binder

The binder shall be a 3-ring heavy duty type, with tab-locked rings (so they won't open accidentally). It shall include clear front and spine pockets for display of printed manual designation inserts. The ring shape will be such that the binder can be opened flat, and remain opened to the selected page. Ring spacing shall be 4-1/4 center-to- center.

Binder size shall be 3-1/4" spine or less, and shall allow for 10% expansion in number of pages.

The binder shall be labeled on the spine and cover, with graphic and colors specified by Amtrak during manual design review. The following information shall be included at a minimum:

- "Amtrak"
- Equipment name such as "Amfleet I"
- Vehicle number series
- Name of book: Running Maintenance, etc.
- Volume number and/or chapter numbers
- Builder

Tabs

Manuals shall be subdivided using plastic-edge tabs. The tabs will be labeled with section name and number. The maintenance manuals will be divided into main sections and subsections, using large and small tabs. The test manual will have a tab for each test code.

Paper

The manual will be black print on white 8-1/2 x 11", 100M non-reinforced paper, title pages/ tabs, foldouts on 140M paper. Printing shall be by lithograph offset method. Printing will be on both sides of the paper, except drawings, which will be on one side of the paper only. Paper will be punched with 3 - 3/8" holes on 4-1/4" centers. Suitable hole reinforcement shall be provided to resist page tear out for all fold-out and any schematics. Reinforcement shall be no thicker than an average page.

Assembly

Manuals shall be shipped with the binders empty, but packaged with binders and paper for a complete set in the same shipping container. All material shall be complete with tabs, and collated with colored printer's blank separators used to separate each complete volume of data.

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

6.6 Configuration: Drawing Manual

The drawing manual will be supplied on 11 x 17" format, mounted in a heavy plastic cover, with graphics and colors specified by Amtrak during manual design review

Binder

The cover will be a flexible plastic material, with silk-screened graphics (or equal). Pages shall be secured with 3 screws, on 4-1/4" centers, along the 11" edge. It shall allow for 10% expansion in the number of pages.

The binder shall be labeled on the spine and cover with the following information at a minimum:

- "Amtrak"
- Equipment name such as "Amfleet I"
- Vehicle number series
- Name of book: Drawing Manual
- Builder

Paper

The drawings will be black print on white 100M reinforced paper, printing by lithograph offset method. Printing will be an one size of the paper only. Paper will be punched with 3-3/8" holes, on 4-1/4 centers along the 11" edge. Suitable hole reinforcement shall be provided on all pages to resist paper tear-out.

Assembly

The drawing manuals shall be shipped fully assembled.

DRAFT

6.7 Configuration: Equipment Plan and Data Book Sheets

Data sheets will be 8-1/2 x 11 format originals, punched with 3- 3/8" holes on 4-1/4" centers. Amtrak will arrange for inclusion into existing manual.

7. MANUAL CONTENT AND ORGANIZATION

The general contents of the manuals shall conform to the following standard outlines.

Amtrak will consider alternative formats for approval, such as for "off the shelf" supplier manuals, however the content must meet the all the items identified in the Amtrak outlines.

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

Figure 7.1: Organization and Content: Operator Manual-Operator (Engineer)

Forward

- Title page
- Record of Revisions
- Table of Contents
- List of Illustrations
- List of Tables

Introduction

- Safety warnings
- "this manual does not supercede …."
- Overview of book
- Equipment arrangement
- Equipment data, salient features
- Brief equipment description:
    - Vehicle
    - Traction system
    - Brake system, including blended & dynamic, as appropriate
    - Compressed air system
    - HEP system
    - Train makeup

General Description of Equipment

Provide a detailed description of each item, switch, indicator, etc, describing function, meaning of indications, etc.:

- Entire cab area
- Cab console, including all controls, indicators, etc
- Other cab control panels
- Engine room/ compartment controls, indicators, etc.

Equipment Operation

Provide a detailed description of how to use the equipment, both at vehicle level and train level:

- Use of throttle
- Starting a train
- Stopping a train, including automatic, dynamic and blended brake modes
- Operation of independent/ parking brake
- Operation of PCS
- Emergency brake applications and recovery
- Penalty brake applications and recovery (each type: alerter, overspeed, ATS, etc.)
- Changing ends:
    - To activate this cab
    - To deactivate this cab

DRAFT

- Shutting down the engines- normal mode
- Emergency activities, such as shutting down all engines in the train
- Dead-in-tow moves
- Use of cab equipment:
- Alerter
- Vehicle overspeed
- Cab signal
- IITS
- 2-way radio
- Alarms
- HEP system
- Starting / stopping HEP engine
- Setup of HEP configuration (lead, trail, pass-through, wayside, etc.)
- Starting/ stopping HEP
- Starting/ stopping traction engine

Train Makeup and Preparation

- Coupling/ uncoupling
- Applying/ removing jumper cables
- Train makeup
- Preparation for service
- Inspection

Trouble shooting

- Symptoms
- What the symptoms means
- Corrective action trees: this shall include cutout procedures for alerter, overspeed, cab signal, IITS, and any other equipment the operator may be called upon to manipulate following a malfunction, etc.

Emergency Equipment

- Emergency equipment locker
- Fire extinguisher
- Emergency door releases
- Emergency windows

DRAFT

Figure 7.6: Organization and Content: Running Maintenance Manual

Forward (entire manual)

- Title page
- Record of Revisions
- Table of Contents
- List of Illustrations
- List of Tables
- List of Procedures

Introduction to Book

- Safety warnings
- "this manual does not supercede …."
- Overview of book

Chapter 1 General

This chapter provides an overview of the vehicle, to familiarize maintenance personnel with the basic equipment, its location and component accessibility. In cases of special importance, reference should be provided to the relevant chapter & section of the manual. This chapter should also include general information, such as torque limits, etc.

Chapters 2-16 (?) Specific System Information

These chapters describe the equipment of a given system/ subsystems. Due to the differing requirements of systems, no one outline will apply to each system, however the following should apply to the extent practical.

Content should be as follows:

1. Chapter Forward

Each chapter shall begin with:

- Title page
- Record of Revisions
- Table of Contents
- List of Illustrations
- List of Tables
- List of Procedures
- Safety Warnings

2. Introduction to System

This section should provide an overview of the entire system, describing function, operation and interaction among subsystems. Using the HVAC system as an example:

Functions:

- Ventilation
- Heating fresh air
- Heating to overcome carbody losses
- Air conditioning

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

- Freeze protection
- Control of all the above

The section should identify and describe subsystems and components composing the system. Provide ratings as appropriate, such as for HVAC unit, etc. Again, using HVAC as an example:

Ventilation subsystems and components:

- Fresh air intakes
- Fresh air dampers
- Air filters
- HVAC unit blower fan
- Supply air ducts
- Supply air diffusers
- Return air ducts
- Exhaust fans

Component Description

(include photos/illustrations, envelope drawings with dimensions)

- Function
- Size
- Weight
- Mechanical, electrical, etc., connections

Specifications

(reference Amtrak specification number if applicable).

Brief equipment specifications covering performance, function, materials, rating, power consumption by individual rating, motors, heaters, etc., capacity, air and water flow rates.

3. Operation

This section describes how the equipment is controlled and operates in normal operation, from the viewpoint of the user.

3.1 Description of Operation - Controls and Indicators

This section should describe each switch, selector, etc., its function, and what the equipment does in each switch position. Each indicator should be described, and the meaning of the indication explained. Include illustrations of control panels.

3.2 Operating Instructions

Explain how to operate the equipment, including any specific procedures as might be required. For equipment which uses a portable test unit (laptop), such as wheel slide controller, event recorder, etc, operating instructions explaining the features and use of the software for these units shall be provided.

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

3.3 Typical Operating Characteristics

This section should describe all normal operating modes of the equipment - say for an air conditioning system, the general series of events the system undergoes as the car interior temperature drops and rises. This description should be reasonably non-technical, but still describe normal characteristics - say battery charger output voltage. Include operating charts, such as temperature chart for temperature control system, typical pressures, timing, etc.

4. Theory of Operation

4.1 Theoretical

Describe technically how the equipment works - for example, the refrigerant cycle in a refrigeration system. For an electronic system, the operating concept, say the controlled phase rectifier battery charger.

4.2 How it's applied here

Describe how the theory of 4.1 is used in the actual system. For electronic equipment, describe the blocks of the circuit.

4.3 Technical Description of System

This section provides system details, such as on a battery charger - typical circuit waveforms, voltage levels at test points, etc.

4.4 Component descriptions

In a complicated system, such as refrigeration, this section would describe each section - evaporator with defrost function, condenser unit, enclosure environmental control, etc.

5. Periodic Maintenance

Amtrak periodic maintenance is generally performed on the following basis, however these intervals are subject to change:

- Trip (every day or two, minor inspections, servicing; primarily a check that all equipment operates)
- 180 (?)Day (car is removed from service for several days and serviced in the shop. A reasonably thorough inspection is made, repairs and adjustments performed.)
- 4 (?)Year Overhaul (medium overhaul)
- 8 (?) Year Overhaul (major overhaul, all mechanical systems removed from car, overhauled or replaced).

5.1 Inspections and Servicing

DRAFT

The manual should provide sufficient information for Amtrak to set up a schedule for servicing and inspection; including a list of tasks to be performed. Inspection schedules planned for these vehicles should be in the form of tables and include:

- Inspections
- Lubrication and lubricant changes
- Filter changes
- Adjustments
- Basic functional tests

Trip Inspection and Service

Show items requiring inspection, cleaning, re-supplying, replacement (consumables), and testing or checking prior to placing car in service for that trip.

180 Day Inspection and Service

Show items requiring inspection, replacement, testing, lubricating, etc. on a 180 day basis; especially those items of safety which may be required by F.R.A. rules. Specific location for lubrication should be identified on a photograph or illustration. Also include such items as normal operating pressure, current, etc.

4 Year Overhaul

Show items requiring inspection, service and overhaul. (Also refer to section 10 of index).

8 Year Overhaul

Show items requiring inspection, service and overhaul. (Also refer to section 10 of index).

DRAFT

5.2 Tests

This section should include step-by-step tests as may be required to periodically confirm system performance on a trip, 180 day 4 year and 8 year basis.

5.3 Service Procedures

This section defines step-by-step periodic service procedures - such as lubrication (where, what type, how much), cleaning, etc; requiring explicit instructions.

6. Trouble Shooting

Troubleshooting guides, presented as a fault tree or matrix, shall consist of a listing of the most probable symptoms of degradation and/or failure of the equipment to operate or perform properly. Each symptom shall be accompanied by a number of probable causes, how to check for the cause, and how to repair and re-inspect the repaired equipment.

An important goal of trouble shooting is to allow service personnel to determine the level

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

of the defect and whether the vehicle can be repaired "in line", or whether it must be shopped.

- Symptoms
- Defect
- Corrective Action
- Cause of Failure

7. Field Repair Procedures

This section describes adjustments/ calibrations and repairs done to equipment while it is still on the car. As appropriate, the manual shall include warning against special danger, such as spilled battery electrolyte, spring-loaded parts, etc.

The Repair Process shall be described by a step- by-step adjustment/ calibration, disassembly, repair, and/or replacement process. All special requirements for bolt and fastener torques, settings and means of applying lubricants and sealants shall be included. The detail presented shall be sufficient for qualified technicians, supervisors, and inspectors to successfully complete the work. Recommendations, based upon a probable combination of symptoms, shall be included for in-place repairs and/or lubrication and adjustments, removal of subassemblies for bench testing and repair, and/or removal of major systems for disassembly, inspection, repair, reassembly, testing, and replacement.

Information describing maintenance procedures, use of diagnostic equipment, special tools to facilitate disassembly and reassembly, and advice based on the supplier's experience with similar equipment, will be included. The section shall include complete data for setting, tuning, adjusting and operating the equipment.

Each procedure will include:

1. Purpose
2. Special Tools
3. Materials
4. Precautions
5. Preparation
6. Procedure (Disassembly, Replacement of Parts, Reassembly)
7. Adjustments
8. Tests
9. Follow-Up

8. Installation/ Removal

8.1 Installation/ Removal

Description of how to handle and install and remove the equipment, including special precautions for human safety, as well as to prevent equipment damage. Include in here such information as brazing procedures, types of copper tubing, cleaning out procedures,

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

etc., as may apply. Installation drawings may be required.

8.2 Installation tests and adjustments

Provide complete procedures for adjusting all components, proper fluid levels, etc., as may be required for initial operation. Tests should include step-by-step procedure to check complete operation of equipment - all features: all controls, all valves, control devices, floats, solenoids, etc. It should also include list of defects to watch for, such as over-under charging of a refrigeration system.

8.3 Initial Operation

This section should include procedure and observations personnel should make to ensure equipment operates properly during and after break-in period. It should also include any adjustments that may be required, and appropriate warnings: "If pressure exceeds 450 PSI, shut unit off immediately", etc.

9. Shop Repair Procedures:

This section is similar to section 8 in style, but describes OFF-car repairs done with the equipment in a shop or lab. This section will include procedures to set/adjust every adjustable device on the system (those not described in 8 above), including every adjustment on each printed circuit board in the system. This section shall include procedures to fully test the operation of each control, switch sensor, etc., of the entire system.

Each procedure will include:

1. Purpose
2. Special Tools
3. Materials
4. Precautions
5. Preparations
6. Procedures (Disassembly, Replacement of Parts, Reassembly)
7. Adjustments
8. Tests
9. Follow-up

DRAFT

10. Special Tools and Test Equipment

This section describes any special tools, fixtures or instruments required to efficiently test and/or overhaul car systems. Information shall be sufficient for Amtrak to either build or purchase this equipment.

1. Test Fixtures
2. Test Instruments

11. Drawing List and Reference

This section is a list of drawings, both supplier and Amtrak, which provide information

useful to Amtrak maintenance or engineering department.

For example, supplier envelope and part list drawings are necessary, whereas manufacturing drawings are not required, in general.

1. Supplier Drawing List
2. Amtrak Drawing List

12. Factory Repairs and Warranty

This section describes vendor's warranty, service policy and procedures followed to make a warranty claim.

1. Who to Contact
2. How to Ship
3. Documentation
4. Warranty

Chapter 17 (?) Scheduled Maintenance

This last chapter shall include tables of all suggested scheduled maintenance activities, listed both by time and by system:

- Inspections
- Lubrication/ lubricant change
- Filter change
- Adjustments
- Tests

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

Chapter 1 General

This chapter provides an overview of the vehicle, to familiarize maintenance personnel with the basic equipment, its location and component accessibility. In cases of special importance, reference should be provided to the relevant chapter & section of the manual. This chapter should also include general information, such as torque limits, etc.

Chapters 2-16 (?) Specific System Information

These chapters describe the equipment of a given system/ subsystems. Due to the differing requirements of systems, no one outline will apply to each system, however the following should apply to the extent practical.

Content should be as follows:

1. Chapter Forward

Each chapter shall begin with:

- Title page
- Record of Revisions
- Table of Contents
- List of Illustrations
- List of Tables
- List of Procedures
- Safety Warnings

2. Theory of Operation

For some equipment, the level of detail provided in the Theory section of Running Maintenance may not be sufficient for overhaul level of work. Where this is the case, provide additional details here.

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

3. Overhaul Procedure

This section shall include sufficient information for Amtrak or another outside qualified repair shop to conduct a complete system overhaul, following a major accident, and/or for periodic overhaul. Instructions shall include: welding and torque specifications, special tooling, fixtures, test gear, plating and painting surface finish specification and part wear tolerances.

It shall include disassembly, assembly, and installation procedures necessary for repair of heavy damage and/or long term wear and tear. The instructions shall provide for complete full load system check as well as a check of all equipment devices.

The section shall include procedures for surface cleaning & preparation, priming, surfacing and painting for the carbody and all equipment that is painted or powder coated. A detailed paint schedule showing the equipment to be painted, paint type and manufactures, recommended thickness and other pertinent information shall be included.

Overall, the section will include:

1. Frequency of Overhaul
2. Scope
3. Preparation for Shipment
4. External Preparation and Cleaning
5. Inspection
6. Disassembly
7. Internal Cleaning
8. Part Inspection & wear limits
9. Routine Part Renewal
10. Retrofits/Modification
11. Reassembly
12. Adjustments
13. Tests
14. Preparation for Shipment

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

4. Special Tools and Test Equipment
   This section describes any special tools, fixtures or instruments required to efficiently test and/or overhaul car systems. Information shall be sufficient for Amtrak to either build or purchase this equipment.
   1. Test Fixtures
   2. Test Instruments

5. Drawing List and Reference
   This section is a list of drawings, both supplier and Amtrak, which provide information useful to Amtrak maintenance or engineering department.

   For example, supplier envelope and part list drawings are necessary, whereas manufacturing drawings are not required, in general.
   1. Supplier Drawing List
   2. Amtrak Drawing List

6. Factory Repairs and Warranty
   This section describes vendor's warranty, service policy and procedures followed to make a warranty claim.
   1. Who to Contact
   2. How to Ship
   3. Documentation
   4. Warranty

- Title page
- Record of Revisions
- Table of Contents
- List of Illustrations
- List of Tables

Introduction

- Safety warnings
- "this manual does not supercede …."
- Overview of book
- "How to use this manual"
    - scope
    - organization
    - locating equipment in the manual
    - how to use the manual when part number is known
    - how to use the manual when part number is not known
    - common commercial hardware
- Manufacturer names, addresses and telephone numbers
- Abbreviations

Body of manual

- Part identification
  Note: This section shall include **all** the information shown below in "Format"
- Numerical index
- Common commercial hardware

The manual must also identify:

- Consumables:
    - Lamps/ light bulbs
    - Lubricants
    - Anti-seize compounds
    - Fluids
    - Brake pads, shoes
    - Wheel sets,
    - Adhesives
    - Sealants
    - Paints
    - Wire
    - Electrical lugs
    - Brazing alloys
    - Etc.

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

- Gages used to check equipment
- Software and instructions for using it for portable test equipment
- Adapter cables for using portable test equipment
- Overhaul/ rebuild kits where available, not merely individual parts.

Format
The following provides details of the required content and format.

Part Identification Illustrations
Illustrations should be provided with sufficient detail to identify all listed parts, including the order of assembly. Phantom line may be used to reference parts that are not part of the illustrated assembly, but need to be shown for clarity. Phantom lines must be used sparingly and should be of light weight so as to avoid "clutter".

Index numbers keyed to the part list and leader lines should be used to locate all listed parts.

Hardware should be exploded only when needed to show detail parts. Where attaching hardware is obvious, on one leader line with stacked index numbers is used.

Subassemblies broken down within their overall assembly should be identified with an index number and note, such as "See Detail A" on the main illustration, with a separate detail showing the additional breakdown.

Part List
This section shall include a compete list of all parts identified on the illustration, in accordance with Part Manual Format shown below. Part numbers for labels and instruction sheets shall be included. (These should include the part number on the label itself, as well.) Casualty parts used only in repairing severely damaged equipment (such as underframe, structural elements, etc.) are not normally stocked and need not be identified.

The cross references provide vital information to the mechanic to easily identify the OEM number on the part, the system vendor's number and the Amtrak number. An example is a plug-in relay, which is typically not identified with the supplier's part number, but only with the OEM's.

The maximum number of parts should not exceed 25 per 8-1/2 x 11" page. To the extent possible, illustrations and the corresponding parts list should be on facing pages of the manual to avoid having to turn the page.

Numerical Index
This index lists in alpha-numeric order all the part numbers in the listing for the chapter. A separate column identifies the applicable figure and index number for the part.

Common Commercial Hardware
This is a list of hardware used through the vehicle, organized by type of fastener and then size.

DRAFT

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

Samples of all the above formats should be presented at or before the first meeting discussing part manuals.

APPENDIX A

AMTRAK ELECTRONIC PARTS AND SERVICE CATALOG SPECIFICATION

The Electronic Parts and Service Book will be Published in LinkOne®. If the Builder does not have LinkOne® Software in-house, it may be necessary to subcontract the work to an Authorized LinkOne® Publisher. Information will be provided about the Distributor Publisher, who is currently contracted to Amtrak for technical support. The Builder is not limited to a sole source situation.

LinkOne® is an international graphical parts book system formerly called Mincom ImageLink. Mincom Inc.'s corporate office is located in Australia, and there is a worldwide network of Distributor Publishers. Mincom's U.S. office is located in Denver, Colorado.

To locate the Electronic Parts Catalog Exchange Standard ("EPCES"), the Builder will be required to log onto the Internet and access the NAPM Rail Industry Forum's WEB Site www.napmrif.org/infostnd/epces/index.html. Compliance with this standard will be required as it applies to the EPCES, Documentation Type Definition ("DTD"), defined terms and allowable graphic standards. Actual Standard Generalized Markup Language ("SGML") tagging will not be required.

DRAFT

General Information

The LinkOne® Parts Book purchased with the equipment is to include copyright privileges that will authorize Amtrak to update the Parts Book, make changes to it and any disposition of the LinkOne® Parts Book without notification or consent of the Builder.

LinkOne® Parts Books built for Amtrak will reference Builder's Part Numbers, Vendor Part Numbers, - i.e., usually the OEM - Original Equipment Manufacturer Part Numbers (applicable to all Builder purchased components) and Amtrak (AAMPS) Corporate item numbers.

The process for establishing AAMPS numbers will be as follows:

In the early stages of documenting the Parts Book, the Builder will convey applicable catalog part number information to Amtrak utilizing an Amtrak provided Excel Spread Sheet. The data to be provided to Amtrak is to include the Noun Descriptions, the identification of the applicable system on which it is used, the Builder's Part Numbers, and the OEM Part Numbers for all parts purchased by the Builder from another source. Amtrak will use this information to identify existing AAMPS numbers or to create new AAMPS item numbers when none are found to exist.

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

Amtrak will respond and supply the Builder with applicable AAMPS numbers within a reasonable turnaround timeframe, normally 5 working days after the Builder has provided complete, accurate data. This procedure should allow the Builder to provide the Publisher of the Source Book Data in a timely manner and expedite Publication of the LinkOne® Parts Book.
The Builder is solely responsible to ensure the accuracy and integrity of its supplied books. It is the responsibility of the Builder to maintain their source books through the complete manufacturing process and until the last Unit in the Contract has been delivered and accepted by Amtrak. The Builder will be obligated to provide Amtrak with updates to their original LinkOne® Parts Book whenever the Builder makes a revision or modification under warranty to the Equipment for the life of the Equipment.

A Preliminary Draft version of the LinkOne® Book must be made available within 60 days of the start of Publication to verify compliance with the Amtrak requirements. Delivery of the Preliminary and Final Versions of the Book are to be made to the Amtrak Catalog Dept. (Catalog Dept. Address and Contact Name will be furnished by Amtrak's Contract Representative upon request). Upon final version acceptance, the Builder will be notified, and the billing invoice is to be submitted for payment.

Delivery of the final version of the LinkOne® books constructed for Amtrak must include both the Target and Source Books. These books will remain the property of Amtrak.

The Builder is also required to deliver a duplicate copy of all source data used to make the LinkOne® books. The data contained on CD(s) is to be delivered to Amtrak's Catalog Department.

Amtrak reserves the right to reject any books that it deems substandard as to quality of content provided by the Builder or if the finished product of the Publisher fails to meet any part of this Specification.

Chapter Index

26-FOI-00415 00000006226 "UNCLASSIFIED" 4/30/2026

List of All Vendors
List of the Common Commercial Hardware
List of Abbreviations and Glossary
Any Other Applicable Front Matter

Chapter Index – Listing Individual Chapter Numbers and Titles
List of Vendors: With Corporate Name, Address, Phone Number, E-mail Address, Contact Person and Vendor Code.

List of Common Commercial Hardware:
This should be a key list of all parts not manufactured by the Builder. The list is to be in the Builder's part numbers sequence. It is to include all common Fasteners, Electrical and Plumbing Hardware items and must be identified by:
Either A: The complete physical description required for purchase.
Or B: The OEM Names and OEM part numbers or Mil. Specs.

List of Abbreviations
Any Other Front Matter, if Applicable

Chapters

The Builder will coordinate with Amtrak's Catalog Department when determining the Book Chapter Titles and the order of sequence of Chapters. This Is required in order to assure concurrence with Amtrak's Work Management System ("WMS").

Each chapter should begin with a list of included figures, (illustrations), with titles, in numerical order. The list is to be followed by the first Figure on the list, which will contain one or more illustrations, followed immediately by an associated list of components of the illustration. The equipment shown on the first illustration will be the top-level view of an equipment system or assembly. It will be followed in logical sequence by lower-level views called the "drill down" or NLA, (next lower assembly). The figure usually will include "callout" numbers identifying sub-parts or detail parts of the Assembly. Each "callout" item number will appear on the Parts List on the following page. The Parts List is identified by the Figure number it is associated with, and the parts are identified with the "callout" numbers.

Example: Figure 1-1 may be the first figure in Chapter 1. The associated Parts List may be identified as Fig/Index No. 1-1, and the items on the parts list will follow in numerical order corresponding with the "callout" item numbers shown on the illustration.

Information for the LinkOne® Publisher: Include the following in the Book:

LinkOne® Book Date of Publication:_____ Date of Revision:_____

Below is the manner in which Amtrak prefers the Parts List and column headings to be listed

DRAFT

List of Vendors and Vendor Codes

Amtrak established Vendor Codes are to be used in the LinkOne® Book.

In the event any of the Equipment Builder's Vendor Codes are different from Amtrak's and this requirement poses a serious problem, it should be listed as an exception in the Equipment Builders' proposal. Amtrak will attempt to negotiate an acceptable compromise to resolve this issue.

Amtrak
Bureau of Rolling Stock Engineering

Specification for Sleeping Car mattress

Specification No. 364 Rev H

1.0 Scope

1.1 General

This Specification is intended to be used in conjunction with any associated Amtrak drawings and/or CADD models, the Amtrak Procurement Department purchase orders, and other contractual documents issued to the vendor. It is Amtrak's intention that all components supplied under this Specification, unless improvements are otherwise identified, be functionally interchangeable with those currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation. Any food service, sanitation or other public health items supplied under this Specification must comply with the applicable requirements of the Food and Drug Administration (FDA) of the US Department of Health and Human Services, and also the National Sanitation Foundation (NSF).

As basic work under this Specification, each item produced must be completely functionally tested, cleaned, sanitized as required, properly packaged for shipment to Amtrak, and have documentation submitted. Amtrak will perform a series of First Article Inspections on the first item produced by a vendor, in order to verify that the process and materials used are in compliance with this Specification and drawings.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to the Amtrak Contracting Agent in a timely manner for mutual investigation and satisfactory resolution, with any revision approved in writing by the Amtrak Contracting Agent. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions. Wherever possible, this Specification has been developed on the basis of equipment performance required, rather than specific hardware to be provided. Where specific hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Amtrak Engineer, in order to allow vendors to employ innovation and advanced technology, where appropriate. Preference, to the extent practicable and economically feasible, will be given for products and services that conserve natural resources, protect the environment and are energy efficient.

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term "or approved equal" if not written thereafter shall be implied. Any reference to a particular manufacturer's product, either by trade name or limited description, is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term "or approved equal" means any other manufactured product or article which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak's written opinion as to whether the proposed alternate is equal

DRAFT

to the specified items for Amtrak's specified use and purposes shall be final and conclusive. The vendor shall not subcontract the design and manufacturing work under this Specification without the written authorization of the Amtrak Contracting Agent. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted vendor Technical Proposal, but are necessary for the completion of the item being supplied, shall be considered a part of the scope of supply. In this Specification, all references to "number of days" shall mean calendar days unless otherwise stated.

Safety shall be of primary importance in the design of any items being supplied. They shall present a safe, hazard-free environment to the extent practical. No sharp edges or corners or pinch points shall occur where any personnel may come into contact with them. Smooth surfaces and avoidance of protrusions shall be used to minimize injury.

1.2 Amtrak Ownership Rights

Unless specifically waived in writing by the Amtrak Contracting Agent, all drawings, bills of materials, catalog lists, mockups, CAD models, documentation and all other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection or other process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

1.3 Vendor's Technical Proposal

As a condition of contract award unless otherwise indicated in the Amtrak Procurement documents, the vendor must submit a written and detailed Technical Proposal to the designated Amtrak Contracting Agent. This Technical Proposal must identify the vendor's interpretation of what it considers to be the scope of Basic Work to be performed, present a complete technical description of the components to be supplied, fully describe the operation and maintenance requirements of the components, include a copy of the vendor's Quality Assurance program, describe any Design Review process, present a step-by-step work plan for construction, include a project schedule by major events starting from the Notice to Proceed, and a Bill of Material of all components to be supplied.

1.4 Exceptions

The vendor shall explicitly identify to the Amtrak Contracting Agent any exceptions being taken to this Specification, referencing the Specification Section number and the exact wording in question. It will otherwise be assumed by Amtrak that the vendor takes no exception to this Specification and is completely compliant with all Specification requirements.

DRAFT

1.5 Legal Requirements

All items being supplied under this Specification must comply with all applicable Federal government requirements, in particular those identified in 36 CFR Part 1192, Subpart F (ADA Requirements for InterCity Rail Cars), 49 CFR Part 223 (Glazing Standards), 49 CFR Part 229 (Locomotive Safety Standards) and 49 CFR Part 238 (Passenger Equipment Safety Standards), among others. This shall include all design aspects, as well as required submittals for approval. It is mandatory that all required materials used by the vendor for application in passenger cars or the cab interior of passenger service locomotives comply with the flammability and smoke emissions requirements of the latest edition of 49 CFR Parts 238.103 (a)(2) and (b)(2), and the Appendix B requirements (including referenced notes) for the category and function of material so listed. Prior to the First Article Inspection and any delivery of material, the vendor must supply the Amtrak Contracting Agent with a report by a recognized third-party independent testing laboratory certifying that all required materials used comply with the 49 CFR Part 238 Appendix B flammability requirements, if applicable.

Any food service and sanitation items to be supplied shall meet all applicable requirements of the U.S. Public Health Service, including the latest edition of the U.S. Food and Drug Administration Food Code. All commercially available appliances shall be approved by Underwriters' Laboratories (UL) and the National Sanitation Foundation (NSF). All approvals, including approvals from USPHS and FDA, are the responsibility of the vendor and its suppliers, and shall be submitted in writing to the Engineer. Appliances developed specifically for this procurement must be designed and manufactured to UL and NSF guidelines. However, actual certification will not be required.

DRAFT

1.6 Engineer

The Engineer or Amtrak Engineering, as referenced in this Specification or any drawings, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. The vendor may be submitting items for the Engineer's approval as required by the Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to all of the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submissions shall contain sufficient detail to confirm that Specification requirements are being met. However, the vendor shall use judgment as to what level is appropriate and shall communicate with the Engineer when guidance is needed on a case-by-case basis. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible.

1.7 Cost Items

Any individual extra work items regarding the items being supplied shall be handled in accordance with the purchase order and other contractual documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Contracting Agent,

and not solely the Engineer, regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Contracting Agent in accordance with the contract documents.

1.8 Vendor Quality Assurance Program

The vendor is required to have in place a documented Quality Assurance Program that is modeled after an established industry quality standard, such as the ISO, AAR, or other organization. The vendor's facility is required to be equipped with equipment, personnel and management completely sufficient to assemble, inspect and test each item being supplied under this Specification. The vendor shall have suitable equipment to diagnose any failure mode, and perform all adjustments and tests required to confirm proper operation. The vendor's Quality Assurance staff shall be active participants in the assembly, inspection, testing and documentation phases of the work. The vendor is required to submit a copy of its Quality Assurance Program as part of its Technical Proposal, as explained in Section 1.3. While it not a mandatory requirement under this Specification, it is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000 or an equivalent recognized standard.

Amtrak Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. The vendor shall fully cooperate in such audits. Specific attention shall be paid to the areas of management responsibility, quality system, contract review, design control, document control (including drawings), purchasing, purchaser-supplied product, product traceability and identification, process control (including procedures, testing and equipment), inspection and testing, measuring and test equipment (including calibration programs), control of nonconforming products (applied controls), corrective and preventative actions, handling, storage, packaging and delivery, quality records, internal quality audits, training, servicing and statistical techniques.

DRAFT

1.9 Critical to Quality (CTQ) Part Criteria

It is mandatory that the vendor comply with Amtrak procedure PD 3.7.4.02, Critical to Quality (CTQ) Part Criteria, which applies to all products identified by either the Engineer or the designated Amtrak Contracting Agent that Amtrak considers to have aspects identified that are Critical To Quality (CTQ). CTQs shall be Critical to Quality (CTQ) characteristic are defined as "Those characteristics of an item which, if non-conforming, may prevent or seriously affect the unit performance, reliability, producibility, or customer satisfaction of a component." This procedure defines the methodology when qualifying parts or processes to assure that the critical to quality product criteria meet Amtrak requirements by:

- Implementing a rigorous Part/Process qualification to ensure the participation, communications of all related departments and the quality acceptance.
- Support the Quality process by involving the vendor early in the project/design process.
- Assure that the vendor is supplying materials that meet the quality, cost, delivery and reliability requirements.

1.10 Components

The vendor shall use only new parts for all components, unless otherwise specified on the drawings or contract documents. It is Amtrak's desire that all materials, to the greatest extent possible, be of commonly available commercial items and hardware. The vendor shall maintain drawings for each component, and where necessary, patterns, jigs and fixtures, to assure identical manufacture. All elastomers used shall have a design life of 10 years in service unless otherwise approved by the Engineer.

1.11 Conducting Tests

The vendor shall be equipped to fully test the items being supplied in accordance with this Specification and any referenced drawings as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended by the apparatus supplier, and the vendor shall maintain documentation of such calibrations.

1.12 Workmanship

All workmanship shall be of high grade and shall conform to the best of manufacturing practices. Skilled, qualified, well motivated personnel, with appropriate experience, training and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in its facility this Specification, and all other referenced drawings and documents.

DRAFT

1.13 Documentation Records

The vendor shall maintain an electronic database and/or approved logbook of information regarding all components supplied to Amtrak under this Specification. At a minimum, records shall identify the Amtrak purchase order number, any serial number of the assembly, Amtrak "AAMPS" internal catalog number (if known), copies of any written authorizations by the Amtrak Contracting Agent, inspection and test data, shipping date and shipping location. In addition, it shall include a copy of the flammability and smoke emission laboratory certification report, if required, under 49 CFR Part 238 Appendix B for the components being supplied. The vendor shall include any applicable fire safety analysis and all certifications such as by the U.S. Public Health Service, the U.S. Food and Drug Administration, Underwriters' Laboratories and the National Sanitation Foundation.

1.14 Referenced Documents

The latest revision level of all referenced drawings and documents are to be considered to be the applicable version.

2.0 General Requirements

2.1 Design Considerations

Any components being supplied under this Specification shall be designed and manufactured to perform satisfactorily for a minimum design life of 10 years, unless otherwise specified. To the extent possible, only readily available components, hardware and fasteners shall be used. Any assembly hardware visible to passengers shall be recess mounted stainless steel.

The design and components shall comply with the flammability, smoke emissions and toxicity requirements of Amtrak Specification 352. Any water systems being supplied shall comply with the design requirements of Amtrak Specification 339. All water and waste systems shall have freeze protection systems provided in compliance with Amtrak Specification 531. All wire and cable shall comply with Amtrak Specification 323. All materials and workmanship shall comply with the requirements of Amtrak Specification 328. Components shall be selected for maximum endurance between inspections, and for ease and quickness of inspection. All items of electronic hardware and software proposed by the vendor to control or monitor any safety functions must have a safety program meeting the requirements of 49 CFR Part 238.105 submitted to the Engineer for approval and compliance.

As appropriate, the overheating of apparatus and overall fire safety design shall be addressed by use of thermal cutouts, selection and use of materials meeting flammability, smoke generation and toxicity requirements, and by means of fire detection and suppression. All food service galley systems and auxiliary equipment shall be equipped with overheat sensors and thermal cutouts.

Any items being supplied under this Specification for use either by passengers or train crew staff shall be designed to provide maximum comfort and safety as dictated by ergonomic requirements. All items shall be designed utilizing Universal or Transgenerational design, considering the needs of a broad range of users and citizens. This is particularly critical for the very young and the elderly who, while not considered "disabled" are often less stable or lack strength in situations considered "normal" by manufacturers. Applying these concepts need not complicate or add expense to the component but insure its continued utility and safety over time regardless of the demographics of the service area. Special attention shall be given to

DRAFT

passengers with reduced visual acuity by providing them with visual cues as required. Floor support surfaces should have high contrast colors in this regard, and high contrast signage and striping patterns shall be provided where necessary, as approved by the Engineer.

All apparatus being supplied which requires inspection or maintenance must be readily accessible and replaceable, and shall be arranged to provide simple, easy access. Special attention shall be given such that opened covers, access doors, etc., provide sufficient room for a maintainer to easily gain access to equipment within lockers or enclosures. Secondary safety latches shall be used for all overhead ceiling covers, and any car exterior enclosure cover. In general, frequency of required service shall determine the degree of equipment accessibility.

For newly designed systems being supplied under this Specification, the vendor shall prepare for Engineer approval a Maintainability Analysis for the components being supplied. The analysis shall be the basis for development of maintenance tasks procedures, methods, and techniques. This analysis shall establish the maintenance concepts to be incorporated in the design, taking into consideration the requirements for safety, reliability, accessibility of apparatus, and the skills available for performing maintenance. Maintainability Analysis shall include all tasks required at each level of maintenance (daily, periodic, annual and overhaul), the task frequency, the time required, required labor resource, skill levels, and the necessary tools and support equipment. The Maintainability Analyses shall be a continuing effort during design and shall provide data for consideration in the review of the design.

2.2 Environmental Conditions

Any components being supplied under this Specification shall be designed to comply with the conditions listed in Amtrak Specification 429, Environmental and Operating Conditions, and must be suitable for use up to 10,000 feet elevation above sea level. They shall also be designed and mounted to have structural integrity and be operationally reliable for the vibration environment at the point of attachment, and shall prevent unacceptable vibration inputs to the attachment structure. The component structure and mounting shall be designed to prevent amplification through component resonance beyond a level twice that of the attachment point. The vibration force output of any rotating component shall not exceed the vibration environment specified for the component.

All carbody mounted equipment shall be designed to withstand continuous vibrations of at least 0.2 g at frequencies up to 100 Hertz in all directions, as well as randomly orientated shock loads of at least 5 g's longitudinally, 3 g's vertically and 3 g's laterally. Truck components located above the primary suspension shall be designed to withstand continuous vibrations of at least 6 g's at frequencies up to 100 Hertz in all directions, as well as randomly orientated shock loads of at least 8 g's. Truck components directly carried on the axles shall withstand continuous vibrations of at least 50 g's up to 100 Hertz in all directions, as well as randomly oriented daily shock loads of at least 200 g's. Vibration resistance shall be verified by analysis, to the satisfaction of the Engineer.

2.3 Interchangeability

All similar parts on each item being supplied and among all other assemblies and their spare parts shall be designed and manufactured to be identical, both as individual parts and as

DRAFT

subassemblies. All assemblies shall mount to the vehicle without modification. Model numbers for identical components shall be identical. Replaceable components of any such apparatus shall be fully interchangeable, without adjustments to any part being necessary.

2.4 Dimensions

All designs, components, dimensions and fasteners used on the components being supplied under this Specification, unless otherwise stated in the bidding and contract documents, shall be of United States inch-standards. Due to potential compatibility issues with existing Amtrak rolling stock, any components and fasteners using metric dimensions shall not be supplied unless approved in writing by the Engineer.

The vendor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value. Drawings prepared by the vendor shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views. Dimensional tolerancing shall be appropriately applied for the part being manufactured.

2.5 Cleaning and Maintenance

All components being supplied under this Specification shall be easy to clean and maintain. They shall not require maintenance or adjustments at internals of less than four years, unless approved in writing by the Engineer. Pockets where dirt and debris can collect shall be minimized; those that exist shall be made easy to clean with standard vacuum cleaner equipment. Light fixtures shall be fully gasketed, including diffuser covers, to prevent dirt entry into the fixtures. Where possible, components requiring maintenance or replacement at overhaul shall be replaceable as individual units. The design shall ensure that items that require repair and or service are easily accessed, removed and replaced and that this is possible with the use of standard hand tools. Variations of fastener thread size, thread length and head style shall be minimized to ease overhaul and regular maintenance. The number of fasteners shall be kept to a minimum. All paints, coatings and corrosion protection shall meet the requirements of Amtrak Specification 328.

DRAFT

2.6 Interference and Transient Suppression

All electrical components and wiring being supplied shall be carefully planned and selected to avoid electrical interference in the operation of train crew and maintenance department portable radios, public address and any other frequency sensitive systems. Likewise, these components shall be immune to the EMI/RFI effects of electrical interference from Amtrak's electrically and diesel-electrically propelled trainsets, passenger cars and locomotives. The vendor shall include the use of shielded cables, chokes, filters, and capacitors, as required by good design standards, to avoid possible interference with these systems. Adequate voltage transient suppression shall be provided for the protection of circuitry involving semiconductor devices. Low voltage circuits shall be capable of withstanding 1.5 joules, unless otherwise approved by the Engineer.

Apparatus creating EMI emissions shall be designed to contain these emissions within their

package area. Suppressors shall be incorporated across inductive devices to minimize switching transients. All suppression devices shall be selected on the basis of their ability to absorb the amount of energy available in the connected circuit, for the number of cycles of operation expected in service, without requiring replacement prior to scheduled overhaul. All magnet valves and relay/contactor coils shall have free-wheeling diode or metal-oxide varistor voltage spike suppression, or other suppression means, except where this results in deterioration of performance. Coil suppression devices shall be located physically on or as close as possible to the coil it protects (preferably directly at the coil terminal). Wherever possible, the suppression of transients shall be at the source.

3.0 Specific Requirement

This specification addresses the design, performance, and acceptance criteria for bedding mattresses used in Amtrak passenger rail sleeping cars. All mattresses furnished under this specification shall provide maximum passenger comfort as dictated by ergonomic requirements.

The foam cushion material shall be flexible cellular foam with fire barrier fabric and a cotton ticking cover, or equal, in as much as it meets or exceeds the resistance qualities for flame, smoke, heat release, toxic chemical emissions, and physical properties

The cushion foam under normal passenger service use will have no deterioration of the mattress core over four years from the date of manufacture and during this period the permanent set will not exceed 20%. (Permanent set is defined as the reduction of foam thickness, at any point, as a result of normal use.)

If failure occurs in the first and second year, the manufacturer will replace mattress assembly at no charge to AMTRAK. The third year AMTRAK will pay 50% of the current foam insert cost. The fourth year AMTRAK will pay 75% of the current foam insert cost. This warranty will apply directly to the prime construction of the complete assembly or, if bought separately, apply to the foam manufacture

3.1 DESIGN CONSIDERATIONS

Mattress Core and Mattress Ticking Fire Performance Properties
All mattress components shall comply with the Federal Regulation 49 CFR 283.103, Appendix B, in addition to all detailed criteria stated in Section 4.0. Fire performance properties required of the cushioning by 49 CFR 238.103, Appendix B, shall be obtained after testing to Dynamic Fatigue Testing required in Section 4.2.

DRAFT

3.2 SYSTEM COMPONENTS

3.2.1 Mattress Core

The mattress core is to be an open cell flexible resilient foam cushioning conforming to the following criteria.

Test Identification	*Test Description*	*Test Pass/fail Criteria*
ASTM D3574 test B, Sample size 15"X15"x4".	Indented Force Deflection IFD	25% IFD =41-49 Support factor =2.1min
ASTM D1055, Oven aged (ASTM D573} for 70 hrs. at 212 degrees F Compression load defection change at 25% deflection	Accelerated Aging test	10% max.
ASTM D3574 test D	Compression set at 50% deflection	5% max
ASTM D1055	Flex Fatigue	Thickness loss = 5% max IFD change = 25% max
ASTM D3574, Test E	Tensile Strength	IFD<35, TLN = 40 max IFD>35, TLN = 30 max
ASTM D3574, Test F	Tear Resistance	0.57 lbs./inch min.
ASTM D3574, Test H	Resilience	50% min.
ASTM D3574, Test I_2 , procedure B (20,000 cycles)	Dynamic fatigue	IFD<35, TLN=40 max IFD>35, TLN=30 max
ASTM 3574, test A	Density	2.5 min.
ASTM D 3675, test shall be performed as an	Radiant Panel, Flexible Cellular	Is < 25

DRAFT

assembly with fire barrier fabric applied over the cushioning foam.	Materials	
ASTM E1537, test shall be conducted with fire barrier fabric but without ticking cover.	Upholstered Furniture Flammability Test	Is , 25
ASTM E662, test shall performed as an assembly with fire barrier applied over the cushioning foam	NBS Smoke Chamber	Ds @ 1.5mins<100 (worst mode) Ds @ 4mins < 175 (worst mode)

3.3 Mattress Core Properties

The I.F.D. value above shall be used unless agreed upon in writing by Amtrak engineering of a variation needed for comfort due to variation in thickness of the mattress insert.

3.4 Mattress Cover

The ticking fabric shall be 6.5 Ounce per square yard minimum Government Standard ACA cotton ticking in accordance to Federal Specifications CCC-C-436E, Type II, Class 2- not preshrunk, blue stripe color..

The ticking materials shall be sewn in such a manner as to present neat appearance without wrinkles, loose ends or tabs that might be used to pull the material loose while installed in the bunk. The cover will have separate top bottom, side piece and closure flap. The sides and leading edge of the closure flap shall be hemmed in conjunction with hook fastener. The exposed edges of the sidepieces and bottom panel shall be hemmed. Located 1/2" from the exposed edge of the bottom panel, one inch wide loop shall be sewn in across the width to accommodate a hook to loop closure seam.

All upholstery seams shall be constructed per ASTM D-6193, Standard Practice for Stitches and Seams, stitch Type 301, Fabric seams are 3/8" at 6-8 stitches per inch,

All perimeters edges of the ticking fabric shall be serged Class 500, 6 stitches per inch minimum per ASTM D-6193.

DRAFT

3.5 Mattress Cover Properties

Ticking material shall be fire retardant and comply with the following:

Test	Method	Requirement
Vertical Burn Test	F.A.R. 25.853(a) 14 CFR 25, Appendix F, Part I (a) (1) (i) (60 second test)	Flame Time ≤ 10 seconds Burn Length ≤ 6 inches
Smoke Generation	ASTM E662 (flaming and nonflaming	D_s (4.0) ≤ 200
Break Strength	ASTM D751	Warp: 136 minimum Fill: 65 minimum
Trapezoid Tear Strength	ASTM D1117	Warp: 25 minimum Fill: 35 minimum

3.6 Mattress Holding Loop

When specified on the purchase order or on drawings accompanying the purchase order, mattresses shall be provided with a holding loop. The loop shall be made of the same ticking material described in paragraph 4.3.

3.7 Identification

Each mattress shall have a label sewn on the outside of the mattress cover complying with applicable state and federal regulations and giving the following information in indelible ink:

a. Manufacturers name and part number
b. Date of manufacture
c. Size of mattress
d. Amtrak's name and AMMS number

Additionally, the manufacturers name and date of manufacture shall be indelibly stamped in one-inch lettering on the top or bottom surface of one end of each foam core.

4.0 Packaging and Shipment

For all components produced, following all assembly the vendor is required to perform and fully document a complete verification test and evaluation of each component being supplied, prior to shipment to Amtrak. The results of this final testing shall be recorded in the documentation record. When successfully completed, the vendor may be directed by the Engineer to apply a

DRAFT

permanent Engineer-approved identification label in an inconspicuous agreed-upon area, which shall include the name and location of the vendor, any serial number used by the vendor, any Amtrak "AAMPS" internal catalog number, and the date of manufacture.

All packaging and shipping requirements shall be performed by the vendor. It is required that the vendor properly prepare all components being supplied under this Specification for shipment to Amtrak so that they are ready to install following unpacking.

The vendor shall package the components, unless otherwise instructed by the Amtrak Contracting Agent, to be suitable for continuous storage prior to unpacking in unheated (subfreezing), dusty indoor storage conditions. Fabric and soft goods shall be individually wrapped in clear plastic for protection against water exposure. Components shall be appropriately packaged for their weight and size. Special efforts must be used to protect unusually fragile or plastic items from damage during shipping and handling. Large and bulky items shall be secured to a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling.

The shipping package shall have an identification label. This label shall include the vendor's name and address, purchase order number, date released for shipment, Amtrak "AAMPS" internal catalog number, and any component assembly serial number. This information shall also appear in the vendor's invoice, and be included in the documentation record.

The vendor shall retain a copy of the shipping documentation record, and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Contracting Agent (or as otherwise designated in the purchase order), and the third copy shall be sent to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

DRAFT

5.0 Product Support

5.1 Program Schedule

If required by the contract documents, any vendor-produced Program Schedule shall include all program milestones, design reviews, production schedule, delivery schedule, and any other pertinent information that will assist with tracking program progress. Any requested changes to the Program Schedule must be presented to the Amtrak Contracting Agent for review and approval.

5.2 First Article Inspections

To verify that any components being supplied under this Specification meet all Specification and drawing requirements, and are truly interchangeable with existing components, Amtrak will conduct a series of two (initial and as-installed) First Article Inspections (FAI) on the first complete assembly manufactured by a vendor, prior to allowing unrestricted manufacturing work to start. It is the intention of the FAI process that every function and feature of the items being supplied under this Specification be fully exercised and tested for proper operation under all

normal, abnormal and fault conditions, both in the vendor's workshop and as applied on the vehicle.

The initial FAI shall consist of a pre-shipment inspection and testing of a prototype assembly at the vendor's facility. This shall be an active test, and the vendor shall provide all mounting fixtures, electrical and pneumatic power, etc, as required to fully functionally exercise all components and features. A complete range of operating voltages, currents, pressures, loads, etc. shall be applied to simulate both normal and abnormal conditions, and the response of the components to these conditions.

Once this FAI is successfully completed at the vendor's facility, the vendor shall ship the same assembly to the Amtrak maintenance facility identified by the Amtrak Bidding and Contract Documents or the Engineer, where Amtrak will install the assembly onto an Amtrak vehicle. A second "as-installed" FAI shall then be performed to verify proper operation of the assembly in the "as-installed" configuration. This shall in particular verify all component interface conditions with the vehicle.

Each FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. They shall include, but not be limited to, a mechanical and electrical inspection to determine compliance with the specifications and the drawings, complete testing of the functionality of the component, demonstration of maintainability and troubleshooting, and verification of proper operation and complete compatibility/interoperability when installed on a vehicle. Approval by the Engineer following successful completion of the FAI process, as communicated through the Amtrak Contracting Agent, shall constitute final system approval.

DRAFT

5.3 Delivery of All CAD Models and Drawings

Following the successful completion of the First Article Inspections, and as a precondition to permit production delivery of material to commence, the vendor must supply to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, an electronic set of every fully-developed CAD model and dimensioned drawing and Bill of Material which may have been created for every individual part used for the manufacture of all items being supplied under this Specification. All models and drawings shall comply with Amtrak Specifications 866 and 867. Refer to Section 5.4 for additional details. Any later modifications as a result of warranty or other actions must include the affected models and drawings being revised as necessary and resubmitted to Amtrak.

5.4 Production Changes Require Engineer Approval

Once final system approval is granted by the Engineer and production has commenced, the vendor is forbidden to make any changes in the design, material or configuration of the items being supplied, unless approved in writing by the Amtrak Contracting Agent as per Amtrak Procedure PD 3.7.3.01, Design Review and Control Procedure. This shall include any modifications required as a result of warranty actions, so as to provide complete documentation.

5.5 Spare Parts List

The vendor shall supply to the Engineer, via the Amtrak Contracting Officer, a Microsoft Excel spreadsheet list in Engineer approved format of any spare or consumable parts which are recommended to be stocked by Amtrak for maintenance of the components being supplied. Such lists shall contain for each item an item number, the spare part name (in noun, adjective format), the name of the Original Equipment Manufacturer (OEM), the OEM part number, approximate cost for each item, and recommended stocking quantity. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

5.6 CAD Models, Drawings, Manuals and Parts Lists

All CAD models and drawings prepared by the vendor under this Specification shall be in full compliance with Amtrak Specification 866, CAD Model Standards and Amtrak Specification 867, Amtrak Drawing Standards for CAD. All CAD models and drawings shall be in Engineer-approved formats, and shall include a complete set of all "as-built" drawings of every part, component and assembly used for all items being supplied to Amtrak of all levels, not only the top assembly level. All CAD models shall identify all materials, surface finish and fasteners. Each drawing shall include a complete Bill of Material, providing quantities, original component manufacturer name and part number of the actual supplier of the part. Every part on the Bill of Material must be fully identified regarding its characteristics including material, plating, finishing, heat treatment, secondary operations, etc. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The drawing package shall also include drawings of every special tool, jig or fixture required to install, maintain or overhaul the assembly, and if referenced in any of the maintenance manuals. The final CAD models shall be delivered as 3 sets of DVDs or CDs in SolidWorks 2004 or above. The as-built drawings shall be delivered as 3 sets of DVDs or CDs of all drawings in electronic format in SolidWorks 2004 or above (DXF and AutoCAD 2000 format files shall be accepted only with prior approval of the Engineer) along with 3 sets of CDs of all drawings in Adobe Acrobat read-only PDF file format. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

One set of software (including any diagnostic tester software) used for any microprocessor system being supplied under this Specification shall be included with each assembly, with an additional complete set on CDs or DVDs to be provided to the Engineer via the Amtrak Contracting Agent. Amtrak shall be identified as the license holder for any commercial software used. Complete operations, programming, and diagnostic tester documentation shall be provided to the Engineer, including procedures for Amtrak to revise all user-changeable software settings. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

The vendor shall also submit in electronic format to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Contracting Agent, a complete set of all documentation including the operating manual, maintenance manual, and parts list. All documentation data must be compatible with Microsoft Office 2000 or newer applications. The parts list shall identify all individual parts used (in noun, adjective format) in the items being supplied under this Specification, and must include the original equipment manufacturer (OEM) name and part number; use of an intermediate supplier or distributor's name or part number is not acceptable. The parts list shall indicate quantities for each item within each assembly, use exploded isometric-view parts diagrams if possible, use separate pages for parts diagrams and tabular data if possible, and be sufficiently complete to permit Amtrak to order individual replacement spare parts direct from the actual parts manufacturer. The maintenance manual shall include

DRAFT

complete information from installation, through troubleshooting, repair and complete overhaul. The manuals shall include maintenance and parts information for every special tool, jig, fixture or diagnostic test equipment used to repair or overhaul the assembly. The vendor shall also supply in electronic format all other manuals and other support documentation it has available for the components being supplied under this Specification. All documentation data must be delivered as 3 sets of CDs in Adobe Acrobat read-only PDF file format, distilled in Acrobat 5.0 or higher and in addition 3 sets of CDs in its original Microsoft Office applications format, for internal use by Amtrak for future revision of the data. The vendor shall also supply any revisions in this data up to the conclusion of the warranty period.

All PDF files (other than drawings) shall be distilled from the authoring documents, resulting in PDF documents that can be indexed and searched. All authoring electronic data files making up the manuals shall be delivered formatted such as to not cause pagination errors during the PDF distillation process. The PDF file produced from the distillation process shall match any published version of the authoring document. All files shall be editable by Amtrak for future document maintenance. All columnar data found within word processing files shall be presented in a table format. Any fonts used on the creation of authoring and/or PDF files shall be embedded and not restricted for use. PDF documents with definable chapters, sections and/or subsections shall be linked to their individual locations with bookmarks internal to the file in the fashion of a hierarchical format such as a Table of Contents. Creation of PDF files from scanned images only, resulting in non-searchable or non-indexable documents, will be restricted to only those allowed by the Engineer. Scanned information in the form of document attachments may be allowed to be imported into an existing PDF file that is searchable and capable of indexing, if the information is supplemental to context to the file and not the primary means of communicating the subject's information. If documents are scanned, careful attention will be taken to not allow misalignment of the pages. Opening options in the PDF file format should be set to show bookmarks and page, with magnification at "Set Width" and "Continuous Page" settings. Distillation settings shall be "E Book" or "Print", with DPI settings set to produce quality printing from a desktop printer without overly increasing the size of the file.

DRAFT

5.7 Training

If required by the Bidding and Contract Documents, following the successful conclusion of the First Article Inspection, the vendor shall provide complete on-site training at the Amtrak maintenance location identified in the Bidding and Contract Documents. The training shall highlight both the operation, maintenance and calibration procedures for the components being supplied. This shall include a minimum of 8 hours of classroom time and "hands-on" training, to be scheduled as mutually agreed between the vendor and the Engineer. The training program shall be presented in written format and shall include the written manuals that are provided for operation and maintenance.

5.8 Failure Analysis

A Failure Analysis to determine the cause and frequency of defects occurring during the warranty shall be performed by the vendor and submitted to the Engineer and the Amtrak Contracting Agent for concurrence. Such analysis shall be performed and reported within 30 days from the date of each failure.

6.0 Source Inspection

6.1 Purpose

Amtrak will perform periodic source inspection of vendor materials and components being supplied. The following is intended to be used as an outline defining activities and responsibilities of the vendor performing the source inspections.

6.2 Professionalism

All inspections, test observations, and other activities performed in the fulfillment of the contract are to be conducted in a professional and ethical manner. The vendor is representing Amtrak in the performance of the contract and therefore must remain courteous, conscientious and professional under all circumstances arising from performance of the contract.

6.3 Scope of Work

Amtrak has implemented a multi-faceted supplier management program of which source inspection is an integral part. Amtrak identifies vendors and materials/components through various methods which will be subject to source inspection. By performing source inspections, Amtrak expects to benefit by use of vendor facilities, measuring and testing equipment to verify materials/components, through rejecting noncompliant materials/components before shipment and receipt by Amtrak, presence of Amtrak representative periodically to ensure continuing good performance, and assist to communicate Amtrak intentions and interpretations of specifications and resolve issues. The vendor will conduct inspection or verify through observation, product compliance with drawings, specifications, standards or Amtrak contract documents and report findings of said inspections to Amtrak.

DRAFT

6.4 Services

6.4.1 Scheduling Inspections

The vendor shall conduct observations and verifications on Amtrak identified materials and components produced by the vendors for Amtrak. Inspections must be scheduled to coincide with final inspection of said materials/components due for shipment to Amtrak. The vendor may use random sampling where large quantities of material are subject to shipment and note sampling method in associated reports. The vendor must perform all dimensional and operational inspections in accordance with the Quality Plan prior to source inspection, and make all inspection records available for review by the Amtrak source inspector, with focus on CTQ items.

6.4.2 Dimensional Inspection

The vendor must witness and verify conformance with dimensional characteristics per drawings identified in the Amtrak contract documents. The vendor must witness and verify conformance with regulatory standards and requirements including material certification as cited in specification or other reference documents identified in Amtrak contract documents.

6.4.3 Operational Inspection

The vendor must witness and verify conformance with operational tests as cited in specifications, operators manual or other reference documents identified in Amtrak contract documents.

6.4.4 Inspection Reports

The vendor must provide a report documenting the vendor source inspection and the inspection results. The report must include the name of the vendor, the date of the inspection, the material or component name, Amtrak (AAMPS) ID number(s) for items inspected, the quantities of each item inspected the inspection results, and the actions taken where nonconforming materials/components are found. Reports should reference appropriate drawings, specifications, standards, requirements, or Amtrak contract document as appropriate.

6.5 Qualification of Personnel

It is the responsibility of the vendor to provide personnel with adequate training and experience to perform all the activities of the source inspections described above. Personnel must also conduct their activities with professionalism.

1.0 **SCOPE**

1.1 Purpose

This specification describes the environment the car electrical and electromechanical equipment will experience in Amtrak operation.

1.2 Intent

If a conflict exists between this specification and the primary procurement specification in which it is referenced, that specification shall rule.

2.0 **GENERAL**

Electrical and electromechanical equipment, its components and associated interconnecting wiring shall be designed to withstand the vehicle shock, vibration, environmental, temperature, and humidity extremes to be expected under operating conditions.

2.1 General Environmental Considerations

The exterior car environment is severe, and care must be taken to protect against the following factors:

a) Heavy rain, driven by wind, or water from a hose
b) Hail, ice, and powdered snow
c) Blown sand, dust, ballast, and rocks
d) Vehicle velocity to 125 mph
e) Wind gust velocity to 90 mph
f) Salt (sea spray or from roads during winter months)
g) Impact from road debris
h) Car washing chemicals and wash rack operation under pressure from sprays
i) Maximum operating altitude of approximately 9200 feet above sea level.
j) Oily film, from diesel locomotive exhaust
k) Electrically conductive dust, primarily from wheel, brake and rail wear.

DRAFT

3.0 **Operating Conditions**

3.1 Normal Operating Environment

The normal operating environment is those conditions the car equipment can experience during typical daily operation. These are conditions the equipment must be expected to encounter continuously for extended periods of time (rather than occasional transient conditions) without suffering from degradation of performance.

3.1.1 Truck

Vibrational Acceleration Extremes

The truck-mounted equipment will encounter the following vibrational acceleration levels which

have been measured on the unsprung mass (side frame) of rail vehicle trucks with wheel flats moving at 120 miles per hour:

Truck Acceleration Parameter	Measured "G" levels (Peak-To-Peak)	Frequency (Hertz)
Vertical	100	60 to 70
Lateral	100	380 Hz

3.1.2 Carbody Exterior

Vibrational Acceleration Extremes

The carbody-mounted equipment will encounter the following vibrational acceleration levels which have been measured in the sprung mass (car body) of rail vehicles moving at 120 miles per hour:

Car Acceleration Parameter	Measured "G" levels (Peak-To-Peak)	Frequency (Hertz)
Vertical	0.40 to 0.60	12 to 15
Lateral	0.20 to 0.40	1.5 to 2.0

Temperature

During the operation, the equipment will be subjected to the following temperature variations outside the vehicle.

The equipment must be functional at any temperature between:
-40 and +150°F for "vital" equipment; -20 and +130°F for "non vital" equipment. Vital/non vital is defined in the basic system specification.

Humidity

The exterior relative humidity for the undercar equipment will vary from 0 to 100%.

3.1.3 Carbody Interior

Temperature

During operation, the equipment will be subjected to the temperature variations within the vehicle.

Typically, the interior temperature ranges from +40 to +90°F. However, the system must be

DRAFT

functional at any temperature between:

-40 and +150°F for "vital" equipment -20 and +110°F for "non-vital" equipment

Humidity
During layover, the interior relative humidity will range from 5 to 100%. During normal operation, the interior relative humidity will range from 20 to 90 percent.

3.1.4 Electrical

AC
Normal operation of the car AC electrical system conforms to NEMA standards of +\-10% nominal voltage and +\-5% nominal frequency. Standard voltages include: 480, 240, 208/120, 120, and 28 all at 60Hz.

AC Power Interruption
During normal operation of the car, 480 volt power, and all derived voltages (240, 208/120, 120 and 28) are often interrupted as follows:

Momentary (0 to 10 seconds typical), such as those caused by pantograph bounce on an Electric Locomotive.

Short Term (up to 1/2 hour typical), such as those experienced in locomotive changes or at adding cars to a train enroute.

Long Term (several hours to several days), such as those experienced in yard switching, train spotting and yard storage and service.

DC
Normal operation of the car DC electrical systems is:

Nominal (when train is on Head End Power (HEP) 72 VDC + 8, -16, ripple less than 2V P-P, (harmonics of 60 Hz).

Battery operation (when train is NOT ON HEP): 64VDC +\-8.

There may be momentary loss of power during transition from HEP to battery, or battery to HEP operation.

3.1.5 Pneumatic
Depending upon equipment, cars are equipped with 1 or 2 pneumatic sources, Main Reservoir and Auxiliary. Compressed air is supplied either from a locomotive or stationary compressor and is supplied to the train via a combination of rubber hoses and steel pipe, with in-car distribution

DRAFT

via copper tubing. Compressors are rotary or reciprocating. Air is often wet, especially in yard operation. Air may also carry some compressor oil.

Main Reservoir Line Air:

Coupled to a Locomotive
When coupled to road locomotive, main reservoir air line pressure ranges from 130 to 140 PSIG. This pressure is normally maintained once the locomotive(s) is coupled to the train; but will experience the following outages; at which time pressure will drop abruptly to zero:

Short Term - (Up to 1/2 hour typical) such as those experienced in locomotive changes or at adding cars to a train enroute.

Coupled to Yard or Station Air - When coupled to either stationary air source, air line pressure ranges from 80-90 PSIG. This pressure is normally maintained once the cars are coupled to the air source, but will experience the following outages at which time pressure will drop abruptly to zero:

Short Term - (up to 1/2 hour typical) such as those experienced in switching moves or adding cars to the consist.

Long Term - (several hours to several days), such as those experienced in yard switching, train spotting, yard storage and service.

Auxiliary Air :
Auxiliary air is an air source derived from main reservoir air. A small air reservoir is charged through a governor valve, which cuts off the air source feeding the reservoir if incoming pressure is less than about 80 PSIG. Because of the reservoir, auxiliary air pressure does not drop abruptly to zero upon loss of train air, but rather drops slowly over a period of several hours.

Coupled To A Locomotive - When coupled to a road locomotive, car auxiliary air pressure ranges from 80 to 140 PSIG. This pressure is normally maintained once the locomotive(s) is coupled to the train. However, main reservoir air feeding the auxiliary air system is interrupted as described above in Main Reservoir Line Air, thus pressure will slowly drop.

Coupled to Yard or Station Air - When coupled to either stationary air source, auxiliary air pressure ranges from 80-90 PSIG. This pressure is normally maintained once cars are coupled to the air source. However, main reservoir air feeding the auxiliary air system is interrupted as described above in Main Reservoir Line Air, thus pressure will slowly drop.

3.1.6 Water
Depending upon equipment, cars are equipped with 1 of 2 water sources: gravity or pressurized.

DRAFT

Tanks are refilled at the origin of the trip, and at intermediate points on lengthy overnight trips.

Gravity
Water is supplied from an overhead tank by gravity. Typical head is 4 feet. Water is not always available:

- If car runs out of water from excessive demand
- In subfreezing weather, temperature sensitive automatic drain valves must drain car water system if car heat is not available.

Pressurized
Water is supplied from an undercar tank through the use of auxiliary compressed air, which pressurizes the water tank directly. Nominal water pressure is regulated 20 - 25 PSIG, but will slowly drop to zero if main reservoir air pressure is not available to the car. (See section 3.1.5 above, Auxiliary Air).
Car water is not always available:

- If car is out of water from excessive demand.
- In subfreezing weather, temperature sensitive automatic drain valves will drain car water system if car heat is not available.
- If car water tanks are being refilled.

In the first case, car water system will have normal pressure of 20-25 PSIG, but it will be air pressure. In the second case, car will have low pressure, if any while in the 3rd case, car will have neither water, nor pressure. Accordingly, equipment which requires no-water protection must sense the presence of water, not pressure.

DRAFT

3.2 Survive Environment
The "survive" environment is the conditions car equipment will experience occasionally. Generally, these are conditions equipment must be expected to encounter continuously for extended periods of time, without change or degradation. While equipment may be under power during these extreme conditions, operations specifications need not be met.

3.2.1 Carbody

Shock:

Vertical	4g
Lateral	4g
Longitudinal	8g

Temperature - Interior and Exterior
The car experiences severe temperatures during storage and operation. Equipment must be designed to withstand without damage, the following temperature extremes. These temperatures

are attained only occasionally: -40 to +150°F. Normal temperature range: -20 to +130°F.

3.2.2 Electrical

AC

Equipment shall not be damaged from sustained undervoltage condition.

Equipment shall not be damaged from reverse phase rotation (when applicable)

DC

Equipment shall sustain no damage from sustained low voltage conditions, 0-56VDC.

Equipment shall be reverse-polarity protected.

3.2.3 Pneumatic

Equipment must not sustain damage from short or long term operation at subnormal air pressure.

3.2.4 Water

Equipment must not sustain damage from short or long term operation at subnormal water pressure, nor partial nor complete loss of water supply.

26-FOI-00415 00000006229 "UNCLASSIFIED" 4/30/2026

1.0 SCOPE

1.1 Purpose

The specification defines the requirement for 480, 240, 208, 120, 28, 3 Phase VAC, and 72 VDC switch board panels to be used on Amtrak railroad passenger cars.

1.2 General

This specification is subordinate to the General Vendor Requirements Specification No. 327, which shall take precedence unless specifically excepted in this specification.

1.3 Function

The switchboards provide power distribution and circuit protection for various car loads. In addition, they may include minor switching functions.

1.4 Supplier Responsibility

The General Vendor Requirements Specification 10-327 defines the supplier responsibility in the following areas:

a. System Approach
b. Program Planning
c. System Development
d. Construction and Workmanship
e. Nameplates
f. Testing
g. Acceptance Testing
h. Product Support
i. Detailed Documentation Requirements

DRAFT

2.0 GENERAL

2.1 Equipment Configuration

Switch boards include the following configurations:

Name	Voltages	Phasing	Function
480 VAC	480 VAC	3Ø 3Wire	Main power distribution
	240 VAC	3Ø 3Wire	
	*72 VDC	1Ø	
Lighting	240 VAC	3Ø 3Wire	Lighting, small-load
	120 VAC	3Ø 3Wire	power distribution
	28 VAC	3Ø 3Wire	
	*72 VDC	1Ø	
Food Service	208/120 VAC	3Ø 4Wire	Food service (kitchen) power distribution
Operating Cab	*72 VDC	1Ø	Operating cab throttle and locomotive control power distribution

*Nominal - may range from 80 to zero volts.

2.2 Location

Unless otherwise specified, switch boards are located within the car interior. The 480 VAC, Lighting and Food Service switch boards are located within electrical closets, while the Operating Cab panel is exposed in the Vehicle Cab, near the operator.

2.3 General Arrangement

The general arrangement of the switchboards will conform to attached Amtrak drawings. The switch boards will have the following arrangements:

480 VAC, Lighting, Food Service	Operating Cab
Rigid back plate	Rigid front panel
Circuit breakers (back mounted)	Circuit breakers (front mounted)
Bus bars	Wiring
Wiring	
Hinged/removable front cover	

Panels are generally mounted on Uni-struts, using mounting holes through the rear of the panel. Cab operating switch boards generally are surface mounted.

DRAFT

2.4 Shipping

Switch boards shall be packaged to protect against damage during shipment and storage prior to use. The shipping label shall include the following information as a minimum:

(a) Part name
(b) Manufacturer name
(c) Type/catalog/part number
(d) Serial number
(e) Manufacture date
(f) AMMS number (Amtrak part number)
(g) Warning and safety precautions for shipping and storage (this side up, do not stack, etc.)
(h) Preparation for delivery shall assure arrival at the designation without degradation of hardware and performance.

3.0 DESIGN CONSIDERATIONS

The switch board panel design must include the following goals:

(a) Safety
(b) Reliability
(c) Maintainability
(d) Availability
(e) Interchangeability

3.1 Environment

The railroad environment is severe and imposes considerable demands on the panels. Refer to Amtrak specification 429 Environmental Operating Conditions for details.

Panel design shall be such that it is stiff enough to not flex, rattle, nor drum during car operation. Wiring and bus bars shall be constructed to prevent "working" which would lead to eventual electrical or mechanical failure.

3.2 Normal Operation

Circuit breakers on the Lighting, Food Service, and Operating Cab switch boards are occasionally used as switches, though they are generally left on at all times. The 480 switch board circuit breakers are rarely used as switches.

DRAFT

3.3 Component Mounting

The design of the 480, Lighting and Food Service switch boards is to be such that all components are front serviceable. All parts shall be removable without access to the rear side of the panel, or panel removal. Only severe damage to the switch board shall require its removal from the car. (Design of the Operating Cab switch board requires access to both front and back for servicing.) All circuit breakers shall be arranged so that the handles move vertically, with the "on" position up.

3.4 Protection Against Accidental Contact

Circuit breakers panels shall have a "Dead Front" construction to provide protection against accidental contact with live conductors.

3.5 Wiring Access

Circuit breakers will be mounted in parallel rows, alternating with bus bars and raceways. Spacing between these components shall be such that all internal and external connection points are readily accessible. The design shall also insure that adequate space is provided to prevent any wiring from being crushed by mechanical components, being sharply bent, or located adjacent to surfaces where vibrations could create failure due to insulation abrasion. Adequate clearance shall also be provided between all exposed electrical contacts and terminals and adjacent conductive components and surfaces. Protective edging shall be used as required to protect against wire abrasion.

DRAFT

3.6 Circuit Breaker to Bus Connection

These connections shall be designed to allow any circuit breaker in any panel position to be connected to any bus bar phase by simply changing the jumper connections. No bus bar modifications are allowed. This is to provide ease in reassigning circuit breaker phasing, should future car loads change.

3.7 Wire Terminations

All internal and external wire connections will be through the use of crimp-on, ring-tongue electrical lugs per Amtrak Specification No. 359. All circuit breakers, bus bars, and all other terminals must accept this type of connection. Panel design shall be such that lugs are not bent nor strained when installed, and wiring is given generous bend radii. Certified crimp tools will be used on all crimp connections.

The position of the phase wires on circuit breakers, etc., will be:

A, B, C, N with A on the top or left
-, + with + on top or right

3.8 Wire Labeling

All vendor installed wiring shall be identified with wire names through the use of sleeve-type wire tags, such as Raychem TMS system. This shall conform to Amtrak Specification No. 319.

3.9 Fault Conditions

The switch board, circuit breakers, bus bars, and accessories must be designed to withstand, without damage, a worst case fault when fed from the following sources:

Main Circuit Breaker	Power Source
480 VAC Main	Locomotive power - 1600 amp continuous
	Yard power - utility transformer feeding entire yard
240 VAC Main	Dry type delta connected transformer, total capacity 45 KVA
208/120 VAC Main	Dry type WYE connected transformer, total capacity 30 to 75 KVA
120 VAC Main	Dry type delta connected transformer, total capacity 30 KVA
28 VAC Main	Dry type delta connected transformer, total capacity 3 KVA
72 VDC Battery	Battery, capacity as stated, typically 80 to 175 amp hr

3.10 Codes and Standards

Switch boards must meet applicable grounding requirements of the National Electrical Code, and applicable NEMA standards.

DRAFT

26-FOI-00415 00000006229 "UNCLASSIFIED" 4/30/2026

4.0 COMPONENTS

4.1 Back Plate

The back plate shall be of heavy gauge steel, sufficient to produce a rigid panel assembly.

Components mounted onto the panel will be attached with screws going into tapped holes (or nutserts) in the back plate. Mounting holes shall be accurately drilled into the back plate to prevent misalignment between components and mounting holes. This will require a drill jig, numerical control machine, etc.

4.2 Cover

The cover shall be of heavy gauge steel or aluminum, of sufficient gauge to avoid rattles and drumming when the car is in motion.

The 480 VAC, lighting and food service panels will be equipped with removable covers, secured with capture sliding-type fasteners, DINCO Gray Co.'s #3 large. The operating cab panel will be secured to the cab structure through the use of a continuous hinge with captive pin. The panel will be held closed through the use of machine screws screwing into the cab structure.

4.3 Bus Bars

Bus bars may be open type, or encapsulated. They will be drilled and tapped on circuit breaker pole centers the entire length of the branch circuit area. They will be aligned to provide fast, easy means of fastening circuit devices to the panel in one-pole increments. This will allow a simple screw driver application for circuit changes. Bus bar system design shall be such that all phase combinations be available at each circuit breaker site.

4.4 Circuit Breakers

Circuit breakers chosen shall be shock resistant, trip free, magnetic/thermal detection, suitable for railroad use with Amtrak approval (see below). Breakers are equipped with toggle operators marked "on" - "off". Minimum interrupt ratings shall be sufficient to handle maximum fault current anticipated in a breaker circuit.

All circuit breakers used on the 480 VAC panel will be screw mounted to the back plate.

DRAFT

Circuit breakers used on the Lighting and Food Service panels will be snap-in as much as possible.

Circuit breakers used on the Operating Cab panel will be front mounted with screws.

The circuit breakers used must accept ring-tongue, crimp-type lugs, and may be either stud type or pan-head screw into swaged nut or keeper-nut configuration.

Compression connections which a set screw is tightened to squeeze a wire inserted into the terminal are not acceptable.

All circuit breakers will be labeled with the following information:

a. Manufacture
b. Manufacture part number
c. Current rating
d. Voltage rating
e. Interrupting capacity
f. Time delay curve name
g. Date of manufacture

The following circuit breakers are approved for use; other manufacturers and models are subject to Amtrak approval.

480 VAC
Westinghouse EHD
Westinghouse FDB

240 VAC
Westinghouse QC-H

208/120 VAC
Westinghouse QC-H

120 VAC
Westinghouse QC-H

72 VDC Main Battery Circuit Breaker
Westinghouse EHD

72 VDC (Lighting Switch Board)
Westinghouse QCHW

72 VDC (Operating Cab)
Heinemann AM

4.5 Paint

The panel and cover shall be painted inside and outside as indicated on the attached Amtrak drawings.

DRAFT

26-FOI-00415 00000006229 "UNCLASSIFIED" 4/30/2026

4.6 Labels

The panel shall be permanently labeled as follows:

Interior

1. All Circuit breakers (such that when front cover is removed to expose wiring, breakers are identified).

2. Bus bars:
   - Voltage
   - Name of each phase
   - Warnings, as appropriate (e.g., Danger 480 Volts)

3. Vendor nameplate:
   - Vendor name
   - Vendor part number
   - Date of manufacture
   - Serial Number

Labels are not to be attached by adhesives.

Exterior

1. All exposed devices shall be labeled, including circuit breakers, receptacles, switches, etc. The labels are to be colored engraved plastic laminate, track mounted. Labels are to be secured from sliding on the track through the use of small machine screws at each end of the track. This will allow ease in future label changes as may be required. Labels are to be color coded as follows (also refer to Amtrak drawing):

Voltage	Label Material	Lettering
480 VAC	Red	White
240 VAC	Yellow	White
208 VAC	Green	White
120 VAC	Orange	White
28 VAC	Black	White
72 VDC	Gray	Black

"Danger high voltage" - type warning labels should be applied as needed.

Additional instruction labels may be required - refer to attached Amtrak drawings for details.

DRAFT

4.7 Wiring

Internal panel wiring shall be stranded wire, as per Amtrak specification 323 "High Performance Wire and Cable".

Wiring will be terminated using crimp-type pre-insulated ring-tongue lugs, per Amtrak specification 359. Wiring shall be adequately secured in position. All wires shall be labeled on both ends using heat-shrink tubing type labels, per Amtrak Specification No. 319.

4.8 120VAC Receptacle

A 20 amp 120 VAC duplex receptacle shall be incorporated as part of the lighting switchboard.

5.0 Testing

5.1 Qualification Test (one sample each type)

A qualification test plan (QTP) shall be submitted for Amtrak approval in a timely fashion prior to the manufacturer's intent to perform the tests.

The qualification test is an engineering proof-of-design test, and will be run on one sample of each panel configurations.

All vibration testing is to be performed in accordance with MIL-STD-202 Vibration test Method 204, test condition D, with the equipment powered.

The QTP shall, as a minimum, demonstrate the following:

1. Panel temperature rise test
2. High potential test (2 X circuit voltage + , 1000V for 1 minute)

Amtrak reserves the right to request additional tests as may be required.

5.2 Acceptance Test

An acceptance test plan (ATP) shall be submitted for Amtrak approval at the same time the qualification test plan is submitted.

The acceptance test is a quality control test used to ensure all panels produced are built consistently and operate properly.

DRAFT

The ATP shall, as a minimum, include the following:

1. Mechanical inspection
2. High potential test (2 X circuit voltage + 1,000V for 1 minute)

6.0 SYSTEM APPROVAL

6.1 General

Each circuit breaker panel shall be subject to Amtrak approval. All major components shall be submitted for Amtrak approval.

6.2 Design Reviews

Design reviews shall be held at times mutually agreed upon between Amtrak and the manufacturer of the panel; such reviews are intended to convey design concepts not readily shown on equipment drawings.

6.3 Documentation

For system approval, the manufacturer of the panel shall submit, as a minimum, the following drawings and documents :

1. Component (assembly) interface drawings, showing:

   a. Outline and mounting dimensions
   b. Weight and center of gravity
   c. Electrical connections
   d. Bill of materials

2. Qualification test plan

3. Acceptance test plan

6.4 First Article Inspection

Prior to the delivery of the first production panel, each type shall be subject to a first article inspection. Such inspection shall include, but not be limited to:

a. A mechanical inspection to determine compliance with the specification and approved drawings.

b. The performance of an acceptance test.

c. The performance of the qualification test. (It is permissible to have the vibration testing previously performed at an independent testing laboratory, the results being available at the first article inspection.) Successful completion of the first article inspection shall consitute final system approval.

DRAFT

26-FOI-00415 00000006229 "UNCLASSIFIED" 4/30/2026

7.0 PRODUCT SUPPORT

7.1 Drawings

All assembly, subassembly, and arrangement drawings shall include a complete bill of material and parts list on the field of the drawing describing all items, including vendor's parts, which form a part of the assembly. Amtrak shall reserve the right to review and approve all drawings prior to construction of a prototype system.

Amtrak shall be supplied, upon completion of the system design, with one set of first generation (not DIAZO) 35 mm film (mounted in accordance with Amtrak specification No. 199) of all assembly drawings, diagrams, schematics, etc., and service manuals.

7.2 Maintenance Manual

The equipment supplier shall provide a maintenance manual in accordance with Amtrak specification No. 353. Manual draft shall be presented for Amtrak approval.

7.3 Photographs

A set of photographs shall be supplied showing the following features of each panel type:

a. Cover
b. Panel with cover removed
c. Bus bar assembly and jumpers to circuit breakers
d. Other salient features of panel

DRAFT

DRAFT

1.0 SCOPE

1.1 Purpose

This specification defines the requirements for 480, 240, 208 VAC and 72VDC relay and contactor panels to be used on Amtrak railroad passenger cars.

1.2 General

This specification is subordinate to the General Vendor Requirement Specification No. 327, which shall take precedence unless specifically excepted in this specification.

1.3 FUNCTION

These panels provide control logic, timing and power switching for various car systems, such as, but not limited to:

A. Auxiliary relay panel (load shed, emergency light, loop relays, etc.)
B. HVAC contactor panel
C. Auxiliary Contactor Panel
    1. Freeze protection
    2. Exhaust fan
    3. Water heater
D. Waste collection contactor panel (except lounge & diner)
E. Refrigeration contactor panel (lounge & diner only)

1.4 Supplier Responsibility

The General Vendor Requirements Specification No. 327 defines the supplier responsibility in the following areas:

a. System Approach
b. Program Planning
c. System Development
d. Construction and Workmanship
e. Nameplates
f. Testing
g. Acceptance Testing
h. Product Support
i. Detailed Documentation Requirements

DRAFT

2.0 GENERAL

2.1 Equipment Configuration

Panels include, but are not limited to, the following configurations:

NAMES	POWER VOLTAGES	CONTROL VOLTAGE		FUNCTION
A. Auxiliary Relay Panel	* 72 VDC	*72VDC	o	Load Shed Relay
	* 72 VDC	*72VDC	o	Loop relays & diodes (including conductor signal)
	* 72 VDC	120 VAC 10Φ	o	Emergency light relay and associated timer(s)
	* Nominal - may range from 80 to zero volts.			
B. HVAC Contactor Panel	480 VAC, 30Φ	120 VAC 10Φ	o	Blower fan control and Overload Protection
	480 VAC, 30Φ	120 VAC 10Φ	o	A/C Compressor and Condenser Fan control, logic and overload protection
	240 and/or 480 VAC 30Φ	120 VAC 10Φ	o	Floor heat control
	480 VAC 30Φ	120 VAC 10Φ	o	Duct Heat control
C. Auxiliary Contactor Panel				
Freeze Protection	120 VAC 30Φ	120 VAC 10Φ	o	Water Tank Heat Control
	120 VAC 30Φ	120 VAC 10Φ	o	Water Pipe Heat Control
	120 VAC 30Φ	120 VAC 10Φ	o	Water drain heat Control
	120 VAC 30Φ	120 VAC 10Φ	o	Door track, pocket,etc. Heat Control
Exhaust Fan	120 VAC 30Φ	120 VAC 10Φ	o	Exhaust Fan Control and overload protection
Water Heater	480 VAC 30Φ	120 VAC 10Φ	o	Water heater control
D. Waste Contactor Panel	480 VAC 30Φ	120 VAC 10Φ	o	Waste treatment macerator Collection and pump control, logic and overload protection
	120 VAC 30Φ	120 VAC 10Φ	o	Freeze protection
E. Refrigeration Contactor	208 VAC 30Φ	120 VAC 10Φ	o	Refrigeration compressor control and overload

DRAFT

Panel					protection.
	208 VAC 30Φ		120 VAC 10Φ	o	Condenser Environmental heat control and time delay.
	208 VAC 30Φ		120 VAC 10Φ	o	Diner kitchen exhaust fan control and overload protection.

DRAFT

2.2 ~~LOCATION~~

Unless otherwise specified, panels are wall-mounted within the car interior as follows:

Item A: switch or electric locker
Items B-D: electric locker
Item E: food service switch locker

2.3 ~~General Arrangement~~

The general arrangement of the relay and contactor panels will be:

A)	Auxiliary Relay Panel	o Rigid back panel o Open construction o Front-mounted components
B)	HVAC Contactor Panel	o Rigid back panel
C)	Auxiliary Contactor Panel	o Removable transparent front panel, secured to standoffs with sliding captive fasteners.
D)	Waste Collection Contactor Panel	o Open construction
E)	Refrigeration Contactor Panel	o Front-mounted components

Panels are generally mounted on Uni-struts, using mounting holes through the rear of the panel.

2.4 ~~Shipping~~

Contactor and Relay Panels shall be packaged to protect against damage during shipment and storage prior to use. The shipping label shall include the following information as a minimum:

(a) Part name
(b) Manufacturer name
(c) Type/catalog/part number
(d) Serial number
(e) Manufacture date
(f) AMMS number (Amtrak part number)
(g) Warning and safety precautions for shipping and storage (this side up, do not stack, etc.)

Preparation for delivery shall assure arrival at the destination without degradation of hardware and performance.

DRAFT

3.0 DESIGN CONSIDERATIONS

The relay/contactor panel design must consider the following goals:

(a) Safety
(b) Reliability
(c) Maintainability
(d) Availability
(e) Interchangeability

3.1 Environment

The railroad environment is severe and imposes considerable demands on the panels. Refer to Amtrak specification 429 Environmental Operating Conditions for details.

Panel design shall be such that it is stiff enough to not flex, rattle, nor drum during car operation nor be damaged in handling. Wiring and cover mounting, in particular, shall be constructed to prevent "working" which would lead to eventual electrical or mechanical failure.

3.2 Normal Operation

In normal car operation ON-BOARD crew (car attendants, conductors, etc.) do not require access to the relay and contactor panels. If car equipment malfunctions, however, the above crew members may require access to these panels to reset overloads, etc. Accordingly, panels require protection against accidental contact with live electrical connections.

Protection shall still provide access to reset overloads, etc., through the use of appropriate holes, etc. labeled with function and reset instructions.

In repair shops, maintenance personnel may temporarily remove protective covers for servicing equipment.

3.3 Component Mounting

Design of the relay and contactor panels is to be such that all components are front serviceable. All parts shall be removable without access to the rear side of the panel, or panel removal from the wall. Only severe damage to the panel shall require its removal from the car. Component mounting shall be as follows:

A. Contactors, motor starters, overload relays:
Machine screws into back plate
B. Overload Relays:

DRAFT

Machine screws into back plate

C. Relays:
Socket mount, secured to socket with clips ~~not~~ wire bail.
D. Relay sockets:
Machine screws into back plate - track mounting is ~~not~~ acceptable.
E. Circuit Boards
Machine screws into back plate; electrical connections to board via terminal strip; edge connector is not acceptable.
F. Terminal strips:
Machine screws into back plate; track-mounted terminals are not acceptable.

Component mounting shall be such that ~~any~~ component may be removed independently without disturbing any other component, except for wiring.

3.4 ~~Protection Against Accidental Contact~~

Contactor panels shall have a "Dead Front" construction to provide protection against accidental contact with live conductors. Also see Section 3.2 and 4.2.

3.5 ~~Wiring Access~~

Relays, contactors and other devices shall be mounted in parallel rows. Spacing between these components shall be such that all internal and external connection points are readily accessible.

The design shall also insure that adequate space is provided to prevent any wiring from being crushed by mechanical components, being sharply bent, or located adjacent to surfaces where vibrations or device operation could create failure due to insulation abrasion. Adequate clearance shall also be provided between all exposed electrical contacts and terminals and adjacent conductive components and surfaces. Protective edging shall be used as required to protect against wire abrasion.

3.6 ~~Wiring and Terminations~~

Control wiring from the car to the contactor or relay panel will terminate on terminal block(s) on the panel.

Generally, power circuit wiring will go directly to the contactor on the panel, rather than to terminal blocks. Exception to this is in situations where power circuit splits to many separate loads, such as in some freeze protection circuits. In these situations, the circuits will fan out at the terminal block, where several adjacent terminals can be ganged together.

DRAFT

All internal and external wire connections will be through the use of crimp-on, ring-tongue electrical lugs per Amtrak Specification #359. Certified crimp tools will be used on all crimped connections. All contactors, starters and relays and all other terminals must accept this type of connection. Exceptions to this rule include:

- Heinemann Hydraulic Overload Relays
- Modular Time Delay Relays.

In both cases, "Faston" terminations are acceptable, but only to wiring internal to the panel. External car wiring connecting to the panel will not use "Faston" connections. Panel design shall be such that lugs are not bent nor strained when installed, and wiring is given generous bend radii.

Compression type terminals, in which a set screw moves down to clamp a wire, whether using a saddle or not, are not acceptable.

The position of the phase wires on contactors, starters, etc., will be:

A, B, C, N with A on the top or left; -, + with + on top or right Generally, power relay and contactor power feed will be from the top row of terminals vertically, or near the back panel horizontally.

3.7 Fault Conditions

The relay and contactor panels must be designed to withstand, without damage, a worst case fault when fed from the following sources through car circuit breakers, etc.:

Main Circuit Breaker	Power Source
480 VAC Main	Locomotive power - 1600 amp continuous
	Yard power - utility transformer, feeding entire yard
240 VAC Main	Dry type delta connected transformer, total capacity 45 KVA
208/120 VAC Main	Dry type WYE connected transformer, total capacity 30 to 75 KVA
120 VAC Main	Dry type delta connected trans- former, total capacity 30 KVA

DRAFT

28 VAC Main	Dry type delta connected transformer, total capacity 3 KVA
72 VDC Battery	Battery, capacity as stated, typically 80 to 175 amp hr.

3.8 Common Return

All circuit branches shall be arranged such that any relay, contactor, solenoid or other load has one side of the device connected directly to the return circuit of the system; switching on both feed and return sides of the circuit is not acceptable.

3.9 Codes and Standards

Panels must meet applicable grounding requirements of the National Electrical Code, and applicable NEMA standards. Likewise, all electrical components i.e., relays, contactors, resistors, diodes, heaters, etc., will meet NEMA requirements.

4.0 COMPONENTS

4.1 Back Plate

The back plate shall be of heavy gauge steel, sufficient to produce a rigid panel assembly. The panel shall be painted as follows:

Prime with 1 coat Federal Spec #TT-P-664A

Approved Suppliers:
Magnus Chemical Co. XK-185
Duralac Chemical Corp. L4392
J. Landau 14128

Paint with 1 coat White Glyptal GE # 8746

The panel shall be provided with 4 or 6 mounting holes, located along the edges (none in the center). Clearance shall be provided around each mounting hole to use a heavy-wall socket wrench, driving a hex head bolt, without disturbing panel components or wiring. Components mounted onto the panel will be attached with screws going into nut-serts in the back plate. Mounting holes shall be accurately drilled into the back plate to prevent misalignment between components and mounting holes. This will require a drill jig, numerical control machine, etc.

4.2 COVER

The cover shall be of a heavy gauge transparent polycarbonate, of

DRAFT

sufficient gauge to avoid rattles and drumming while the car is in motion. The cover shall be secured to the back panel standoffs with captive sliding - type fasteners, such as Dinco Gray Co.'s #3 large.

When the panel is equipped with overloads, the cover shall contain holes which allow manual reset of the overload relays without removing the cover. For a specific type of panel, all covers shall be interchangeable.

4.3 Contactors/Motor Starters

All contactors and motor starters will be domestic industrial grade, NEMA standard, conservatively rated. IEC Rated components are not acceptable. Coil voltage will be Nominal 120VAC, or 72 VDC (for battery loads only refer to Battery Charger/Low Voltage Power Supply Specification #64-312 for details). Contactors will be screw mounted to the backplate. If reversing or multiple speed motor starters are used, the two contactors shall be both mechanically and electrically interlocked, the later using auxiliary contact sets on the contactors. Multiple speed starters shall use 5-3 contact arrangement.

Minimum contactor/starter size shall be:

Motor starter	NEMA 0
Contactor	NEMA 1
A/C Compressor starter	NEMA 2

A suppression device such as MOV, will be used across the coil of each contactor, mounted on the contactor coil. AC coils will use devices with 150VAC continuous rating. DC coils will use devices with 90 volt or higher continuous rating.

Approved Contactors/Motor Starters

AC	GE	CR305 and CR306 family
	Allen Bradley	500/509 family
	Westinghouse	A200/A201 family
	Cutler Hammer	CN15/AN16 family
DC	Refer to battery charger/low voltage power supply specification, 312.	

4.4 Overload Relays

Overload relays will be industrial grade, NEMA standard, conservatively rated. IEC Rated components are not acceptable. Overloads will be screw mounted either to the backplate, or the motor starter mounting plate.

DRAFT

Overload relays may be either hydraulic, or bi metallic thermal, with manual reset, except for A/C compressor, which will be hydraulic.

Thermal overloads, if adjustable, must have a very limited adjustment range, +\-10% maximum. The setting shall be made, then permanently sealed - a drop of paint is not sufficient.

Approved Overload Relays

- Thermal-type: same as contactors (motor starters above)
- Hydraulic: Heinemann SILIC-O-NETIC

4.5 Relays and Sockets

All relays will be domestic industrial grade components, conservatively rated for the intended service. Except for the larger relays, as outlined below, all relays will be enclosed, plug-in type, mounted in surface mount sockets. A suppression device, such as a MOV, will be mounted across the coil of each relay, mounted at the relay socket, or, on larger devices, on the coil terminals. AC coils will use devices with 150VAC continuous rating, DC coils will use devices with 90 Volt or higher continuous rating. Within a given panel, all plug-in relays will be the same type. Relays will be held securely in their sockets with suitable captive socket clips, not bail wires, etc.

Relay pockets will use screw-type terminals for all electrical connections.

Function	Approved Relay Type	Contacts	Coil Voltage
General purpose control	*Potter Brumfield KUP	10A, 3PDT	120 VAC 48 VDC
Loop Relay	Struthers Dunn 8DXX183	4P-NO	64 VDC
Emergency Light Relay	*Struthers Dunn 8AXA159	1P-NO 1P-NC	120 VAC
Emergency Light Relay	*Vapor 36530117-04	3PDT	74 VDC

* Or Amtrak Approved Equal

4.6 Timing Relays

Timing relays will be domestic industrial grade components,

DRAFT

conservately rated for the intended service. Refer to specification 429 for electrical environment. Timers may take the form of Agastat, surface-mount modular, or plug-in (octal base). The first two relay types will be panel mounted, whereas the latter will use a surface mount socket.

The plug-in type relay will be held securely in its socket with suitable socket clips, or a clamp which is permanently secured to the back plate, ie., cannot be lost. Timer relay coils shall generally operate on 120VAC.

A suppression device, such as a MOV, will be mounted across the coil of mechanical type timing relays, mounted at the relay itself, or its socket. AC timers will use devices with 150VAC continuous rating, where as DC coils will use devices with 90 volt or higher continuous rating.

Solid state timers shall be protected in two ways:

- Spike protection for power source
- Input protection against false triggering (Solid state timers generally have a high input impedance, and can be subject to false triggering from leakage voltage in car wiring - capacitive, inductive or resistive. One means to overcome this is to shunt the input with a resistor.)

Modular timers must be supplied with timing preset - either with internal resistor, or soldered - on resistor. Loose item resistors, etc. are not acceptable.

Agastat or similar timers will have time setting locked, such as through the use of a glob of RTV, not paint.

DRAFT

Approved Timing Relays

Manufacturer	
Agastat 7000 family	electromechanical
Agastat	modular
Agastat	hybrid, plug in
SSAC	modular

The use of other types of timer is subject to specific Amtrak approval.

4.7 Printed circuit boards

Printed circuit boards shall be designed to minimize the chance of miswiring. All terminals shall be clearly labelled, and oriented in such a way that a board can be replaced without requiring a drawing to reconnect the wiring correctly. Circuit

boards shall be conformal (or equivalent) coated, both sides, and be labeled as to:

Vendor name
Vendor part number
Manufacturer date
Amtrak AMMS number
Serial number

4.8 Terminal Blocks

Panel terminal blocks will be rigid phenolic, double row screw type blocks, such as Kulka 602 series. Track-mounted, modular type are not acceptable.

4.9 Wiring

Internal panel wiring shall be stranded wire, as per Amtrak Specification No. 323 "High Performance Wire and Cable.

Wiring will be terminated using crimp-type pre-insulated ring-tongue lugs, per Amtrak specification 359. Wiring shall be adequately secured in position, using ty-wraps, screw-down cable clamps, etc. Cable clamps secured to the panel by an adhesive are not acceptable for this purpose. All wires Shall be labeled on both ends using using heat-shrink tubing type labels, per Amtrak Specification No. 319. Wires 4" or less in length need only 1 label.

4.10 Labels

The panel shall be permanently labeled as follows:

Backplate

1. Devices

The back plate itself is to be permanently labeled with labels located so they can still be easily read with the panel fully wired. All devices shall be labeled; refer to Specification No. 359 for naming procedure.

Device	Example
Contactor	DHC1
Motor Starter	BFC
Overload Relay	OL1
Overload Relay Heater Values	2.06A
Relay	PDR
Timer and delay	TDR1, 10 SEC DOD
Terminal Block	TB1

DRAFT

Terminal Numbers	1,2,3
Wire Names	LSL0/1A
Circuit Breaker	CB1
Fuse and Value	FU1, 5A

2. ~~Vendor nameplate~~:

Vendor name
Vendor part number
Date of manufacture
Amtrak AMMS number
Serial number

3. ~~Label materials~~:

- Silk screened paint
- Engraved plastic, mounted with screws or rivets, ~~not~~ adhesive.

4. ~~Cover~~

The panel cover shall permanently labeled as follows:

1. ~~Panel name~~ eg. HVAC contactor panel
2. ~~Overload reset~~ identification and reset instructions (if panel has manual reset overloads) See appendix A.
3. ~~Warning labels~~ as appropriate: Danger High Voltage-480 Volts
4. ~~Label materials~~
   Stick - on metal film

5.0 ~~TESTING~~

5.1 ~~Qualification Test~~ (one sample each type)

A qualification test plan (QTP) shall be submitted for Amtrak approval in a timely fashion prior to the manufacturer's intent to perform the tests.

The qualification test is an engineering proof-of-design test, and will be run on one sample of each panel configuration. All vibration testing is to be performed in accordance with MIL-STD-202 Vibration test Method 204, test condition D, with the equipment powered.

The QTP shall, as a minimum, demonstrate the following:

DRAFT

1. Proper operation of panel logic (as appropriate).
2. High Potential test (2 x circuit voltage + 1,000V for one (1) minute)

Amtrak reserves the right to request additional tests as may be required.

5.2 Acceptance Tests

An Acceptance Test Plan (ATP) shall be submitted for Amtrak approval at the same time the qualification test plan is submitted.

The acceptance test is a quality control test used to ensure all panels produced are built consistently and operate properly.

The ATP shall, as a minimum include the following:

1. Mechanical inspection
2. High potential test (2 x circuit voltage +1,000v for one (1) minute)
3. Wiring checkout (continuity)

6.0 SYSTEM APPROVAL

6.1 General

Each contactor or relay panel type shall be subject to Amtrak approval. All major components shall be submitted for Amtrak approval.

6.2 Design Reviews

Design reviews shall be held at times mutually agreed upon between Amtrak and the manufacturer of the panel; such reviews are intended to convey design concepts not readily shown on equipment drawings.

6.3 Documentation

For system approval, the manufacturer of the panel shall submit, as a minimum, the following drawings and documents:

1. Component (assembly) interface drawings, showing:
   a. Outline and mounting dimensions
   b. Weight and center gravity
   c. Electrical connections

DRAFT

d. Bill of materials

2. Component cut sheets

3. Qualification test plan

4. Acceptance test plan

6.4 First Article Inspection

Prior to the delivery of the first production panel, each type shall be subject to a first article inspection. Such inspection shall include but not be limited to:

a. A mechanical inspection to determine compliance with the specification and approved drawings.

b. The performance of an acceptance test.

c. The performance of the qualification test. (It is permissible to have the vibration, testing previously performed at an independent testing laboratory, the results being available at the first article inspection.) Successful completion of the first article inspection shall constitute final panel approval.

7.0 PRODUCT SUPPORT

7.1 Drawings

All assembly, subassembly, and arrangement drawings shall include a complete bill of material and parts list on the field of the drawing describing all items, including vendor's parts, which form a part of the assembly. Amtrak shall reserve the right to review and approve all drawings prior to construction of a prototype system.

Amtrak shall be supplied, upon completion of the system design, with one set for first generation (not DIAZO) 35 mm file (mounted in accordance with Amtrak specification 199 of all assembly drawings, diagrams, schematics, etc.

7.2 Maintenance Manual

The equipment supplier shall provide a maintenance manual in accordance with Amtrak Specification Nos. 353 and 354. Manual draft shall be presented for Amtrak approval.

DRAFT

7.3 Photographs

A set of photographs shall be supplied showing the following features of each panel type:

a. Cover
b. Panel with cover removed
c. Other salient features of panel

8.0 APPLICABLE DOCUMENTS

The following shall be considered part of this specification:

Amtrak Specification No.	Name
199	Microfilm
312	Low Voltage Power Supply/Battery Charger
319	Wire, Terminal, Terminal Block Contactor/ Relay and Connector Identification
323	High Performance Wire and Cable
327	System and Components Vendor Responsibility
328	Materials and Workmanship
353	Vendor's Manual Data
359	Solderless Wire Termination
429	Environmental Operating Conditions
354	Carbuilder Maintenance Manual
317	Waste Collection System
311	HVAC System

DRAFT

Appendix A
Typical Contactor Panel Instruction Label

Toilet System Contactor Panel
Instructions For Resetting Tripped Overload Relays

Toilet Pump/Grinders(Macerators) are each equipped with Manual Reset Overload Relays, which may occasionally trip (usually from toilet blockage).

If the Overload Relay trips, the corresponding toilet will not flush.

A. To reset an Overload Relay:

1) Ensure toilet is clear, and no one is servicing unit.
2) Locate reset pushbutton labeled... "Overload Reset" on this panel. Adjacent will be a hole with an Actuator behind it.
3) Push Actuator to reset, if it was tripped, it will click.
4) Check both Overload Relays.

B. Cycle toilet to ensure it now operates.

C. Do not repeat procedure A more than 3 times or equipment damage may result.

Amtrak

Bureau of Rolling Stock Equipment

Specification for Replacement Truck Springs

Specification No. 563
Revision 7

1.0 Scope

1.1 General

This specification and any attached Amtrak drawings set forth the minimum requirements for materials, workmanship, inspection and testing of for helical steel springs used on various Amtrak passenger car trucks. This Specification is intended to be used in conjunction with any associated Amtrak drawings and/or CADD models, the Amtrak Procurement Department purchase orders, and other contractual documents issued to the vendor. It is Amtrak's intention that all components supplied under this Specification, unless improvements are otherwise identified, be functionally interchangeable with those currently in use at Amtrak in terms of form, fit, function, general appearance, durability and operation.

As basic work under this Specification, each item produced must be completely functionally tested, properly packaged for shipment to Amtrak, and have documentation submitted. Amtrak will perform a First Article Inspection on the first item of each type produced by a vendor, in order to verify that the process and materials used are in compliance with this Specification and drawings.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to the Amtrak Contracting Agent in a timely manner for mutual investigation and satisfactory resolution, with any revision approved in writing by the Amtrak Contracting Agent. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions.

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term "or approved equal" if not written thereafter shall be implied. Any reference to a particular manufacturer's product, either by trade name or limited description, is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term "or approved equal" means any other manufactured product or article which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak's written opinion as to whether the proposed alternate is equal to the specified items for Amtrak's specified use and purposes shall be final and conclusive. The vendor shall not subcontract the design and manufacturing work under this Specification without the written authorization of the Amtrak Contracting Agent. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted vendor Technical Proposal, but are necessary for the completion of the item being supplied, shall be considered a part of the scope of supply. In this Specification, all references to "number of days" shall mean calendar days unless otherwise stated.

DRAFT

1.2 Standards

It is mandatory that all springs supplied by the vendor under this Specification must comply with the referenced requirements of the latest revision of the Association of American Railroads (AAR) Manual of Standards and Recommended Practices. The vendor shall provide special attention to compliance with AAR Standard M-114.

1.3 Amtrak Ownership Rights

Unless specifically waived in writing by the Amtrak Contracting Agent, all drawings, bills of materials, catalog lists, mockups, CAD models, documentation and all other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection or other process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

1.4 Vendor's Technical Proposal

As a condition of contract award unless otherwise indicated in the Amtrak Procurement documents, the vendor must submit a written and detailed Technical Proposal to the designated Amtrak Contracting Agent. This Technical Proposal must identify the vendor's interpretation of what it considers to be the scope of Basic Work to be performed, present a complete technical description of the components to be supplied, include a copy of the vendor's Quality Assurance program, describe any Design Review process, describe the product testing, present a step-by-step work plan for construction, include a project schedule by major events starting from the Notice to Proceed, and a Bill of Material of all components to be supplied.

1.5 Exceptions

The vendor shall explicitly identify to the Amtrak Contracting Agent any exceptions being taken to this Specification, referencing the Specification Section number and the exact wording in question. It will otherwise be assumed by Amtrak that the vendor takes no exception to this Specification and is completely compliant with all Specification requirements.

1.6 Engineer

The Engineer or Amtrak Engineering, as referenced in this Specification or any drawings, is defined as the Director of the Amtrak Bureau of Rolling Stock Equipment within its Mechanical Department, or its written designee. The vendor may be submitting items for the Engineer's approval as required by the Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to all of the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submissions shall contain sufficient detail to confirm that Specification requirements are being met. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible.

DRAFT

1.7 Cost Items

Any individual extra work items regarding the items being supplied shall be handled in accordance with the purchase order and other contractual documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Contracting Agent, and not solely the Engineer, regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Contracting Agent in accordance with the contract documents.

1.8 Vendor Quality Policy

The vendor is required to have in place a documented Quality Assurance Program that is modeled after an established industry quality standard, such as the ISO, AAR, or other organization. The vendor's shop is required to be equipped with equipment, personnel and management completely sufficient to manufacture and inspect each spring being supplied under this Specification. The shop shall have suitable equipment to diagnose any failure mode and to perform all adjustments and tests required to confirm proper manufacture. The vendor's Quality Assurance staff shall be active participants in the production, inspection, testing, and documentation phases of the work. The vendor is required to submit a copy of its Quality Assurance Program as part of its Technical Proposal. While it not a mandatory requirement under this Specification, it is highly desirable that the vendor's quality assurance program be certified under ISO 9001:2000 or an equivalent recognized standard.

Amtrak Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. In addition, Amtrak may choose to inspect springs prior to shipment or upon receipt at any of its maintenance facilities. The vendor shall fully cooperate in such audits.

DRAFT

1.9 Conducting Tests

The vendor shall be equipped to fully perform all inspections and tests required in accordance with this Specification and any referenced Association of American Railroads standards as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended either by its supplier, or by the vendor's quality system requirements.

1.10 Documentation Records

The vendor shall provide a complete record of all inspections for each spring assembly produced, as well as maintain a logbook of information regarding all springs manufactured by it for Amtrak. The records format must be reviewed and approved by the Engineer to ensure all required information is captured. As a minimum, records shall identify the Amtrak purchase order number, material certifications, all component serial numbers, copies of any written authorizations by the Amtrak Contracting Agent, inspection and test data, shipping date and shipping location. This documentation must be retained by the vendor for a minimum period of five years.

1.11 Dimensions

The vendor shall provide English dimensioning for its documentation, drawings and other communications which are generated. All springs supplied under this Specification shall be of United States inch-standards, unless otherwise approved in writing by the Engineer.

1.12 Referenced Documents

The latest revision level of all referenced drawings and documents are to be considered to be the applicable version.

- Amtrak drawings and models provided with the bidding and contract documents.
- Association of American Railroads (AAR) Manual of Standards and Recommended Practices Specification M-114, Specification for Helical Springs, Heat Treated Steel
- ASTM A 125, Specification for Steel Springs, Helical Springs, Heat Treated Steel
- ASTM A 689, Specification for Carbon and Alloy Steel Bars and Springs

2.0 General Requirements

2.1 Design Considerations

Unless otherwise instructed by this Specification or any provided Amtrak drawing, the vendor shall design, manufacture and test all springs in accordance with both the latest revision of AAR Specification M-114, Specification for Helical Springs, and the latest revision of ASTM Specification A 125, Specification for Steel Springs. This shall include both the ASTM specification mandatory requirements and the following supplementary requirement sections: S2 Magnetic Particle Inspection, S3 Shotpeening, S4 and S5 Protective Finishes, and S7 Special Loads Requirement.

2.2 Load Stress Requirements

For each spring type, the calculated uncorrected stress, when loaded to 133 percent of the sprung weight at the gross rail load identified by the Engineer, shall not exceed 90,000 psi for carbon steel or 103,500 psi for alloy steel.

2.3 Material and Manufacturing

All springs shall be made from alloy steel bars conforming to the latest revision of ASTM Specification A 689, and shall have a chemical composition in accordance with the latest revision of ASTM Specification A 304 or as noted on any Amtrak drawing supplied for this procurement.

The spring material for all outer coil springs shall be centerless ground or turned and polished (springs for "Heritage" fleet equipment as identified by the Engineer in writing are exempt from this requirement). Any deviation from this requirement must be issued in writing by the Engineer.

The maximum hardness shall not exceed 477 Brinell number. The minimum hardness must be 388 Brinell number.

Both ends of each spring shall be squared and ground (3/4 bearing) or forged tapered as required by ASTM Specification A 125 Section 4.4.1. The grinding process should avoid excessive heat input so as to prevent any undesirable transformation (such as un-tempering) of the material's mechanical properties. Perpendicularity and squareness of ground spring ends shall be in accordance with ASTM Specification A 125 Sections 4.4.2 and 4.4.3, unless otherwise identified on any Amtrak drawing referenced in the procurement.

Ends of 2" (approx.) rod diameter springs shall maintain a 1/2" minimum thickness with a taper.

Termination of the tapered ends of each outer coil spring shall be 180 degrees $\pm$ 45 degrees apart from each other (see Figure 1).

DRAFT

Spacing between each coil shall be equally distant to the maximum extent possible (see Figure 2).

Amtrak requires the suppliers to provide drawings of each spring supplied. The drawings should be complete showing all details including coil spacing and end terminations with tolerances. The drawings will need to be submitted for Amtrak approval at least 2 weeks before the FAI.

Any deviation from the above requirements must be with the written approval of the Engineer.

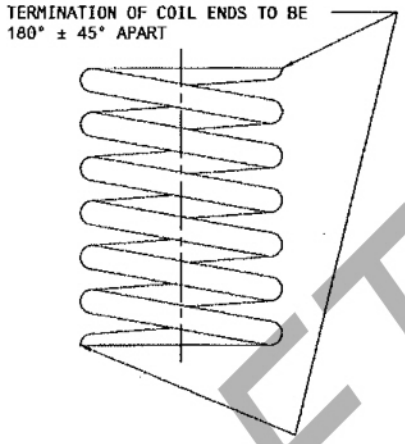

Figure 1: Coil Terminal Locations

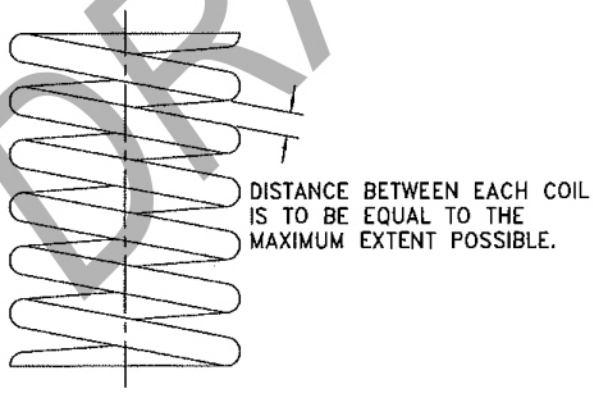

Figure 2: Coil Spacing

DRAFT

2.4 Magnetic Particle Inspection

A **wet** magnetic particle inspection must be performed on each individual spring, including the ground ends, in accordance with methods addressed in ASTM A 125 Supplementary Requirement Section S2. The maximum seam or surface defect on the body of the spring shall not exceed 3 percent of the bar diameter. No surface defects are allowed on the ground ends.

2.5 Shotpeening

Shotpeening, including the ground ends, must be performed on each individual spring in accordance with ASTM A 125 Supplementary Requirements Section S3. The ground ends of the spring shall be shotpeened after grinding. The minimum intensity for shotpeening shall be 0.006C for springs with a bar diameter of 1" and under, 0.008C minimum intensity for springs with a bar diameter of over 1" to and including 1.5", and 0.010C minimum for springs with a bar diameter larger than 1.5", with 90 percent visual coverage as measured on an Almen C strip.

2.6 Finishing

Each spring shall be finished following manufacturing in accordance with the additional finishing requirements of ASTM A 125 Supplementary Requirement Sections S4 and S5. The springs shall be coated with either:

- one coat of high gloss coat of black powder (Mirror Black PRSF 10306, PPG Envirocron PCT90128, or approved equal);
- or two coats of Williams-Hayward Black Dip Primer (No. 62-12075);
- or coated with red oxide primer and Seibert Powder Coatings Silver Metallic Polyester TGIC #PTM 1384;
- or similar paint (upon approval by Amtrak) for corrosion protection.

2.7 Special Load and Inspection Requirements

Test sample inspections shall be performed in accordance with ASTM A-125 Supplementary Requirements Section S7. For each type of spring being supplied in the Purchase Order, either 10 percent or 10 springs, whichever is greater, are to be inspected and tested to the light load and other parameters listed below. Spring sets are to be tested as a set. The test results and the mill certifications are to be maintained as a part of the Documentation Records described in Section 1.11. A copy must also be provided to the Amtrak Contracting Agent and the Amtrak Senior Quality Assurance Analyst at time of shipment. The inspection report must include, at a minimum, the results of the following inspections or tests in accordance with ASTM A 125, Paragraphs S7.1 and S7.2:

A. Outside Diameter
B. Bar Diameter
C. Free Height
D. * Load and Load Height (under the light or AWO car weight load)
E. * Solid Height.

For the load test in section D, apply the light or AWO car weight load to the spring and then measure the height of the spring.

* Indicates the two parameters that are specified. The remaining parameters will be considered reference.

2.8 Marking Requirements

Each spring and spring set being supplied shall be marked in accordance with AAR Specification M-114, Section 5.0. In addition, each spring and spring set shall be identified with its Amtrak "AAMPS" internal catalog part number.

The Amtrak spring AAMPS part number shall be stamped on each spring. The number stamped shall consist, at a minimum, of the last five (5) digits of the Amtrak part number.

DRAFT

Springs comprising a nested set shall be firmly wired together for shipping. A metal tag with the word "set", the Amtrak AAMPS part number for the set, and the manufacturer's name shall be attached. Any individual springs shall have a metal tag with the Amtrak AAMPS part number for the spring and the manufacturer's name attached. All individual and nested spring set metal tags shall be positioned for ease of reading.

3.0 Packaging and Shipment

For all components produced, following all assembly the vendor is required to perform and fully document a complete verification test and evaluation of each component being supplied, prior to shipment to Amtrak. The results of this final testing shall be recorded in the documentation record.

All packaging and shipping requirements shall be performed by the vendor. It is required that the vendor properly prepare all components being supplied under this Specification for shipment to Amtrak so that they are ready to install following unpacking.

The vendor shall package the components, unless otherwise instructed by the Amtrak Contracting Agent, to be suitable for continuous storage prior to unpacking in outdoor storage conditions. Components shall be appropriately packaged for their weight and size. Large and bulky items shall be secured to a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling.

The shipping package shall have an identification label. This label shall include the vendor's name and address, purchase order number, date released for shipment, Amtrak "AAMPS" internal catalog number, and any component assembly serial number. This information shall also appear in the vendor's invoice, and be included in the documentation record.

The vendor shall retain a copy of the shipping documentation record, and shall make three copies for Amtrak. One copy shall be included within the shipping container for the assembly, one copy shall be sent to the Amtrak Contracting Agent (or as otherwise designated in the purchase order), and the third copy shall be sent to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

DRAFT

4.0 Product Support

4.1 Program Schedule

If required by the contract documents, any vendor-produced Program Schedule shall include all program milestones, design reviews, production schedule, delivery schedule, and any other pertinent information that will assist with tracking program progress. Any requested changes to the Program Schedule must be presented to the Amtrak Contracting Agent for review and approval.

4.2 First Article Inspection

To verify that components being supplied under this Specification meet all Specification and drawing requirements, and are truly interchangeable with existing components, Amtrak will conduct a First Article Inspection (FAI) on the first spring of each type manufactured by a vendor, prior to allowing unrestricted manufacturing work to start. It is the intention of the FAI process that every function and feature of the items being supplied under this Specification be fully exercised and tested for proper operation under all normal, abnormal and fault conditions in the

vendor's workshop. The FAI shall include testing of all spring dimensions, loads, capacity, spring rate, etc. as well as verification of compliance with all specification requirements and drawings. The FAI shall have Amtrak Engineering and/or Quality Assurance personnel as well as the vendor in attendance. Approval by the Engineer following successful completion of the FAI process, as communicated through the Amtrak Contracting Agent, shall constitute final system approval.

Following the successful completion of the First Article Inspections, and as a precondition to permit production delivery of material to commence, the vendor must supply to the Amtrak Bureau of Rolling Stock Equipment, via the Amtrak Contracting Agent, an electronic set of the dimensioned drawings and Bill of Material which may have been created for every individual spring of all items being supplied under this Specification. Any later modifications as a result of warranty or other actions must include the affected drawings being revised as necessary and resubmitted to Amtrak.

4.3 Failure Analysis

A Failure Analysis to determine the cause and frequency of defects occurring during the warranty shall be performed by the vendor and submitted to the Engineer and the Amtrak Contracting Agent for concurrence. Such analysis shall be performed and reported within 30 days from the date of each failure.

SPECIFICATION

FOR

DISPOSABLE AIR CONDITIONING AIR FILTERS

FOR

USE ON

AMTRAK PASSENGER CARS

SPECIFICATION NO. 685

DRAFT

ORIGINATOR: Tammy Krause

APPROVED: Tammy Krause 5/16/2003

(signature page follows)

This specification has been adopted by the Passenger Rail Improvement and Investment Act (PRIIA) Next Generation Equipment Committee (NGEC) for use in its vehicle specifications. If changes to this document are made, please contact the PRIIA Revision Control Coordinator (RCC) so that the NGEC can evaluate changing its version for use in vehicle specifications. The RCC's contact information can be found on the AASHTO web site http://www.highspeed-rail.org/Pages/default.aspx, then follow the link to documents and the Document Management Process procedure.

SPECIFICATION FOR DISPOSABLE AIR CONDITIONING AIR FILTERS FOR USE ON AMTRAK PASSENGER CARS

SPECIFICATION # 685

DRAFT

APPROVED	DATE	REVISION	DATE
Tammy Krause	05/16/03		

ORIGINATOR

T. L. KRAUSE

26-FOI-00415 00000006232 "UNCLASSIFIED" 4/30/2026

SPECIFICATION # 685 CHANGE SHEET

REVISION LEVEL	DATE	PAGE	DESCRIPTION

DRAFT

1.0 SCOPE

This specification is a derivative of Specification # 545, dated 3/25/91, and establishes the materials and performance requirements for air conditioning filters utilized on the air conditioning system for Amtrak's passenger cars.

2. 0 APPLICABLE DOCUMENTS

ASHRAE Standard 52.2-1999 and Standard 52.1-1999 (latest revision) titled "Method of testing air cleaning devices used in general ventilation for removing particulate matter."

Underwriter's Laboratories Standard 900.

3.0 FILTER REQUIREMENTS

3.1 Filter Construction

The air filters shall be a 2" deep disposable type. Each filter shall consist of a synthetic media incorporating an electrical charge; a welded wire or expanded metal media support grid; and a high wet-strength beverage board frame. The filter shall be rated by Underwriters Laboratories as Class 2 (two).

DRAFT

3.1.1 Filter Media

Filter media shall be comprised of multi-layered synthetic fibers with an electrostatic charge. The media shall be formed in a pleat design and laminated to the support grid. It shall be listed by Underwriters Laboratories as Class 2 (two).

When tested in accordance with ASHRAE standard 52.2-1999, the filter shall have a minimum efficiency reporting value (MERV) of 8 (eight).

3.1.2 Media Support Grid

The media support grid shall be of welded wire or expanded metal construction with an effective open area of not less than 96%. The support grid shall be treated for corrosion resistance. The completed grid shall be further coated with rust inhibiting adhesive prior to being laminated to the filter media. The media support grid shall be formed in such a manner that it creates a pleat design. The support grid shall be laminated to the filter media to eliminate the possibility of media oscillation and media pull-away.

3.1.3 Enclosing Frame

The enclosing frame shall be constructed of a rigid, heavy-duty, high wet-strength beverage board, with diagonal support members bonded to the air entering and air exit side of each pleats, to ensure pleat stability. Corners shall be interlocked and reinforced for durability, structural rigidity and ease of installation. The inside periphery of the enclosing frame shall be bonded to the filter pack.

3.1.4 Alternate Filters

Alternate filter constructions must be approved by Amtrak Engineering Department.

3.2 Physical Characteristics

Thickness of Media	0.14 inches (avg.)
Number of Pleats per Linear Foot (Note: Pleats to be parallel to the short direction and evenly spaced)	15 (min)
Total Media Area (TMA) Where TMA is defined as: Nom. thk (usually 1 3/4") x (length of shortest side) x (2) x (# of Pleats in Filter)	30 sq. ft. (min.)

Alternate physical characteristics must be approved by Amtrak Engineering Department.

3.3 Ashrae Standard 52 - (Latest Revision) Tests

3.3.1 Test Parameters

The filter shall be tested at the following test parameters:

Nominal Filter Size	24" x 24" x 2" Standard Capacity approx 3.1 sq. ft media area per l sq. ft. face area.
Test Air Flow Rate	2000 CFM
Dust Feeding Rate	2.0 gm/MCF

3.3.2 Performance Characteristics

The filter shall have the following performance characteristics using the test parameters listed in Section 3.5.1.

DRAFT

Initial Resistance	0.26 in w.g. (max.)
Initial Atmospheric Dust Spot Efficiency	19.0% (min.)
Average Atmospheric Dust Spot Efficiency	30.0% (min.)
Average Synthetic Dust Weight Arrestance	92.0% (min.)
ASHRAE Dust Holding capacity at 1.0 in. w.g.	90 grams (min.)

3.4 Filters Marking

The exterior of the enclosing frame of each filter shall be identified with the following information:

a. Manufacturer's name and part or model number.
b. Arrows identifying air flow direction.
c. Locate on edge of filter box a date and installation location.
d. Underwriters Laboratories, Inc. flammability classification.

3.5 Field Testing

3.5.1 Compliance to ASHRAE Standard

Supplier to submit an independent laboratory test report using standards set forth under ASHRAE Standard 52 (latest revision) prior to testing. Such report shall be less than one year of age and in accordance with Section 3.3. Test Filter must conform to all requirements of this specification.

3.5.2 Amtrak Field Test

Supplier to submit minimum of 18 sample test filters for evaluation and field testing by Amtrak and Vendor. Amtrak reserves the right to request additional filters or filters of different dimensions for field testing.

Filters are to be qualified by a 60-day service test on Amtrak equipment. The filter is to experience a maximum change in resistance of 0.8 in. of water, where the maximum change in resistance is equal to the resistance at 60 days minus the initial resistance at installation.

eg. Max. Change Resist = (Resist. at 60 days) - Initial Resist.)

DRAFT

3.6 Dimension of Filters

The dimensions of the air filters are as follows:

CAR TYPE	FILTER SIZE	AMMS NUMBER
Amfleet 1	16” x 20” x 2”	26-075-30008
Amfleet 2	16” x 20” x 2”	26-075-30008
Heritage	16” x 20” x 2”	26-075-30008
Horizon	16” x 20” x 2”	26-075-30008
Santa Fe Parlor	16” x 20” x 2”	26-075-30008
Superliner 1	32” x 40” x 2”	22-090-00451
Superliner 2	32” x 40” x 2”	22-090-00451
Viewliner	16” x 16” x 2”	24-090-24090
Surfliner	14” x 20” x 2”	24-222-00011

4.0 QUALITY CONTROL PROVISIONS

The Contractor shall provide a certificate of compliance in accordance with the requirements (Section 3) of this specification.

The vendor is responsible for inspecting all materials furnished in accordance with the requirements of this specification. Acceptance by the Amtrak of materials furnished by the Vendor, is subject to inspection verification and approval or disapproval by Amtrak.

5.0 PREPARATIONS AND DELIVERY

The Vendor’s package shall be of a cardboard construction and have label attached to it, stating the quantity and dimensions of the air conditioning filters within. Deliveries shall be made to the place designated by Amtrak.

6.0 NOTES

This section is not applicable to this specification.

DRAFT

4. GENERAL REQUIREMENTS

4.1. GENERAL

All devices, systems and subsystems shall be identified using a methods approved by Amtrak. The labels, their marking and securement method shall be designed to survive the life of the vehicle.
Labels and/or tags shall be applied to identify exterior car equipment as well as the function and position of all valves, pressure switches, test ports and other devices on the vehicle interior and exterior.

The adequacy of identification as well as the labels/tags employed and their location shall be subject to Amtrak approval.

A drawing shall be provided by the builder which identifies all tags and labels used on the vehicle, both interior and exterior. This will include not only the label/tag and its properties, but also the location of each.

4.2. TAGS

Tags shall be of color-coded laminated plastic, secured to the device or near it with a permanent attachment, such as a tie-wrap or wire. Tags shall be approximately .75 inch by 3.0 inch, with text centered.

4.3. LABELS

Labels shall be either deeply stamped or etched metal plates or self-adhesive types, with a permanent adhesive. Contrast shall be used to make the labels easy to read in reduced light, such as at night. Refer to Spec 697: National Onboard Signage Manual for details of signs.

DRAFT

5. PASSENGER COACHES

The following label and operating instructions apply to coaches.

5.1. TAGS

Functions shall be color-coded as follows:

System	Tag color	Text color
Potable water	blue	white
Toilet flush water	green	white
Water drain	white	black
Waste	brown	white
Auxiliary air	yellow	black
Air Brake	green	white

5.2. EXTERIOR SERVICE LABEL AND TAG REQUIREMENTS

The following equipment, at a minimum, shall be identified on the car exterior:

Tags:

Tags shall be applied to the following, at a minimum:

Brake cylinder cutout (at each truck)
Main reservoir cutout for Decelostat valve (at each truck, if used)
Main reservoir (pipe at ends of car)
Brake pipe (at ends of car)

Labels:

Battery (box)
Potable water fill
Water fill valve positions: "Water" and "Fill"
Dump valve (waste tank)
Brake cylinder cutout
Brake indicator (applied)
Jacking pad
Circuit breaker panel undercar

DRAFT

Any undercar equipment which includes switches, circuit breakers, relays, contactors and/ or other similar devices
Instruction plate for connecting car-to-car jumper cables
Danger 480 volt warning at 480v jumpers and receptacles and any other high voltage enclosures
Communication and MU receptacle labels (if 27 point, on the lid, per APTA RP-E-019-99)

Emergency labels:

- Emergency door release
- Emergency window instructions
- Body end door cutout switch/ valve

5.3. INTERIOR LABEL AND TAG REQUIREMENTS

The following valves, switches, etc. shall, at a minimum, be labeled whether within the carbody interior, equipment room(s) or undercar within an enclosure:

Tags:

Main water supply
Water supply to each sink, toilet, water cooler, food service appliance, etc.
Water drain of each sink, toilet, appliance or water system
Water pressure regulator, including function and set point
Main auxiliary air supply
Auxiliary air supply to each toilet or other device
Auxiliary air pressure regulator, including function and set point
Other air-operated equipment, such as doors or dampers
Main waste system line valve
Waste system line valves to each toilet
Air brake valves
Thermostats/ temperature sensors

On operator's cabs:
Horn cutout
Bell cutout
Windshield wiper cutout

DRAFT

Alerter, overspeed and ATS cutout
Dead-in-tow valve

5.4. OVERALL INTERIOR LABELING

A label shall be applied at a central place, such as in the electric locker, which shows the location of all water, waste and air valves on the car.

In addition, in locations were valves within the car interior is not obvious, locator labels shall be included to help crew to locate them. For example, water shutoff valves located beneath the sink they serve do not normally require a locator label, but if the valve was located inside a trash locker, it would require a label.

A label shall be provided which explains the "Dead in Tow" procedure to be followed to set up the brake system to operate when MR is not available. The text of the procedure shall be developed with the input of Amtrak.

DRAFT

6. LOCOMOTIVES/ POWER CARS

The following label and operating instructions apply to locomotives/ power cars.

6.1. TAGS

Functions shall be color-coded as follows: (per AAR RP-512)

System	Tag color	Text color
Fuel	red	white
Engine coolant	blue	white
Engine oil	yellow	black
Engine drain	tbd	tbd
Sump drain	tbd	tbd
Waste drain	tbd	tbd
Air brake	green	white

6.2. EXTERIOR SERVICE LABEL AND TAG REQUIREMENTS

The following equipment, at a minimum, shall be identified on the vehicle exterior:

Tags:

Tags shall be applied to the following, at a minimum:

Brake cylinder cutout (at each truck)
Main reservoir (pipe at ends of vehicle)
Brake pipe (at ends of vehicle)
Application/ release (pipe at ends of vehicle)
Actuation (pipe at ends of vehicle)
Main auxiliary air cutout
Sump drain(s)

Labels:

Battery (box)
Dump valve (toilet waste)
Brake indicator (unless tread brakes)
Jacking pad
Emergency fuel shut off
Any undercar equipment which includes switches, circuit breakers, relays, contactors and/ or other similar devices
Danger 480 volt warning at 480v jumpers and receptacles and any other high voltage enclosures
Communication and MU receptacle labels (on lid, per APTA RP-E-019-99)

DRAFT

6.3. INTERIOR LABEL AND TAG REQUIREMENTS

The following valves, switches, etc. shall, at a minimum, be labeled whether within the carbody interior, equipment space or undercar:

Tags:

Power plant:
Fuel
Engine coolant fill
Engine coolant drain
Engine oil drain
HEP engine coolant fill

HEP engine coolant drain
HEP engine oil drain
Engine sensors: timing, pressure, temperature, etc.

Auxiliary air:
Horn
Bell
Windshield wipers
Dampers
Sand

General:
Air compressor cutout

Cab:
Alerter/ Overspeed and ATS cutout (color coded Yellow, White and Red, respectively)
Dead-in-tow valve

6.4. OVERALL INTERIOR LABELING

A label shall be applied at a central place, such as in the high voltage locker, which shows the location of all water, fuel and air valves, etc. on the vehicle.

In addition, in locations were valves within the vehicle interior is not obvious, locator labels shall be included to help crew to locate them. For example, air cocks located inside a cabinet would require a label.

A label shall be provided which explains the "Dead in Tow" procedure to be followed to set up the brake system to operate when Main Reservoir is not available. The text of the procedure shall be developed with the input of Amtrak.

Labels shall be provided which explain:
– fuel compartmentization controls
– how to add coolant, including system depressurization.
– how to cutin/ cutout the air compressor
– how to check engine oil level, including idle speed required

REVISION: DATE: **August 6, 2001**

ABSTRACT: This signage manual and the accompanying equipment specific manuals, define the On-Board Signage for use on Amtrak passenger vehicles, locomotives and freight equipment incorporating the new corporate identity. Equipment specific sub-manuals are included for each vehicle type with interior and exterior application drawings, as well as exterior locomotive, freight and non-revenue decal manuals.

Key words: signage, sign, decal, graphic, application

SPECIFICATION FOR FLAMMABILITY, SMOKE EMISSIONS AND TOXICITY FOR USE ON RAILWAY PASSENGER CARS AND LOCOMOTIVE CABS

Document Number: 352

Original Issue Date: 01/29/1990
Current Revision Date: 01/27/2010

Abstract:
This specification establishes testing methods and evaluation criteria for smoke generation, flammability and toxicity of materials used in locomotive cab and passenger car interiors and passenger car exteriors.

Key Words: smoke, flame, toxicity, flammability

Original prepared by: George Lobstein **Date:** 1989

Approved by: C.J. Engelhardt **Date:** 1/29/1990

DRAFT

1.0 SCOPE

1.1 Purpose

This specification provides parameters and/or test methods for determining properties of materials exposed to thermal degradation.

1.2 Areas of Concern

The following material properties will be determined: Flammability, Smoke Emission and Acute Inhalation Toxicity.

2.0 GENERAL

This specification is issued to govern testing of all flammable materials used in a railcar. All materials tested must be evaluated in their base form unless otherwise specified by Amtrak, required by Federal Regulation or approved by Amtrak's Bureau of Rolling Stock Engineering. A compound form will be considered for testing in lieu of individual base forms if the compound form improves the flammability, smoke or toxicity of a single assembly. A compound form requiring approval by Amtrak for use will be accessed for its overall appropriateness, not just the compound's improved smoke, flame and toxicity performance. Tests conducted on a compound form must be conducted on a production sample.
An example of a compound form is the Kevlar encapsulated foam seat cushion. The foam / Kevlar assembly is considered a compound part and is tested only as an assembly. Seat cushion covers are tested based on the individual parts. An upholstered seat cushion assembly is not an approved compound for testing because individual covers from one manufacturer may be placed on another manufacturer's foam / Kevlar assembly.

The data from each individual test method will not be used independently in evaluating the fire safety of a material since additional factors must be considered for a given situation. These additional factors include, but shall not be limited to: the quantity of material present, its configuration, the proximity to other combustibles, the volume of the compartment(s) to which the combustion products may spread, the ventilation conditions, the ignition and combustion properties of the material(s) present, the presence of ignition sources, the presence of fire protection systems and vehicle occupancy. Therefore data from all tests will be combined with other information to develop a fire hazard assessment, which will be used to select materials on the basis of function, safety and cost.

2.1 FRA Requirements

DRAFT

49 CFR Part 238 Passenger Safety Standards shall govern smoke and flammability testing for interior components of railroad passenger cars and locomotive cabs. No exceptions beyond those allowed by Part 238 will be considered.

2.2 Documentation

2.2.1 Individual Tests

Independent certified laboratories shall conduct individual Tests. In-house testing will not be considered for initial approval. Test results from certified laboratories shall be provided to Amtrak each component covered by this document and FRA Part 238.

2.2.2 Multiple Tests

When assemblies, modules or whole vehicles require multiple products to be tested and approved, results of the testing shall be provided to Amtrak in a three ring binder properly labeled for its contents.

2.2.3 Fire Safety Analysis

This section applies only to whole vehicle manufacturers and suppliers of large assemblies such as room modules.
A Fire Safety Analysis shall be provided for the vehicle or major assembly in accordance with 49 CFR Part 238 Subpart B, 238.103.

3.0 TESTS FOR FLAMMABILITY AND SMOKE EMISSIONS

This specification and all associated tests relates to all combustible materials used in an intercity rail passenger system. Relative test number factors will be utilized in the final hazard analysis.

3.1 Cushions, Mattresses

Seat cushions, mattress materials, foam padded armrests & pads.

3.1.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238.

3.1.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238.

DRAFT

3.2 Panels, Partitions and Frames

Walls, panels and ceiling panels, shelves, tables, partitions, windscreens, seat frames, seat shrouds, mattress frames, toilet seats and to toilet shrouds.

3.2.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238.

3.2.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238.

3.3 HVAC Ducting

HVAC ducting (both rigid and flexible) where nonmetallic.

3.3.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238.

3.3.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238.

3.4 Windows & Light Diffusers

All window assemblies, light diffusers and lenses.

3.4.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238.

3.4.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238.

3.5 Upholstery & Fabric Finishes

All seat upholstery, fabric finishes, draperies, curtains, mattress ticking, and covers.

3.5.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238.

DRAFT

3.5.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238

3.6 Flooring

Structural flooring, floor panels.

3.6.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238 Flooring shall be capable of withstanding the requirements of ASTM-E-119 when exposed for 15 minutes at up to 1400EF (760EC) on the material underside.

This test is designed to simulate resistance to penetration from under car fires. Perforation of floor in the form of ducts, conduits, shall be designed so as not to act as passageways for fire and smoke.

3.7 Floor Covering

To include carpet, padding, rubber flooring or other floor finishes.

3.7.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238

3.7.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238

3.8 Insulation

Acoustical and thermal insulation.

3.8.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238

3.8.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238

DRAFT

3.9 Elastomers

Window gaskets, door housings, diaphragms, matting, gaskets.

3.9.1 Flammability

Materials shall be tested in accordance with CFR 49 part 238

3.9.2 Smoke Emissions

Materials shall be tested in accordance with CFR 49 part 238

3.10 Exterior Shell
End caps, roof housings, non-metallic shrouding, non-metal flexible conduit, battery cases, shields, covers, and exterior boxes.

3.10.1 Flammability

Materials shall be capable of passing ASTM-E-162, radiant panel test with a flame propagation index (Is) not to exceed 35. Additional qualifications are as follows:

a) There shall be no flaming running or dripping.

b) If components are supplied as laminate construction or composites, they shall be tested as complete assemblies as actually installed.

3.10.2 Smoke Emissions

Materials shall be capable of passing ASTM-E-662, specific optical density of smoke generated by solid materials with an optical smoke density index (Ds) not to exceed 100 after 90 seconds or 200 after 4 minutes. Additional qualifications are as follows:

a) See qualifications as stated in 3.10.1 a), b).

b) Maximum limits for smoke emissions shall be measured in either flaming or nonflaming modes, whichever mode produces the most smoke.

DRAFT

3.11 Electrical Wire Insulation

Refer to Amtrak Specification No. 323.

4.0 TOXICITY

All materials tested under paragraph 3.0 shall also be tested to determine inhalation toxicity using Boeing Specification Support Standard BSS-7239.

Parts per million (PPM) shall be gathered for the following gasses:

Carbon Monoxide	(CO)
Hydrogen Fluoride	(HF)
Nitrogen Dioxide	(NO_2)
Hydrogen Chloride	(HCL)
Hydrogen Cyanide	(HCN)
Sulfur Dioxide	(SO_2)

Test reports shall include the specific method used to collect data where multiple methods are described in BSS-7239.

Bureau of Rolling Stock Engineering

Technical Specification for Sleeping Car Deluxe Bedroom Occasional Seat

SECTION 1: INTRODUCTION

A. General

This document defines the requirements for the design and supply of a replacement single passenger Occasional Seat for use in the deluxe bedrooms of Amtrak's Superliner I, Superliner II and Viewliner sleeping cars. The current Occasional Seat is a free standing single passenger seat. When not in use the seat may be folded flat and stored under the sleeper seat. The current seat is awkward to assemble and could possibly injure someone during this operation. As the seat is free standing it may become a loose object in the event of sudden deceleration.

There are five occasional seats required for each of the 59 Superliner I and 46 Superliner II regular sleeping cars, with three of the seats being right-handed and two seats being left-handed when mounted to the car sidewall. There are ten occasional seats required for each of the 5 Superliner II deluxe sleeping cars, with five of the seats being right-handed and five seats being left-handed when mounted to the car sidewall. There are three occasional seats required for each of the 51 Viewliner regular sleeping cars, with two of the seats being right-handed and one seat being left-handed when mounted to the car sidewall.

This Specification described a replacement for the present Occasional Seat which includes a permanent mounting to the car structure, to prevent injury from a loose seat during an accident. This replacement seat shall be of a universal design, able to be used in both Superliner and Viewliner sleeping cars, and easily convertible in the field using common hand tools when required from a left hand to a right hand mounting to the sleeping room sidewall. A Design Review approach involving both the Engineer and the Contractor shall be used to design the prototype seat, which shall undergo Type Tests prior to production to verify the design. All production seats shall undergo Routine Tests.

The design criteria and constraints that are known to Amtrak have been specified. Further definition and clarification are anticipated during negotiation. If other factors require definition after Contract award, the Contractor shall be responsible for making those definition requirements known to Amtrak in a timely manner for mutual investigation and satisfactory resolution. The Contractor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions.

Wherever possible, this Technical Specification has been developed on the basis of car performance required, rather than specific hardware to be provided. Where specific

DRAFT

hardware is mentioned, it is for the purpose of providing an example of concepts or designs acceptable to the Engineer. This approach will allow Proposers to employ innovation and advanced technology where appropriate.

Any items of material or equipment, which are not fully described or are omitted in this Specification or the accepted Technical Proposal, but are necessary for the completion of the seats, shall be considered a part of the scope of supply. In this Specification all references to "number of days" shall mean calendar days unless otherwise stated.

Safety shall be of primary importance in the design of the seat. The seat shall present a safe, hazard-free environment to passengers and the operating and maintenance personnel to the extent practical. Use of the seat shall be easy and safe. No sharp edges or corners or pinch points shall occur where passengers, crew, or maintenance personnel may come into contact with them. Adequate handholds shall be provided where necessary. Smooth surfaces and avoidance of protrusions shall be used to minimize passenger injury in the event of a collision.

B. Engineer

The Engineer, as stated in this Technical Specification, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee.

During the course of the project the Contractor will be submitting items for the Engineer's approval as required by the Contract and Technical Specifications. The Contractor shall not interpret this process to mean that the Engineer will function as an arm of the Contractor's Project Management or Engineering staff. Submissions shall be structured to show how the Contractor is responding to the requirements of the specifications, and not on the basis of requiring the Engineer to discover how the Contractor is not meeting those requirements. All material being submitted shall have been reviewed by qualified Contractor personnel and judged to be suitable for submission prior to doing so, and this shall be so stated in the letter of transmission or on the document, particularly as regards material passed through from subcontractors. Test results shall receive Contractor staff review and signature prior to submission. Submissions found to be deficient with regard to any of the above shall be immediately returned without review to the Contractor.

Submissions shall contain sufficient detail to confirm that specification requirements are being met. However, the Contractor shall use judgment as to what level is appropriate and shall communicate with the Engineer when guidance is needed on a case-by-case basis. Documents with levels of detail and information considered to be beyond what is needed or is time-effective to confirm compliance shall be given cursory review by the Engineer and considered as background information and shall not receive formal approval. Individual submissions shall not contain material from multiple subsystems or subcontractors and such submissions will be returned without review to the Contractor.

DRAFT

Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received based on a rate of submittal that is reflective of the pace of an orderly, properly managed program. Priorities will be given to special cases when possible. However, the Contractor shall consider the 30 days criteria and the time requirements involved for mailing when scheduling submittals. The days used by the Engineer in Design Review meetings or in travel to or from such meetings shall not be included in the 30 days figure. Delays caused by the Engineer's failure to review and approve drawings or schedules in a timely fashion as listed above shall be treated as an excusable delay, provided that the Contractor can demonstrate to the satisfaction of the Engineer that actual production delays have been caused by the Engineer and there is no other concurrent cause for delay.

C. Interchangeability

All similar parts on each seat, and among all other seats and their spare parts, shall designed and manufactured to be identical, both as individual parts and as subassemblies. Model numbers for identical components shall be identical. Replaceable components of any such apparatus shall be fully interchangeable, without adjustments to any part being necessary. Specific approval shall be obtained from the Engineer during Design Review for each part whose replacement may require an adjustment, and such approval may be granted only where it can be shown to be absolutely necessary.

D. Inch-Standard

The Proposer is advised that the existing sleeping cars used by Amtrak are entirely composed of inch-standard components and fasteners. All designs, components, dimensions and fasteners used on the new seats shall be of United States inch-standards.

E. Design Life

The seats shall be designed and manufactured to perform satisfactorily for a minimum design life of 16 years, except for the seat cushions which shall have a minimum design life of 8 years, and the fabric upholstery which shall have a minimum design life of 4 years, prior to replacement. Each car will receive an annual inspection, and a four year light overhaul cycle.

F. Dimensions

The Contractor shall provide English dimensioning for its drawings and other communications which are generated. Fractional measurements shall be expressed as a decimal value, and unless otherwise noted and approved drawings shall be made using third angle projections. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views.

DRAFT

SECTION 2: DESIGN

A. General

The seats shall be designed and manufactured to provide maximum passenger comfort as defined as the absence of discomfort while maintaining the natural curves of the spine with safety, strength, durability and ease of maintenance as primary considerations. The seats shall reflect high quality, comfort and appearance standards. Resistance to wear and ease of cleaning shall be important considerations. The aesthetic and functional aspects of the seat shall be addressed through the use of industrial design to create a comfortable and inviting environment. When in use the seat shall not vibrate (natural frequency of the seat assembly shall be greater than 10 Hz if possible). The use of the seat shall be straightforward and easy for the user to understand).

The seats shall be designed to provide maximum passenger comfort and safety as dictated by ergonomic requirements. The seat, and all options, shall be designed to comfortably accommodate the 2.5th percentile female to 97.5th percentile male of current United States adult general population anthropometric data. Specifics may be found in "Humanscale 1/2/3, 4/5/6, 7/8/9" (3 volumes), by Different, Tilley, Harman and Bardagjy of Henry Dreyfuss Associates (published by MIT Press, Cambridge, MA), or Engineer approved equal sources of current general (not military) population data.

Special attention shall be given to passengers with reduced visual acuity by providing them with visual cues as required and identified during the Design Review effort. Floor support surfaces should have high contrast colors in this regard, and high contrast signage and striping patterns shall be provided for the seat when folded, as approved by the Engineer, recognizing that the seat will typically be folded during the overnight hours.

Where possible, components requiring maintenance or those that have a high frequency of passenger use shall be replaceable as individual units. The entire seat assembly shall comply with the flammability, smoke emissions and toxicity requirements of Amtrak Specification 352.

DRAFT

B. Application

Amtrak deluxe sleeping car bedrooms have a folding partition between pairs of rooms to allow a large party of passengers to have use of two rooms "en suite". When this partition door is opened, the occasional seat must be able to be easily stored against the side wall in order to not obstruct the partition opening, and require no heavy lifting greater than generally 30 pounds. The mechanism to hold the seat in its stowed position must not unfold during motion. It is anticipated that the passenger will store and deploy the seat as needed during their journey.

The seat shall be attached to the car structure and the design shall allow for the simplest possible installation procedure. It is preferred that the seat assembly be mounted to the car sidewall structural posts, otherwise it may be mounted to the car floor structure. The

mounting system shall be approved by the Engineer. All mounting provisions shall be designed to prevent the accumulation of dirt, debris, and infestation by rodents. The room floor carpeting shall be removable without the need to remove the seat mounting structure.

C. Features

The seat assembly shall include the following features:

- Universal design to permit one assembly to be mounted either left or right hand
- Sidewall or approved floor mount (stainless steel hardware to be included)
- Primary suspension system
- Fixed backrest
- Outer armrests

It is intended that seat assembly be of a universal application design, such that the seat could be easily changed in the field using only hand tools to remove and reapply fasteners, from the left hand to the right hand configuration, or vice versa. All required mounting holes, tapping plates, etc. for both configurations shall be included in each seat, regardless of originally-delivered configuration. The ability to change configurations must be demonstrated by the Contractor during Design Review.

D. Frame

The seat frame shall be fabricated from square and tubular painted carbon steel or approved equal, and AISI number 3 finished stainless steel where exposed to passengers. It shall be robustly constructed for long life with minimal maintenance. All frames shall have their tube ends sealed to prevent the entry of vermin. The sidewall attachments shall be designed to discourage the accumulation of dust or debris, and shall not interfere with heater enclosures or other equipment. All welding shall meet AWS standards, and all welders and weld procedures used shall be certified to applicable AWS standards. Seat frame welding shall be done in appropriately designed and constructed weld fixtures which shall insure dimensional consistency of all frames**.** The seat frame components shall be so designed and fabricated that when cleaned or exposed to liquids, no accumulation will occur. All tube assemblies shall have their lowest points drilled for draining when the seat is in a normal sitting position. Seat assemblies shall be installed to allow ready access to baseboard heater elements and other similar items.

E. Cushions and Upholstery

The seat bottom and backrest cushions shall conform to the requirements of Amtrak Specification 665 "Specification for Seat Cushioning Assemblies", incorporated herein by reference. Seat cushion construction shall employ high resilient flexible foam completely covered and sealed with a fire barrier as described in Amtrak Specification 665, paragraph 2.2.3. The cushion material shall be capable of passing the cushion life test described in Section 6.2 of the American Public Transportation Association

DRAFT

Specification SS-C&S-016-99, Revision 1, "Standard for Row-to-Row Seating in Commuter Rail Cars". Alternative cushion assemblies may be submitted to the Engineer for approval provided they meet all requirements as detailed in this specification.

All surfaces, including the bottom of the seat bottom cushion, shall be attractively finished. The upholstery used to cover the seat bottom cushion and the surfaces exposed to passenger view of the backrest cushion shall be the current Amtrak-approved "Blue Triangle" upholstery. Currently-approved Amtrak suppliers for this upholstery are LaFrance style 381 090D 3194-75, "Blue Triangles", and Lantal Textiles style 92-3194 075, "Blue Triangles". Any surfaces of the bottom and backrest cushion assemblies exposed to passenger view when the seat assembly is stored shall be suitably and attractively covered with either upholstery, or a shroud manufactured from compression molded fiberglass reinforced plastic (FRP), thermoformed Royalite R61 or approved equal thermoplastic, or other approved and equally durable material. The minimum inside radius of all shroud corners shall be 0.375 inch. All exposed edges shall be smoothly finished and form an aesthetic smooth interface with the seat cushions. The color shall be homogeneous throughout. All FRP shall be covered with DuPont Tedlar composite laminate, or approved equal, during the compression molding process to provide a colored graffiti resistant surface. The FRP color shall match the color utilized in the Tedlar composite laminate. The shroud shall be attached to and be fully supported by the seat frame in a tamperproof manner using appropriate fasteners, without stress risers at attachment points. The shroud shall closely match the shape of the support frame to prevent any buckling or poor fitting when assembled, and prevent cracking while in service. It shall not be possible for a passenger to pull the shroud away from the support frame. The design and colors of the cushions and upholstery shall be approved by the Engineer.

The latest technological advances shall be considered to provide maximum comfort, durability and minimize cleaning and maintenance requirements. The attachment of all cushion types to the seat structure shall be reliable over the life of the seat and cushion. In addition, the attachment shall be designed to allow maintenance staff to easily and reliably attach and detach the cushions for maintenance, preferably without the use of tools. It shall be possible to remove and replace these two cushions, by one person, in 5 minutes.

F. Cleaning and Maintenance

The complete seat assembly shall be easy to clean and maintain. It shall not require maintenance, adjustments or lubrication at internals of less than four years. To the extent possible, only readily available components, hardware and fasteners shall be used. Any assembly hardware visible to passengers shall be flush mounted stainless steel. There shall not be any sharp or exposed edges in the entire seat assembly which could cause injury to passengers or workmen, or snag passenger's clothing. Pockets where dirt and debris can collect shall be minimized; those that exist shall be easy to clean with standard vacuum cleaner equipment.

DRAFT

Design of the seat shall ensure that items that require repair and or service are easily accessed, removed and replaced and that this is possible with the use of standard hand tools. It shall be possible to readily repair or replace any item on the seat, except the frame, with the seat installed in the car.

G. Overhaul

The seat design shall ensure that when used in daily revenue service, it shall not require overhaul (nor look shabby) in less than:

- Upholstery - 4 years
- Foam Cushion - 8 years
- Rest of seat - 16 years

The modular design of the seat shall allow the easy addition or deletion of options in the seat overhaul shop.

The seat attachment to the car shall ensure that a seat can be removed and a new seat installed in its place, using specified tools, in 10 minutes with a two-man team. This shall be demonstrated by a test during Design Review. The seat, complete with all options, shall be designed to allow it to be overhauled in 1.5 hours in an appropriately equipped seat shop. This shall include the following:

- Disassembly
- Inspection
- Cleaning
- Renewal of worn and defective parts
- Reassembly
- Adjustments
- Testing

DRAFT

The seat frame design shall include provisions for lifting from a central point with overhead conveying devices such that the seat remains balanced and upright. This will facilitate handling during overhaul. A special device may be provided that is used on the overhaul line, which affixes to the seat and allows single point lifting.

All wear points such as pivots, slides and bearing surfaces shall be renewable at overhaul by means of inserts. Such inserts shall not require complex pressing procedures, but shall be retained by simple fastening devices. Variations of thread size, thread length and head style of fasteners shall be minimized to ease overhaul and regular maintenance. The number of fasteners shall be kept to a minimum. For example if a cover plate requires 2 or 4 screws, a retaining clip or tab and a single screw is preferable. Frequently accessed fasteners shall be self-retained in the removable part.

For overhaul, all disposable parts shall be marked with recycling codes identifying the material content. This particularly applies to composites and plastics. Readily

identifiable metal components need not be marked. At the end of its useful life, a seat shall be completely recyclable except for cushions and small wear components. The Contractor shall supply a recycling plan for the seat for approval during Design Review.

H. Standards

The following drawings and documents form a part of the specification to the extent herein specified:

Flammability, Smoke Emissions and Toxicity	Amtrak Spec. 352
Vendor Maintenance Manual	Amtrak Spec. 353
Seat Cushioning Assemblies	Amtrak Spec. 665
Passenger Coach Seat	Amtrak Spec. 683-A
Environmental and Operating Conditions	Amtrak Spec. 429
Code of Federal Regulations	49 CFR Part 238.233
Standard for Row-to-Row Seating in Commuter Rail Cars	APTA SS-C&S-016-99, rev1

DRAFT

SECTION 3: TESTS

A. General

The Contractor shall be responsible for a comprehensive series of tests to be performed to verify both the suitability of design, and the workmanship of each seat. The Contractor is also responsible to fulfill all requirements called for by the Federal Railroad Administration (FRA) of the United States Department of Transportation for testing passenger equipment which has not been used in revenue service, for submission by the Engineer to the FRA. Whenever test requirements overlap, the more comprehensive shall govern. The Contractor shall perform all tests under Engineer observation, and the FRA may also observe such tests. All contractual tests shall be conducted in accordance with Engineer approved test procedures. Testing activity scheduled and/or conducted before test procedure approval will be at the Contractor's risk.

The Contractor is required to perform all tests as specified herein. The Contractor and its subcontractors may, at their option, perform additional testing as they deem necessary as part of their quality assurance program. All costs associated with any of the tests performed are to be borne by the Contractor. In the event of a failure to meet the Technical Specification requirements in any test, necessary corrections shall be made by the Contractor at its expense, and the failed test shall be rerun in its entirety at the Contractor's expense. If further corrections or modifications affecting the item under test are instituted, the Contractor shall perform a complete retest at its expense to demonstrate compliance with the Technical Specification requirements. The Contractor shall give at least ten working days notice to the Engineer prior to the start of any test referred to herein, not counting Federal holidays.

DRAFT

B. Test Plans

The Contractor shall submit to the Engineer for approval a Master Test Plan covering all tests and adjustments listed in or otherwise required by this Technical Specification. The Master Test Plan shall be submitted to the Engineer for review and approval no later than 60 calendar days after the Notice to Proceed.

The Contractor shall prepare a detailed Test Procedure for each test described herein, and for any other tests conducted by the Contractor in connection with its own quality assurance program. Each test shall be a separately controlled document and identified by its own number, title and revision. All revisions shall be submitted to the Engineer for approval. A history of test revisions and changes shall be maintained and recorded within the test document. All tests must be written in an instructional form describing the full activity of each test step. All special tools and/or equipment to be used must be specified within the test document. All calibrated test equipment shall be verified as part of the test plans to be within calibration dates. A data collection form shall be used with each procedure and shall be fully identified.

Each individual test shall be accompanied by a separate test results sheet. Each step of the test requiring a specified result or measurement shall be included and identified by the

paragraph number referenced in the test document. Areas shall be provided for recording actual values produced during the test where needed. In addition, acceptance criteria and associated tolerances shall also be shown in parenthesis near the space available for recording the actual value. Each test sheet shall be identified by the associated test number and revision. Areas shall also be allocated for the date, component serial numbers (as applicable), test equipment serial numbers, verification of test equipment calibration, test status (accept/reject) and signature areas for the test technician, Contractor QC and the Engineer.

Each detailed Test Procedure shall be submitted to the Engineer for review far enough in advance of the planned test date to allow the Engineer at least 15 working days to initially review and comment on, or approve the procedure, and still have sufficient time to allow the Contractor to modify a rejected procedure and resubmit to the Engineer, to have approval a minimum of 3 working days prior to any testing covered by the procedure. The Engineer will, at its option, witness all tests.

Within 30 days upon the completion of each test, the Contractor shall submit a written report of each test, including copies of all test data, to the Engineer for approval. In every case, the report shall include a description of the test, all raw data collected in the test, and a summary of the results in a form that can be directly compared to the Technical Specification without further calculations. A test shall not be considered as completed until the Engineer (and the FRA, as required) has approved its final written test report. The approval of the Engineer does not in any way relieve the Contractor of responsibility for the adequacy of the Test Program within the scope of this Technical Specification.

C. Type Tests

Type (proof of design) tests shall be performed to verify that the proper materials were used and that the equipment meets the stated design requirements. These seat qualification tests, including static, dynamic, anti-rotation and component tests, shall be conducted on a production seat assembly. The test seat shall be mounted to a structure for testing that simulates actual car construction. The seat assembly tested shall be a fully assembled seat incorporating all featured referenced in this specification.

Seat testing shall be conducted per the procedures outlined in American Public Transportation Association (APTA) Specification SS-C&S-016-99, revision 1, Sections 5 and 6. The pass-fail criteria listed in the APTA specification shall apply. Test plans, test procedures and test reports shall be in compliance with Section 8 of the APTA Specification. Tests shall also be performed as specified in Amtrak Specification 665 on cushions and cushion materials.

A series of tests conducted in accordance with Section 8 of the APTA Specification shall be conducted to verify compliance with the following design requirements:

- Third-party Flammability, Smoke Emissions and Toxicity test data (section 2-A)
- Universal (left and right hand) seat application (section 2-C)

DRAFT

- Cushion renewal time (section 2-E)
- Seat replacement time (section 2-G)
- Seat overhaul time (section 2-G)

D. Routine Tests

The Contractor's Quality Control department shall perform a complete inspection of every seat produced to verify compliance with all design, workmanship and specification items.

E. Test Reports

The Contractor shall provide test reports from authorized labs and statement(s) of compliance with all laws, rules or regulations currently in effect in the United States and Canada as applied by the AAR, USDOT, Canadian Ministry of Transport, APTA and/or Amtrak applicable to any assembly, part, material and process. These test reports and statements of compliance shall be provided in a binder labeled as to its contents. Electronic PDF files shall also be provided on CD.

DRAFT

SECTION 4: PERFORMANCE OF THE WORK

A. Design Review

The Design Review Program is a design development and approval program which shall begin with a Conceptual Design Phase and progress through a Preliminary Design Phase and a Final Design Phase.

The Design Review Program shall include, but not be limited to, Engineer review and approval of all the design concept and arrangement drawings of the seat, all the engineering and production detail drawings, performance and design calculations, configuration drawings and design details, clearance diagrams, mock-ups, stress analysis reports, tests, and publication preparation. Design Review activities shall also include review and approval of substitute or equal materials not dealt with in the pre-proposal period, and review and approval of the Contractor's test program and Quality Assurance program as well as all other Contractor management programs. Design Review activities shall continue throughout the entire pre-production period, with each succeeding stage presenting greater amounts of detail and reflecting the progress of the designs. In addition to his own designs, the Contractor shall submit the design of all components being purchased by him for review and discussion at the Design Review sessions. In all submissions and at all sessions the Contractor and supplier presentations shall be organized so as to show exactly how the design meets each specific requirement of the Technical Specification. Amtrak shall be granted by the Contractor full delivery and ownership rights of all drawings, documentation, parts information, test data, etc. associated with this Program.

B. Conceptual Design Phase

The Contractor shall provide the following for Engineer approval in accordance with the delivery schedule:

- Develop component layouts to verify the initial design;
- Produce soft mock-ups to verify the volume, basic ergonomic requirements and maintenance requirements;
- Produce three-dimensional renderings to convey the primary appearance of the seat; and
- Prepare control drawings of the seat structure and interface control drawings.

C. Preliminary Design Phase

Following written approval of the appropriateness of the design by the Engineer, the Contractor shall provide the following for Engineer approval in accordance with the delivery schedule:

- Develop top assembly drawings of the major components of the seat;

DRAFT

- Verify designs with modification of the soft mock-up from Section 4-B;
- Prepare preliminary Stress Analysis;
- Review drawings with the Engineer for approval; and
- Generate color renderings in a three dimensional computer generated format, to reflect the approved design.

D. Final Design Phase

Following written approval of the Preliminary Design Phase by the Engineer, the Contractor shall provide the following for Engineer approval in accordance with the delivery schedule:

- Develop detailed engineering drawings for the manufacture, production and installation of the seat;
- Complete the Stress Analysis;
- Develop the Bills of Material; and
- Prepare one car set of seats for installation in a standard Superliner sleeping car.

Prior to the completion of the Final Design Phase, the Contractor shall supply to the Engineer a complete Bill of Material and a set of all seat component drawings and overall assembly drawing. This must be accomplished a minimum of 30 days prior to the initial shipment of any material, in order for the Engineer to have Amtrak internal part numbers ("AAMPS numbers") created for each part. The Engineer will promptly forward these AAMPS numbers to the Contractor, who must include this data in the nameplate labels for the seat components.

E. Stress Analysis

In order to verify that the strength of the seat design and its attachments to the carbody complies with the seating requirements of the FRA in 49 CFR Part 238 and APTA, a complete stress analysis of the seat design and its carbody attachments shall be performed by the Contractor. This may be performed by manual or computerized calculations of stress, or by using an advanced computer-driven finite element analysis such as Nastran, Ansys, Strudl, Algor or approved equal. The stress analysis shall show the calculated stresses, allowable stresses and margins of safety for all elements at all specified loading conditions, and shall comply with all FRA and APTA requirements and recommendations.

During Design Review the finite element model to be used by the Contractor shall be submitted to the Engineer for approval. The element grid, all assumptions, and all input data, such as loads, section properties, material properties, etc., shall be included as part of the preliminary submittal, and again as part of the complete analyses. Prior to the start of manufacture, the Contractor shall submit his complete stress analysis report to the Engineer for approval. A typical stress analysis of any structural element shall consist of a sketch of the element, a statement of the specified applied loadings, a listing of the

DRAFT

material of which the element is to be made and its thickness, an identification of critical sections, the calculated stresses at these sections and the corresponding calculated factor of safety. A complete copy of the finite element analysis shall be included with the analysis, with each page numbered and data clearly identified on each page using terms defined in the analysis.

The Engineer reserves the right to require submittal of relevant detailed stress analysis calculations prior to his approval of production structural drawings if in his opinion the structural adequacy of the proposed construction is questionable.

F. Installation Support

The Contractor shall develop a detailed installation instruction package showing steps and sequence of installing the seat into a car. Prior to the shipment of the first seat, the Contractor shall also supply the Engineer with 12 installation templates, to act as a guide for the drilling and tapping of the carbody structure required to install the seat. Drawings for this template shall be included in the as-delivered drawing package and the maintenance manuals. The Contractor shall provides a minimum of three days of Field Engineer support at the Amtrak Beech Grove, IN shop during the initial production installation of the seat in each of the three sleeping car types (Superliner I, Superliner II and Viewliner cars), as scheduled by the Engineer.

G. Program Schedule

The Contractor shall provide a program schedule that includes all program milestones, design reviews, delivery schedule for prototypes and any other pertinent information.

H. First Article Inspection

The Contractor's Quality Assurance program shall include a procedure for conducting a First Article Inspection (FAI) of the first production article considered to be complete by the manufacturer and reflecting the approved baseline drawings. This shall be performed by the Engineer at the Contractor's facility prior to shipment. Successful completion of all type tests is a prerequisite for conducting the FAI. The Engineer shall be given notice of an upcoming FAI at least two weeks before its schedule date. Successful conduct of the FAI shall precede any shipment of material.

The FAI shall be performed using the approved baseline drawings in conjunction with the Technical Specification reflecting specific requirements of the subject along with any special tools and/or equipment needed to verify the design requirements, configuration and operation (if applicable) of the item being inspected. All technical data required for maintenance manual and or parts catalogs shall be submitted as initial drafts prior to the full acceptance of the FAI. The initial drafts shall contain enough information to adequately maintain the equipment during the initial production delivery.

Prior to the scheduling of an FAI, the Contractor shall submit to the Engineer the following:

DRAFT

- Samples of related color and materials for each of the supplied products;
- A complete drawing package with all approved drawings defining the supplied product;
- An outline or list of specific items and equipment to be reviewed;
- Structural analysis reports of seat to carbody mounting, and product design integrity (as required), as it applies to the crashworthiness requirements; and
- Flammability and smoke emissions test results as required by 49 CFR Part 238 and also Amtrak Specification 352 for all supplied parts and assemblies, certifying material compliance.

I. Review Drawings

During each of the three phases (Conceptual Design, Preliminary Design and Final Design) of the Design Review program, the Contractor shall submit to the Engineer three printed copies of all drawings for review and approval. All drawings submitted to the Engineer for review shall be high quality blue or black-line prints with sharp lines and white backgrounds. Individual sheets with a maximum size of 3 feet 8 inches wide by 2 feet 10 inches high shall be used, unless otherwise approved by the Engineer.

J. As-Built Drawings

Prior to the shipment of the last seat assembly, the Contractor shall deliver to the Engineer, using Engineer-approved formats, a complete set of "as-built" drawings of every part, component and assembly used for the complete seat assembly. Each drawing shall include a complete Bill of Material, providing original component manufacturer name and part number of the actual supplier of the part. Amtrak drawing formats and number series shall be used as agreed upon with the Engineer. The drawing package shall also include drawings of every special tool, jig or fixture required to install, maintain or overhaul the seats, and if referenced in any of the maintenance manuals.

The as-built drawings shall be delivered in the following formats:

- 3 bound sets of all drawings in 11 inch by 17 inch format;
- 2 bound sets of all drawings in full drawing size;
- 3 sets of CDs of all drawings in electronic format in DXF, AutoCAD 2000 and Solidworks 2004 or above, including installation fixture drawings; and
- 3 sets of CDs of all drawings in electronic format in Adobe read-only PDF files, including installation fixture drawings.

K. Maintenance and Spare Parts Manuals

Prior to the shipment of the last seat assembly, the Contractor shall deliver to the Engineer, using Engineer-approved formats, a complete set of maintenance and spare

DRAFT

parts manuals, in accordance with Amtrak Specification 353, revision A, "Vendor Maintenance Manuals".

L. Production

The Contractor shall deliver each seat completely assembled and ready for installation into a car. All small assembly hardware items shall be packaged in relation to the stage or assembly in which they are to be used. All parts must be packed with each seat and will be checked by Amtrak prior to shipping or upon delivery to Amtrak, at Amtrak's discretion.

Each seat assembly shall be individually packed in a shipping container, which shall be plainly marked with the name and address of the manufacturer, identification of the seat and if left or right hand configuration, manufacturer's part number and the Amtrak AAMPS part number. Each seat assembly shall include a package of all stainless steel seat mounting hardware required to install the seat to the carbody, and a set of installation instructions which provide dimensional information for drilling and tapping the carbody structure for mounting. All components will be shipped in secure packaging and palletized when appropriate. The Contractor will confirm the appropriate container and pallet sizes with the Amtrak Material Control department at the Beech Grove, IN shop prior to shipping the first seat.

Each seat shall be serial numbered and permanently marked in a location that is not in normal passenger view but viewable in a service area. The serial number "plate" shall include the Amtrak AAMPS number, serial number, manufacturer's name and model number, and the date of manufacture, and shall be embedded in or otherwise permanently affixed to the seat frame.

M. Exceptions

Amtrak at its sole discretion, and upon written request, may waive delivery of particular items if the Deliverable is covered in conjunction with another Deliverable.

Amtrak

Bureau of Rolling Stock Engineering

Specification for Paints and Coatings

Specification No. 742
Revision 1

1.0 Scope

1.1 Purpose

This Specification covers only Paints and Coatings applied to interior surfaces of certain Amtrak passenger cars. All Paints and Coatings referred to herein shall comply with the requirements of CFR 49 Part 238. It is required that prior to the start of any work, the Contractor must supply the Amtrak Procurement officer with a report by a recognized independent testing laboratory certifying that all materials supplied by the Contractor comply with the 49 CFR Part 238 Appendix B requirements.

1.2 Exceptions

The Contractor shall explicitly identify to the Amtrak Procurement officer any exceptions being taken to this Specification, referencing the Specification paragraph and exact wording in question.

1.3 Surfaces

Surfaces to be painted or coated shall include, but not be limited to: AISI Series 300 stainless steel, fiberglass, Melamine, Di-Noc and Schneller vinyls, anodized aluminum and Plymetal with previously applied factory paint. Fasteners used to retain removable panels must not be painted. Rubber or elastomers shall not be painted or coated EXCEPT as specifically designated in the particular Scope of Work.

1.4 Locations

Areas to be painted or coated and all associated colors shall be as identified in Amtrak's 'Interior Color Scheme' book for the specific equipment and Scope of Work documents.

1.5 Color

Colors shall match Amtrak's Frosty White, Navy Legacy, Nebular and Wilsonart Midnight Melange Surface 9091-ML color standards. Sufficiency of match shall be determined by Amtrak's Industrial Design Department, Bureau of Rolling Stock Engineering, Mechanical Department, whose decision is final. Contractor must submit samples for Approval before commencing work.

DRAFT

1.6 Quality

Paints and Coatings must be applied in a competent, workmanlike manner. There shall be no defects such as: pinholes, peeling, craters, sags, runs, lumps, evidence of pigment segregation or improper mixing, thin or tacky areas, overspray, solvent burn or alligatoring. Contractor shall correct any such defects at its expense. Amtrak's Q/A department shall determine compliance.

1.7 Touch-Up

Contractor shall perform any touch-up work as necessary at its expense. Contractor shall furnish touch-up kits to Amtrak for field repair.

1.8 Color Match

In so far as possible, Contractor shall maintain color consistency between batches of paints and areas on the car. Paints from different batches shall be applied in separated locations to minimize the visual impact of any color variation. Manufacturer, batch or run numbers of all materials and dates of application shall be recorded.

1.9 Masking

Adjacent surfaces must be masked as necessary. Paint lines must be sharp, without bleed. Fasteners used to retain removable panels shall be masked.

1.10 Clear Coating

All painted surfaces shall be Clear Coated. Clear Coating may be required on other surfaces as specified in the 'Interior Color Scheme ' book and Scope of Work documents.

1.11 Primers

Primers and Clear Coats shall be compatible with paints and substrates. They may not cause any undesirable reaction or degradation.

1.12 Clear Coats

Clear Coats shall resist abrasion and graffiti removing compounds.

1.13 Disposal of Waste

Contractor shall comply with all Amtrak, Local, State and Federal Regulations regarding disposal of waste materials.

DRAFT

1.14 Repair of Surfaces

Amtrak shall repair all surfaces before presentation to the Contractor. Contractor shall repair only minor defects such as scratches and small dents.

1.15 Environment

Paints and Coatings shall be applied in accordance with manufacturer's recommended range of temperature and humidity. All materials shall air dry. Contractor shall ensure proper conditions for storage of materials.

DRAFT

2.0 Surface Preparation

All Materials: All dirt and grease must be removed. Any residue from adhesives, polishes, waxes and like materials must be removed chemically. Surface shall be sufficiently 'scuffed' to promote adhesion of primer as necessary. Immediately prior to application of any coat, surface must be cleaned.

Stainless steel: All surfaces shall be 'scuffed' with 80 grit sanding material.

Anodized aluminum: Anodizing must be thoroughly abraded by aggressive sanding with 60 Grit paper, followed by 80 Grit. The surface must be cleaned again to remove all dirt and sanding residues prior to application of primer (etching type recommended). Primer must be applied IMMEDIATELY after final cleaning.

Melamine: Light 'scuffing' recommended.

Fiberglass: Clean. 'Scuff' to break gloss if necessary.

Di-Noc and Schneller: Clean with compatible solvent. Solvent must not degrade bond between vinyl and substrate.

Plymetal with Factory Applied Paint: Contractor shall determine compatibility of primers and paints by spot testing.

Contractor shall be responsible for all surface preparation.

DRAFT

3.0 Technical Requirements

Contractor shall furnish all MSDS.

All paints, primers and coatings shall be free of lead, cadmium and arsenic.

All Compliance testing required by this Part shall be conducted by an Amtrak approved laboratory. All test results shall be submitted for approval to Amtrak's Bureau of Rolling Stock Engineering, Mechanical Department. Submittals must be certified and on the testing laboratory's letterhead.

Paints and Coatings may consist of multiple parts and/or multiple applications.

Film thicknesses must conform to manufacturer's and Amtrak specifications for the application. Contractor shall furnish written documentation that its procedures and application methods produce compliant films. Documentation shall include thicknesses (in mils) of individual layers as well as the finished coating.

Testing must be performed on appropriately coated test plates. EXCEPT: Compatibility testing shall be performed on scrap material.

Contractor shall bear all costs of testing.

DRAFT

4.0 Standards

4.1 Hardness

Final application must comply with ASTM D-3363, and withstand being scratched with a 2H drawing pencil.

4.2 Adhesion

Final application must comply with ASTM D2197 > 6 Kg, ASTM D-3359 Minimum Rating 5A.

4.3 Flammability and Smoke Emissions

Final application must comply with the requirements of Appendix B of 49 CFR Part 238, as well as ASTM E162 with an Is not to exceed 35 with no flaming running or dripping materials. Smoke emissions shall comply with ASTM E662 with a Ds (1.4) not to exceed 100 and a Ds (4.0) not to exceed 200.

4.4 Solvent Resistance (Clear Coat)

Clear Coat material shall comply with ASTM D4752. No mar with 300 methyl ethyl ketone double rubs.

4.5 Gloss

Clear Coat material shall comply with ASTM D523, 60 Degree angle > 90 Gloss. Loss < 10%. Color loss ASTM D2244 <1.1

4.6 VOC

VOC's shall not exceed local Permitted values.

4.7 Warranty

Warranty shall be provided as per terms of Amtrak Procurement documents.

Amtrak
Bureau of Rolling Stock Engineering

Specification for
General Requirements for Wheels

Specification No. 771
Revision 1

1.0 Scope

1.1 Purpose

This Specification defines the vendor general requirements applicable for the design and supply of replacement wheels for use on Amtrak-maintained locomotives and passenger cars. This Specification is to be used in conjunction with the Amtrak Procurement Department contract documents, purchase orders, other contractual documents, and various Amtrak drawings which provide specific dimensional details for the several sizes and types of wheels used.

It is mandatory that the wheels supplied under this Specification be of a low stress design, manufactured from wrought steel, and fully comply with the referenced standards identified in the latest revision of the Association of American Railroads (AAR) Manual of Standards and Recommended Practices Specification M-107/208 for multiple-wear wrought steel wheels.

Amtrak will define the basic outline dimensions for various types of wheels on drawings associated with this Specification and/or the contract documents. It is the vendor's responsibility to fully design the complete wheel, including the wheel plate, in accordance with this Specification. As basic work under this Specification each item produced must be properly packaged for shipment to Amtrak and documentation submitted.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to Amtrak in a timely manner for mutual investigation and satisfactory resolution. The vendor shall not be relieved of the overall responsibility of providing an adequate design for the Amtrak service conditions.

Whenever in this Specification an item is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term “or approved equal” if not written thereafter shall be implied. Any reference to a particular manufacturer’s product either by trade name or limited description is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term “or approved equal” means any other manufactured product or article, which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak’s opinion as to whether the proposed alternate is equal to the specified items for Amtrak’s specified use and purposes shall be final and conclusive.

1.2 Vendor AAR Certification

It is mandatory that the proposed vendor must be qualified as a manufacturer of wrought wheels for use in Association of American Railroads (AAR) interchange service, in accordance with Appendix B of the AAR Manual of Standards and Recommended Practices Specification M-

DRAFT

107/208 for multiple-wear wrought steel wheels. The vendor must maintain its AAR qualification for the duration of the contract term.

1.3 Exceptions

The vendor shall explicitly identify to the Amtrak Procurement officer any exceptions being taken to this Specification, referencing the Specification paragraph and exact wording in question.

1.4 Engineer

The Engineer, as referenced in this Specification, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. During the course of the project the vendor may be submitting items for the Engineer's approval as required by the Contract and Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received. Submittal rates shall be reflective of the pace for an orderly and properly managed program. Priorities will be given to special cases when possible. Delays caused by the Engineer's failure to review and approve drawings or schedules in a timely fashion as listed above shall be treated as an excusable delay, provided that the vendor can demonstrate to the satisfaction of the Amtrak Procurement officer that actual production delays have been caused by the Engineer and there is no other concurrent cause for delay.

1.5 Cost Items

Any individual extra work items regarding supply of the wheels shall be handled in accordance with the contract and purchase order documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Procurement officer regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first reviewed and approved in writing by both the Engineer and the Amtrak Procurement officer.

1.6 Vendor Quality Policy

It is mandatory under this Specification that the vendor have an established Quality policy system meeting the requirements of the Association of American Railroads (AAR) Manual of Standards and Recommended Practices Specification M-1003 and Appendix B of its Specification M-107/208. The vendor's shop is required to be equipped with equipment, personnel and management completely sufficient to manufacture, inspect, and test each wheel being supplied under this Specification. The shop shall have suitable equipment to diagnose any failure mode and to perform all adjustments and tests required to confirm proper manufacture. The vendor's Quality Assurance staff shall be active participants in the production, inspection, testing, and documentation phases of the work, and shall also promptly assist Amtrak in the analysis of any wheel failing in service. The vendor must maintain all Association of American Railroads wheel manufacturer certifications for the entire duration of its contract period with Amtrak. Both the Engineer and the Amtrak Procurement officer shall be immediately notified in writing by the vendor if there is any notification issued to the vendor by the AAR of any exceptions to its certifications or its wheel manufacturing process. Amtrak

DRAFT

Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. In addition, Amtrak may choose to inspect wheels prior to shipment or upon receipt at any of its maintenance facilities. The vendor shall fully cooperate in such audits.

1.7 Conducting Tests

The vendor shall be equipped to fully perform all tests required in accordance with this Specification and any referenced Association of American Railroads (AAR) standard as part of basic work. All testing apparatus shall be calibrated on a periodic basis as recommended by its original manufacturer, any AAR standards, or the vendor's quality system requirements.

1.8 Workmanship

All workmanship shall be of high grade and shall conform to the best of manufacturing practices. Skilled, qualified, well motivated personnel with appropriate experience, training, and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in his facility for reference this Specification, all referenced Amtrak drawings, and all referenced current Association of American Railroads (AAR) standards and wheel gauges.

1.9 Documentation Records

The vendor shall maintain a logbook of information regarding all wheels manufactured by it for Amtrak. As a minimum, records shall identify the Amtrak purchase order number, wheel heat numbers, material certifications, wheel serial number, copies of any written authorizations by the Amtrak Procurement officer, inspection and test data, shipping date and shipping location. This documentation must be retained by the vendor for a minimum period of five years.

1.10 Dimensions

The vendor shall provide inch-standard dimensioning for its drawings and other communications which are generated. All drawings shall be made using third angle projections and shall be in English. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views.

2.0 General Requirements

2.1 Scope

This Specification covers the general requirements for the supply of wheels to Amtrak. Associated with use of this Specification will be various Amtrak wheel drawings issued by the Amtrak Procurement officer which provide specific wheel geometry dimensional details for the various classes of wheels used by Amtrak.

The vendor shall supply a heat treated (rim quenched and tempered), multiple-wear, wrought steel wheel of a low-stress design suitable for use on passenger locomotives and cars operating in both Federal Railroad Administration (FRA) Tier I and Tier II revenue service. The wheel

DRAFT

shall be in full compliance with the latest revision of the Association of American Railroads (AAR) Manual of Standards and Recommended Practices Specification M-107/208 for multiple-wear wrought steel wheels.

Permissible variations in wheel dimensions not otherwise shown by tolerances either in this Specification, the Amtrak-referenced drawings, or in AAR Specification M-107/208, shall be in accordance with Section 8.0 of Appendix B of AAR Specification M-107/208.

2.2 Design

2.2.1 General

Unless otherwise identified on the Amtrak referenced drawing for a specific wheel type, the wheel supplied shall be of Class B carbon steel multiple-wear wrought steel wheel. Brinell hardness shall comply with Association of American Railroads (AAR) Specification M-107/208 requirements.

2.2.2 Qualification of Low Stress Wheel Design

It is mandatory that every low stress wheel design being supplied by a vendor to Amtrak must be fully approved by the Engineer prior to being considered for use. The vendor must prequalify its low stress wheel design using an analytical design review process based upon the general principles of AAR Manual of Standards and Recommended Practices Standard S-660 as would be appropriate for passenger car wheels in Amtrak high speed service conditions. The analysis method, criteria, acceptable results, and personnel used to conduct the analysis shall be approved by the Engineer. As a minimum, the vendor shall supply for each low stress wheel design a complete set of analysis documentation as identified in AAR Standard S-660, along with a completely dimensioned drawing of the proposed low stress wheel. The Engineer will review this submission for acceptability and inform the vendor if the proposed low stress wheel design is considered approved. Once an analytical procedure has been approved by the Engineer for a wheel design, it shall be the responsibility of the vendor to immediately inform Amtrak if it deviates from the conditions under which the design was qualified, and the vendor must then resubmit the wheel design for requalification. Amtrak will keep this vendor information confidential, but requires that it be available for its qualification and inspection processes.

DRAFT

2.3 Wheel Profile

The wheel profile, including manufacturing tolerances, shall comply with the latest revision of Amtrak drawing 62-00106, Wheel Tread Profile, unless otherwise identified by the Engineer. It is Amtrak's desire that the vendor attempt to manufacture the wheel flange to the maximum width permitted by manufacturing tolerances.

2.4 Manufacture

The vendor is advised that the wheels to be supplied under this Specification will be used in high speed passenger service. The vendor shall give particular attention to providing the highest quality material and manufacturing process to provide a high quality finished product. Process improvements such as extended duration inert gas stirring of the heat shall be used to achieve these results. Careful attention shall be given to the composition of the raw materials and steel scrap used to create a heat to avoid contamination of material properties. Sufficient

discard shall be made to insure the quality of the finished product. A ladle analysis shall be made of each heat, and this information shall be traceable in the vendor documentation to the individual serial number of each wheel. Temperatures shall be carefully controlled during the entire manufacturing process to prevent the development of internal defects.

2.5 Finishing

All mill scale shall be removed from the entire wheel. The wheel shall be shot peened with Society of Automotive Engineers (SAE) No. 550 or larger hardened steel as specified in SAE Specification J827. The minimum peening time shall be sufficient to ensure that full coverage is attained on the Almen C strip as defined in SAE Recommended Practices J443, Alternate Procedure, or Military Specification MIL-S-13165 C, paragraph 6.11.

Each wheel, unless otherwise identified on the Amtrak drawing, shall be completely machined all over, in addition to the machining requirements of Association of American Railroads (AAR) Specification M-107/208. It is Amtrak's intention that this complete machining process provide wheel balancing, and that separate wheel balancing is not required. If the Amtrak purchasing and contract documents do not require a wheel to be completely machined all over, the maximum wheel unbalance must not exceed 0.6 pound at the outside diameter of the rim.

All wheels intended for AEM-7 electric locomotives must have machining of the mounting surfaces for cheek-mounted disc brakes and hub machining for oil-assisted removal performed in accordance with Amtrak drawing D-08-1311, latest revision.

The machined surface finish on the wheel shall not exceed the following requirements:

- 500 micro inches for the wheel hub;
- 350 micro inches for the tread, flange and rim faces; and
- 250 micro inches for the inner diameter of the rims, web, and outer diameter of the hub.

No steps, grooves or "black spots" are permitted. The eccentricity between the wheel hub rough bore and the wheel tread measured in the plane of the taping line shall not exceed 0.030 inch, unless otherwise indicated on the Amtrak drawings or agreed to by the Engineer. If the bidding and contract documents call for the wheels to be supplied finish bored, the inner face of the wheel hub must be square with the centerline of the finished wheel bore within 0.002 inch total indicated runout (TIR).

DRAFT

2.6 Inspection

Following machining, each wheel shall be ultrasonically inspected to Association of American Railroads (AAR) Specification M-107/208. Each wheel shipped to any Amtrak facility must be ultrasonically tested at 25 percent of the amplitude response associated with a 0.125 inch flat bottom hole. The wheel shall be inspected axially from either the front or back rim face and radially from the tread surface with an instrument that incorporates a pulse echo receiver with an operating frequency of 2 to 5 MHz. Manufacturers shall ensure optimum volumetric coverage for the test method and manufacturing process. Optimization of coverage is verified by using supplemental reference standard holes in different areas of the rim. Scanning speed shall permit detection of reference standards at calibration level. Any wheel with a flaw indication equal to or larger than 25 percent of the reference standard at the estimated discontinuity depth shall be cause for rejection. Any indication from discontinuity giving a loss of back reflection equal to or greater than the reference standard during axial scanning shall be

cause for rejection. Ultrasonic indications that result from wheel geometry or spurious electrical signals shall not be valid for rejection. Final disposition of rejectable wheels may be determined by manual testing of questionable areas. Any wheel subject to manual testing must have a level II operator verify that the wheel is compliant with all AAR Specification M-107/208 requirements and the above criteria before shipment to Amtrak.

In addition, each wheel shall be subjected to wet fluorescent magnetic particle inspection to AAR Specification M-107/208, with the requirement that the rim faces, hub and bore shall also be inspected in addition to the wheel plate identified in Section 18.5.2 of the AAR Specification.

The tread profile of each wheel must be successfully verified by the vendor using inspection methods agreed to by the Engineer.

2.7 Marking

Each wheel shall have its identification markings either hot or cold stamped on the hub face identified on the Amtrak drawings or as identified by the Engineer, consisting of the manufacturer's serial number, date of manufacture, manufacturer's identification, class of heat treatment and design designation. All wheels must be marked for class using letters L, A, B, or C as appropriate. Stamping shall be applied in accordance with Section 17.1 and Figure B.5 of Association of American Railroads (AAR) Specification M-107/208.

In addition, each wheel shall have the following information paint stenciled in minimum 1 inch high letters using durable paint:

- the identification "Amtrak" on the inside wheel plate in white paint;
- the wheel design designation on the inside wheel plate in white paint;
- the tape size on the wheel tread in white paint; and
- the identification "H.B. M.T." followed by month and date on the wheel tread in yellow paint, to indicate that the wheel hub and bore has undergone wet fluorescent magnetic particle final inspection.

2.8 Shipping

Wheels shall be supplied to Amtrak in pairs with the same tape size to the locations specified in the bidding and contract documents. Prior to shipment, the vendor shall install plastic plugs in any threaded holes, and shall then apply to each wheel, including loose wheels, a heavy uniform coating of an Association of American Railroads (AAR) approved lead-free rust preventative which complies with AAR Specification S-727. Wheels shall be appropriately packaged for their weight and size within a shipping skid or other commercial shipping media suitable to allow the use of fork lift trucks for handling. Where identified in the Amtrak purchasing and contract documents, wheels may be shipped loose to certain Amtrak locations. The vendor shall apply an identification label on the shipping package. This label shall include the vendor's name and address, telephone number, purchase order number, date released for shipment, and the Amtrak "AAMPS" (internal catalog) number for the wheel as identified by the Amtrak Procurement officer. This information shall also appear in the vendor's invoice, and be included in the vendor's documentation record.

The vendor shall retain a copy for 5 years of the shipping documentation record, and shall make three copies for Amtrak. One copy shall be included with the wheel shipment, one copy shall be sent to the Amtrak Procurement officer (or as otherwise designated in the purchase order), and

DRAFT

the third copy shall be mailed to the attention of the Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

3.0 Drawings

Prior to the start of manufacturing, and as a precondition to permit production delivery of material to commence, the vendor shall supply to the Amtrak Bureau of Rolling Stock Engineering, via the Amtrak Procurement officer, an electronic version of the fully dimensioned drawing for every wheel type being supplied under this Specification. All drawings shall be made using third angle projections, shall provide inch-standard dimensioning, and shall be in English. First angle projection shall be allowed provided all views are labeled, including the front, top, bottom and side views. All wheel dimensions, including the wheel profile, shall be completely provided on only one drawing, which may be in multiple sheets, without the need for Amtrak to refer to other referenced drawings. The vendor shall also include any other vendor drawings or documentation referenced on its drawing for such manufacturing items or standards such as tolerancing, etc. Amtrak will keep details of the wheel designs proprietary, if requested by the vendor, but reserves the right to reproduce the drawings as required for its internal use such as for receiving inspections. Drawings shall be in Engineer-approved formats, using Amtrak drawing formats and number series if possible, as agreed upon with the Engineer. The drawings shall be delivered to Amtrak as 3 sets of CDs of all drawings in electronic format in either DXF, AutoCAD 2000, Solidworks 2004, or newer release; and 3 sets of CDs of all drawings in electronic format in Adobe read-only PDF files.

4.0 Warranty

Warranty shall be provided as per the terms of the Amtrak Procurement documents. The supplying wheel manufacturer shall fully support Amtrak in the event of any wheel failure while their wheel is in revenue service, and shall promptly perform a failure analysis of each failed wheel identified by Amtrak.

Subject: COBRA® Disc Brake Pads

Attachments: DTR-06-0012 Rev 00 Report.pdf
Chuck,

The enclosed report DTR-06-0012 Revision 00 summarizes results of dynamometer tests of a new COBRA® Disc Brake Pad material according to the Amtrak Specification No. 80-276, Revision E. A comparison of pad wear results (in cubic centimeters worn for the various sections of the Amtrak Specification) for this material, designated D-715, in comparison to current test results for the previous standard COBRA D-527 Material are as follows:

DISC PAD MATERIAL	PROCEDURE A Stop Tests (cm^3)	PROCEDURE B Slowdown Tests (cm^3)	PROCEDURE C NEC Schedule Tests (cm^3)	PROCEDURE D Grade Tests (cm^3)
D-527	76.4	29.5	297.1	113.5
D-715	51.8	6.6	102.3	28.7

Based on the above comparisons and attached dynamometer data, and on similar relative results when compared to current tests of the Bremskerl 2050 material used by Amtrak, we believe the D-715 material will provide improved performance on Amtrak Superliner and Amfleet Cars.

It is RFPC's proposal to provide sufficient samples to allow service testing of the D-715 material. We will look forward to your review of the attached data, and directions regarding the next actions for arrangement of field evaluations. In making this request, we recognize that a relatively short period is available for the field evaluation before the next contract bid for Amtrak disc pads. As a result, please be assured that we will assist in any way possible to expedite submittal of the necessary sample quantities of brake pads and to facilitate the evaluation process.

Very Truly,

Joseph C. Kahr

Subject: **COBRA® DISC BRAKE PADS – QUALIFICATION PROCESS**

DRAFT

Thank you for reviewing with us by phone on Thursday August 24, 2006 the plans for testing our COBRA brake pads. We understand the Qualifications Process consists of three portions and is summarized as follows.

1. Dynamometer Test: Current Amtrak dynamometer test Specification 80-276 will be used for dynamometer evaluation. Performance Criteria is based on COBRA D-527 and Bremskerl 2050 dynamometer results as approximate upper and lower limits for braking performance. Performance should be closer to, but not exceed upper limit represented by the Bremskerl product.

2. Field Test for Brake Pad Wear and rotor condition: Six (6) Amfleet 1 vehicles fully equipped with new rotors and new test brake pads (Requiring 48 caliper sets of COBRA brake pads) are to be operated in multiple train sets in random revenue service for 92 days. Interim inspections conducted at bi-weekly intervals are planned to monitor brake pad and rotor wear and a final inspection is to occur when the test vehicles reaches 92 days of service. The pass/fail Criteria is that the brake pads should remain in service for the full test period of 92 days, unless unusual vehicle conditions or operating circumstances occur.

   After review of the field test plan we recommend the test include a provision for applying at least one caliper set of control pads of the existing pad type to each test vehicle. This may assist in confirming normal vehicle operation.

   We also request that all pads are removed and retained for joint AMTRAK and RFPC inspection at the completion of the test period.

   To facilitate the interim inspection process, RFPC is interested to participate in as many of the interim inspections as possible and will provide a suggested data sheet and test log electronic file.

3. Vehicle Braking Performance: A train consisting of (4) Amfleet 1 vehicles (requiring 32 caliper sets of COBRA brake pads) and (1) AEM-7 locomotive is to be used to perform and record Full Service brake applications at various speeds up to 125 mph. Pass/fail criteria per Amtrak requirements. These test vehicles are not required to have new brake rotors.

   The same train consist may be used to perform brake rate tests using the existing brake pads as a performance baseline or for comparison.

® Registered Trademark of Railroad Friction Products Corporation

We would appreciate your review and comments on the qualification process and criteria as described above. As discussed in our phone call, RFPC is currently in the process of determining the best available new material for the Amtrak Disc Pads, and will provide preliminary dynamometer information as soon as possible. Please be assured that RFPC will assist in any way possible during the field test activity, and that Amtrak Representatives are welcome to witness the dynamometer qualification test portion of the program.

Very Truly,

Martin A. Petzoldt

3. Superliner Brake Disc testing

COBRAR Disc Brake Pads

Preparation Notes from C Florian
Attached for reference is the 11/7/06 Cobra Dynamometer test report for the new COBRA D-715 material that Rwy Friction Products Corp/WABTEC are proposing for Amtrak to put into the qualification evaluation & test procedure.

Wabtec also plans a Dynamometer test of their 'new' design Superliner Disc (based on the 'new' Amfleet design, for the week of 12/18/06 - Amtrak is invited - but must choose which pad material to use for the test -

Considered materials include the:

- old D-527, no longer used,
- newer D-702 as used for the Amfleet Disc Dyno test 12/19-20/06 before Amtrak field tests showed wear less than expected.
- -newest D-715 - not yet tested in any form by Amtrak - just now being proposed by RFPC and
- -Bremskerl material, the current approved and contract supplier.

Also, WABTEC International now owns European based Becorite. They are the brake pad supplier (to Knorr) for the ACELA TS and HHP-8 Loco equipment. Becorite have some materials that meet some new UIC standards requiring more uniform performance in wet-to -dry and across temperature ranges as well as noise and wear life. We will want to learn how RFPC will incorporate those qualities into their offering to Amtrak.

Amtrak also needs to update our old dynamometer Spec 80-267, Rev E to more accurately represent the equipment, operating conditions and test technology currently active and available.

Amtrak

Bureau of Rolling Stock Engineering

Specification for Passenger Car Wheelsets
Specification No. 907

1.0 Scope

1.1 Purpose

This Specification defines the vendor general requirements applicable for the repair, replacement or overhaul of mounted wheelsets for use on Amtrak-maintained or operated passenger cars, including Amfleet I, Amfleet II, Heritage, Horizon, Superliner I, Superliner II, Surfliner and Viewliner car fleets. This Specification is to be used in conjunction with the Amtrak Procurement Department contract documents, purchase orders, other contractual documents, and various Amtrak drawings. All work performed and components used in this Specification must comply with the requirements of the Association of American Railroads (AAR) commodity Group B.

The design criteria and constraints that are known to Amtrak have been specified. If other factors require definition after Contract award, the vendor shall be responsible for making those definition requirements known to Amtrak in a timely manner for mutual investigation and satisfactory resolution. The vendor shall not be relieved of the overall responsibility of providing an adequate product for the service conditions.

Whenever in this Specification an article or material is defined by using a trade name or the name and catalog number of a particular manufacturer or vendor, or a limited description, the term “or approved equal” if not written thereafter shall be implied. Any reference to a particular manufacturer’s product either by trade name or limited description is only for the purpose of setting a standard of performance, quality, composition, construction or size. The term “or approved equal” means any other manufactured product or article, which is equivalent in material, workmanship and service and is as efficient and economical in operation in the opinion of the Amtrak Engineer. Amtrak’s opinion as to whether the proposed alternate is equal to the specified items for Amtrak’s specified use and purposes shall be final and conclusive. In this Specification all references to "number of days" shall mean calendar days. The vendor shall not patent or copyright any original materials or information created by this procurement which will be submitted to Amtrak.

DRAFT

1.2 Amtrak Ownership Rights

Unless specifically waived in writing by the Amtrak Procurement officer, all drawings, bills of materials, catalog lists, mockups, CAD models, documentation and all other engineering and design materials related to this Specification shall become the property of Amtrak, and shall be delivered by the vendor in total as part of the First Article Inspection or other process. If any patented items are used, Amtrak must be granted an unrestricted license to use, copy or otherwise manufacture the item by itself or a third party.

1.3 Vendor's Technical Proposal

As a condition of contract award unless otherwise indicated in the Amtrak Procurement

documents, the vendor must submit a written and detailed Technical Proposal to the designated Amtrak Procurement officer. This Technical Proposal must identify the vendor's interpretation of what it considers to be the scope of Basic Work to be performed, present a complete technical description of the components to be supplied, fully describe the work procedure to be used, include a copy of the vendor's Quality Assurance program and all AAR certifications, include a project schedule by major events starting from the Notice to Proceed, and include a Bill of Material of all components to be supplied by wheelset type.

1.4 Scope of Work

This Specification shall be used to define the technical requirements for the supply of passenger car wheelsets to Amtrak, as defined by the Amtrak Purchase Order and as directed by the Amtrak Procurement officer. This scope shall include the supply of wheelsets using all new components, the repair/recondition and return of existing wheelsets using new or fully reconditioned subcomponents, or solely the reprofiling of an existing wheelset. All wheels, either new, requalified or reprofiled, shall be supplied to the Amtrak standard wheel tread profile per the latest revision of Amtrak drawing 062-00106.

Unless otherwise directed by the Amtrak Procurement officer, a wheelset reaching the end of its economic life (i.e., wheel thickness near condemning limit) shall be remanufactured by the vendor using new wheels, a requalified existing axle, requalified brake discs, and either new or fully reconditioned bearings as further detailed in Section 2.

On occasion as defined in the Amtrak Purchase Order, Amtrak may also require service under this Specification for a wheelset with more than 50 percent remaining rim thickness. In such a situation, the vendor shall prepare a written estimate to the Amtrak Procurement officer regarding the cost to reprofile the wheels to the Amtrak standard per the latest revision of Amtrak drawing 062-00106, and to requalify the existing axle, brake discs and wheel bearings for continued use. The Amtrak Procurement officer shall then authorize in writing if such components shall be reused, or if new or reconditioned components are to be used (in accordance with the latest revision of the Association of American Railroads (AAR) Manual of Standards and Recommended Practices, Standards S-659 and S-723). In every case, the wheel bearings must be requalified for continued use. The reporting methods to Amtrak and the costing methods shall be in accordance with the Amtrak purchase order and other contract documents.

1.5 Vendor Certification

It is mandatory that the vendor performing the wheelset assembly work under this Specification, as well as all suppliers of components, must be an Association of American Railroads certified company holding a valid M-1003 certification. The vendor’s and supplier's certifications must be current for the time period that the work is being performed. As part of its Technical Proposal, the vendor shall identify all of the major component suppliers being used, to permit Amtrak to verify this certification requirement. The vendor must have valid certifications and status codes for each specific work process involved with the mounting of wheel and axle sets, including new, second hand and reprofiled wheels. The Amtrak Procurement officer and the Engineer shall be immediately notified by the vendor if there is any notification issued to the vendor or its suppliers by the Association of American Railroads of any exceptions to its certifications or its wheel shop process.

DRAFT

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

1.6 Standards

It is mandatory that all wheelsets supplied by the vendor under this Specification, including its components and all assembly services, must comply with the referenced requirements of the latest revision of the Association of American Railroads (AAR) Manual of Standards and Recommended Practices, Section G, Parts I and II - Wheel and Axle Manual. The vendor shall provide special attention to compliance with AAR Standards M-101, M-107/M-208, RP-631, RP-632, RP-633, RP-634, S-659, S-723 and S-727.

1.7 Exceptions

The vendor shall explicitly identify to the Amtrak Procurement officer any exceptions being taken to this Specification, referencing the Specification paragraph and exact wording in question.

1.8 Engineer

The Engineer, as referenced in this Specification, is defined as the Senior Director of the Amtrak Bureau of Rolling Stock Engineering within its Mechanical Department, or its written designee. During the course of the project the vendor may be submitting items for the Engineer's approval as required by the Contract and Specification. The vendor shall not interpret this process to mean that the Engineer will function as an arm of the vendor's Project Management or Engineering staff. Submissions shall be structured to show how the vendor is responding to the requirements of the Specification, and not on the basis of requiring the Engineer to discover how the vendor is not meeting those requirements. Submittals requiring the Engineer's approval prior to implementation shall be reviewed and classified by the Engineer within 30 days from the day the submittal is received. Delays caused by the Engineer's failure to review and approve drawings or schedules in a timely fashion as listed above shall be treated as an excusable delay, provided that the vendor can demonstrate to the satisfaction of the Amtrak Procurement officer that actual production delays have been caused by the Engineer and there is no other concurrent cause for delay.

DRAFT

1.9 Cost Items

Any individual extra work items regarding supply of the wheelsets shall be handled in accordance with the contract and purchase order documents issued to the vendor by the Amtrak Procurement Department. The vendor must contact the Amtrak Procurement officer regarding all such issues. The vendor agrees that no payment will be made by Amtrak for any additional work outside the basic work scope of the contract documents unless such work is first preapproved in writing by the Amtrak Procurement officer in accordance with the contract documents.

1.10 Vendor Quality Policy

It is mandatory under this Specification that the vendor and its suppliers have established and maintain a Quality Policy System meeting the requirements of the Association of American Railroads Manual of Standards and Recommended Practices Specification M-1003 and also Section G, Part II - Wheel and Axle Manual. The vendor's shop is required to be equipped with equipment, personnel and management completely sufficient to assemble and inspect each wheelset being supplied under this Specification. The shop shall have suitable equipment to diagnose any failure mode and to perform all adjustments and tests required to confirm proper manufacture. The vendor's Quality Assurance staff shall be active participants in the

production, inspection, testing, and documentation phases of the work. The vendor and its component suppliers must maintain all Association of American Railroads wheel shop certifications for the entire duration of its contract period with Amtrak. The Amtrak Procurement officer and Engineer shall be immediately notified by the vendor if there is any notification issued to the vendor by the Association of American Railroads of any exceptions to its certifications or its wheel shop process. Amtrak Quality Assurance personnel may conduct random audits of the vendor's quality assurance program to verify that these Specification requirements are being achieved. In addition, Amtrak may choose to inspect wheelsets prior to shipment or upon receipt at any of its maintenance facilities. The vendor shall fully cooperate in such audits.

All measuring and test equipment used in the vendor's and suppliers' wheel, axle and roller bearing shops shall be traceable to a national standard. When no national standard exists, the original equipment manufacturer's standards shall be used for calibration.

1.11 Critical to Quality (CTQ) Part Criteria

It is mandatory that the vendor comply with Amtrak procedure PD 3.7.4.02, Critical to Quality (CTQ) Part Criteria, which applies to all components of the wheelsets. Critical to Quality (CTQ) characteristics are defined as "Those characteristics of an item which, if non-conforming, may prevent or seriously affect the unit performance, reliability, producibility, or customer satisfaction of a component." This procedure defines the methodology when qualifying parts or processes to assure that the critical to quality product criteria meet Amtrak requirements by:

- Implementing a rigorous Part/Process qualification to ensure the participation, communications of all related departments and the quality acceptance.
- Support the Quality process by involving the vendor early in the project/design process.
- Assure that the vendor is supplying materials that meet the quality, cost, delivery and reliability requirements.

1.12 Conducting Tests

The vendor and its suppliers shall be equipped to fully perform all inspections and tests required in accordance with this Specification and any referenced Association of American Railroads standards as part of basic work. All torque wrenches, press tonnage recording equipment and pressure gauges, testing apparatus, etc. shall be calibrated on a periodic basis as recommended either by its supplier, by Association of American Railroads standards, or by the vendor's quality system requirements.

1.13 Workmanship

All workmanship shall be of high grade and shall conform to the best of wheel shop practices. Skilled, qualified, well motivated personnel with appropriate experience, training, and aptitude shall be utilized to assure high quality of workmanship at all levels. Foremen, supervisors, inspectors, and shop managers shall be well integrated within the project team and be fully experienced and capable in their fields. They shall manage their teams in a competent and professional manner. The vendor is required to have on hand in his facility for reference this Specification, all referenced Amtrak drawings, and all referenced Association of American Railroads standards and wheel gauges.

DRAFT

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

1.14 Documentation Records

The vendor shall provide a complete Wheelset Inspection Record (using an Engineer-approved form) for each wheelset produced, as well as maintain a logbook of documentation. As a minimum, records shall identify the Amtrak purchase order number, component documentation (such as wheel heat numbers), material certifications, all component serial numbers, copies of any written authorizations by the Amtrak Procurement officer, inspection and test data, assembly documentation (such as press tonnage records), shipping date and shipping location. This documentation must be retained by the vendor for a minimum period of five years.

1.15 Dimensions

The vendor shall provide English dimensioning for its documentation, drawings and other communications which are generated. All wheelsets supplied under this Specification shall be of United States inch-standards, unless otherwise approved in writing by the Engineer.

1.16 Use of Approved Components Required

It is mandatory that the vendor use only Amtrak approved components in the assembly of any wheelsets under this Specification. Any replacement wheel bearing parts must be new or reconditioned parts supplied by the Timken Company, and in all cases the wheel bearings must be equipped with new hydrodynamic labyrinth (HDL) seals. As information, a tabulation of Amtrak approved components is given in Appendix A. These components are identified by the Amtrak "AAMPS" internal catalog number. The vendor may obtain supplier details for these AAMPS number items from the Amtrak Procurement officer.

1.17 Referenced Documents

- Association of American Railroads (AAR) Manual of Standards and Recommended Practices
- Refer to Appendix A and B for a tabulation of Amtrak drawings and wheelset dimensions.

DRAFT

2.0 General Requirements

2.1 Process

All wheelsets supplied to Amtrak must meet the following criteria. Under this Specification, the vender shall provide either (A) repaired, (B) reconditioned or (C) complete new wheelsets.

Wheelsets supplied to Amtrak shall consist of the following components listed below (note that end caps are not used on Amfleet I and Amfleet II wheelsets), and be rebuilt as furnished from Amtrak unless otherwise identified by the Amtrak Procurement officer.

1. Axle
2. Wheels
3. Brake discs (if applicable)
4. End caps with center plastic plug
5. New locking plates
6. Journal bearings
7. Fitted backing rings
8. New end cap bolts

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Wheelset components marked 'D' (Derail) shall be inspected and reconditioned, if acceptable, per the latest issue of the Field Manual of the AAR Interchanges Rules, APTA specification SS-I&M-015-00, and the AAR Manual of Standards and Recommended Practices, Section G-II.

It is mandatory that all wheels be of wrought steel, and not of cast construction. Unless otherwise approved, all wheels shall be of Class B multiple-wear design, with a tread profile in compliance with the latest revision of Amtrak drawing 062-00106. All brake discs shall be inspected and installed in compliance with Amtrak Standard Maintenance Procedure (SMP) 03610. All brake discs bolted to the wheel shall be installed using new locking plates and bolts.

All journal bearings shall be either new, or reconditioned in accordance with all Timken Company procedures, Amtrak Specification No. 900 entitled Purchase of New or Reconditioned Roller Bearings, and in all cases shall be equipped with new hydrodynamic labyrinth (HDL) seals. The end cap shall be either new or reconditioned. New seals, plugs, cap screws and locking plates shall be used.

All axles shall be Grade F in accordance with AAR specification M-101. The Engineer shall be furnished a certification of the chemical composition and physical properties for every new axle. Any axle being reused must be requalified in accordance with the latest edition of AAR Specification M-101 Appendix A, and also AAR Standard S-659 rules 1.1 through 1.2.8.2. All axles shall be inspected and finished in accordance with Amtrak Standard Maintenance Procedure (SMP) 49408. In all cases, each axle must be wet fluorescent magnetic particle inspected for its entire length and found completely free of defects before assembly.

DRAFT

2.2 Definitions

Accepted Material - When roller bearing/wheel and axle components are inspected during incoming or in-process inspection and found acceptable they shall be identified by applying a suitable status indicator (Refer Table 1 - Status Indicator).

Rejected Material - When material is rejected in the roller bearing/wheel and axle reconditioning cycle, it must be segregated immediately from the acceptable material. There are three (3) types of rejected material. Rejected material shall be handled as follows:

Scrap material - material that is known to be scrap or physically marked scrap (S), shall be put in a bin, container or racks designated for scrap material or placed in an area that is designated for scrap material only.

Rework material - material that is not acceptable to continue in the bearing, wheel and axle reconditioning cycle is to be physically marked Rework (RWK) and set aside in containers, shelves or areas designated to be sent out for rework. Material in this category is to be accumulated until such time as it is sent to an AAR certified roller bearing/wheel and axle re-manufacturer.

New material - new or reconditioned material that is rejected shall be physically marked and set aside for the Corporate Quality Control Department or authorized personnel to handle with the supplier. Nonconformance material shall be documented (Reference QA Forms Manuals and Nonconformance Control and Quality Program Improvement Instructions).

Additionally, nonconformance AAR approved material items shall be reported to the AAR as specified in AAR Manual, Section J, M1003, Figure 7.1 and 7.1-II, AAR Material Rejection Report/Response and Amtrak Problem Tracking Field Reports NRPC Form 2925 (reference QA Forms and Section 2.18, Non-Conformance Control and Quality Program Improvement).

Component	Markings	Description

	R&R	Remove and Replace
	D	Derailed
	OK OFF	Hold Wheel for Inspection - Remount
	RWK	Rework

Table 1 - Status Indicators

Any wheel assembly involved in a major derailment must be tagged or marked (DERAIL or "D") and placed in an area to indicate status. Wheel assemblies that have been derailed shall be handled in accordance with APTA specification SS-I&M-015-00 and the AAR Field Manual inspection procedures for derailed wheel sets.

DRAFT

2.3 Inbound Inspection

All wheels, axles, discs and bearings that enter the wheel shop shall be inspected for defects. Refer to Rule 2.8 of the AAR Manual of Standards and Recommended Practices, Section G, Part II for types and identification of defects. Each inbound wheel shall be inspected using a steel wheel gauge to determine if the wheel is acceptable for machining or needs to be rejected. A passenger car wheel may be reprofiled if the tread thickness remains 1.5 inch and above after machining. Refer to Rule 1.5 for additional details. Visually inspect wheel for flat spots, spalls, cracks, etc.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Visually inspect each disc brake for cracks, chip off, etc. Refer to Amtrak Standard Maintenance Procedure (SMP) 03610 - Maintenance Instructions on Brake Discs for detailed inspection procedures. Visual inspection of the hub and spokes shall be conducted more closely. Visually inspect the chamfer on the outside diameter of the disc brake. A chamfer that is significant is considered acceptable. If the chamfer is almost absent, then the disc is rejected. Markings shall be identified by applying a suitable a status indicator (Refer to Table 1 - Status Indicator).

Rotate the roller bearing by hand. The bearing should rotate freely without any internal obstruction or any noise.

DRAFT

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Any wheel or axle with a defect that cannot be removed by machining must be scrapped. Scrap wheelsets shall be marked with a status indicator “S” (scrap). Wheelsets that can be reprofiled shall be marked with a status indicator “T” (turn). Refer to Table 1 for a list of status indicators that shall be used. Wheelsets that need only wheels to be reprofiled shall be moved into the wheel lathe queue. Wheelsets that have scrap components (marked ‘S’) or have been involved in a derailment (marked ‘D’) shall be moved into the dismount press queue.

2.4 Wheelset Demounting

Record the serial number of the axle, wheels, journal bearings and brake discs. Demount the wheelset components. Both the journal and dust guard combinations of the axle must be protected during the entire demounting operation to prevent any nicking or scratching of the journal surfaces. A suitable method must be used to prevent upset ends and high spots on the wheel bearing journals. The outer diameter of the journal and dust guard protector must not be less than 0.025 inch under the axle wheel seat minimum diameter. The inner bore shall be recessed to assure protection of the dust guard, and shall be sufficiently long to cover the entire bore.

If the reuse of the axle has been authorized by the Amtrak Procurement officer, clean the axle to bare metal, including the gear, journal bearing and wheel seats. Inspect the axle for the following defects: water etching in the bearing fillet area, nicks, gouges, or deep scratches less than 0.125 inch deep as measured from the original body contour. All such defects must be removed to create a smooth contour and blended into the contour of the axle body, with a minimum radius of 2.0 inch. The surface roughness of all such repairs shall not exceed 90 Ra. A maximum of 25 such repairs will be permitted in each axle. Material removal must be performed such that all marks are aligned with the length of the axle. Operations must not produce discoloration at any time during the process. No high spots or depression greater than 0.0625 inch on any part of a journal bearing surface is permitted.

Axle bodies may be machined, provided that surface defects can be removed without violating

DRAFT

minimum dimensions or specifications. The surface roughness of the machined body shall not exceed 125 Ra. Check for bent axle or other condemnable damage, and reject all nonconforming axles. Any reused axle must be wet fluorescent magnetic particle inspected for its entire length and found completely free of defects before remounting.

2.5 Axle Lathe Work Station

The following rules and practices outline the procedures to be followed for the reconditioning of all Amtrak axles. They are to be used in conjunction with the recommendations of the OEM, Amtrak, and Association of American Railroads Rules and Practices.

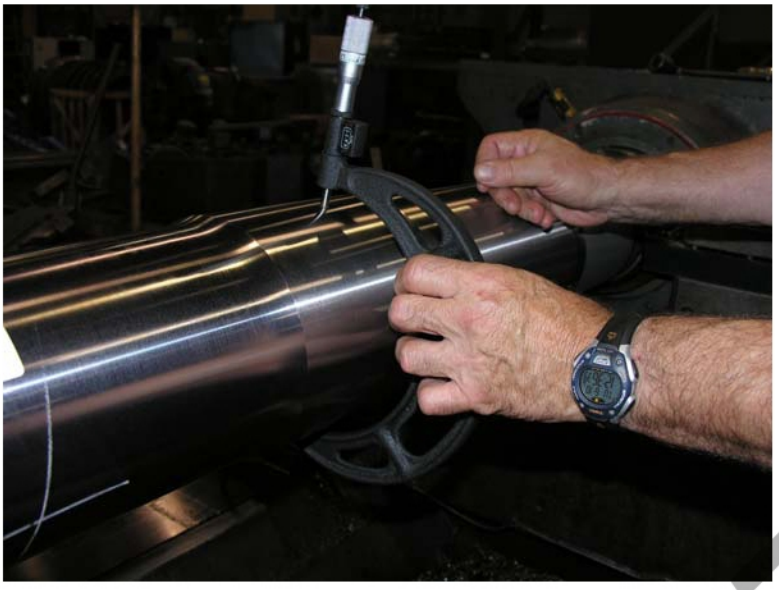
Axles must be reconditioned in compliance with AAR Manual, Section G, Part II, latest revision. Axles that are not covered in the AAR Manual should be inspected according to the Original Equipment Manufacturers and Amtrak specifications and procedures. All scrap and reworked axles must be segregated and marked in accordance with Table 1 - Status Indicators. Unmounted secondhand axles and any mounted axles involved in a major derailment must be checked per Rule 1.2.2, AAR Manual of Standards and Recommended Practices, Section G, Part II. Axles must be checked for bent condition with roller bearings removed. This check, including tolerances, must be the same as specified in Rule 1.2.2 of the AAR Manual of Standards and Recommended Practices, Section G, Part II, or as specified by the Original Equipment Manufacturer (OEM).

Wheel seats of secondhand axles need to be turned prior to mounting, provided they meet the specifications of Rule 1.1.2 of the AAR Manual of Standards and Recommended Practices, Section G, Part II.

At the beginning of each shift, an axle wheel seat must be checked from each lathe in service, at not less than three (3) points in its length and on two different diameters at each of these points to ensure rotundity per Rule 1.1.7 of the AAR Manual of Standards and Recommended Practices, Section G, Part II.

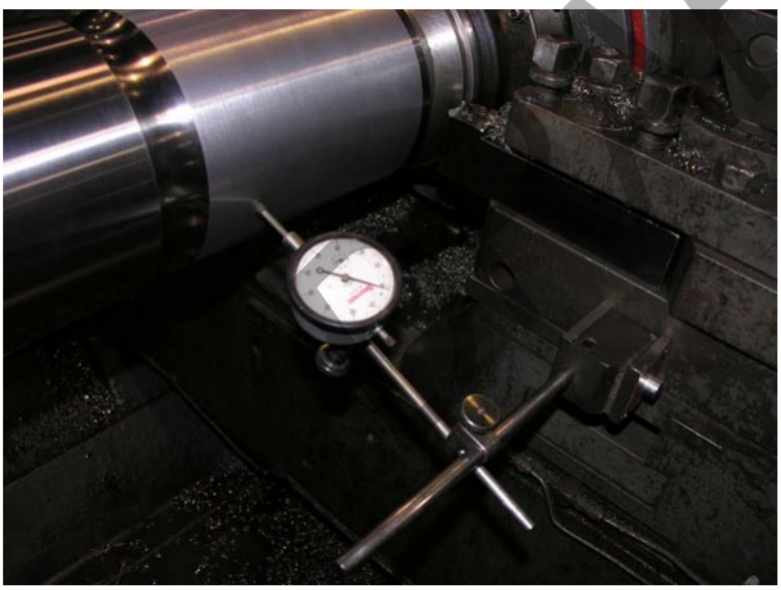
Centering holes must be wiped clean before placing the axle in the lathe in order that journals and wheel seats are not eccentric and grit will not cut the lathe centers. Using the center gauge, inspect the angle of the axle centering hole. Centering holes in the ends of axles must form an angle of 60° and be in accordance with Figure 4.8 of the AAR Manual of Standards and Recommendations, Section G, Part II. Any burrs around the centers must be removed.

DRAFT



Incoming axles that need to be reconditioned shall be mounted securely between the lathe spindles. Remove rust, oil, dirt and paint from the axle using a suitable cleaning agent. Surface defects such as nicks, gouges or deep scratches less than 0.125 inch deep, as measured from the original body contour, must be removed to a smooth contour and blended into the contour of the axle body, with a minimum radius of 2 inches.

Using temperature compensating dial snap gauges measure the bearing seat diameter. Rotate the snap gauge around the journal diameter at least 180° within the bearing seat locations to obtain maximum and minimum journal diameters. The average diameter of each bearing seat must be within the specific axle type's tolerance limits. Refer to Wheelset Tabulation for shop limits.



Using the outside diameter micrometer, measure the wheel and disc seat diameter at three different locations along the longitudinal axis of the axle. Refer to Wheelset Tabulation for shop limits.

DRAFT

Record the wheel seat values obtained by attaching a magnetic base dial indicator to the tool rest, and set it up to record readings about 0.25 inch to 0.5 inch from the end of the journal. Plunger of indicator should be located at the longitudinal centerline of the axle.

Crank the lathe tool rest in till the indicator plunger comes in contact with the axle. Set the dial indicator to zero at this point. Rotate the axle, noting the total amount of indicator runout to the bearing journal. At the end of each revolution, the dial will return to zero if it has been set up properly. Maximum runout of 0.010 inch total indicator reading is acceptable.

The maximum allowable runout for bearing journals, when mounted between centers, is 0.015 inch total dial indicator. When runout exceeds 0.015 inch on the bearing journal, the bearing journals must be turned or axle ends recentered to bring the runout into tolerance.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Compare the obtained data against the shop allowable values, tolerances and limits for each corresponding axle type. Refer to Wheelset Tabulation in Appendix A for shop limits.

Using the journal fillet gauge, inspect the fillet radius to ensure proper fit and proper seating of the backing ring on the axle fillet. If a 0.005 inch fillet gauge can be inserted more than 0.375 inch down from the dust guard seat at all points around the periphery, the axle fillet must be corrected. Axle journal length should also be in compliance with Amtrak drawings.

DRAFT

2.6 Magnaflux

The following rules and practices apply to the Magnaflux process for surface crack detection of axles. These rules outline the procedures to be followed for inspecting axles for surface discontinuities not visible to the eye, such as inclusions, seams and cracks, by the magnetic particle method. They are to be used in conjunction with Magnaflux Corporation recommendations and the Association of American Railroads Manual of Recommend Practices, Section G, Standard M-101, latest revision. All Magnaflux operating procedures shall be in accordance with the Magnaflux Corporation specifications and instructions. A pie gauge test shall be performed and recorded at the start of every shift.

All personnel performing the inspections, at a minimum, shall be qualified and certified by the vendor as a Level I MPI inspector, with Level II MPI inspector oversight under the requirements of the American Society for Nondestructive Testing (ASNT) Personnel Qualification SNT-TC-1A, Recommended Practice and Supplement Magnetic Particle Inspection.

Thoroughly clean out the agitator pipe, the tank and the strainer, and prepare the bath with Magnaglo-14AM for newly mixed bath and daily thereafter, per Magnaflux Corporation's recommended limits and procedure. Axles that need to be inspected by the magnetic particle method shall be mounted between the spindles on the Magnaflux unit.

Remove all rust, oil, dirt and paint from the axle using a suitable cleaning agent.

Visually inspect the axle for scars, pits and other surface defects. Blend and remove any surface defects on the axle, to the extent possible, by using the grinding tool before commencing with the magnetic particle inspection.

DRAFT

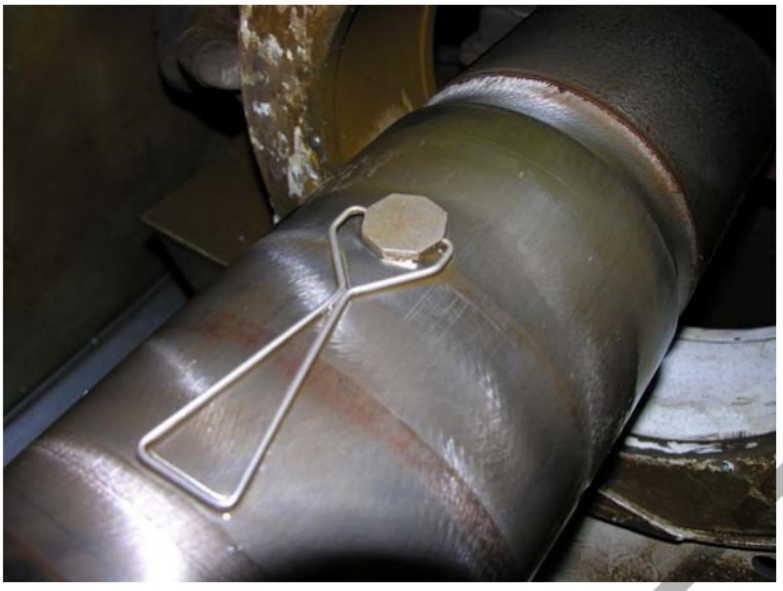
To begin magnetizing the axle, turn the lever on the control panel to 'MAG'. Move one of the coils from the end of the axle slowly towards the center of the axle and simultaneously spray Magnaglo-14AM using the spray gun.

Repeat the above process with the other coil. Use the Ultraviolet/Black Light Filter in the absence of any ambient or artificial light, and carefully inspect the magnetized axle for cracks, seams and other discontinuities. Any crack that cuts across the magnetic field attracts the magnetic particles to form an indication and reveals defects.

DRAFT

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Each surface crack detected shall be blended and removed using the grinding tool. Magnetic particle inspection shall be repeated as per the Magnaflux recommended work procedure to ensure that the surface cracks detected during the magnetic particle inspection have been successfully removed during the grinding operation.



At the end of inspection the axle must be demagnetized by passing a demagnetizing current through the coils. Move each coil towards the center of the axle in 6 inch increments. Wait for the demagnetizing current reading to reach zero before moving the coil further down the axle. Using a Gauss meter, ensure that the axle has been completely demagnetized. The Gauss meter reading should be 3 gauss or less. When completed, apply an internal follower adhesive sticker on each axle end.

A Pie Gauge test must be documented and recorded at the start of every shift. The depth of setting must be performed and recorded daily. To perform the pie gauge test, magnetize the axle by turning the lever on the control panel to 'MAG'. Place the Pie Gauge on the axle with

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

the smooth surface facing up. The pie gage must sit as flat as possible against the axle and be in full contact with the parent metal.

Move one of the coils from the end of the axle slowly towards the center of the axle and simultaneously spray Magnaglo-14AM using the spray gun. Repeat the above process with the other coil. In the absence of any ambient or artificial light, use the Ultraviolet/Black Light Filter and carefully inspect the pie gauge. The magnetic field will attract magnetic particles to the flat surface of the gauge to form a segmented pie design. This indicates that the magnetic fields are working correctly and that the axle has been fully magnetized.

DRAFT

2.7 Assembly

Each wheelset shall be assembled in full compliance with the requirements of latest revision of the Association of American Railroads (AAR) Manual of Standards and Recommended

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Practices, Section G, Parts I and II, Wheel and Axle Manual. All wheel mounting presses must be equipped with a periodically calibrated dial pressure gauge and a pressure recording gauge. These gauges must be used for every mounting operation and agree within plus or minus 2 percent. The dial gauge must be recalibrated against a dead weight tester or an accurate master gauge at least once every six months of service. Documentation of the brake disc, wheel and journal bearing press tonnage charts must be retained as part of the wheelset documentation record. A wheelset inspection record shall be completed for each wheelset.

Verify that the dimensions of all wheel hub bores and axle wheel seats are suitable to achieve the necessary interference fit and resulting mounting tonnage. Prior to wheel mounting, apply an Association of American Railroads approved mounting compound using standard wheel shop practices. Wheels shall be mounted using an application tonnage of 100 to 170 tons, with a back to back reading of 53-3/16 to 53-3/8 inches, which shall be recorded by instrumentation for each wheelset produced. The use of white lead for wheelset assembly is expressly prohibited. Apply torque seal to the heads of all fasteners after torquing.

In preparation for journal bearing installation, coat the relief groove on both sides of the axle bearing seats, and an area 4 inch inboard of each bearing location, with an Engineer-approved rust preventative compound (Chromac 420, Tectyl 506 EH WD, or approved equal). Coat the entire bearing seat of the axle with either mineral or Caster oil prior to mounting. Appropriate journal bearing locking plates will be applied with at least two locking tabs secured against each end cap screw per AAR MSRP Section G-II requirements.

Upon completion of all assembly and inspection work, stamp the locking plate with the month/year and the shop code, in accordance with Association of American Railroads procedures.

DRAFT

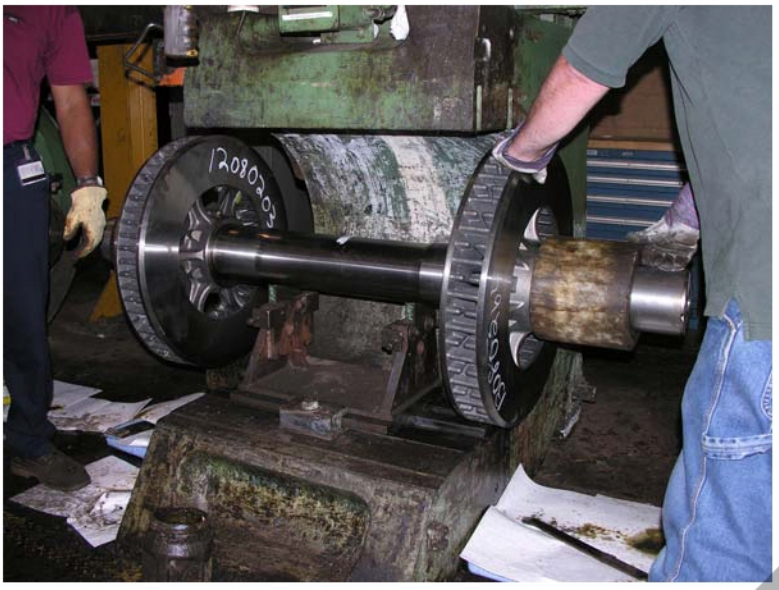
2.8 Wheel Mounting Press

Both wheels must be the same tape size, and have a tread profile in compliance with Amtrak Drawing No. 062-00106. Check for bent axle or other condemnable damage, and reject all nonconforming axles. Insure that all wheelset components and material is stored together under identical temperature conditions for a minimum of 24 hours to achieve a common internal temperature, prior to taking any interference fit measurements or performing any assembly. Measure and record all assembly interference fit measurements of the wheelset components. Machine the wheel bores sufficient to produce the required interference fit. All measurements must be documented on an Engineer-approved Wheelset Inspection Record form.

The following rules and practices apply to the Wheel Mounting Press operation. These rules outline the procedure to be followed for the mounting of wheels, brake disc, bearings, end caps, and speed sensors. Note that these procedures are only generic descriptions of the process. Refer to the Wheelset Assembly Drawings to determine the wheelset configuration and the Wheelset Tabulation Chart for tonnage requirements for each wheelset type.

Seats and bores of brake discs, roller bearings and wheels shall be cleaned using Quilsol or equal to remove rust, grit, chips and grease. Both the seat and the bore must be cleaned as necessary with an AAR and Amtrak approved mounting lubricant. Apply Castor Oil or Molykote, as required, on the bore of the brake disc and axle disc seat using a brush before commencing with pressing the disc brakes onto the axle.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026



Hoist and position both brake discs onto the axle at the same time.

Place the pressing collar in between the brake disc and the hydraulic press in order to transfer the load and not damage the discs by direct loading.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Refer to the mounting press recording procedure. Press the brake disc until the Disc Gauge reaches the center line of the axle which is marked with a white reference line.

Apply a pre-heated (to 250°F) speed sensor gear on the axle. Apply Molykote to lubricate the bore of each journal bearing and axle bearing seat before commencing with the mounting the wheels onto the axle. Refer to Rule 1.8.2.6 of the AAR Manual of Standards and Recommended Practices, Section G, Part II for more information.

2.9 Boring Mill

The following rules and practices are to be followed for boring of wheels, used in conjunction with the Association of American Railroads Manual of Standards and Recommended Practices, Section G, Part II.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Using the outside micrometer, measure and record the wheel seat diameter of the axle associated with the wheel to be bored.

Center the wheel between the chuck to prevent eccentricity. It is necessary to align the wheel properly in position on the mill with regard to concentricity and to plane. The tread of the wheel must be clean in order to permit concentric chucking and boring. Wheels having new tread and flange contours will normally be aligned automatically with contact of the jaws. Worn wheels should be aligned from the back face of the rim by means of shims under the contact points of the jaws. Wheels that have the front face of the rim machined should be aligned by means of hard steel blocks of equal height resting on the cleaned surface of the table, and supporting the front face of the rim of the wheel. This alignment should be checked to ensure the required accuracy of the finished bore.

DRAFT

Enter the wheel seat diameter measured on the axle into the CNC program if the boring machine is so equipped, to limit the bore diameter. Initiate the boring cycle.

Use an inside micrometer to measure and record the inside diameter of the wheel. The measured diameter should match the diameter that was programmed into the CNC boring machine.

Using a grinding tool, remove all sharp edges of the bore on the back hub of the wheel.

Using the Pocket Surf, check the surface finish on the wheel bore. The surface finish shall be compatible with the axle surface finish. Refer to the AAR Manual of Standards and recommended Practices, Section G, Part II for acceptable surface finish values.

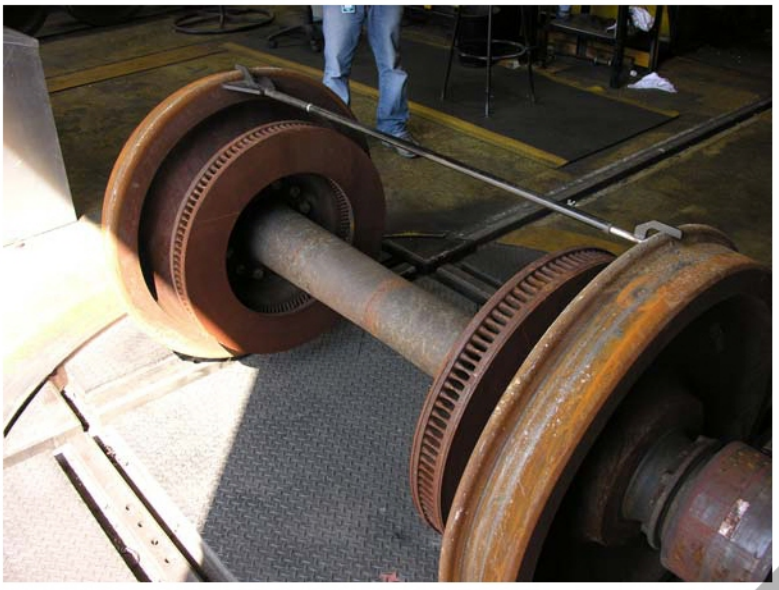
Using an all-surface white marker, write the bore size and wheel series number on the wheel as shown below.

DRAFT

2.10 Wheel Lathe

The following rules and practices apply to the wheel lathe operation. These procedures outline the steps to be followed for the reconditioning of wheels. They are to be used in conjunction with the OEM Recommendations and the Association of American Railroads Rules and Practices.

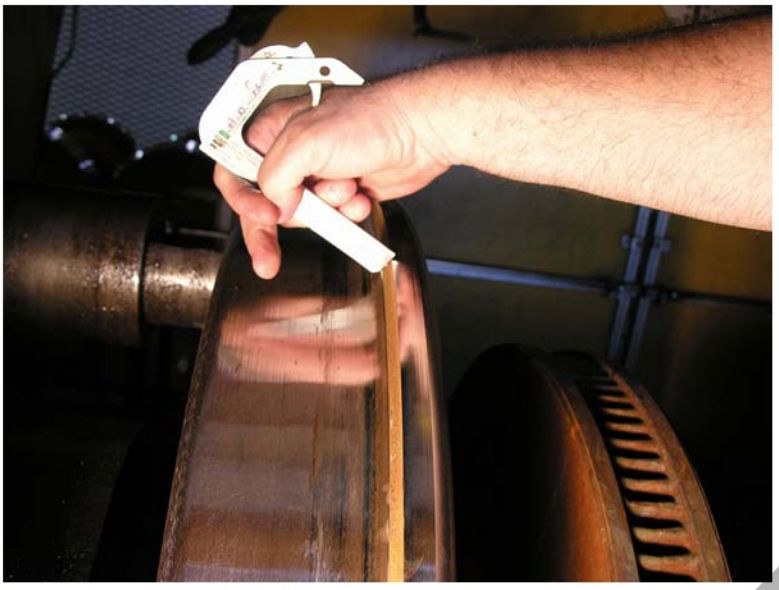
Inbound wheels that are marked Turn (T) for reconditioning shall be moved into the wheel lathe work area.



Remove the plastic cap from the axle centering hole on the outside of roller bearing end cap.

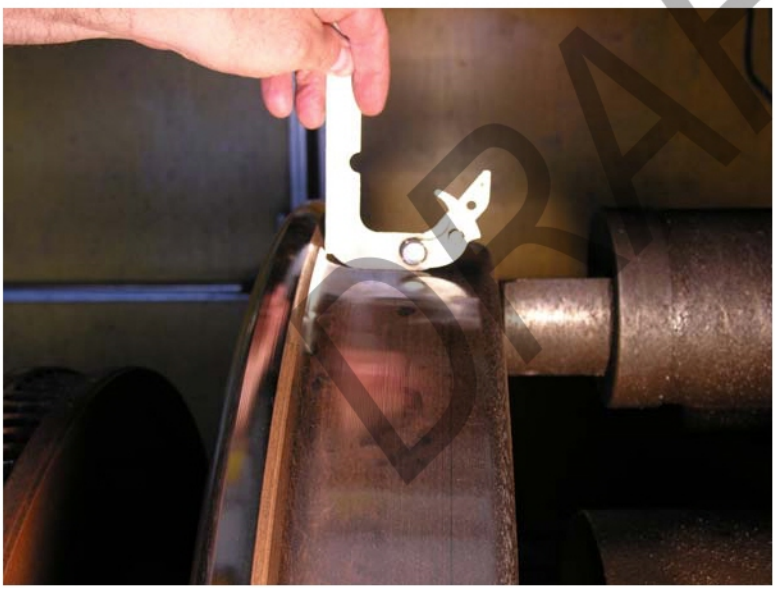
Using the Back-to-Back gauge, measure and record the distance between the wheels before machining.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026



Compare the current wheel profile against the required wheel profile and determine the depth of cut. Refer to Rule 2.4 of the AAR Manual of Standards and Recommended Practices, Section G, Part II to determine the wheel defect and the necessary amount of service metal to remove to restore wheels to proper contour. All wheels must be reprofiled to the Amtrak standard per the latest revision of Amtrak drawing 062-00106.

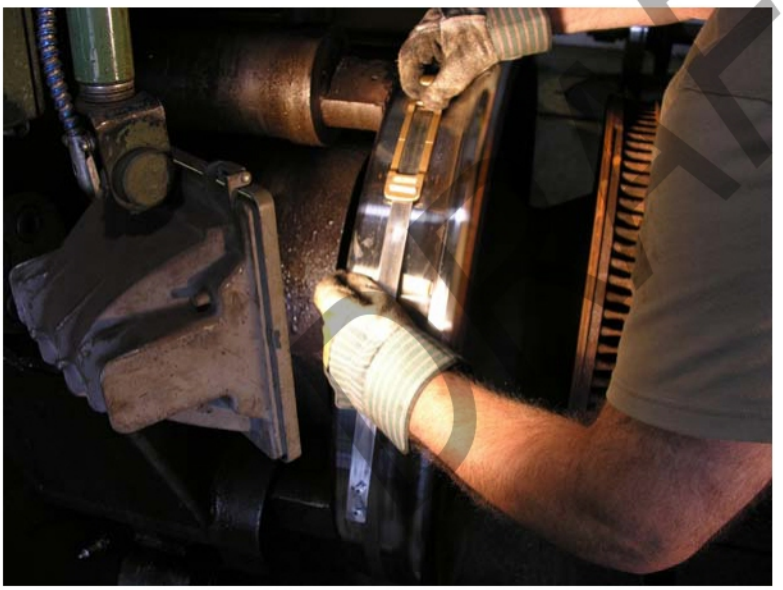
Enter the minimum depth of cut parameter in the CNC program if the wheel lathe is so equipped. Closely monitor the machining process so as to be ready to activate the Emergency Stop button if required.



When machining is complete, measure the wheel using the steel wheel gauge at three (3) unique points. Witness groove, if present, in the flange indicates that service metal has not been wasted. The witness groove must not be more than 3/64 inch deep. Refer to Figure 4.47 of the AAR Manual of Standards and Recommended Practices, Section G, Part II.

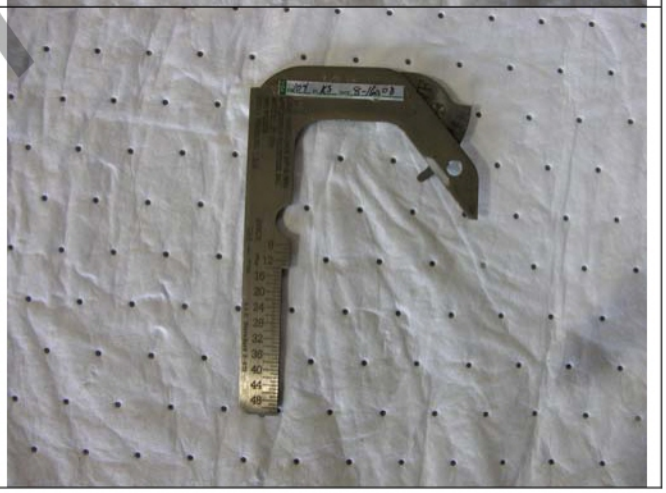
DRAFT

Using the steel wheel gauge, measure the height of witness groove at three (3) unique points. Refer to Figure 4.48 of AAR Manual of Standards and Recommended Practices, Section G, Part II.



Using the profile gauge, measure the profile of each retrued wheel at three (3) unique points. If there is any mismatch between the profile gauge and the profile of the wheel, the wheel shall be remachined with a new depth of cut.

DRAFT



26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Using the wheel tape gauge, measure and record the diameter of each retrued wheel. Both wheels in a wheelset must be within 1 tape size of each other.

DRAFT

DRAFT

3.0 Packaging and Shipment

Wheelsets shall be securely attached to suitable shipping pallets or other Engineer-approved packaging. All wheelset items susceptible to corrosion during shipping or any exterior storage prior to Amtrak installation shall be protected by coating with an Engineer-approved rust preventative compound and protective wrappings. To prevent chaffing or nicking of the axle, a cushioned protective wrapping material (such as heavy duck or approved equal) shall be applied to the axle in any area where it would be contacted by lifting or shipment securement devices.

The vendor shall apply an identification label on the finished wheelset assembly. This label shall include the vendor's name and address, purchase order number, date released for shipment, and the Amtrak "AAMPS" (internal catalog) number for the wheelset. This information shall also appear in the vendor's invoice, and be included in the vendor's documentation record.

The vendor shall retain a copy for 5 years of the Wheelset Inspection Record and the shipping documentation, and shall make three copies for Amtrak. One copy shall be included with the wheelset shipment, one copy shall be sent to the Amtrak Procurement officer (or as otherwise designated in the purchase order), and the third copy shall be mailed to the attention of the

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Amtrak Quality Assurance inspector in care of the Amtrak "ship to" address.

4.0 Product Support

4.1 Program Schedule

If required by the contract documents, any vendor-produced Program Schedule shall include all program milestones, design reviews, production schedule, delivery schedule, and any other pertinent information that will assist with tracking program progress. Any requested changes to the Program Schedule must be presented to the Amtrak Procurement officer for review and approval.

4.2 First Article Inspection

To verify that the wheelsets being supplied under this Specification meets all Specification and drawing requirements, Amtrak will conduct a First Article Inspection (FAI) on the first complete inside bearing and outside bearing type of wheelset produced by the vendor, prior to allowing unrestricted manufacturing work to start. Each FAI shall follow the complete wheelset manufacturing process, from inbound inspection to the final assembly. Each FAI shall have Amtrak Engineering and Quality Assurance personnel as well as the vendor in attendance. Approval by the Engineer following successful completion of the FAI process, as communicated through the Amtrak Procurement officer, shall constitute final system approval.

4.3 Production Changes Require Engineer Approval

Once final system approval is granted by the Engineer and production has commenced, the vendor is forbidden to make any changes in the wheelset manufacturing or assembly process, unless approved in writing by the Amtrak Procurement officer as per Amtrak Procedure PD 3.7.3.01, Design Review and Control Procedure. This shall include any modifications required as a result of warranty actions, so as to provide complete documentation.

4.4 Failure Analysis

A Failure Analysis to determine the cause of any wheelset defect occurring during the warranty shall be performed by the vendor and submitted to the Engineer and the Amtrak Procurement officer for concurrence. Such analysis shall be performed and reported within 30 days from the date of each failure.

5.0 Source Inspection

5.1 Purpose

Amtrak will perform periodic source inspection of vendor materials and components being supplied. The following is intended to be used as an outline defining activities and responsibilities of the vendor performing the source inspections.

5.2 Professionalism

All inspections, test observations, and other activities performed in the fulfillment of the contract

DRAFT

are to be conducted in a professional and ethical manner. The vendor is representing Amtrak in the performance of the contract and therefore must remain courteous, conscientious and professional under all circumstances arising from performance of the contract.

5.3 Scope of Work

Amtrak has implemented a multi-faceted supplier management program of which source inspection is an integral part. Amtrak identifies vendors and materials/components through various methods which will be subject to source inspection. By performing source inspections, Amtrak expects to benefit by use of vendor facilities, measuring and testing equipment to verify materials/components, through rejecting noncompliant materials/components before shipment and receipt by Amtrak, presence of Amtrak representative periodically to ensure continuing good performance, and assist to communicate Amtrak intentions and interpretations of specifications and resolve issues. The vendor will conduct inspection or verify through observation, product compliance with drawings, specifications, standards or Amtrak contract documents and report findings of said inspections to Amtrak.

5.4 Services

5.4.1 Scheduling Inspections

The vendor shall conduct observations and verifications on Amtrak identified materials and components produced by the vendors for Amtrak. Inspections must be scheduled to coincide with final inspection of said materials/components due for shipment to Amtrak. The vendor may use random sampling where large quantities of material are subject to shipment and note sampling method in associated reports. The vendor must perform all dimensional and operational inspections in accordance with the Quality Plan prior to source inspection, and make all inspection records available for review by the Amtrak source inspector, with focus on CTQ items.

DRAFT

5.4.2 Dimensional Inspection

The vendor must witness and verify conformance with dimensional characteristics per drawings identified in the Amtrak contract documents. The vendor must witness and verify conformance with regulatory standards and requirements including material certification as cited in specification or other reference documents identified in Amtrak contract documents.

5.4.3 Operational Inspection

The vendor must witness and verify conformance with operational tests as cited in specifications, operators manual or other reference documents identified in Amtrak contract documents.

5.4.4 Inspection Reports

The vendor must provide a report documenting the vendor source inspection and the inspection results. The report must include the name of the vendor, the date of the inspection, the material or component name, Amtrak (AAMPS) ID number(s) for items inspected, the quantities of each item inspected, the inspection results, and the actions taken where nonconforming materials/components are found. Reports should reference appropriate drawings, specifications, standards, requirements, or Amtrak contract document as appropriate.

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

5.5 Qualification of Personnel

It is the responsibility of the vendor to provide personnel with adequate training and experience to perform all the activities of the source inspections described above. Personnel must also conduct their activities with professionalism.

6.0 Warranty

Warranty shall be provided as per the terms of the Amtrak Procurement documents.

DRAFT

26-FOI-00415 00000006201 "UNCLASSIFIED" 4/30/2026

Appendix A

Amtrak Drawings for Passenger Car Wheelset Assemblies

Listed within Appendix A are the following assembly drawings

- Axle Tabulation drawings
  - Amfleet (Amtrak Drawing No. A-62-00502, Wilmington Reference Drawing C-62-0014)

DRAFT

1.0 Overview

This specification identifies the operational and environmental conditions in which all rail rolling stock and associated components must function without failure, degradation of component performance or condition, or reduced factor of safety. This specification applies to all aspects, features and parts of rail vehicles, including all exterior and interior components.

Rolling stock and associated components shall comply with this specification regardless of whether the vehicle or component is in normal operating service, in layover at a rail facility, or unpowered for storage or shipment.

These requirements shall apply under all possible combinations of conditions as described herein.

DRAFT

3.0 Scope

This specification applies to all Department-owned rail rolling stock, and all associated components, materials, machinery, equipment and supplies.

Specific provisions in rail equipment procurement or remanufacture contracts may require or permit vehicle, component or material performance that differs from those performance requirements set forth herein. In the case of a differing performance requirement, the requirement identified in the specific equipment contract shall supersede that requirement in this specification. Only the requirement that is specified differently shall be superseded. All other requirements shall apply.

4.0 Abbreviations and Acronyms

AAR: Association of American Railroads

APTA: American Public Transportation Association

AREMA: American Railway Engineering and Maintenance-of-Way Association

ATOR: Above Top of Rail

AW0: Actual weight of an empty car, ready for revenue service, with no crew or passengers aboard

AW2: Calculated weight of a car with normal full load defined as seated load plus one standee per 3 square feet of clear floor space

BNSF: Burlington Northern Santa Fe Railway (BNSF Railway)

CFR: Code of Federal Regulations

FRA: Federal Railroad Administration

mphps: miles per hour per second

mphpsps: miles per hour per second per second

5.0 General Requirements

Under the operational and environmental conditions identified in this specification:

- Materials shall not shrink or expand beyond their manufacturing tolerances, become brittle or soft such that they fail to perform their intended function, warp or lose original shape, or discolor or haze.
- Fasteners shall not loosen or tighten outside their specified torque range.
- System and component performance shall not degrade beyond specified limits.
- Paint, decals and elastomeric materials such as rubber shall not fade, crack, peel or delaminate.
- Liquids shall not harden, freeze or evaporate such that they cause damage to components, pipes, tanks or hoses. All liquids inside closed components shall either be equipped with freeze protection or shall be designed to accommodate freezing and expansion without damage to components, parts or performance.
- Components shall not rattle, shake, squeak, vibrate, flex beyond specified limits, hum or whistle, drum or oilcan, abrade against adjacent surfaces, distort or loosen.
- Vehicle or component performance shall not change beyond specified limits due to changes in passenger load, volume or quantity of operational supplies (such as fuel, water or sand) or shifting of passengers and supplies from one area or level of the vehicle to another.
- All vehicles and components shall maintain adequate clearance to wayside structures in compliance with specified clearance standards under all operational and environmental conditions at all applicable speeds.
- Unsafe conditions shall not be created for passengers, crew, maintenance personnel or others due to environmental or operational conditions relating to the design, performance or operation of rail rolling stock and associated components.

DRAFT

6.0 Operational Requirements

6.1 Speed

6.1.1 Design Maximum (mph)

All rolling stock shall be designed for revenue operation at all speeds up to 125 mph, unless otherwise specified.

6.1.2 Certification Maximum (mph)

All rolling stock shall be delivered ready for revenue operation at all speeds up to 90 mph without requiring additional testing or documentation, unless otherwise specified.

6.2 Track

6.2.1 FRA Class of Track

The rolling stock shall be designed for revenue operation on all classes of track from FRA Class 1 to Class 7.

Track quality shall be the minimally compliant for each class of track, per FRA regulations and AREMA standards.

6.2.2 Track Gauge

All equipment shall operate on standard gauge track. Standard gauge is 56.5 in.

6.2.3 Grade

All rolling stock shall be capable of operation on track with a gradient of up to 5%. Pneumatic and mechanical braking systems shall be capable of stopping moving equipment, and retaining stationary equipment, on all ascending or descending grades up to 5% in either the forward or rearward direction.

6.2.4 Curvature, Horizontal

All rolling stock shall be capable of negotiating a 250 ft radius (23 degree) horizontal curve, coupled to other equipment, without damage to any portion of the trucks and suspension, coupler, draft gear, air and electrical connections, carbody, diaphragm or track.

6.2.5 Curvature, Vertical

All rolling stock shall be capable of negotiating a 1000 ft radius vertical curve (concave or convex), coupled to other equipment, without damage to any portion of the trucks and suspension, coupler, draft gear, air and electrical connections, carbody, diaphragm or track.

6.2.6 Superelevation

Rolling stock shall be stable (no greater than 50% wheel unloading) at all design speeds, including while stationary, on superelevated curves up to 7 in. above level.

6.2.7 Cant Deficiency

DRAFT

Rolling stock shall be capable of operation at maximum authorized track speed on curves with a cant deficiency of up to 5 in, per the requirements of 49CFR 213.329.

6.2.8 Operation on Adjacent Tracks

Rolling stock shall be capable of safely passing other trains that are operating at maximum authorized track speed in either direction on adjacent tracks with 12 ft centers.

6.2.9 Operation through Crossovers

All rolling stock shall be capable of negotiating a number 8 crossover between two tracks with centers 12 ft apart, coupled to other equipment, without damage.

6.3 Compatibility with Station Platforms

6.3.1 Height Above Top of Rail

Revenue passenger cars shall be compatible for loading and unloading of passengers and supplies while adjacent to platforms that range from top of tie (8 in. below top of rail) to 18 in. ATOR. Platforms may be located on tangent or curved track, with or without superelevation.

6.3.2 Distance from Track Centerline

Station platform edges may be as far as 64 in. from center of track.

6.3.3 Accessible Mini-High Platforms

Some stations are equipped with mini-high level accessible platforms for use with an equipment-based bridge plate. These accessible platforms are located 21 in. ATOR and 95 in. from centerline of track. See Figure 2.

Rolling stock utilizing non-powered bridge plates or ramps for accessibility must interface with these platforms in accordance with ADA requirements.

6.3.4 Reference Documents – Station Platform Standards

1. Figure 1: BNSF Plan 2509, Sheet 3, *Passenger Platform.*
2. Figure 2: Metrolink *Accessible Station Platform Design Standard.*

DRAFT

7.0 Equipment Standards

7.1 Electrical

7.1.1 HEP - Voltage, Cycle, and Phase

All rolling stock shall operate on head-end power system with the following characteristics:

- Voltage: 480 VAC nominal (tolerance range from 408 to 528 VAC)
- Frequency: 60 Hz nominal (tolerance range from 56 to 64 Hz)
- 3-phase
- Pin assignments for HEP supply and control circuits are shown in Table 1.

7.1.2 Communication Trainline Pin Assignments

The Department standard for Communication trainline pin assignment is shown in Table 2.

7.1.3 MU (locomotive control) Trainline Pin Assignments

The Department standard for MU (locomotive control) trainline pin assignment is shown in Table 3.

7.1.4 Trainline Cable and Receptacle Standards

Car-to-car and car-to-locomotive trainlines shall conform to APTA RP-E-017-99, *Recommended Practice for 27-Point Control and Communication Trainlines for Locomotives and Locomotive-Hauled Equipment.*

Trainlines and receptacles shall be located on the end plate of passenger rail cars in accordance with APTA RP-E-017-99 figure 2, the "Intercity Car" configuration and in the dimensional locations shown in APTA RP-E-017-99 figure 4A.

DRAFT

7.2 Locomotive Air Supply

7.2.1 Brake Pipe - Operating Pressure

Maximum brake pipe air pressure is 110 psig (full release).

7.2.2 Main Reservoir - Operating Pressure range

Maximum main reservoir air pressure in normal operation is 140 psig.

Minimum main reservoir air pressure in normal operation is 80 psig.

7.2.3 Air Quality Standard

Air will be delivered from the locomotive compressed air supply in accordance with APTA Standard SS-M-011-99, *Standard for Compressed Air Quality for Passenger Locomotive and Car Equipment.*

7.3 Carbody Dimensions

Carbody dimensions shall be designed and measured with the rail vehicle at load condition AW0, unless otherwise specified.

7.3.1 Static and Dynamic Clearance

All rolling stock shall comply with the static dimensional and dynamic envelope clearances specified on Amtrak Bi-Level Clearance drawing B-066-00050, revision A, under all load conditions AW0 through AW2.

7.3.2 End Door Pass-Through/Floor Height

7.3.2.1 For bi-level rail passenger cars

- Upper floor height and floor height at the end door passageway shall be 104.5 in. ATOR (+/- 0.5 in.).
- The height of the lower floor and threshold for side entry doors shall be 18 in. ATOR (+/- 0.5 in.).

7.3.2.2 For single-level rail passenger cars

Floor height and end door passageway height shall be 51 in. ATOR (+/- 0.5 in.).

7.3.3 Coupler Height

Coupler height shall be in conformance with 49CFR 231.31.

Coupler height shall be maintained at a nominal 34.5 in. ATOR, measured at the center of the coupler knuckle when car is uncoupled.

DRAFT

7.4 Braking Performance

7.4.1 Full Service Brake Rate

Trains consisting of five cars at load condition AW2, and one locomotive shall have a minimum full service braking rate of 1.35 mphps at 125 mph increasing to and maintaining an average of 2.0 mphps at speeds of 70 mph or less. The instantaneous full service deceleration rate shall not exceed 2.75 mphps nor be less than 1.25 mphps. Locomotive dynamic or blended braking shall not be used to calculate brake rates.

7.4.2 Emergency Brake Rate

The emergency brake rate shall not be less than 2.5 mphps at speeds below 70 mph.

7.4.3 Jerk Rate

The maximum jerk rate (change in the rate of deceleration) during initial service brake application shall be limited to 1.5 mphpsps under all normal braking conditions. There shall be no jerk rate limit for emergency brake applications.

7.5 Standard Amtrak Coach Key

All locks, latches and access control devices that are capable of locking shall be designed for use with a standard Amtrak coach key. This key shall be compliant or equivalent with the following references:

- Amtrak drawing B-144, rev B
- Amtrak AMMS part number 24-601-07430
- J L. Howard style 2555

8.0 Environmental Conditions

All rail rolling stock, and associated components, shall be designed to be fully operational under the following environmental conditions, in all possible combinations of conditions, without failure, degradation of component functionality, condition, installation or maintainability. This requirement applies to all equipment:

- While under normal operating conditions in revenue service (normal).
- While in layover with wayside or head end power (layover).
- While in storage or transit with no internal or external power source (dead).

8.1 Ambient Exterior Conditions

8.1.1 General Atmospheric Conditions

All rail rolling stock, and associated components, shall be fully operational in the presence or absence of the following conditions:

- Strong direct sunlight
- Heavy rain, driven by wind
- High temperatures outside and inside the equipment
- Freezing conditions, including buildup of snow and ice
- Blown sand, dust, pollen, leaves and aerial debris
- Airborne salt from sea spray or snowmelt
- Wind gusts up to 90 mph

8.1.2 Chemical and Electrical Contaminants

- Oily exhaust from diesel locomotives
- Cleaning agents and lubricants
- Ferrous dust from rail, wheel and brake shoe wear

8.1.3 Vehicle Washing Facilities

- Acid and alkaline wash water composition
- High-pressure rinse spray and rotating brushes
- Specific technical characteristics of vehicle wash facilities are shown in Table 4.

DRAFT

8.2 Specific Atmospheric Conditions

All rail rolling stock, and associated components, shall be fully operational in the presence or absence of the following specific environmental conditions:

8.2.1 Temperature

- Outside ambient temperatures may range from -35°F to 150°F.
- Equipment may experience an ambient outside temperature change of up to 70°F (from cool to hot, or from hot to cool) in a 6-hour period while in service.
- The ambient temperature inside an unpowered rail vehicle may range from -35°F to 150°F.

8.2.2 Humidity

- Ambient atmospheric humidity ranges from 5% to 100%.
- Atmospheric moisture in coastal areas contains salt.

8.2.3 Precipitation

- Potential precipitation types include rain, hail, snow, ice and freezing rain.
- Peak precipitation may be as high as 6 in. of rainfall per hour.

8.2.4 Wind

- Wind speeds may range from still air to sustained gusts up to 90 mph.
- Wind direction is independent of train direction.
- Wind speed may be combined with train speed to create relative headwinds in excess of 200mph.

8.2.5 Elevation

Equipment must be fully functional at all elevations and barometric pressures from 200 ft below mean sea level to 9200 ft above mean sea level.

8.2.6 Dust, Dirt, Debris, etc.

- All rail equipment must be capable of normal operation in an environment with a high degree of wind-blown dust, such as the San Joaquin Valley. This dust may be found throughout the vehicle, including the interior.
- The dust in the San Joaquin Valley is composed of fine silica sand, silt, salt compounds (calcite, halite, gypsum), and ferrous iron dust from rails, wheels and brake shoes. This dust is highly corrosive, hard, and abrasive, and easily accumulates on surfaces coated with water, grease, oil, or other lubricants. It is also attracted to magnetic objects such as motors.

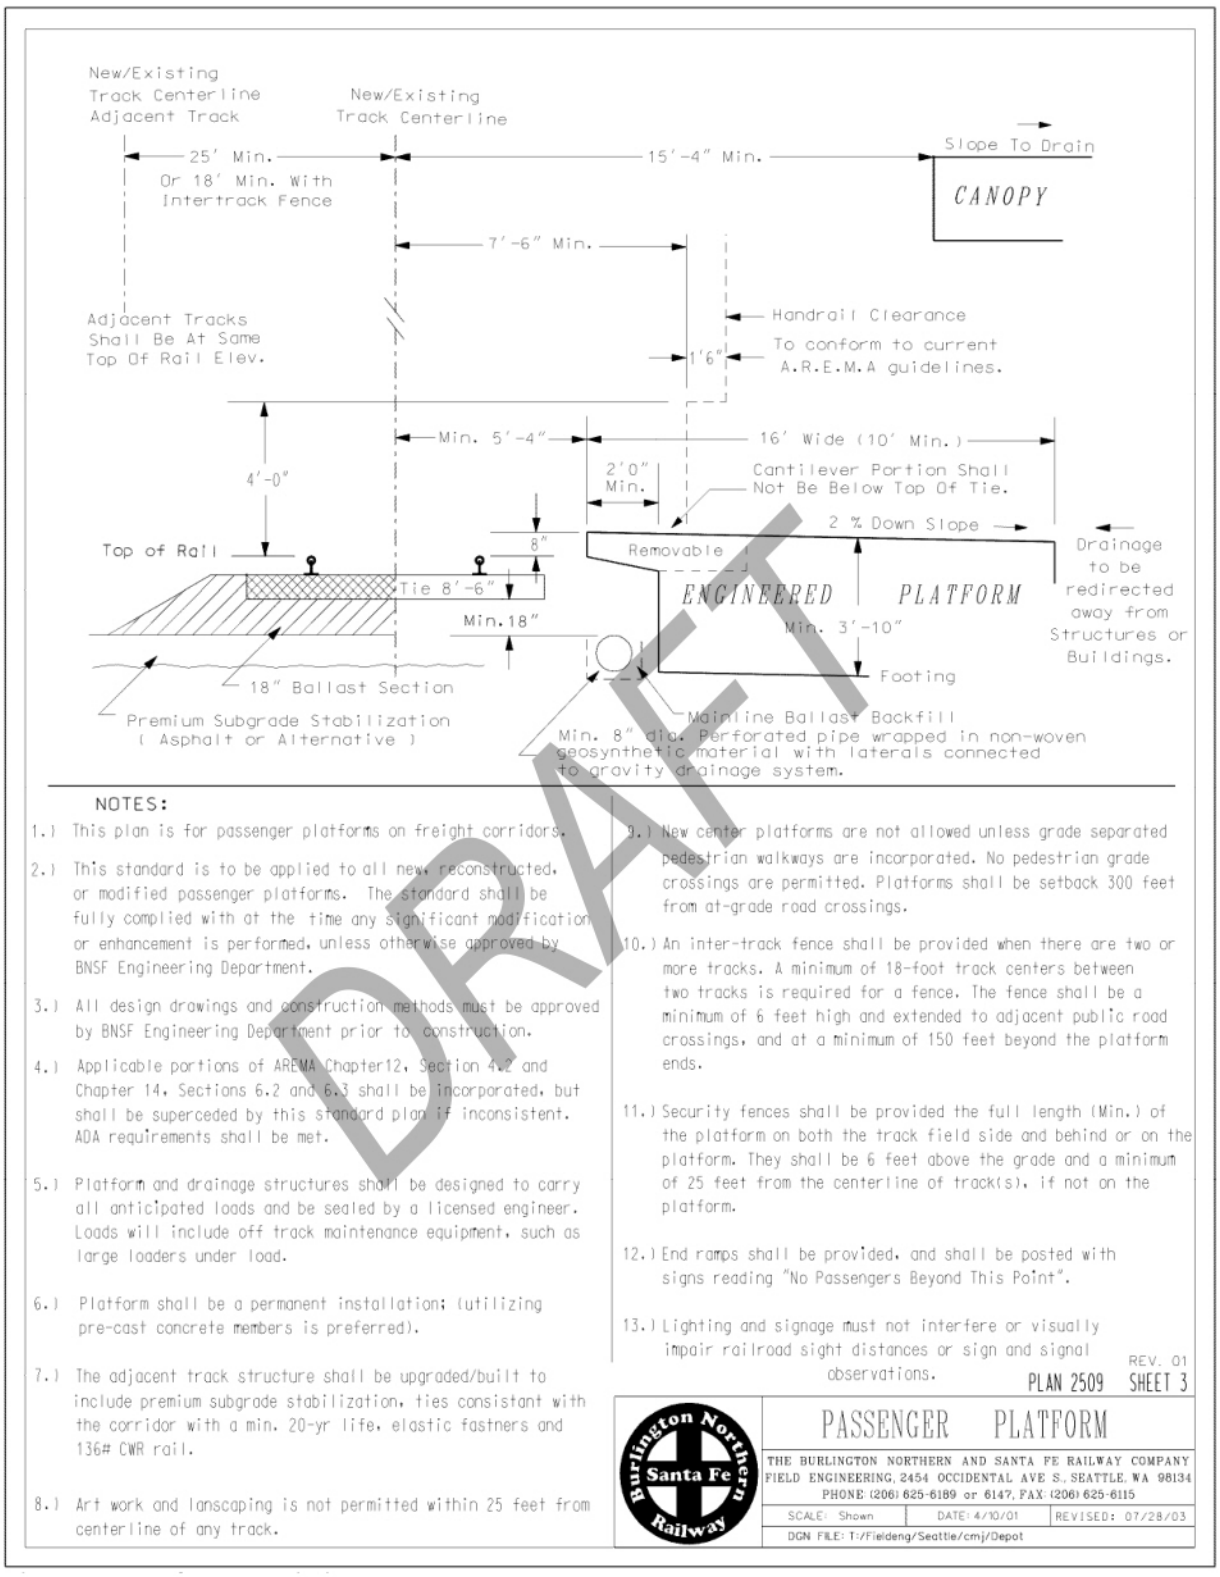
DRAFT

8.3 Vibration and Shock

8.3.1 Vibrational Acceleration Extremes – Trucks

Truck-mounted equipment shall be designed and manufactured to withstand long-term exposure to the following vibrational acceleration levels:

Truck Acceleration Parameter	Measured "G" Levels	Frequency (Hz)
Vertical	100	60 to 70
Lateral	100	380



8.3.2 Vibrational Acceleration Extremes – Carbody

Carbody-mounted equipment shall be designed and manufactured to withstand long-term exposure to the following vibrational acceleration levels:

Carbody Acceleration Parameter	Measured "G" Levels	Frequency (Hz)
Vertical	100	12 to 15
Lateral	100	1.5 to 2.0

DRAFT

Figure 1: BNSF Plan 2509, Sheet 3, *Passenger Platform*

NOTES:

1.) This plan is for passenger platforms on freight corridors.

2.) This standard is to be applied to all new, reconstructed, or modified passenger platforms. The standard shall be fully complied with at the time any significant modification or enhancement is performed, unless otherwise approved by BNSF Engineering Department.

3.) All design drawings and construction methods must be approved by BNSF Engineering Department prior to construction.

4.) Applicable portions of AREMA Chapter12, Section 4.2 and Chapter 14, Sections 6.2 and 6.3 shall be incorporated, but shall be superceded by this standard plan if inconsistent. ADA requirements shall be met.

5.) Platform and drainage structures shall be designed to carry all anticipated loads and be sealed by a licensed engineer. Loads will include off track maintenance equipment, such as large loaders under load.

6.) Platform shall be a permanent installation; (utilizing pre-cast concrete members is preferred).

7.) The adjacent track structure shall be upgraded/built to include premium subgrade stabilization, ties consistant with the corridor with a min. 20-yr life, elastic fastners and 136# CWR rail.

8.) Art work and lanscaping is not permitted within 25 feet from centerline of any track.

9.) New center platforms are not allowed unless grade separated pedestrian walkways are incorporated. No pedestrian grade crossings are permitted. Platforms shall be setback 300 feet from at-grade road crossings.

10.) An inter-track fence shall be provided when there are two or more tracks. A minimum of 18-foot track centers between two tracks is required for a fence. The fence shall be a minimum of 6 feet high and extended to adjacent public road crossings, and at a minimum of 150 feet beyond the platform ends.

11.) Security fences shall be provided the full length (Min.) of the platform on both the track field side and behind or on the platform. They shall be 6 feet above the grade and a minimum of 25 feet from the centerline of track(s), if not on the platform.

12.) End ramps shall be provided, and shall be posted with signs reading "No Passengers Beyond This Point".

13.) Lighting and signage must not interfere or visually impair railroad sight distances or sign and signal observations.

DRAFT

1.0 SCOPE

1.1 Purpose of Specification.

The purpose of this specification and related engineering drawings is to state the minimum technical criteria for the design, material selection, and construction of seat cushion assemblies and components acceptable for application into Amtrak owned and/or operated rail passenger vehicles.

1.2 Workmanship

The manufactured quality of all cushioning products and assemblies shall meet or exceed applicable Federal Standards and applicable industry standards and recommended practices in addition to those defined in this specification. All product suppliers, fabricators, and assemblers shall demonstrate their ability to manufacture products of the highest quality by providing, at the request of Amtrak, a copy of their Quality Assurance program in writing or provide proof of certification of ISO 9001:2008 or an equal industry wide quality assurance program.

1.3 Testing Requirements

1.3.1 Material Physical Properties

Manufacturer must submit a formal material specification showing material meets the criteria identified in this specification

1.3.2 Material Fire Safety Properties

Seat cushion assembly shall meet the criteria specified in Amtrak specification 352. A formal test report, signed by an independent testing laboratory technician and supervisor, identifying the manufacturer, product name or part number with all reportable data shall be forwarded to Amtrak prior to approval for use. All non-metallic parts must be tested. These tests must be performed by an independent testing facility certified to ISO 9001 or equal.

DRAFT

2.0 GENERAL

2.1 Description

Seat cushion assemblies described herein shall be manufactured for installation as coach seat bottom and back, sleeper seat/mattress bottom/back assemblies, sleeper headrest assemblies, armrest and leg rest assemblies single lounge bottom and back, diner booth bottom and back, and lounge bottom and back cushions to include:

- o Cushioning foam
- o Fire barrier fabric (if so designated)
- o Upholstery fabric or approved equal
- o Attachment straps and hardware
- o Hook and Loop attachment tape
- o Zippers

o Labels

Cushion assemblies may be purchased complete with cushioning foam and upholstery covers or as component sub-assemblies of cushioning foam with fire barrier fabric, fire resistant cushioning foam without barrier fabric, or upholstery covers complete with attachments and hardware.

2.2 Materials

The cover shall be constructed from the materials shown in appropriate Amtrak drawing. Material A will be used in the main center panel. Material B will be used in the bolsters, side boxing and aft visible areas. Non-visible areas of the cover may be constructed from nylon pack cloth. Covers must be designed to dress easily (zipper recommended) and such that the main seat surfaces are tight and wrinkle free. All A and B fabric surfaces must be laminated using a ¼" dax foam and a jersey backing material.

Lamination:

All visible surfaces must be made from a tri-laminate panels. The laminate is a heat set polymer web adhesive (Min 0.9 OZ/SQ YD) that allows the fabric to bend and breathe easily. The durability of the laminate is a key performance requirement for Amtrak and each vendor submitting a bid must be able to demonstrate that they have at least two years of experience in manufacturing laminated textile panels, they have a quality control systems to ensure repeatable performance, and their lamination panels have been tested under jounce and squirm conditions to 100,000 cycles with no visible delamination, puckering, crack marks, bubbles, or blisters. Tests must be conducted to Daimler Chrysler Test Specification PF-10254 Change A, S6.4 Jounce and Squirm or approved equivalent. Additionally, the laminate must meet the 12 second vertical burn flammability requirements of 14 CRF 25.853(a) Appendix F, Part I(1)(a)(ii) as defined in FRA 238.103 appendix B.

DRAFT

Alternate materials may be suggested but must be submitted to Amtrak Industrial Design for prior approval.

2.2.1 Woven Fabric

Woven fabrics used for seat upholstery shall be made of woven, transportation grade fabrics of a 90% wool and 10% nylon blend with a minimum weight of 12 ounces per square yard. The maximum fabric shrinkage shall be no greater than 2% in either the warp or fill direction. All woven fabrics shall be back-coated with a latex or equivalent coating material to prevent/reduce linear distortion. Alternative fabric construction and materials will be considered, however approval for their use is subject to Amtrak's Industrial Design Group review and written approval. The following testing criteria shall apply to woven fabrics:

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D-4966 (12KPA)	Abrasion Resistance Martindale	20,000 cycles min – no breaks
ASTM D-4034	Yarn Slippage	Warp/Fill – 25lbf. min
ASTM D-2262	Tear Strength (Tongue)	Warp/Fill - 6 lbf. min.
ASTM D 3597	Breaking Strength	Warp/Fill – 50lbf. min
ASTM D 3597	Color Fastness	Water-Class 4 min. Solvent – Class 4 min. Crocking – Class 4 min. Light – Class 4 min.

DRAFT

2.2 Materials

2.2.2 Vinyl Fabric

Fabric-backed vinyl fabrics used for seat upholstery shall be made of woven, transportation grade fabric-backed vinyl with a weight of 22 ounces per square yard min. Alternative fabric construction and materials will be considered, however approval for their use is subject to Amtrak's Industrial Design Group review and written approval. The following testing criteria shall apply to vinyl fabrics:

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D-5034	Tensile Strength	Warp - 65 lbf. min. Fill -60 lbf. min.
ASTM D-2261	Tear Strength (Tongue)	Warp - 10 lbf. min. Fill - 12 lbf. min.
ASTM D-1117	Shear Strength (Trapezoid)	Warp - 29 lbf. Fill - 29 lbf.
ASTM D-1117	Martindale Abrasion Test	250,000 double rubs with #8 cotton duck. – no wear through

2.2.3 Leather

Aniline dyed leather with a light texture.

Test Identification	*Test Identification*	*Test Pass/Fail Criteria*
ASTM d-3884	Abrasion	300 cycles, 500g H-18 wheels. No wear through
	Colorfastness	72 hr. exposure to UV light. 4 or better on the AATCC grey scale for color change.
ASTM D-4705	Tear Strength	12 lbf. min.

DRAFT

2.2.4 Synthetic Leather

Lantal XP is the Amtrak approved synthetic leather. Alternative synthetic leathers and materials will be considered, however approval for their use is subject to Amtrak's Industrial Design Group review and written approval. The following testing criteria shall apply to synthetic leathers:

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D-2261	Abrasion Resistance (500g, H-18 Wheel)	>1000
ASTM D2209	Tensile Strength	>3194 psi Warp/Weft Average.
ASTM D-5034	Breaking Force	>195 lbf Warp/Weft Average
AATCC 16	Light Fastness	Class 5
AATCC 8	Color Fast Crocking	Dry/Wet Grade 5

DRAFT

2.2.5 Fire Barrier Fabric (when employed)

Approved fire barrier fabrics are Tex Tech Industries TTI 8174 and Dupont Nomex 17253. Alternative fire barrier materials will be considered. Approval is contingent upon submittal of the following tests to Amtrak's Industrial Design group for review and written approval.

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D3884 (CS-10 wheel, 1000 gm wt.)	Abrasion Resistance	150 cycles @ 50% wear through
ASTM D2261	Tear Resistance	15 lbf (in both the warp and fill directions)
FTMS 191A Method 5122	Burst/Puncture Resistance	200 lbf

2.2.6 Cushioning Foam

2.2.6.1 Foam with Fire Barrier Cover

Cushioning foam employed in applications with fire barrier fabrics shall be high quality transportation grade flexible cellular resilient foam conforming to the following criteria:

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D3574, test B_1 (Sample size, 15" x 15" x 4")	Indented Force Deflection	Back Cushion Foam 25% IFD = 31 - 39 Bottom Cushion Foam 25% IFD = 41 - 49 Support Factor = 2.1 min.
ASTM D3574 test D	Compression Set at 50% deflection	10% max.
ASTM D3574, test E	Tensile Strength	IFD < 35TLN = 15 lbs/in^2 min. min. IFD > 35TLN = 15 lbs/in^2 min.
ASTM D3574, test F	Tear Resistance	2 lbs/inch min.
ASTM D3574, test H	Resilience	40 % min.
ASTM D3574, test A	Density	2.5 lbs/ft^3 min.

Cushion foam assemblies may be molded, or fabricated from buns or slab stock. Adhesives used to bond foam cut from slab stock must be fire resistant.

2.2.6.2 Cushioning Foam without Fire barrier Cover

Cushioning foam employed in applications without fire barrier covers shall be high quality transportation grade flexible cellular resilient foam conforming to the following criteria:

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D3574, test B_1 (Sample size, 15" x 15" x 4")	Indented Force Deflection	Back Cushion Foam 25% IFD = 31-39 Bottom Cushion Foam 25% IFD = 41-49
ASTM D3574 test D	Compression Set at 50% deflection	10% max.
ASTM D3574, test E	Tensile Strength	IFD <35, TLN = 12 lbs/in^2 min. IFD > 35, TLN = 12 lbs/in^2 min.
ASTM D3574, test F	Tear Resistance	2 lbs/inch min.

DRAFT

ASTM D3574, test H	Resilience	40 % min.
ASTM D3574, test A	Density	2.5 lbs/ft^3 min.

Cushion foam assemblies may be molded, or fabricated from buns or slab stock. Adhesives used to bond foam cut from slab stock must be fire resistant.

2.2.7 400D Nylon Packcloth

400D Nylon Packcloth fabric supplied by Associated Textile Mills may be employed as part of the upholstery covers on the cushion bottoms and backs in areas which are not exposed. No nylon fabric shall be exposed to view after the cushion is applied to the seat frame. Alternative materials and suppliers may be considered but will require the review and written approval of Amtrak's Industrial Design Group.

Test Identification	*Test Description*	*Test Pass/Fail Criteria*
ASTM D-5034	Breaking Strength	Warp -355 lbs. min. Fill - 275 lbs. min.

DRAFT

2.2.8 Snaps

Snap attachment, where employed, shall be nickel plated brass eyelet and bottom. Nominal size is 1/4.

2.2.9 Zippers

Zippers used to close upholstery covers shall be nominally 5/8" black chain with black slider and large pull tab. Zipper shall be metal.

2.2.10 Hook and Loop

1-1/2" wide Loop attachment tape shall be applied to cushion backs, and bottoms where required. All Hook and Loop attachment tape shall be applied by stitching defined in paragraph 3.1.

The color of the 1-1/2" wide Loop attachment tape on the backs of the backrest and bottom cushions may be selected by discretion of the manufacturer. The color of the 3/4" wide Hook tape attached to the coach seat headrests shall be as defined on applicable Amtrak drawings. Amtrak shall be consulted for advisement of color of all Hook or Loop tape applications which have not been specified on document drawings or applicable Amtrak specifications.

Aplix is an approved supplier for smoke, flame and toxicity approved Hook and Loop tape.

2.2.11 Nylon Straps – Astrup is an approved supplier.

Attachment straps shall be 3/4" wide woven nylon tape.

2.2.12 Eyelet

Eyelets where used shall be brass with plain washer face, .315" inside diameter, Astrup code 233221-1 or equal

2.2.13 Thread

All thread employed to attach fabrics, zippers, straps, and hook & loop shall be Nylbond nylon thread #69 (or equal). The thread color shall either compliment or contrast the finish upholstery fabric. Samples of finished upholstery seams shall be forwarded to Amtrak for approval of thread color.

Serging thread shall be spun 50/3 spun polyester thread (or equal).

All thread employed in the construction of the fire barrier cover shall be 100 percent DuPont Kevlar # 69.

DRAFT

3.0 CONSTRUCTION

3.1 Stitching and Seaming

All upholstery seams shall be constructed per Federal Standard 751a, general seam type SS, stitch type 301.

Back tacks are required at the beginning and end of every stitch run and must be a minimum of 3 stitches.

Seams not requiring a decorative top stich will have a 3/8” hem and be type SSa.

Seams requiring a decorative topstitch will have a 3/8” hem with a 3/16” top stitch and be type LSq.

See latest revision of approved Amtrak drawing for locations requiring top stitch and the side of the seam on which the top stitch is visible.

When the Amtrak cushion design requires horizontal bars on both the back and bottom covers. The aesthetic appearance of these features is critical and as such, these features must be tooled and sewn in an automated systems. Marking and hand sewing is not acceptable. Vendors submitting bids

must demonstrate to Amtrak their computerized sewing system to ensure these lines are consistent and repeatable.

3.1.1 Woven to woven fabric joints

All finish cover upholstery seams shall be constructed employing Type SSa-1 seams with one row of flat stitching and one row of top stitching, 6 stitches per inch min.

3.1.2 Zipper Attachment

All zippers shall be attached with a Type SSa-1 seam, a single row of stitching, 6 stitches per inch min. Ends must be “locked”.

3.1.3 Hook and Loop@ Attachment Seam

All Hook and Loop attachment seams shall be seam type SSa-1, single row of stitching, 6 stitches per inch min. Stitching thread shall be Nylbond #69. Nylon thread (or equal). Color to match fabric.

3.1.4 Fire Barrier Cover Construction

Method A: All fire barrier cover attachment seams on seat cushion assemblies shall be lock stitched, single row of stitching, 7 stitches per inch min. Stitching thread shall be 100 percent Kevlar, #69. Final joint (joint remaining after cushioning foam is inserted into cover) may be bonded rather than stitched providing a flap with a 2" minimum overlap is employed. Approved fire barrier fabrics for method A are Tex Tech Industries TTI 8174 and Dupont Nomex 17253.

Method B: Foam must be fully encapsulated in protective fire-blocking material, TexTech 7725R or equivalent. Fire-blocking must be firmly affixed to foam through adhesive process with water based eco-friendly adhesive such as Simalfa 321FR or equivalent such that all seams overlap a minimum of 1” and there are no puckers or wrinkles greater than ¼” high. All puckers or wrinkles in fire-blocking must be such that they will lay flat and not be visible once the fire-blocked assembly is dressed. To protect the fireblock and ensure the longevity of the fire-blocked assembly, a ballistic nylon (420 denier nylon pack cloth or equivalent) wear strip must be adhered inside the aft insert channel that engages with the seat plate. Any sewing on the fireblock must be accomplished using an approved Kevlar thread.

Alternate materials may be suggested but must be submitted to Amtrak Engineering for prior approval.

Alternative construction will be considered, for cushions other than seat bottoms, but will require Amtrak’s Industrial Design Group review and written approval.

3.2 Serging

DRAFT

All perimeters of fabric that fray must be serged per Federal Standard Number 751a, stitch type 504, 5 stitches per inch minimum using spun 50/3 spun polyester thread or equal.

3.3 Size - Tolerances

Overall finished size and dimensional tolerance for all cushions shall be as identified on the respective engineering drawing for each cushion type where available. Where no engineering drawings exist, or where dimensional tolerancing is not shown the following shall apply:

Length = +1/2", -0"
Width = + 3/8", -0"
Height = +1/4", - 1/8"

The above tolerancing shall be viewed as relative to the engineering drawings where applicable or the FAI (First Article Inspection) model where drawings are not available.

4.0 LABELLING

4.1 Upholstery Cover

All finished upholstery covers shall include an identification label. The label shall be constructed of Tyvek fabric paper and shall be sized to include the following information in 3/16" high lettering:

Amtrak - (Part description, i.e. back or Bottom)
SAP XX-XXX-XXXXX
Mfg. By XXXXXX
Mfg. P/N XXXX
Mfg. Date MO-DY-YR

The label shall be attached to the upholstery cover with stitching on two opposite sides of the label and shall be located on the under side near the nose of the bottom cushion and on the backside near the bottom of the back cushion. Labels shall be attached on the outside of the upholstery covers and readable without removing the cushion assembly from the seat. Label must be able to tolerate washing and still have legible text after washing.

4.2 Cushioning Foam Assembly

Cushioning foam and cushioning foam assemblies with a fire barrier cover shall be identified with the manufacturers name and date of manufacture (Calendar Quarter-YR or MO-YR) stenciled in 1" high lettering on the foam or fire barrier cover directly beneath the upholstery zipper.

5.0 WARRANTY

5.1 Upholstery Cover

DRAFT

All upholstery assemblies shall be warrantied for a period of two years against defects in material, workmanship and premature wear.

5.2 Cushioning Foam Assembly

5.2.2 Foam

All cushioning foam employed shall be warrantied for a period of 8 years from date of manufacture. The foam material under normal passenger service use shall exhibit no deterioration of the foam and during this period shall exhibit no loss of height in excess of 25 percent of its original height and the resilience as measured per ASTM D3574 test H shall not be less than 40 percent.

If failure occurs in the first through fourth years the manufacturer will replace cushions and refit the existing upholstery and fire barrier covers at no charge to Amtrak. The fifth and sixth year Amtrak will pay 50 percent of the foam replacement cost and 50 percent of the upholstery and fire barrier cover refit cost. The seventh and eighth year Amtrak will pay 75 percent of the foam replacement cost and 75 percent of the upholstery and fire barrier cover refit cost.

This warranty shall apply directly to the manufacturer of complete cushion assemblies.

6.0 DOCUMENTATION

Amtrak requires the manufacturer to supply a detailed parts list for each cushion assembly. This is required as part of the product approval process.

7.0 SUPPLIER QUALIFICATION and PRODUCT APPROVAL

In addition to meeting the Vendor Qualification requirements established by the Amtrak Materials Management Service Center the supplier shall demonstrate his ability to:

1. Manufacture products which are compliant with this and all relevant technical requirements of Amtrak.
2. Manufacture products which are of consistently high quality.
3. Manufacture products in the production quantities required by Amtrak.
4. Select materials which are compliant with all Amtrak specifications and FRA (Federal Railroad Association) standards.

As demonstration of his ability to do all of the above, the manufacturer shall provide the following evidence:

1. Manufacture and deliver to Amtrak one coach seat bottom and matching backrest cushion. Cushions shall be manufactured to the criteria depicted on an approved Amtrak drawing.

2. Forward to Amtrak duplicate copies of the manufacturers Quality Assurance Plan/Manual and the quality assurance organization chart. Amtrak will perform a Quality Assurance audit to qualify the supplier initially and further, reserves the right to perform similar such

DRAFT

audits as deemed necessary by Amtrak at periodic intervals. Additionally, prior to manufacture of a product, one Aas manufactured@ sample of each product shall be forwarded to the Amtrak Quality Assurance group who will perform a First Article Inspection (FAI) and grant product approval status of each manufactured product.

3. Forward a written report to Amtrak identifying and quantifying all of the equipment used to process, manufacture, and ship the subject products.
   This report shall include the quantity of manufacturing and administrative personnel and quantify the facility space employed in the manufacture, inventory of all related materials and products.

4. Forward copies of all test reports and material specifications identified in paragraph 1.3 Testing Requirements@ to Amtrak.

8.0 FIRST ARTICLE INSPECTION (FAI)

DRAFT

An FAI shall be required for all manufactured materials for New Parts, New Suppliers, New Tooling, or New Process. These categories are defined as follows:

- New Part: First shipment of newly released product or change to a released part resulting in a P/N and/or drawing / Spec revision change.
- New Supplier: When changing to a different supplier or adding a supplier as an alternate source for released parts.
- New Tooling: When hard tooling originally qualified is changed due to wear, damage, or change to part design.
- New Process: When the supplier makes a major change to their manufacturing process.

NOTE: OEM Supplier components purchased as “factory off the shelf” would normally be outside the scope of this procedure. A repeat of all or selected portions of the First Article Inspection may be required under the following conditions.

a) The original FAI results/report were disapproved
b) Design changes to, or software changes in the product or system
c) Changes in the production process or to any of the associated processes including changes in facilities, tooling or test equipment.
d) Changes in materials or parts and /or suppliers of parts, materials, components or acquired software used in the products or systems delivered
e) Establishment of new or movement of product lines
f) Production inactivity of more than 1 year
g) After a critical tool or piece of equipment has been refurbished, moved, modified or replaced

Timely availability of an FAI plan is essential to ensure that the appropriate level of Amtrak technical expertise is available for the FAI and that the individuals have sufficient prior information to inspect the Equipment. The supplier shall provide the following information to Amtrak at least 5 working days before a scheduled FAI:

1. A complete list of Equipment to be inspected as well as a bill of material. Identify each completed assembly along with the configuration in which it is to be presented.
2. A copy of the technical Specification for the Equipment and the Subcontractor's scope of supply.
3. A report by a recognized independent testing laboratory certifying that all materials used in the equipment comply with the 49 CFR Part 238 Appendix B requirements, as applicable.
4. An Amtrak approved Inspection & Acceptance Test Procedure and an Amtrak approved Qualification Test Procedure to which the equipment will be inspected. A fit, form and functional test shall be required as part of the FAI.
5. All manufacturing variations of specified materials that vary in color, texture, pattern, etc., shall be presented, for approval by Amtrak, at FAI. Samples of acceptable variation extremes will be retained for reference in future inspections.
6. Should any of the above documents be incomplete or otherwise unacceptable to Amtrak, this shall be grounds to delay the FAI until they are made right. The burden of any delay shall be with the Supplier.
7. The FAI sample shall be retained by the equipment manufacturer at a minimum 90 days after the warranty expiration date on the last produced piece. This FAI sample needs to be clearly identified as such with manufacturing date on the label.

9.0 CHANGE MANAGEMENT

Amtrak requires its Suppliers to inform Amtrak of any Product or Process changes that they would like to implement. Formal acceptance by Amtrak is mandatory before this change request can be considered as approved.
Process modifications include but are not limited to:

- Relocation of the production site (manufacturing transfer),
- Production process,
- Tools change,
- Material change,
- Subcontractors change.

Configuration management of the Product is the Supplier’s responsibility.
Any change with an impact on Amtrak and/or the Contract requirements must be reviewed and approved by Amtrak prior to implementation.

1 Amtrak NRCC / APTA 340 wheel tread profile provides 75 +/- 2.5 degrees of flange angle, similar to APTA 340 wheel profile.

2 Amtrak NRCC / APTA340 Wheel Profile is based on Amtrak drawing of "AMTK-NRCC Wheel Profile" dated 02/10/02. Wheel acceptance gage (W846-1) or wheel contour gage (W846), made by Winchester industries, can be used to check the wheel tread profile (Amtrak SAP numbers 5000005041 and 5000005040 respectively)

*NRCC- National Research Council of Canada

CONFIDENTIALITY - CONTRACTORS SHALL KEEP CONFIDENTIAL ALL INFORMATION, DRAWINGS, SPECIFICATIONS, OR OTHER DATA FURNISHED BY AMTRAK, OR PREPARED BY THE CONTRACTOR, OR SUB-CONTRACTOR, THEY SHALL NOT DIVULGE OR USE SUCH INFORMATION, DRAWINGS, SPECIFICATIONS OR DATA FOR THE BENEFIT OF ANY OTHER PARTY. CONTRACTORS SHALL NOT IN ANY MANNER ADVERTISE OR PUBLISH THE FACT THAT THEY HAVE FURNISHED, OR CONTRACTED TO FURNISH, TO AMTRAK THE GOODS OR SERVICES HEREIN MENTIONED WITHOUT PRIOR WRITTEN CONSENT OF AMTRAK.

THE AMTRAK DRAWING IS THE GOVERNING DOCUMENT, AND SUPERSEDES ANY LIKE INFORMATION ON REFERENCE DRAWINGS, PART NUMBERS, SPECIFICATIONS, ETC.

NOTES:
1. ASSEMBLY MUST CONFORM TO THE APPLICABLE REQUIREMENTS SET FORTH IN THE LASTEST REVISION OF AMTRAK SPEC. 854 GENERAL SPEC. FOR VEHICLE DESIGN/BUILD COMPONENTS, AS THEY RELATE TO LABELING, WORKMANSHIP, MATERIALS AND TOLERANCES.
2. DIMENSIONS MARKED WITH THE INSPECTION SYMBOL ( ) ARE TO BE USED FOR THE FIRST ARTICLE INSPECTION. ALL OTHER DIMENSIONS ARE FOR MANUFACTURE OR ARE FOR REFERENCE ONLY.
3. PAINTING & SURFACE PREPARATION TO BE ACCORDING TO LATEST REVISION OF AMTRAK SPEC 328, SECTION 15.0 - COATINGS AND APPLICATIONS

3 SHEAR MOUNT ASSY – DIAPHRAGM

NOTES

1. FACEPLATE ASSY TOLERANCES & FINISH:
   FACEPLATE ASSY MUST BE FLAT WITHIN 0.10" TOTAL WHEN CHECKED ON A SURFACE PLATE.
   FOR THE ANTI-FRICTION PLATES:
   ROUGHNESS: 125 MU IN (MICRO INCHES) MAX.
   WAVINESS: .002" IN 2"
   STRAIGHTNESS: .060" MAX DEFLECTION ACROSS MAX. HEIGHT.
   .015" MAX DEFLECTION ACROSS MAX. WIDTH.
2. ALL RELIEF CUTS TO BE WELDED 100 PERCENT PENETRATION.
3. WELD AREAS TO BE FLUSH ON BOTH SIDES – GRIND IF NECESSARY. 100 PERCENT PENETRATION IS REQUIRED.
4. FINISH: U.S.S. #3 (100 GRIT) ON ALL EXPOSED SURFACES.
5. MAXIMUM ALLOWABLE FORCES AS MEASURED AT POINTS A & B WHEN COMPRESSED TO 8.38 ±.25 DIMENSION ARE:
   - $A_1 + A_2$ = 800 LB – 1050 LB
   - $B_1 + B_2$ = 200 LB – 300 LB
6. THE CONSTRUCTION OF THE DIAPHRAGM SHALL PRECLUDE THE ENTRY OF WATER AND DIRT INTO THE DIAPHRAGM & PASSAGEWAY, AS WELL AS INTO THE ASSEMBLY ITSELF.
7. MANUFACTURE DATE (MONTH/YEAR), VENDOR I.D., PART NUMBER & SERIAL NUMBER AND AMTRAK PART NO. 24 457 00709 TO BE STAMPED ON THE FLANGE OF THE FACEPLATE WHERE INDICATED, IN 1/4" HIGH NUMERALS.
8. WHEN REMANUFACTURED VENDOR TAG TO BE APPLIED WHERE INDICATED (NOT TO DISTURB ORIGINAL LABEL).
   THE PERMANENT LABEL WILL INCLUDE:
   SHOP NAME
   LOCATION
   TYPE OF REPAIR: REPAIR OR OVERHAUL
   DATE OF REPAIR (DAY, MONTH, YEAR)
9. ENVIRONMENTAL NOTE:
   SEE AMTRAK SPEC. 429 PARTS 1, 2, 3.1, 3.1.2 (VITAL), 3.2 & 3.2.1.
10. ALL DISSIMILAR METAL JOINTS SHALL USE SUITABLE TECHNOLOGIES TO PREVENT CORROSION.
11. ALL MATERIALS USED MUST MEET AMTRAK SPECIFICATION #352 LATEST REVISION.
12. SEE OEM DRAWINGS FOR ASSEMBLY DETAILS

NOTES:

1. THE STATIC OUTLINE (SHEET 1) REPRESENTS THE MAXIMUM STATIC DIMENSIONS OF THE VEHICLE. THE DYNAMIC OUTLINE (SHEET 2) REPRESENTS THE MAXIMUM DYNAMIC RANGE OF MOTION OF THE VEHICLE, AND IS NOT TO BE USED AS THE STATIC CONSTRUCTION OUTLINE OF THE VEHICLE. PROVIDED THE VEHICLE MEETS THE REQUIREMENTS OF THE DYNAMIC OUTLINE AND ALL NOTES, THE STATIC OUTLINE MAY BE USED AS THE STATIC CONSTRUCTION OUTLINE OF THE VEHICLE.

2. THE STATIC OUTLINE AND DYNAMIC OUTLINE IS REFERENCED TO THE PLANE OF THE TOP OF RAILS, FOR TRACK WITH AND WITHOUT SUPERELEVATION, FOR A VEHICLE HAVING A MAXIMUM LENGTH OF 85'-0", AND A TRUCK CENTER DISTANCE OF 59'-6".

3. THE VEHICLE MUST REMAIN WITHIN THE DYNAMIC OUTLINE UNDER ALL CONDITIONS, INCLUDING LATERAL AND VERTICAL MOVEMENT OF THE VEHICLE ON ITS SUSPENSION, ROLL INDUCED BY UP TO 6" SUPERELEVATION (WITH THE VEHICLE STOPPED OR IN MOTION), ROLL INDUCED BY THE DESIGN CANT DEFICIENCY, RANGE OF MOTION OF THE TILT SYSTEM (IF SO EQUIPPED), NORMAL WEAR, VARIATIONS OF LOAD, FAILURE OF ANY SINGLE SUSPENSION COMPONENT, AND ANY COMBINATION OF THESE CONDITIONS.

4. THE HORIZONAL DISTANCE FROM CENTER LINE OF TRACK, FOR VERTICAL DISTANCES BETWEEN 2.75" AND 1'-1" ABOVE TOP OF RAIL, MUST ALLOW FOR THE INSIDE AND OUTSIDE OVERHANG OF THE VEHICLE ON A 12°-30' CURVE, AS SHOWN ON SHEET 3 AND THE SHADED AREAS OF THE STATIC OUTLINE AND THE DYNAMIC OUTLINE. ALL VEHICLE STRUCTURE, EQUIPMENT, AND APPLIANCES, MUST REMAIN WITHIN THIS OUTLINE UNDER ALL CONDITIONS.

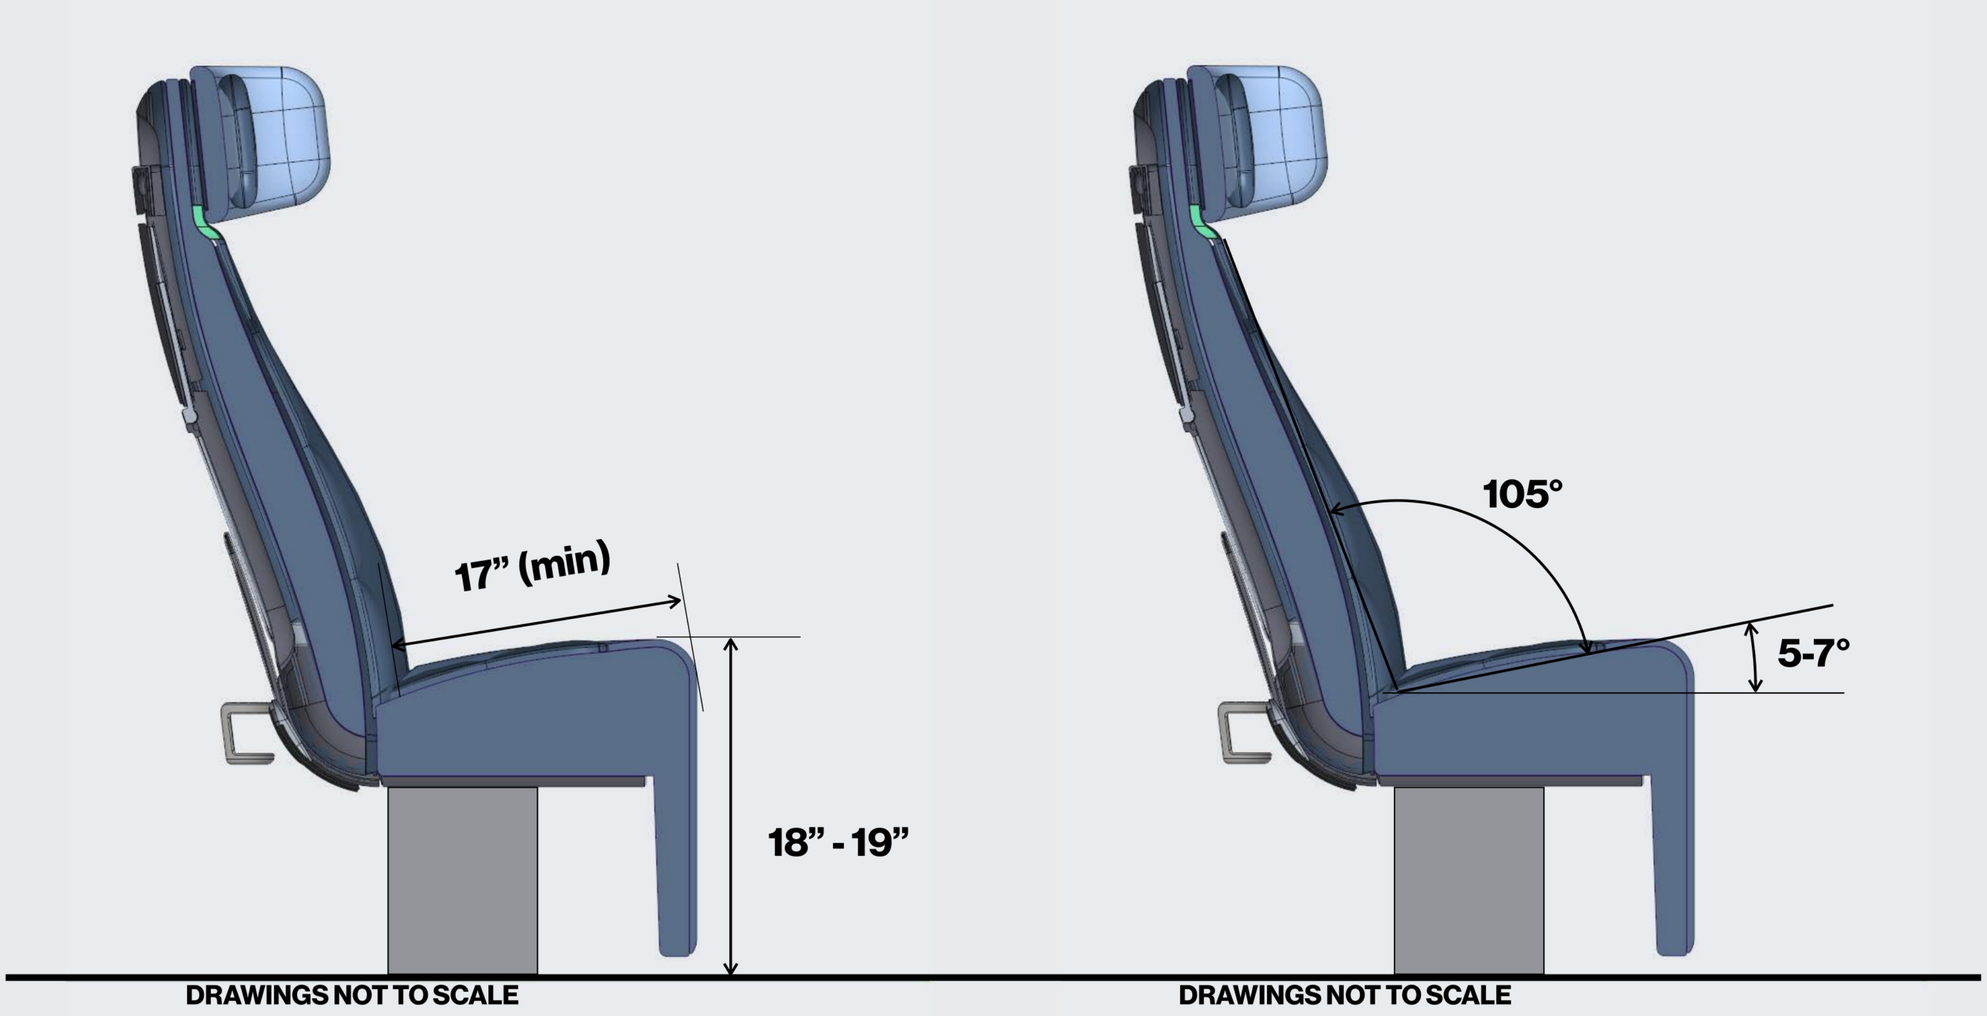
Coach Seat | General

The Coach Seat

The coach seat is designed to work as pairs with four seats across the width of the train. The seat should be optimized for both day and night time operations.

Features should be included that aid a better night's sleep or support passengers on longer journeys by maximizing comfort and available passenger space.



The minimum width of the seat between armrests should be 19.5” when arranged with a minimum aisle dimension of 22”.

A single seat option may also be required in smaller numbers to accommodate transfer seats and fulfill requirements around accessible paths in our accessible coach car.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Coach Seat | General

Seat Dimensions
All seat dimensions, cushion density/shore hardness will be subject to mockup review, a detailed human factors study and approval by Amtrak.

Coach Seat | Features

Headrest Pillow
Headrest pillow should be adjustable in height for a range of people sizes. It should have adjustable wings that fold outwards to adjust the width of the headrest.

Privacy Wing
Privacy wing on the seats should provide good separation between passengers at head level.

Seat Comfort
Seat cushions are contoured to aid seat comfort. Detailing will be evaluated and judged carefully during the design review process and will be subject to Amtrak approval.

Hand Grab
Every aisle seat should have a compliant accessible grab for better access along the aisle.

Reading Light
Positioned so as not to disturb neighbors during night time hours. Passengers should be able to adjust the lighting angle to cast light over the shoulder. Light intensity should have three settings.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Coach Seat | Features

20° Recline
The seat should have a minimum seat recline angle of 20 degrees.

Seat Controls
Seat controls for recline and leg rest should be located within easy reach of a customer. It should be possible to control the seat back recline and the calf rest independently.

Folding Armrests
2” wide armrest with a soft wrap around the top for comfort, and a hard-wearing bottom wrap and side cap for durability.

Seat Recline Mech
Seat recline mechanism should allow the seat pan to slide forwards so as not to burden the full recline onto the passenger behind.

Calf Rest Pad
Calf-rests tilt up for optimal leg support and comfort. The calf rest should be integral to the seat pan to avoid seat pinch.

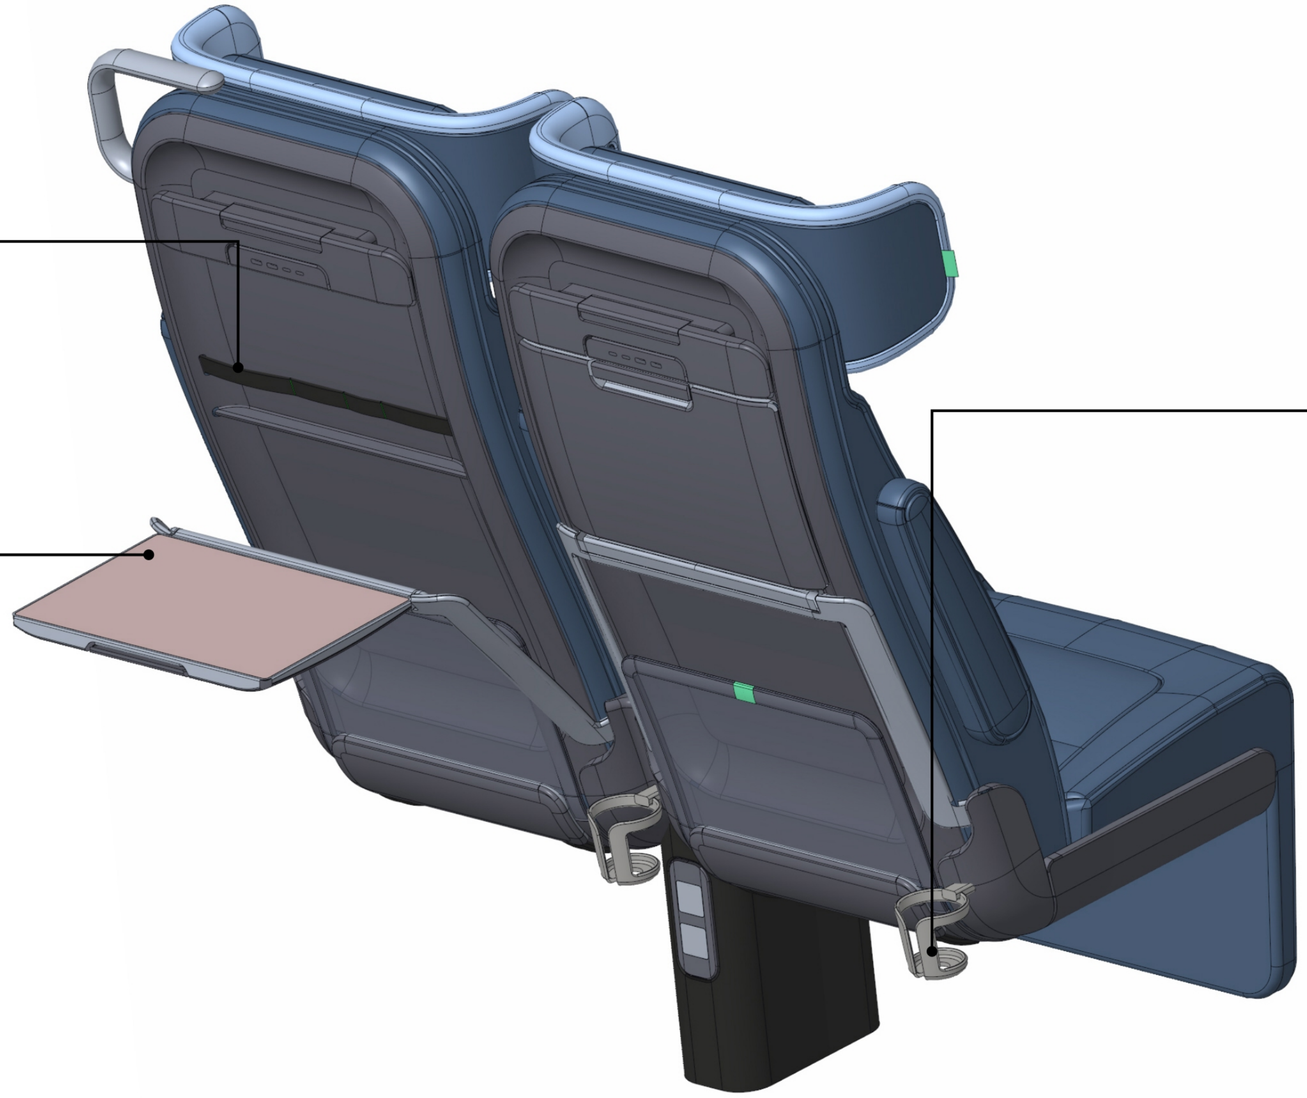
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Coach Seat | Features

Clean, Tidy Seat Back
The back of the seat should be designed to have an integrated appearance.

Flexible Pocket
A stowage pocket should be provided on the back of the seat.

Central Foot Pedestal
A central seat pedestal should be positioned to maximize foot clearance.



On-seat Power
Two USB ports should be provided on the back of each of the seats.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Coach Seat | Features

Stowage Lectern
Behind the fold down table a lectern edge and elastic restraint band suitable to allow customers to simply stow smart phones and other personal items behind table.

Fold out Table
A fold out table should have an independent pivot point so that its resting position will not be impacted by the recline of the seat in front.

Cup Holders
A metal cup holder should be positioned on the back of the seat. Cup holders should be placed in positions outside of knee and leg clearance and free from the movement of the seat.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

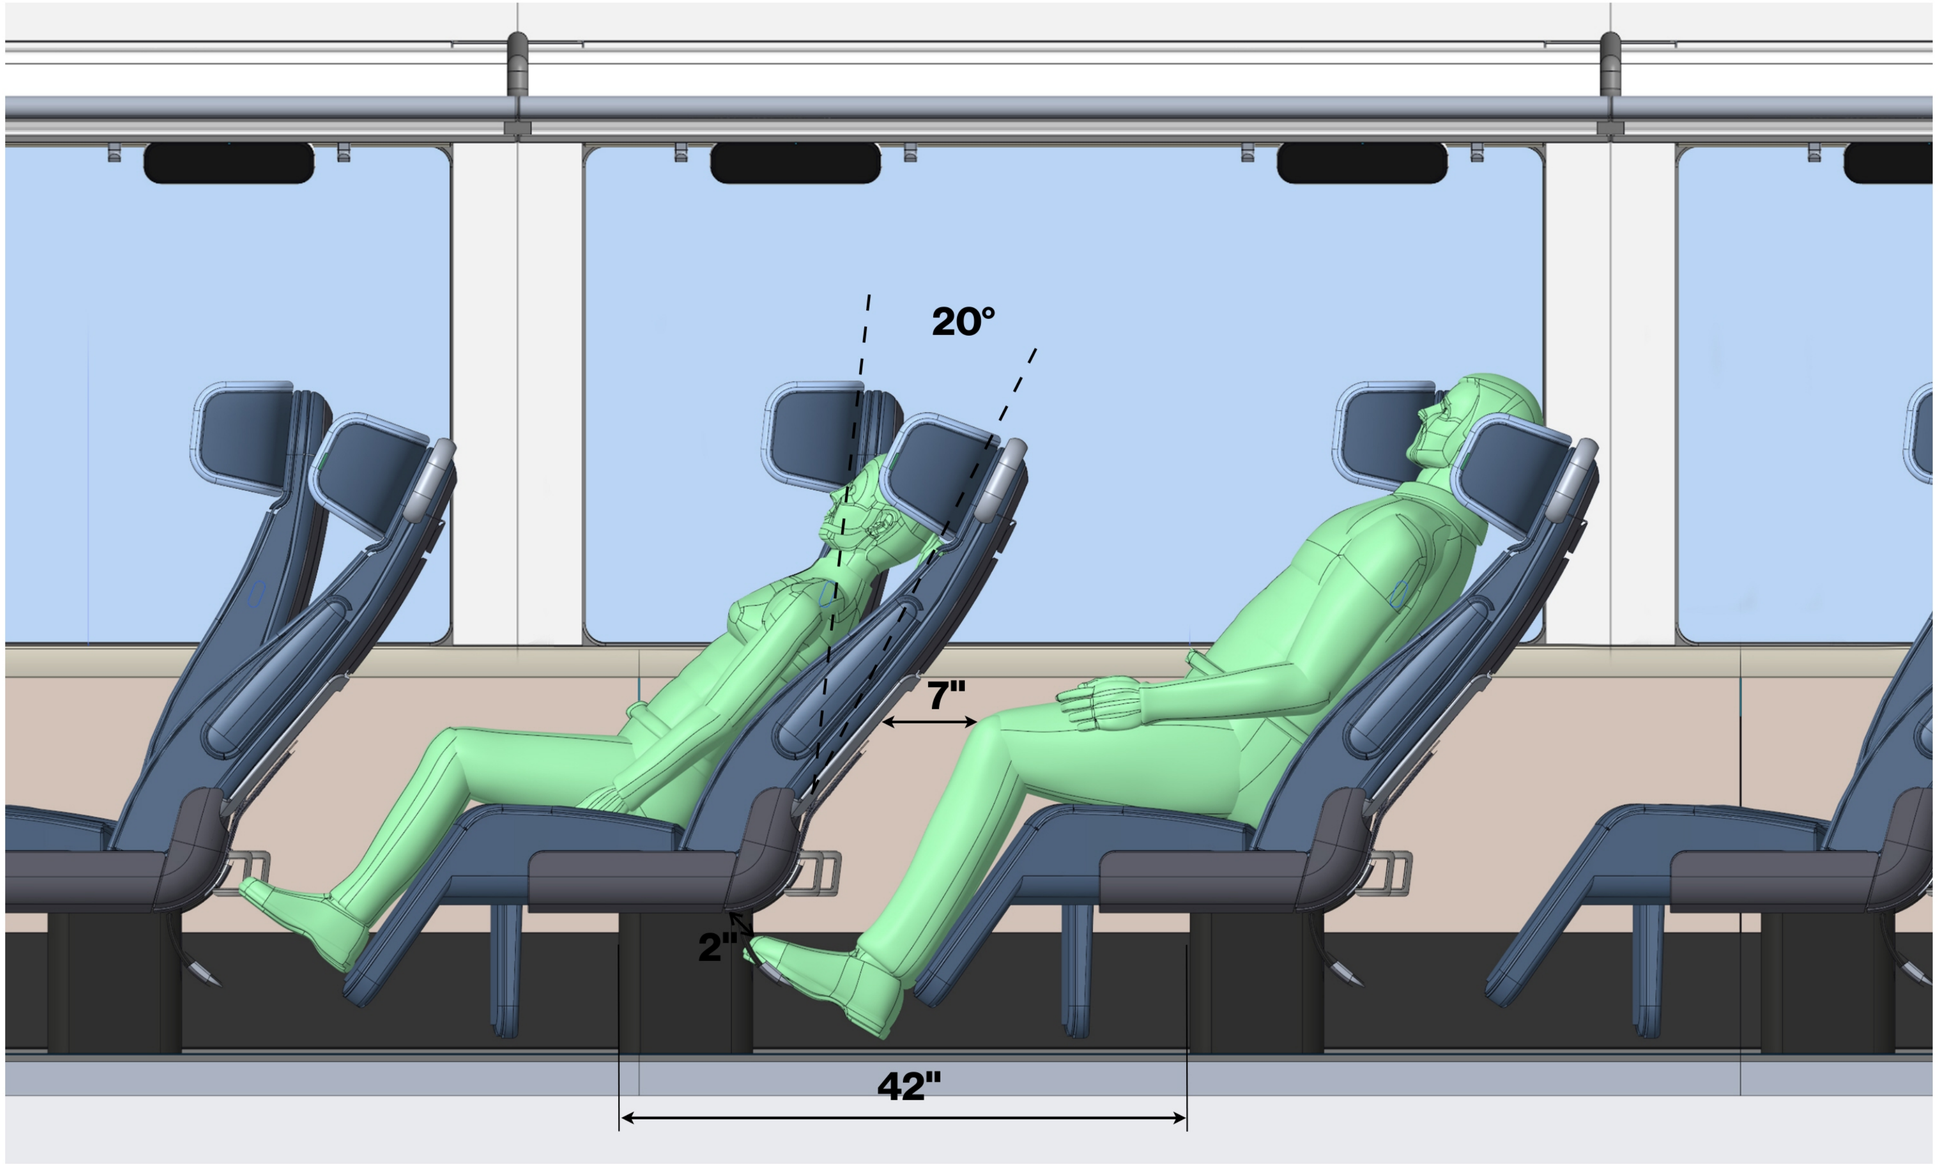
Coach Seat | Features

Device Holder
A fold out lectern edge with clip should allow the secure mounting of passengers' personal devices. The angle should be set so it is usable in both recline and upright positions.

Folding Table Extension
The table should be able to extend forwards telescopically. The usable surface should allow people to use a 15” laptop even when seat is fully reclined.

Fold-out Footrest
A fold-out adjustable footrest should be provided. There should be three set positions and the footrest should have a degree of angle adjustment.

Power Socket
Two power sockets should be located on the seat pedestal.



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Coach Seat | Features

Seat Dimensions
All seat dimensions, cushion density/ shore hardness will be subject to mockup review and approval by Amtrak.

Knee Clearance
Seats set at a 42” pitch must provide at least 7” knee clearance and at least 2” of feet clearance for a 95th percentile male in the seat's worst case scenario - i.e. when both seats are reclined.

5th Percentile Female **95th Percentile Male**

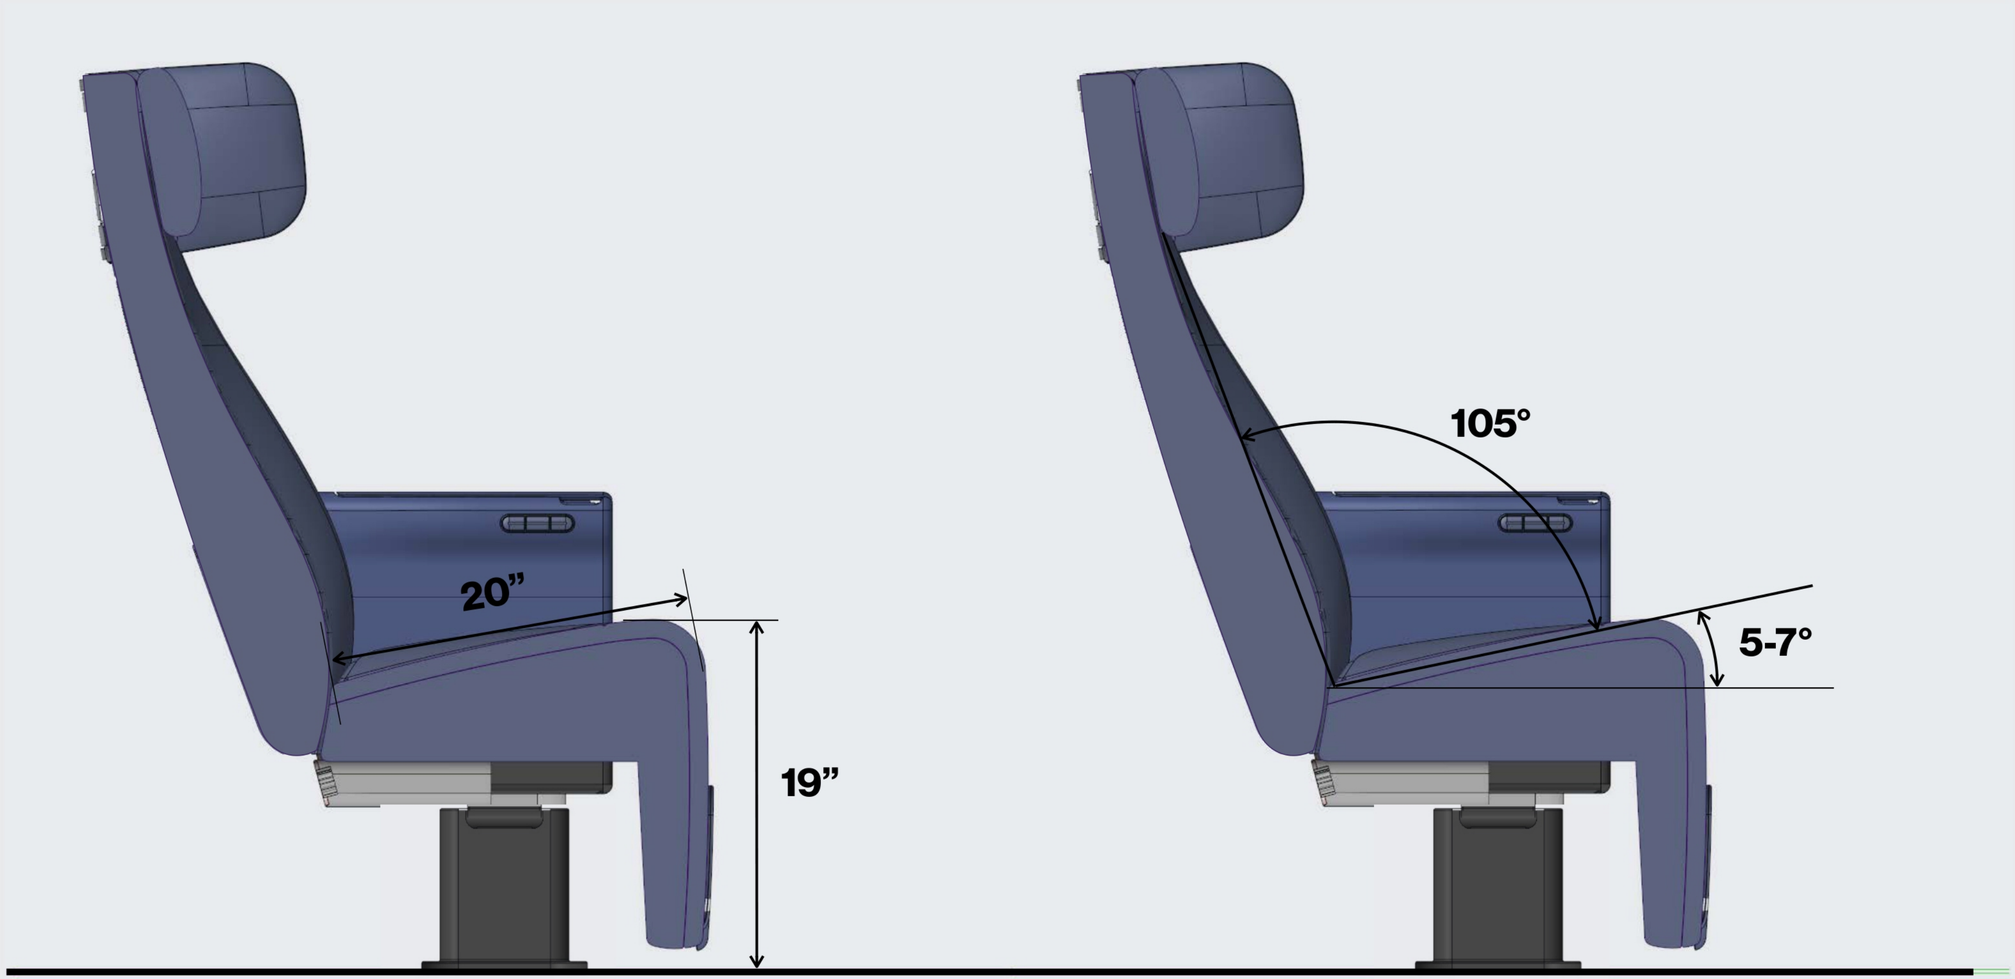
Premium Coach Seat | General

The Premium Coach Seat

The Premium Coach seat is designed as an elevated coach product. The seat can be arranged 2x1 across a 32” accessible aisle. The seat should be optimized for both day and night time operations.



All features should be optimized to provide a better night's sleep, maximizing comfort and the available space to support passengers on longer journeys.

The minimum width of the seat between armrests should be 22” when arranged with a 32” aisle.

Premium Coach Seat | General

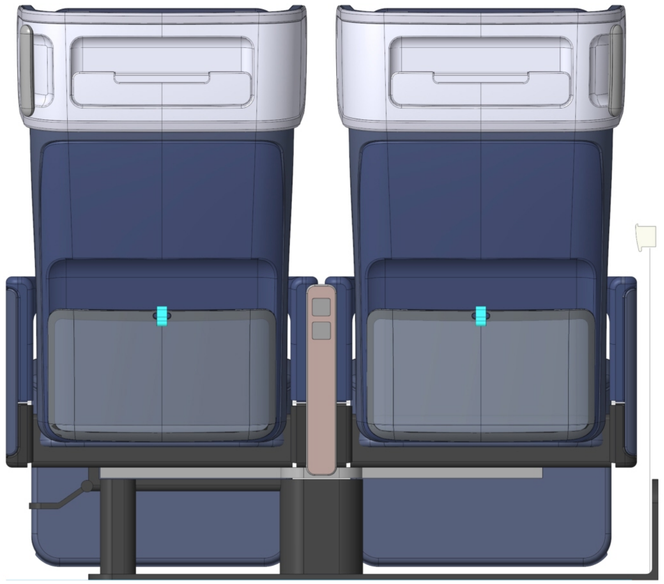
Lazy Z
The Premium Coach Seat has a 25° recline. Importantly the seat pan should also change angle with the recline by 10° lifting the knees upwards to create a cradle position. An adjustable calf rest angle of 43° supports the legs while a flip out foot rest with a telescopic movement of 10” supports the feet.

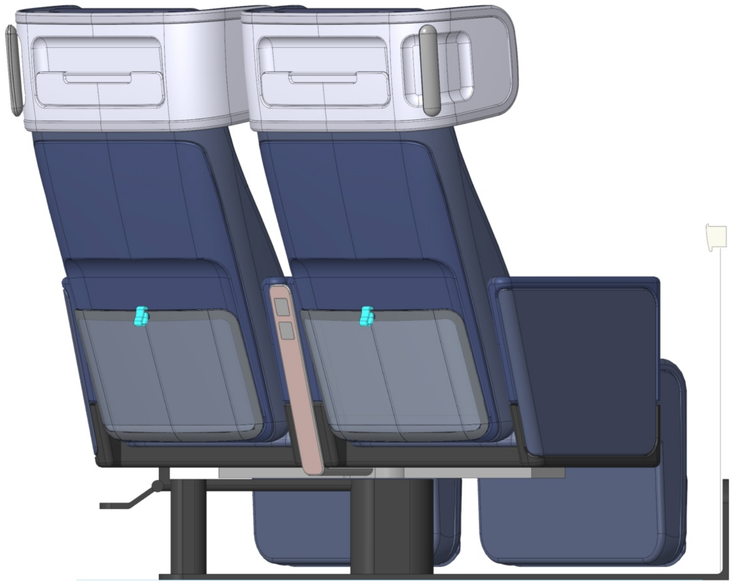
The seat should be optimized to maximize foot and leg clearance at a 48” pitch.

DRAWINGS NOT TO SCALE



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Premium Coach Seat | General



Rotating Seat Mechanism
The seat should rotate with the seat pan moving past the side wall when the seat is fully upright. The pivot location should be positioned in such a way to maximize the width of the seat and provide an optimized arrangement of the seats in both directions.

Rotating Seat Pedestal
The pedestal size and position should be designed to maximize foot space and space for small bags under the seat. The design under the seat should be free from protrusions and snag points and be easy to clean around the pedestal

Release Pedal
A foot release pedal should unlock the seat ready for rotation.

0° Rotation

Accessibility
All accessible spaces, turning circles and transfer seats will be subject to mockup review, user testing and approval by Amtrak.

Transfer Seats
Transfer seats shall have an RVAAC Accessible space allowance so people who choose to transfer from their wheelchairs to a seat have free and easy access to complete this maneuver.

First Row Seating
First row seating should have the same provisions and features as all other seats, including at seat power, stowage pockets, tables and footrests. In the case of rotating seats these shall be provisions at both ends of the cars so features are accessible in both seating orientations.

Folded Wheeled Mobility Device Storage

60” Turning Circles
60” turning circles should be provided at each accessible space per ADA and RVAAC guidelines.

Accessible Spaces
Accessible spaces should have the same provisions and features as all other seats, including at seat power, stowage pockets and tables. Accessible spaces should be protected in the case of rotating seats. A short partition should be provided that gives an option for wheelchair restraints. Accessible spaces should allow passengers to have a choice in direction of travel.

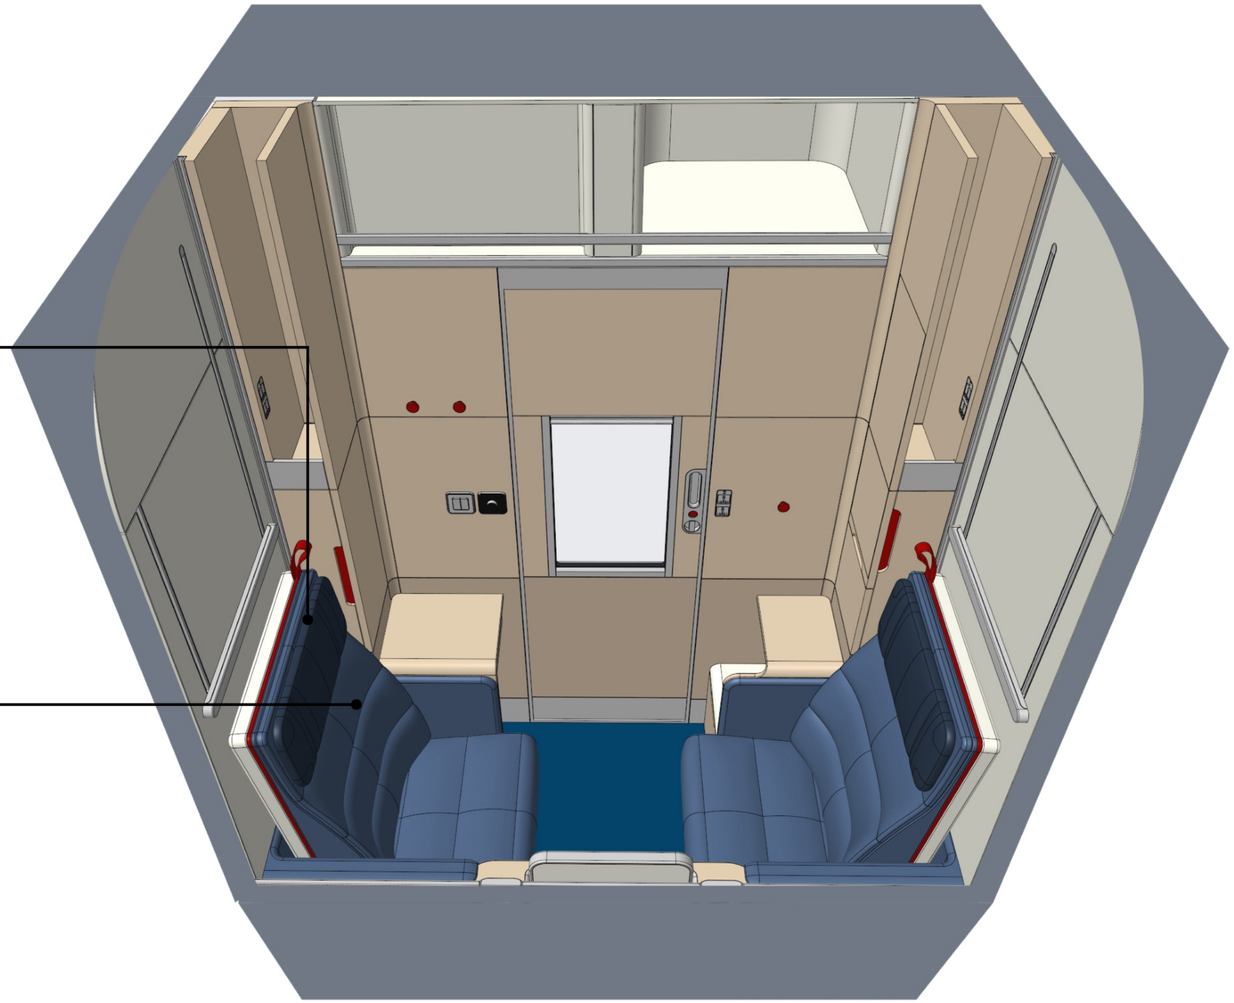
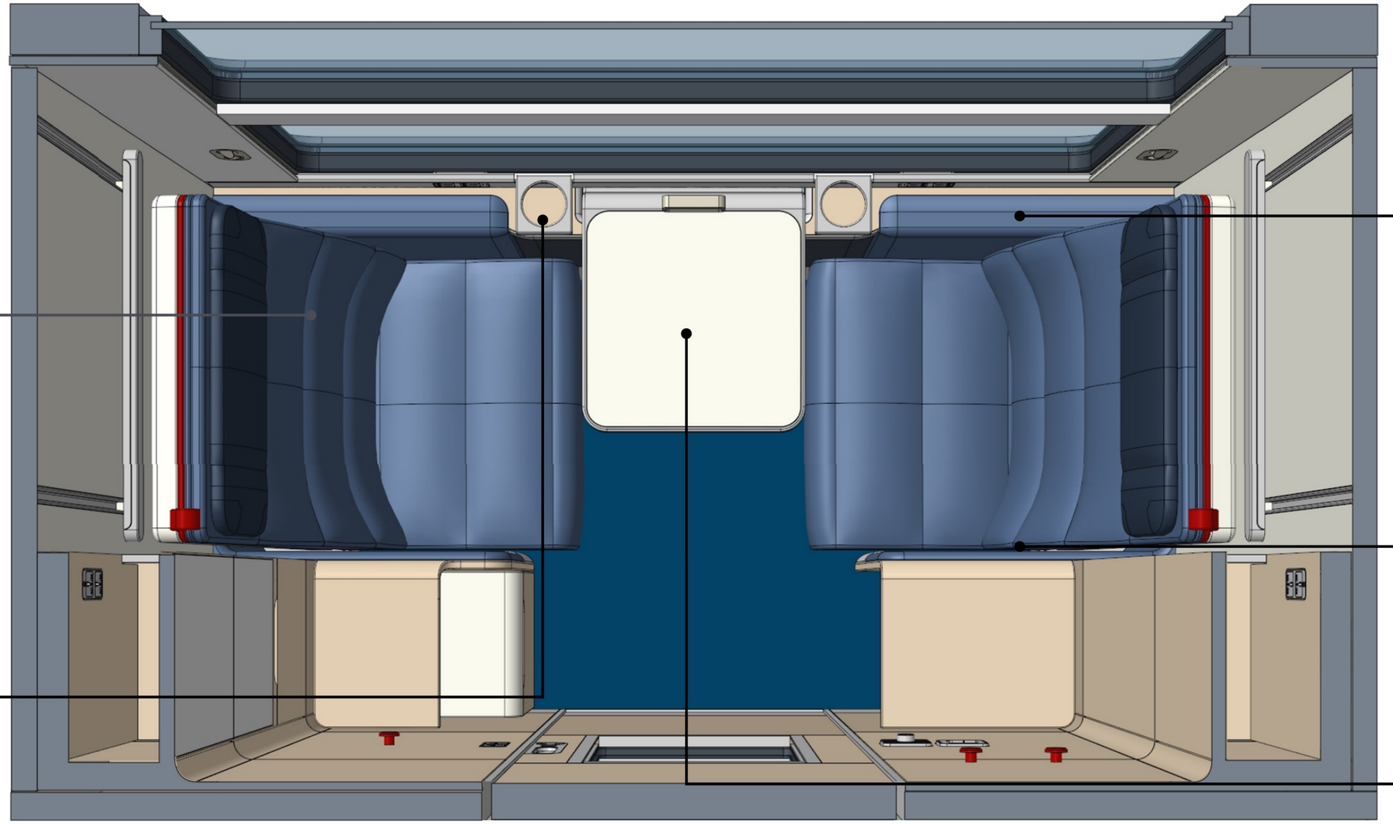
04 | Roomette



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Features

Roomette | Features



Seat Headrests
Seat headrest should be adjustable in height for a range of people sizes and have adjustable wings that fold outwards to adjust the width of the headrest.

Seat Comfort
Seat cushions should be contoured to aid seat comfort.

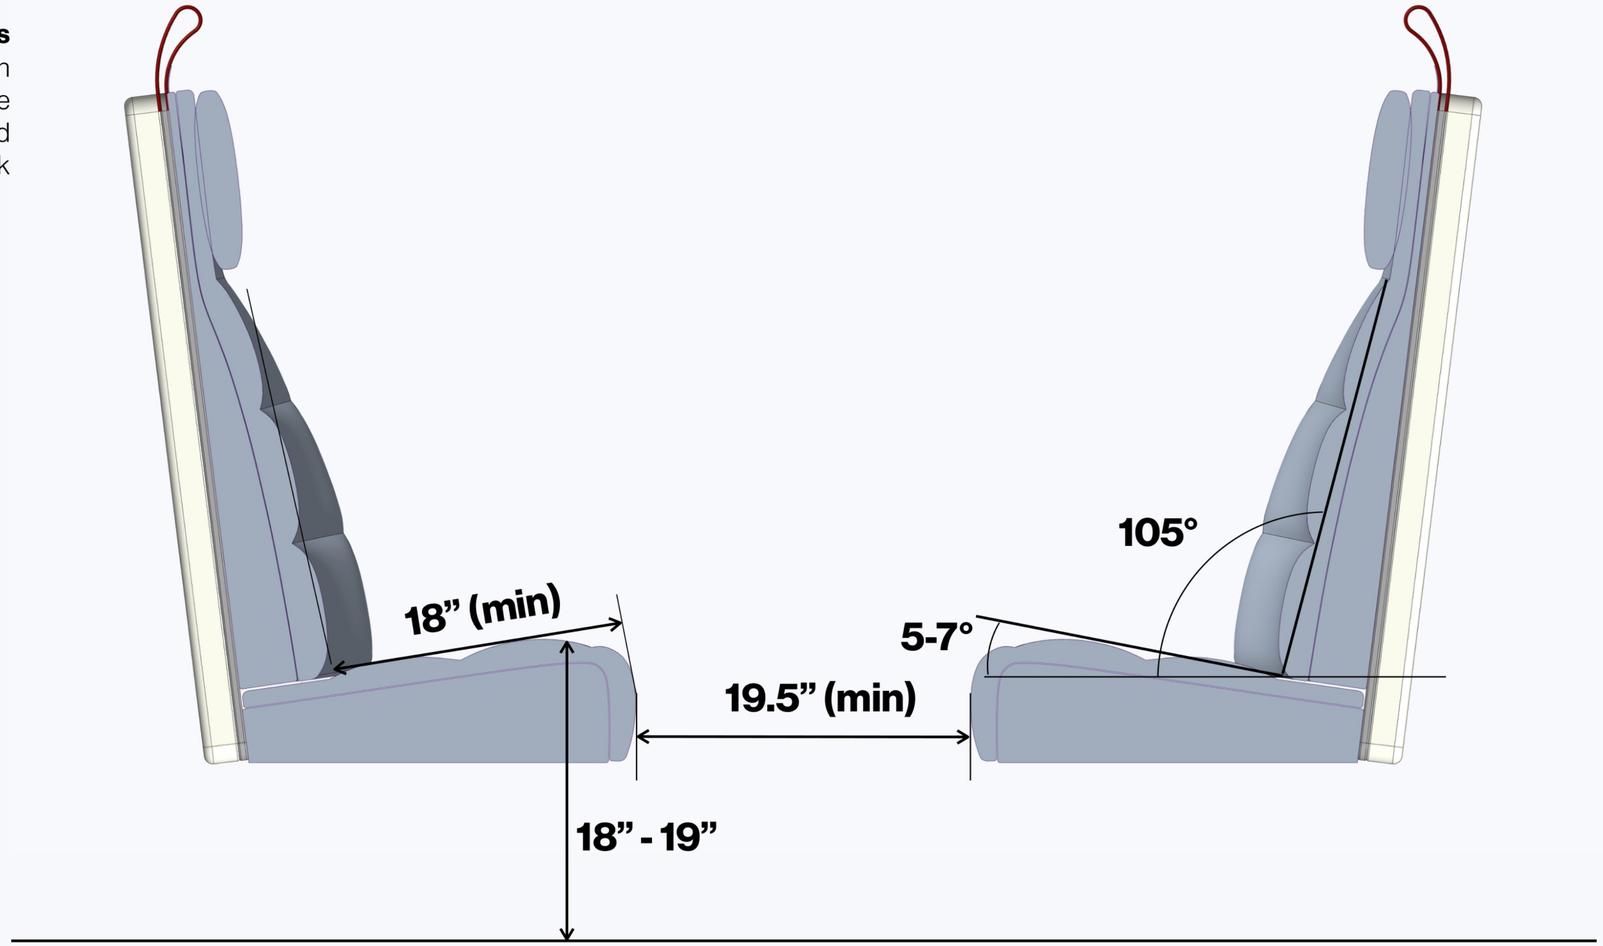
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Features

Seat Dimensions
A minimum seat width between inside surfaces of armrests should be a minimum of 26”.

Cup Holders
One for each passenger, located so people can use and access the cupholders from a seated position. Cup holders should be able fold away when not.

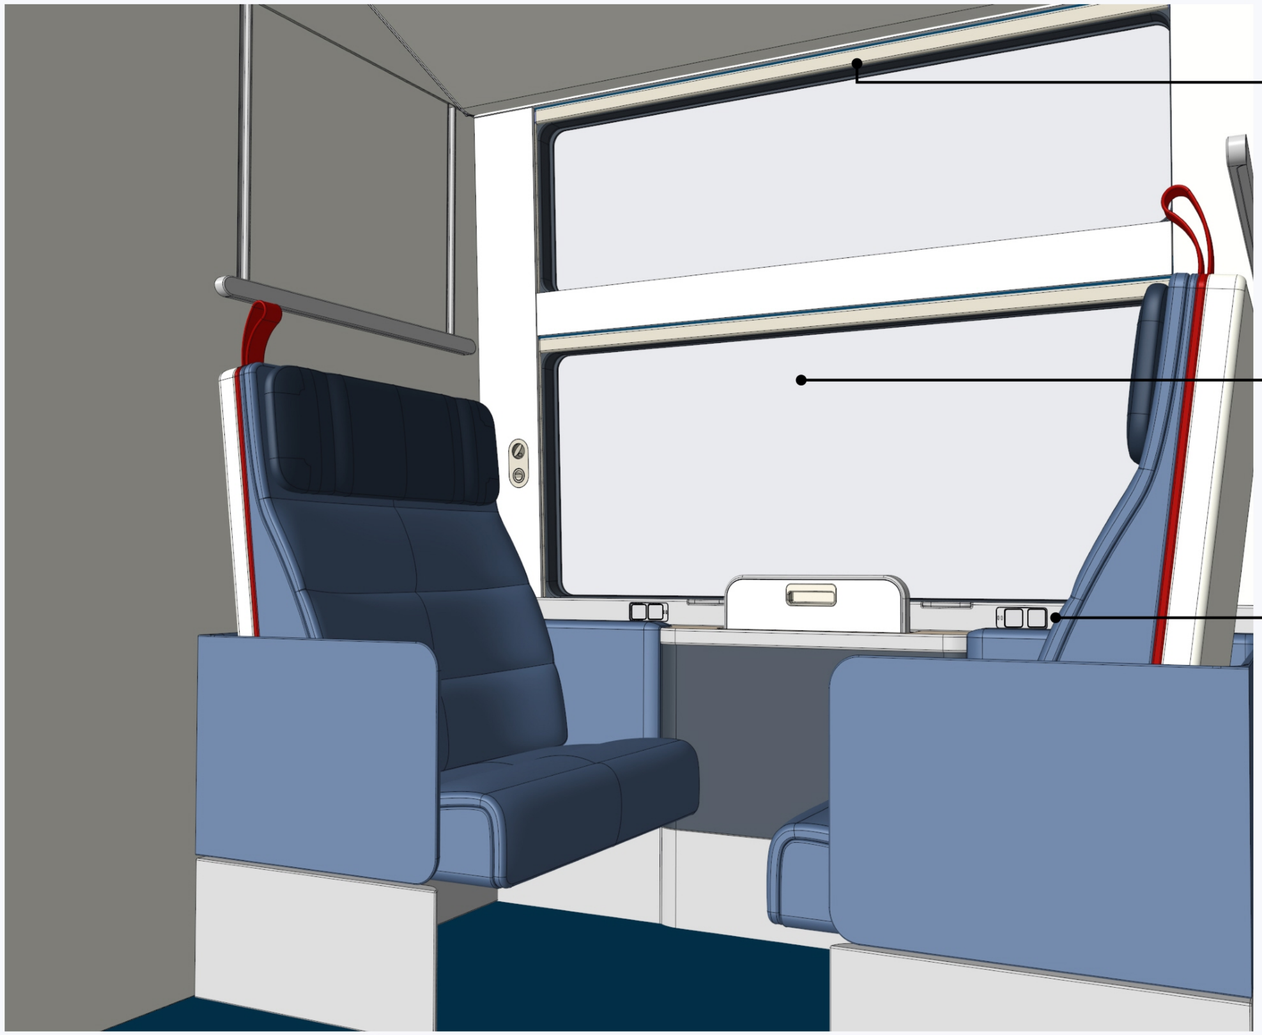
Armrest
A full and cushioned armrest of 3.5” should be provided on the window side. The armrest should be of a suitable length for a seated passenger to rest their forearm on the cushioned section.



Seat side pad
A soft seat side pad is required on the inside side of the seat to balance the seat and allow some cushioning to the inside edge to soften joining panel work

Fold out Table
Single leaf table deployed from side wall. The table height should provide good knee clearance for seated people with a height off the finished floor between 27” and 29”. The table should be easy to deploy and stow with an intuitive handle.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

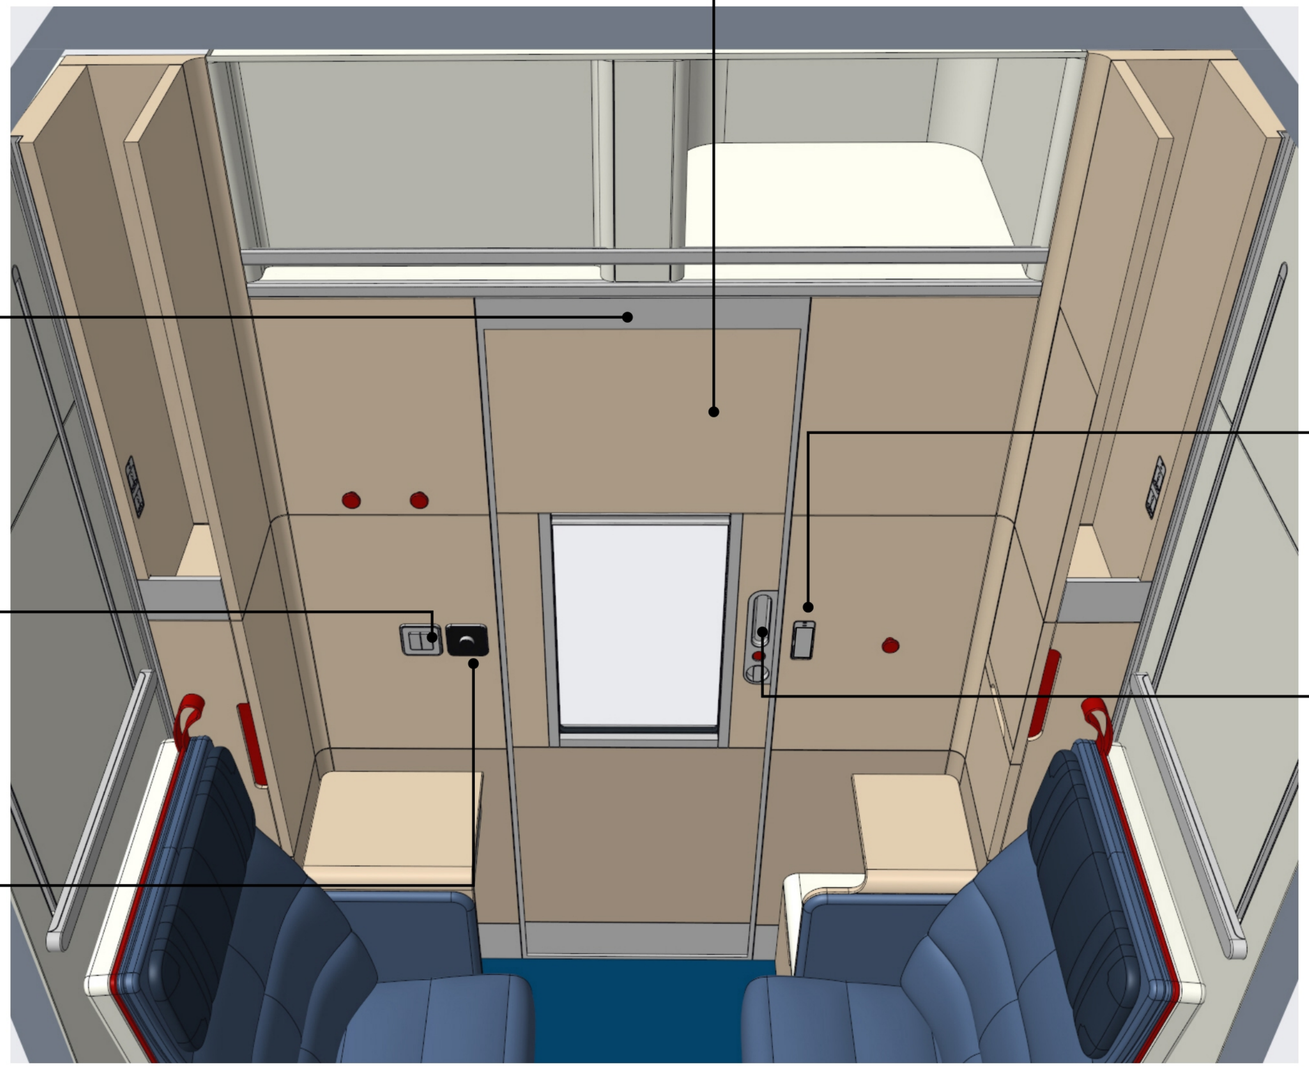


Roomette | Features

Seat Dimensions
All seat dimensions, cushion density/ shore hardness will be subject to mockup review and approval by Amtrak

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Features



Blinds
A single pull-down blind system shall be provided per window, capable of delivering both daytime solar/glare control and full blackout performance.

Window and Window Mask
Window and window mask should be central to the room and overall window size maximized.

At Seat Power
Two power sockets and two USB sockets should be provided to each seated location. The position should be above the armrest height and in easy reach of people while seated.

Roomette | Features

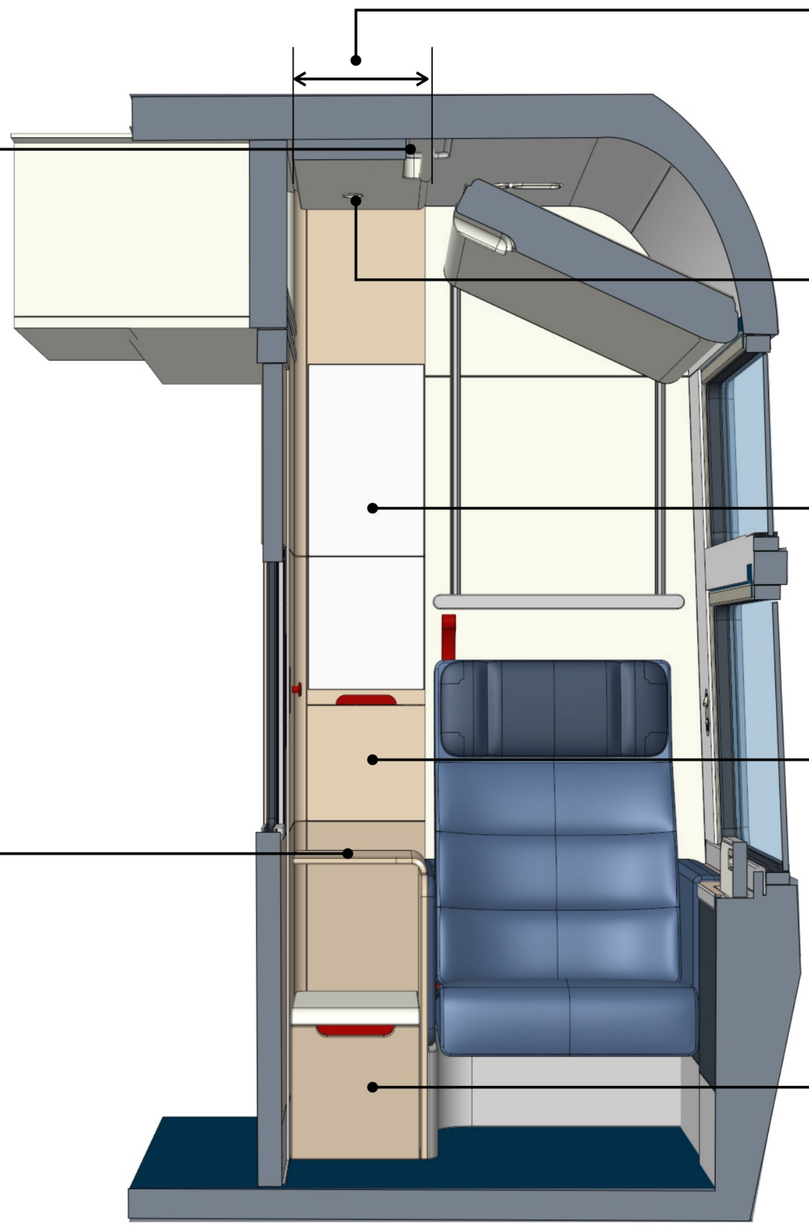
Door Window and Blind
Door window should be central to door and come equipped with an integrated blinds

Door
Door free from rattle, smooth sliding operation.

Power Outlets
Two power sockets and two USB sockets positioned on outer wall in close proximity to vanity area

Master Light Switch
Master Light switches to be positioned near door. A second master switch should be safely accessible by a person lying in the top bunk

Door Handle and Lock
Door handles should be positioned to slide door easily open and closed. An accessible manual lock should be included with an indicator to show lock condition.



Temperature Control

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Features

Handrails and Grabs
Suitable handholds shall be provided to assist people transiting to the bunk when deployed. .

Steps
At least two integrated steps should be built into the area beside the seat to allow people to safely transit to the upper bunk. Step surfaces shall be free from trip hazards and have an anti-slip finish to the tread surfaces. Steps shall be designed in such a way that the seat cushions, armrests or any soft furnishings are protected and clear of tread surfaces.

Minimum clear way
A free clear channel of at least 14” should be provided. Key dimensions and access to the upper bunk will be subject to mockup testing and Amtrak approval.

HVAC
HVAC control in the room should have a feature that allows passengers to adjust the direction of airflow away from their sleeping positions.

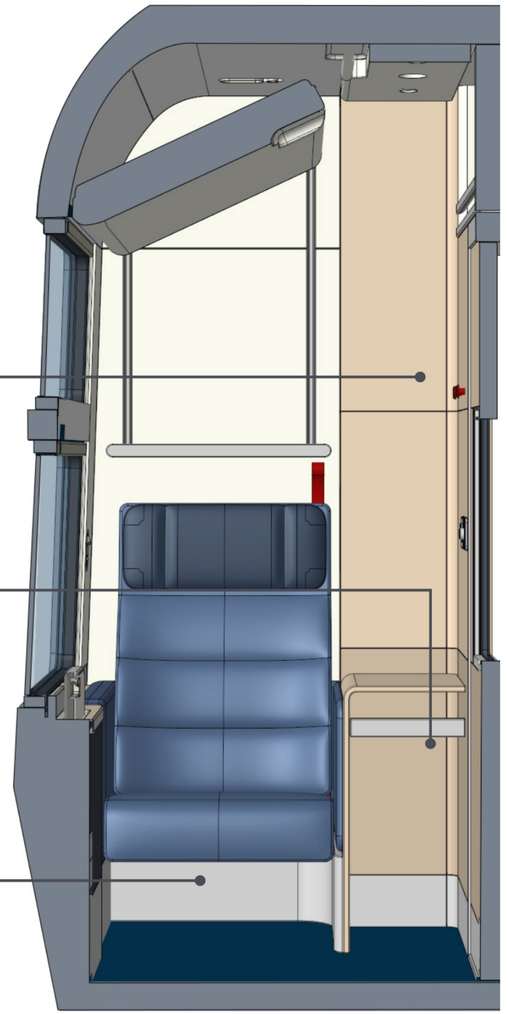
Mirror
The mirror on the front of the vanity unit should be suitable for people to see their reflection while standing.

Fold Out Sink

Trash Bin

Roomette | Storage

Roomette | Storage

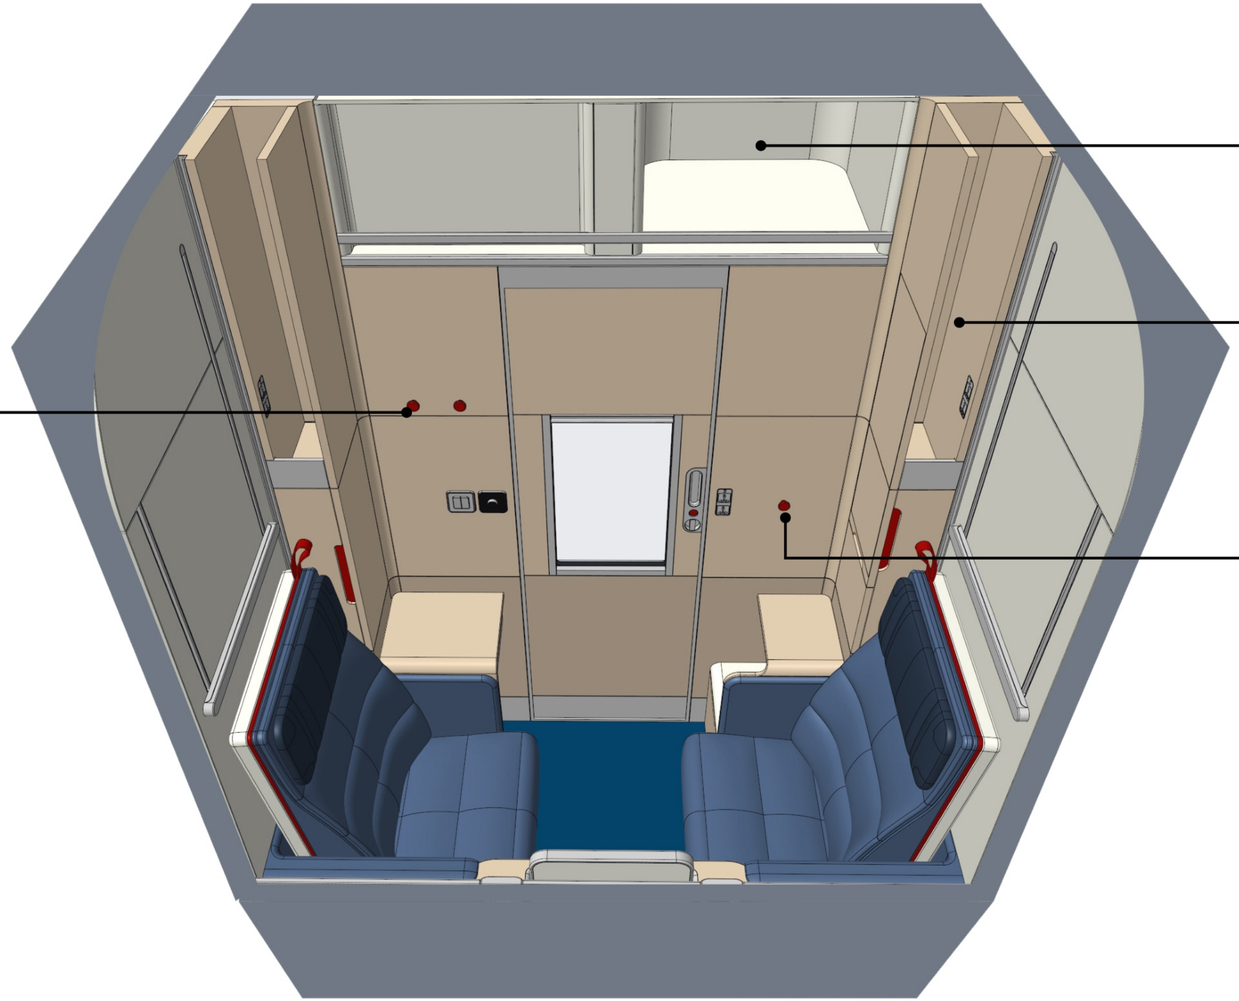


Cabinet
Shelved cabinet with retaining bars for clothes and personal items.

Vanity Cabinet
Shelved cabinet for toiletries, hand towels and face cloths (2 of each Amtrak's standard towels supplied). Space required for integrated tissue dispenser.

Carry On Stowage Area
Maximize area beside seat for small carry on luggage. Area should be protected from seat area so luggage can be stored discreetly out of the way.

Under Seat Stowage
Space under the both seats should remain free for carry on luggage. No seat mechanism or structure should preclude the ability to store large carry on bags.



LH Side

RH Side

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Storage

Upper Storage
High level storage for carry on luggage

Cubbies
Cubbies shall provide storage for personal items at both berth heights

Vanity Hook
Provision should be made to allow for wash bags or towels to be hung by the sink and vanity unit.

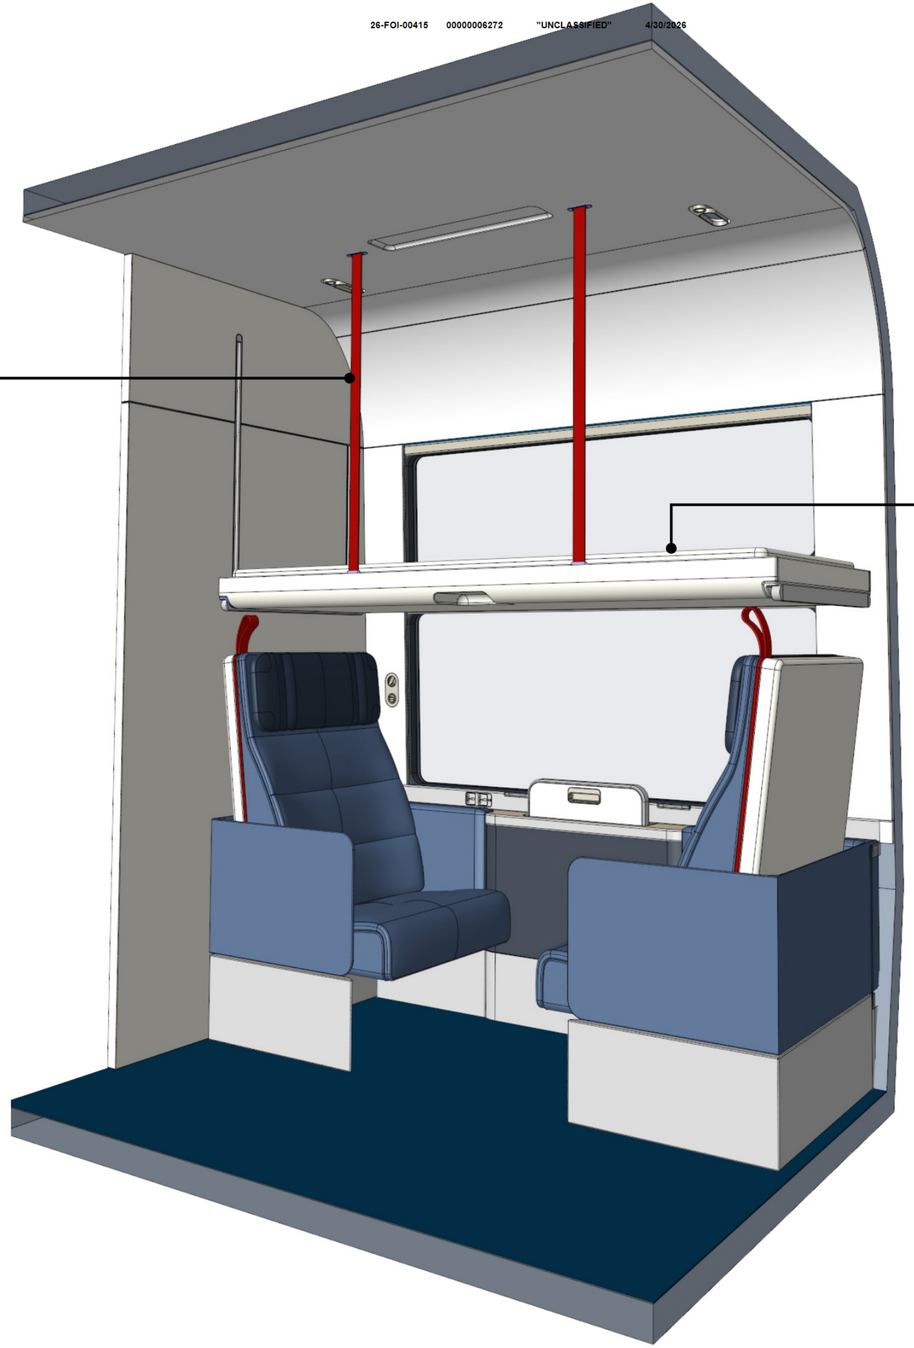
Hanging Space
At least two coat hooks should be provided on the inner wall, suitable to hang clothes or provide the function of an open wardrobe

Roomette | Seat to Bed Conversions

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Seat to Bed Conversions

Lower Berth Deployment
A simple unlatch mechanism is required to convert the seats into a lower bed/berth. This should be positioned in a place that is easy for people to use and designed in a way so that people can understand its purpose.

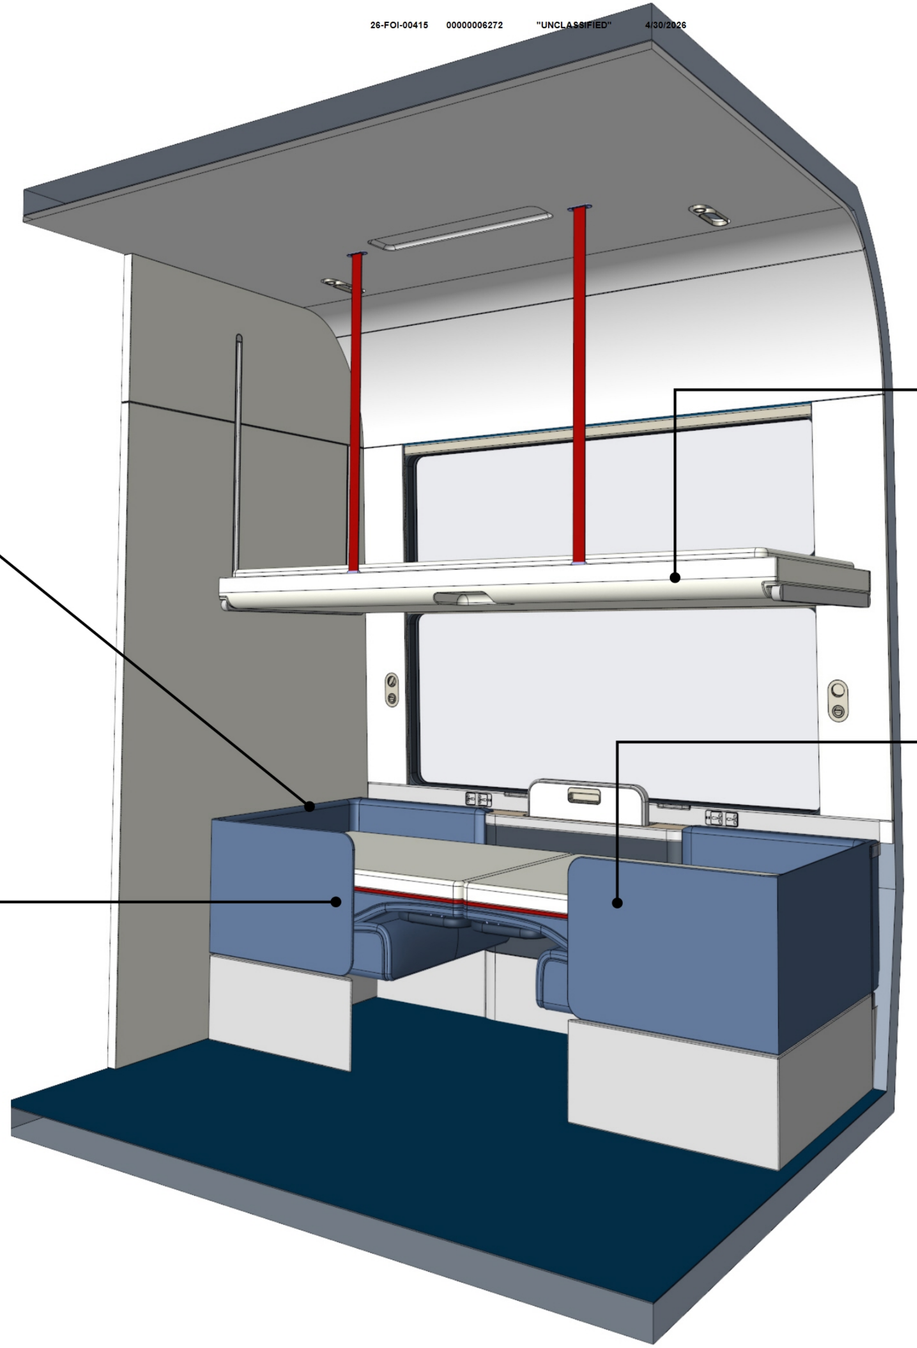


Upper Bunk
Bunk should be stored horizontally at an optimized height in the room. Bunk should not preclude any part of the window when stowed.

Upper Bunk Deployment
A simple and easy to use handle, latch and lock mechanism should be within easy reach from a standing position. Successful locking should be visually indicated and safety measures should be put in place to prevent accidental deployment and prevent misuse.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Seat to Bed Conversions



Bunk Retaining Straps
Retaining straps are required to prevent people from rolling out of the bunk . These should retract into the ceiling and be easily pulled down and click into place using an automatic locking retractor belt system (similar to a car seat belt system).

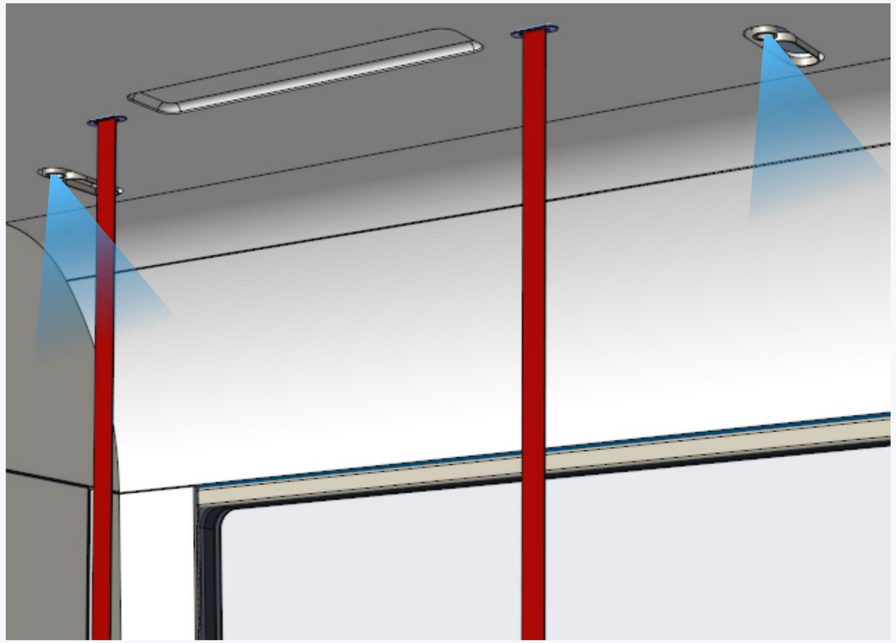
Bunk Height
The seated area below the bunk should still be usable by seated passengers when the upper bunk is deployed.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Seat to Bed Conversions

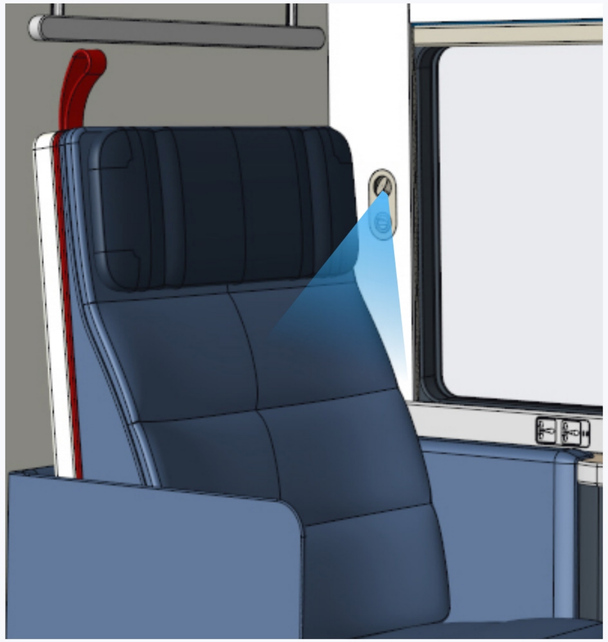
Head Board
The armrest and seat side pad should continue and connect to form a thin soft headboard around the back of the seat when the bed for the lower berth is down.

Lower Berth
Conversion of seats to bed should result in an entirely flat bed surface. The mattress surface should be integral to the seat . A single seam between the bed surface is acceptable with a single thin topper to finish the bed surface.



Bunk Dimensions
Minimum width 27" x Minimum length 77”

Lower Berth Dimensions
Minimum width 27" x Minimum length 77”

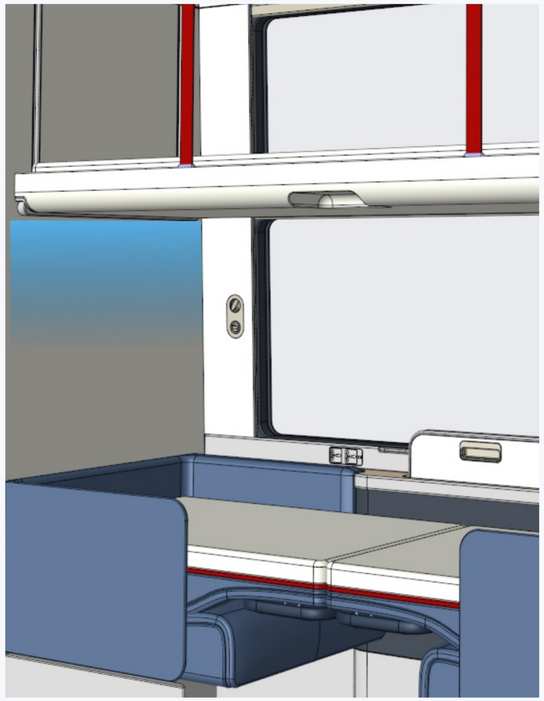


26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Roomette | Lighting

Roomette | Lighting

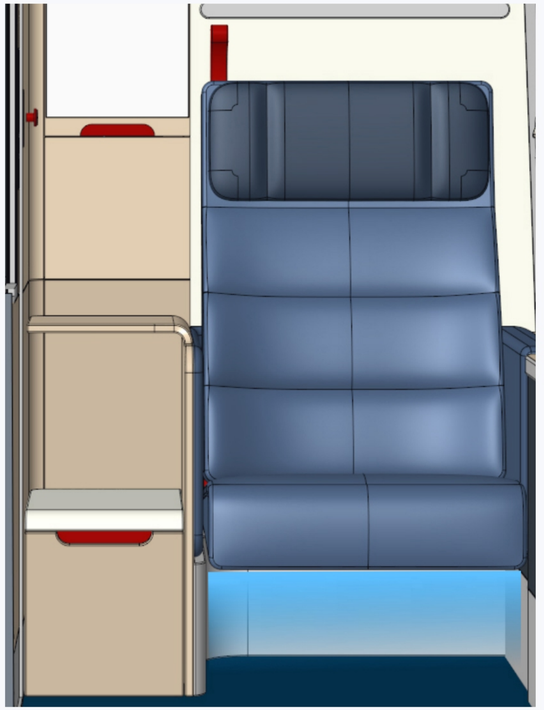
Upper Reading Lights
Reading lights should be provided embedded in ceiling above the bunk. These should be mini panel lights. 2 lights in total located at each end of the bed. Light switches should be located next to the reading light.



Lower Reading Lights
Reading lights should be provided at each seated location. People should be able to adjust the direction position of the light over their lap and in a suitable way to read a book at night. Switches should be located near or on the light.

LED light panel light
LED light panels or panel spot lights lights provide ceiling master lights.

*See lighting spec for detailed definition



Roomette | Lighting

Back Wall Wash Light
Bunk support runner washes indirect light down the end walls on both sides of the room.

Back Wall Wash Light
Bunk support runner washes indirect light up across the end walls on both sides of the room.

Under Seat Light
Under seat light should be indirect and spill light out across the floor.

Step Light
Indirect light provides wash light over the steps.

*See lighting spec for detailed definition

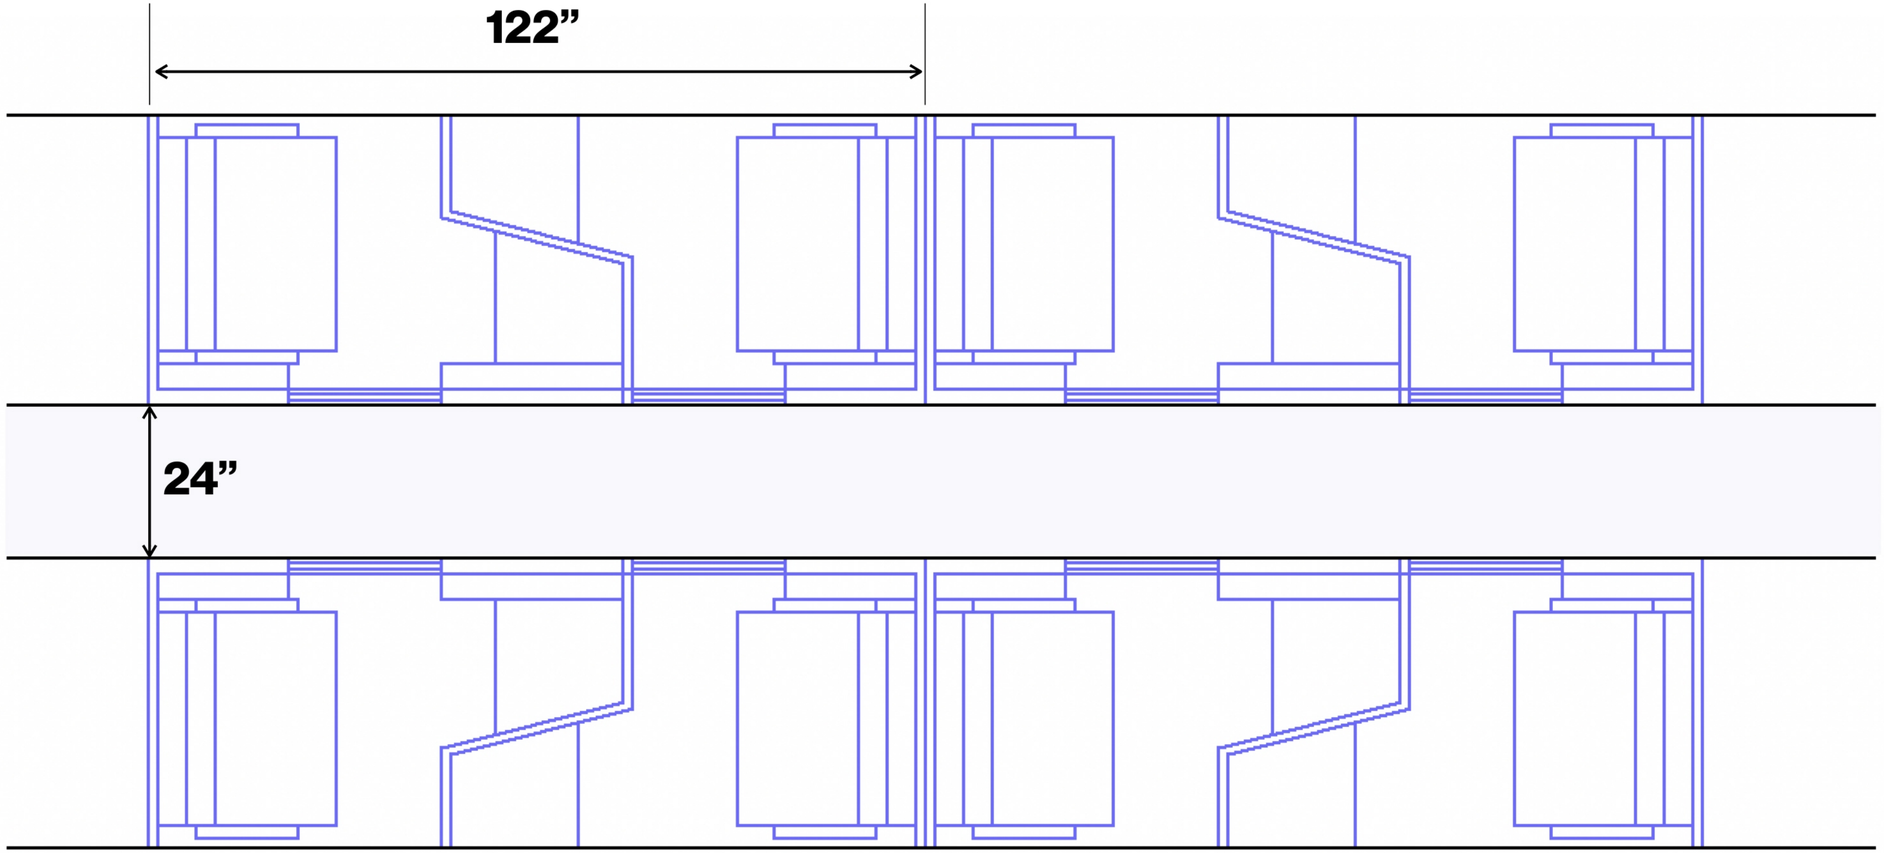
05 | SoloSuite

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Solo SoloSuite

Twin SoloSuite

SoloSuite



SoloSuite is a room designed and optimized for a single occupant. SoloSuite rooms can combined with a mirrored version of the room to create a larger twin room for two.

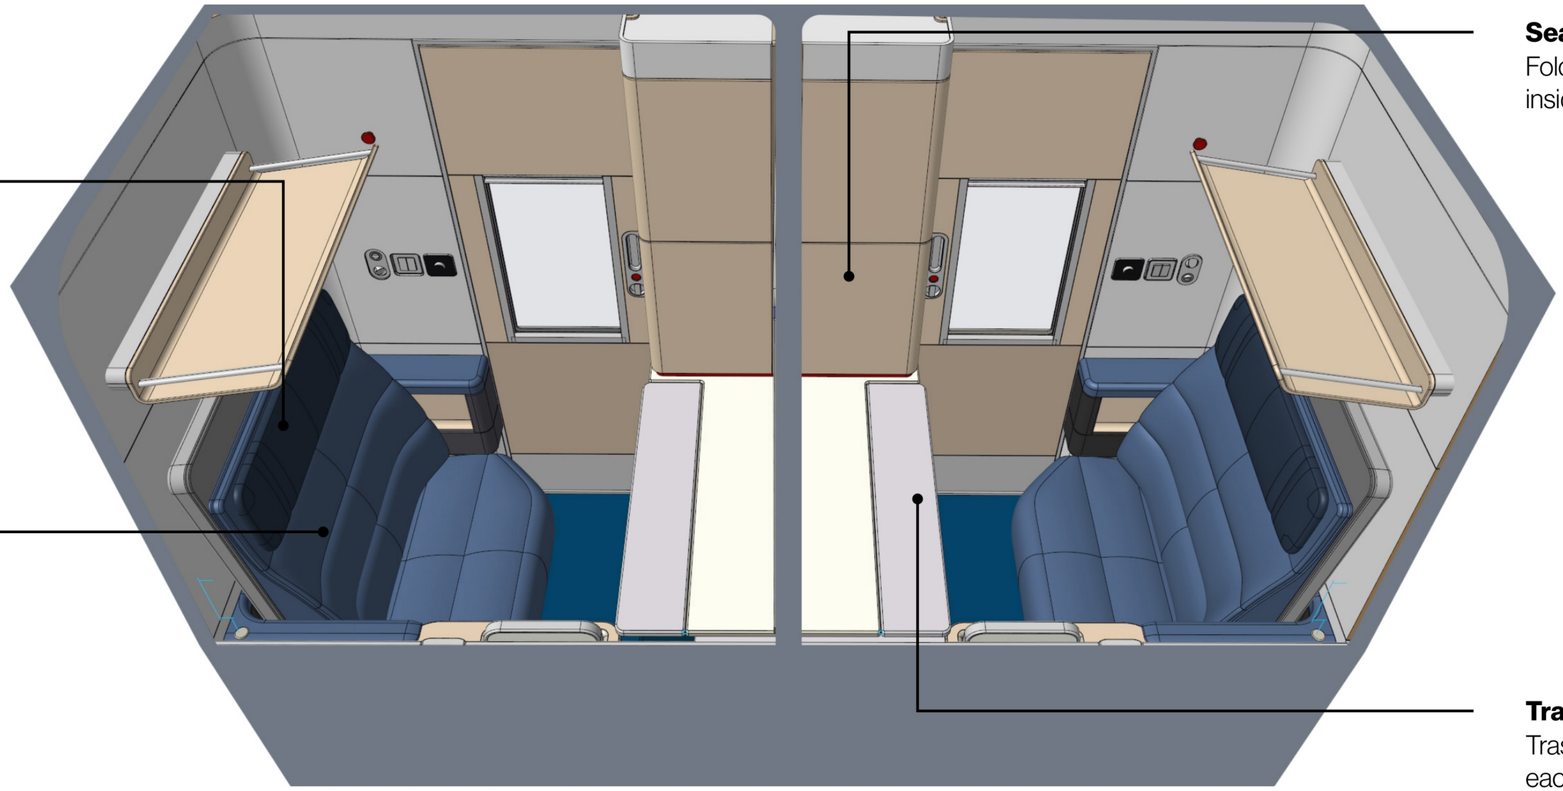
***The following diagrams illustrate two SoloSuite rooms as a facing pair.**

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

SoloSuite

SoloSuite rooms should be optimized for a central 24” aisle. Two SoloSuite modules combined (or facing pair) should be designed to a minimum length of 122”.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



Solo Suite | Features

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

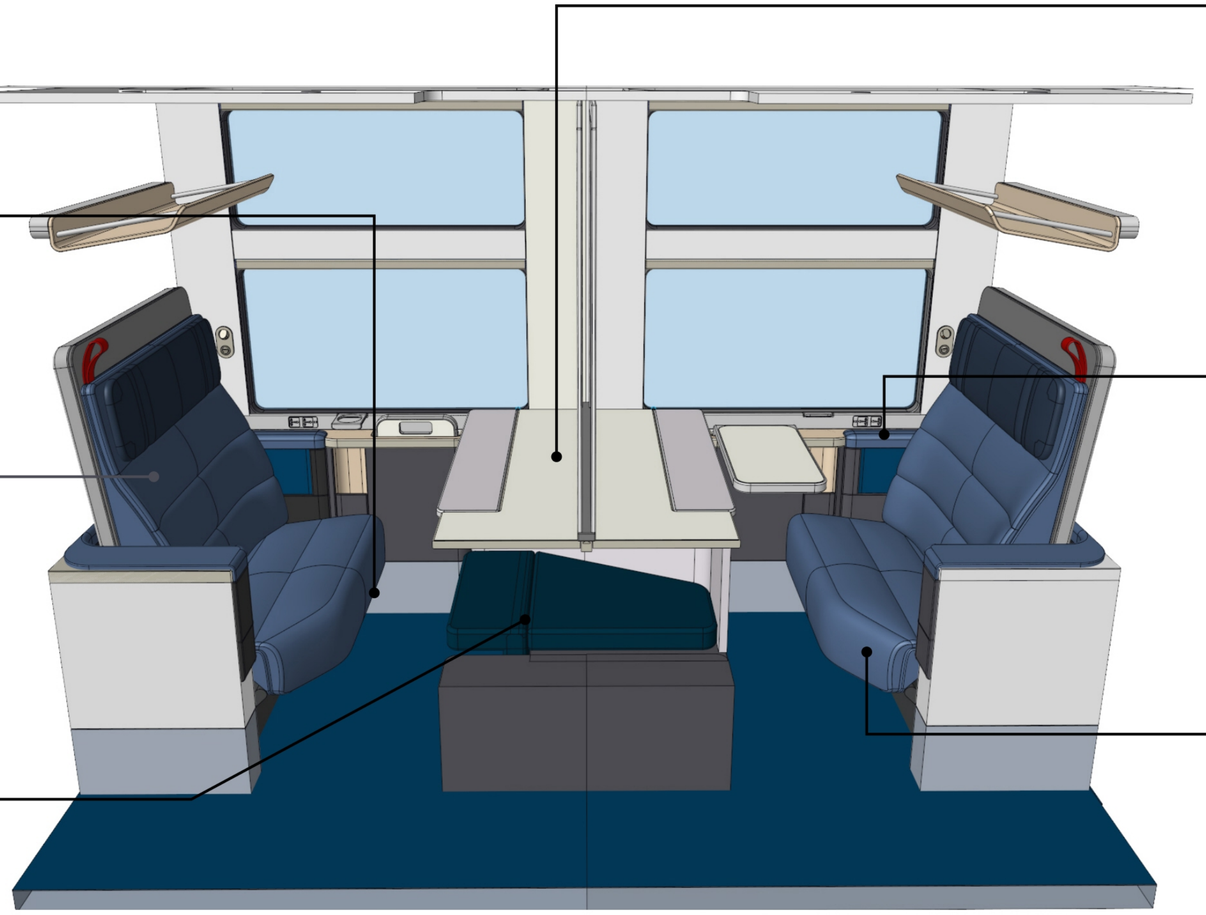
Solo Suite | Features

Seat Headrests
Seat headrest should be adjustable in height for a range of people sizes and have adjustable wings that fold outwards to adjust the width of the headrest.

Seat Comfort
Seat cushions should be contoured to aid seat comfort.

Seat Fold Out Sink
Fold out sinks shall be provided inside vanity cabinets

Trash
Trash bins shall be provided in each room located under central console.



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Solo Suite | Features

Seat Tracking
Seat should track forward so customers can utilize the large central table. The result will provide some recline for the seat.

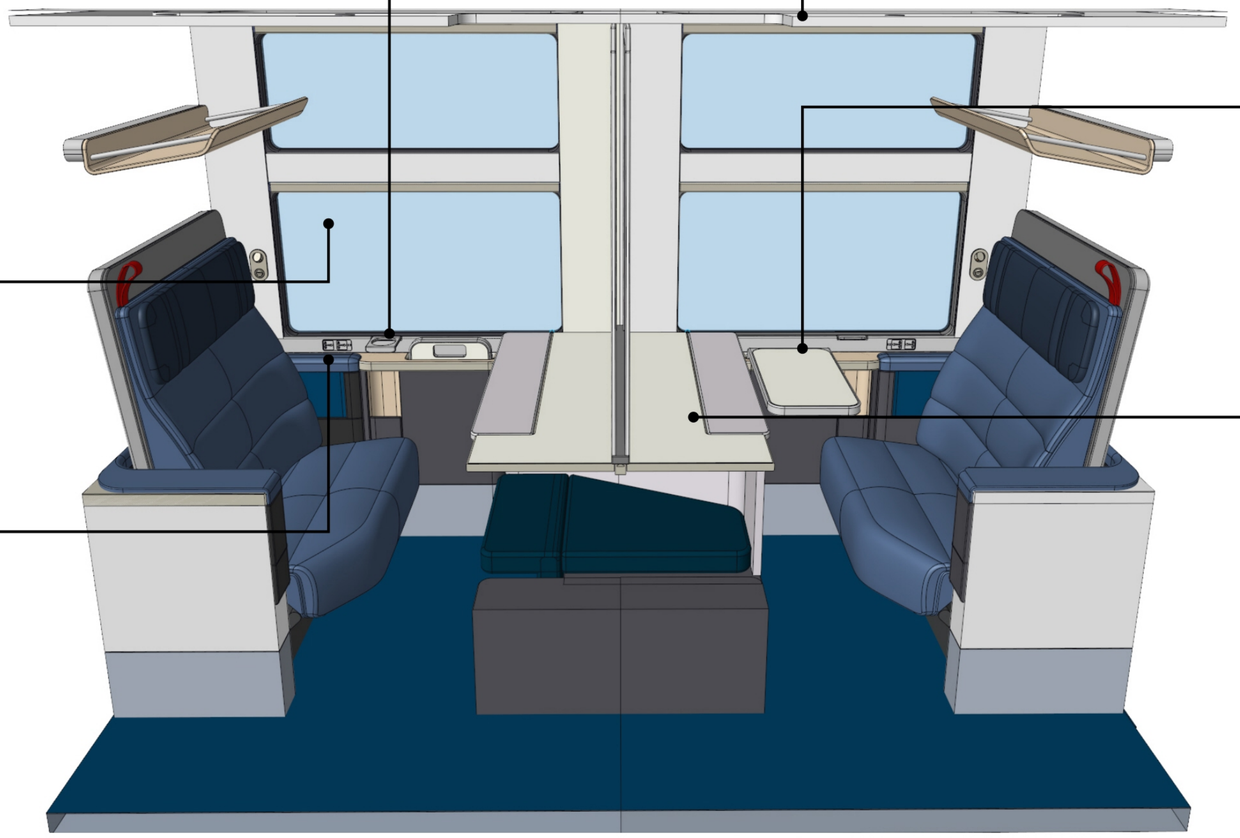
Seat Dimensions
A minimum seat width between inside surfaces of armrests should be a minimum of 34". It should be possible to invite a companion into the room and comfortably sit side by side on the same seat.

Ottoman
A fixed ottoman should be provided inside a foot-box. A foldable portion of the ottoman should fold up to complete the bed surface and down to provide some standing space when the main part of the bed is deployed.

Central Console
A fixed central console houses foot-boxes for the facing SoloSuite pairs. Careful balance between each pair should be considered to maximize living accommodation for each of the passengers.

Armrest
A full and cushioned armrest of 3.5" should be provided on both sides of the seat. The armrest should be of a suitable length for a seated passenger to rest their forearm on the cushioned section.

Seat pan shape
The seat pan should be profiled to maintain ingress and egress clearance. This is a high wearing area of the seat surfaces and this area should be suitably designed to be durable and free from snagging or entrapment.



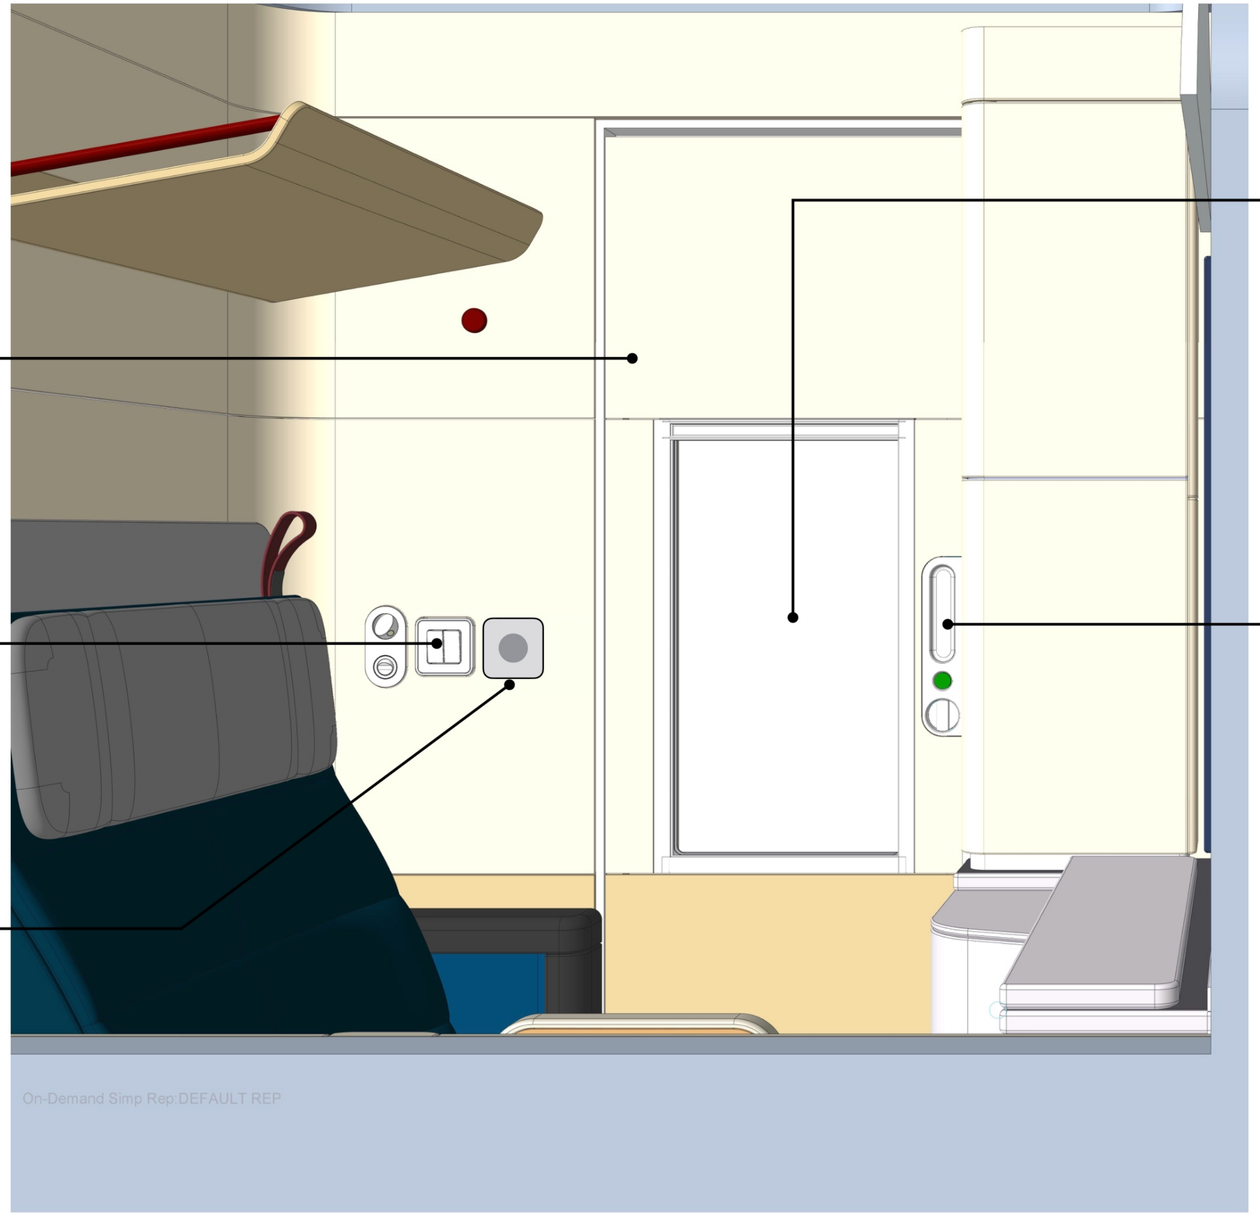
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Solo Suite | Features

Cup Holders
Each room should have one cup holder located so people can use and access the cupholders from a seated position. They should fold away when not in use.

Window and Window Mask
Window and window mask should be central to the room and overall window size maximized.

At Seat Power
Two power sockets and two USB sockets should be provided to each seated location. The position should be above the armrest height and in easy reach of people while seated.



Blinds
A single pull-down blind system shall be provided per window, capable of delivering both daytime solar/glare control and full blackout performance.

Fold out Table
Single leaf table deployed from side wall. The table height should provide good knee clearance for seated people with a height off the finished floor between 27” and 29”. The table should be easy to deploy and stow with an intuitive handle.

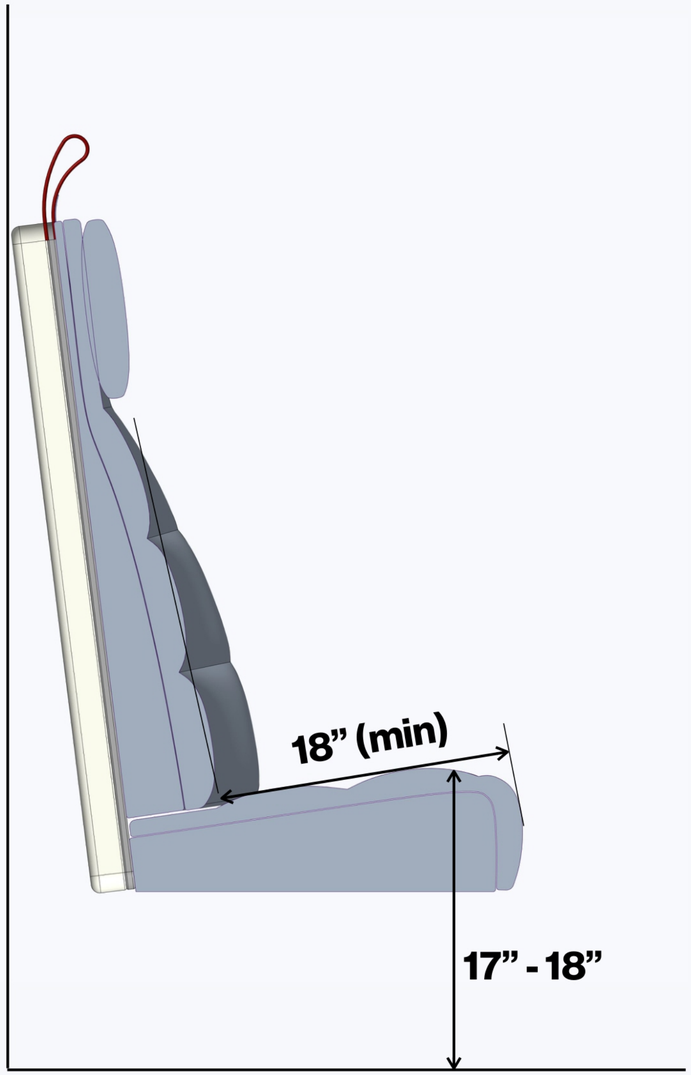
Ottoman Table
The ottoman table should be large enough for face to face dining. When the seat is tracked forward. It should incorporate a folding leaf to create extra knee and turnover space for sleeping passengers. The leaf must not interfere with divider mechanism when folded.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Solo Suite | Features

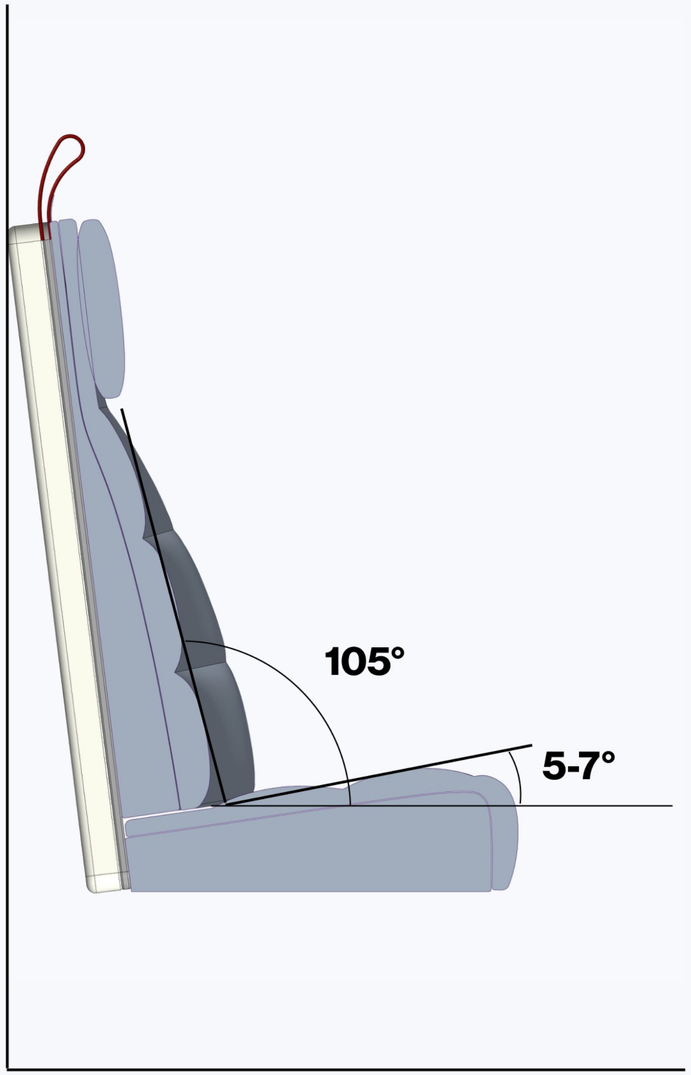
Door
Door free from rattle, smooth sliding operation.

Master Light Switch
Master light switches to be positioned near door. A second master switch should be safely accessible by a person lying in the top bunk.



Temperature Control

Door Window and Blind
Door window should be central to door and come equipped with an integrated blind.



Door Handle and Lock
Door handles should be positioned to slide door easily open and closed. An accessible manual lock should be included with an indicator to show lock condition.

Solo Suite | Storage

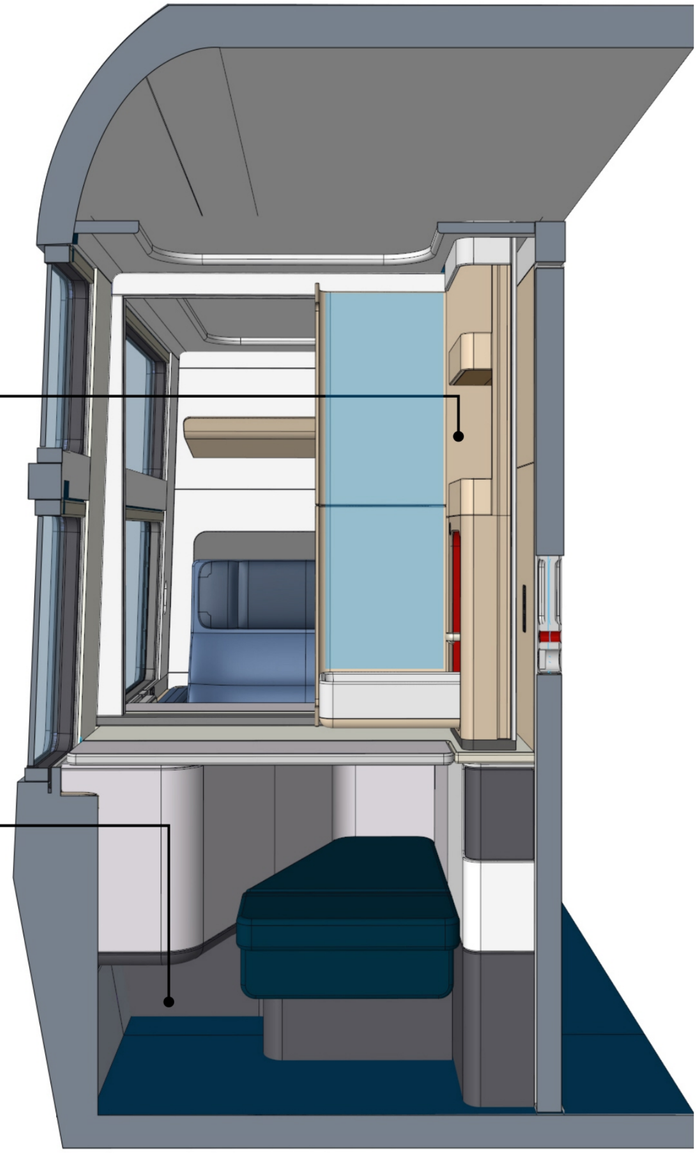
Seat Side

Luggage Rack

Luggage rack for clothes and/or small carry on luggage. The rack should be design to prevent luggage falling off in typical railroad conditions i.e. with lip or retention strap.

Vanity Cabinet

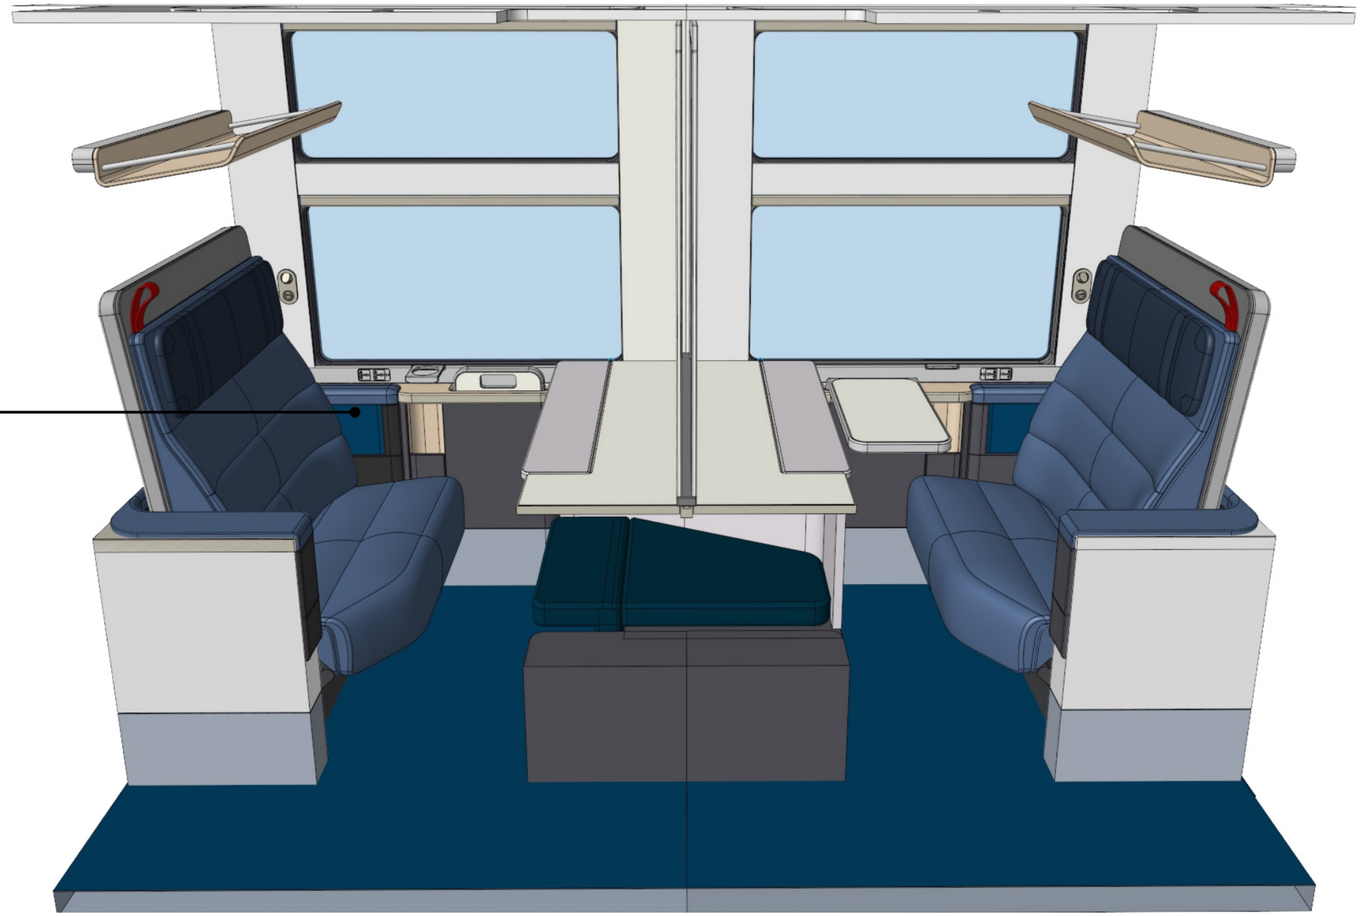


Shelved cabinet for toiletries, hand towels and face cloths and bath towel storage and integrated tissue dispenser. Mirror and towel shall be included.

Hanging Space

At least one coat hook should be provided on the inner wall, suitable to hang clothes or provide the function of an open wardrobe.

Ottoman Stowage



Space under the opposite passenger's ottoman should remain free for carry on luggage. The carry on luggage shouldn't encroach into the door space.

Ottoman Side

Solo Suite | Storage

Armrest storage
Available space on each side of the seat shall be provide storage for personal items and water bottles.

Solo Suite | Seat to Bed Conversions

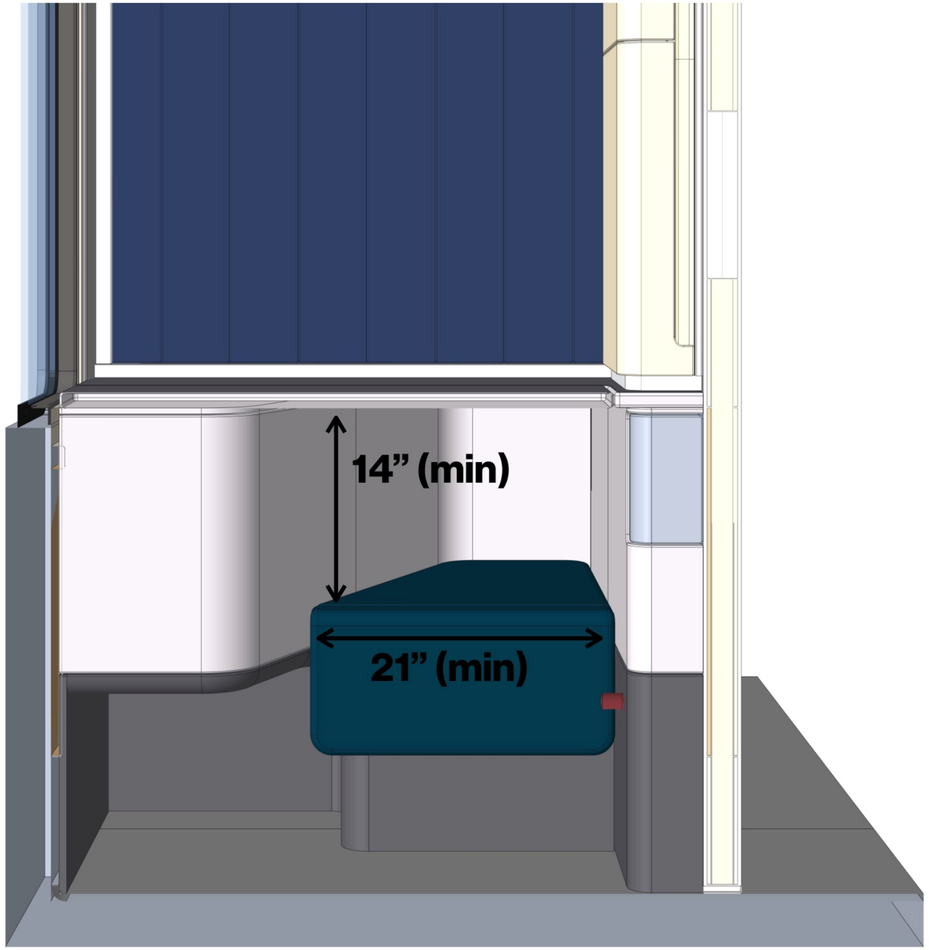
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Solo Suite | Seat to Bed Conversions

Ottoman Table
Table leaf fold up to create knee space.

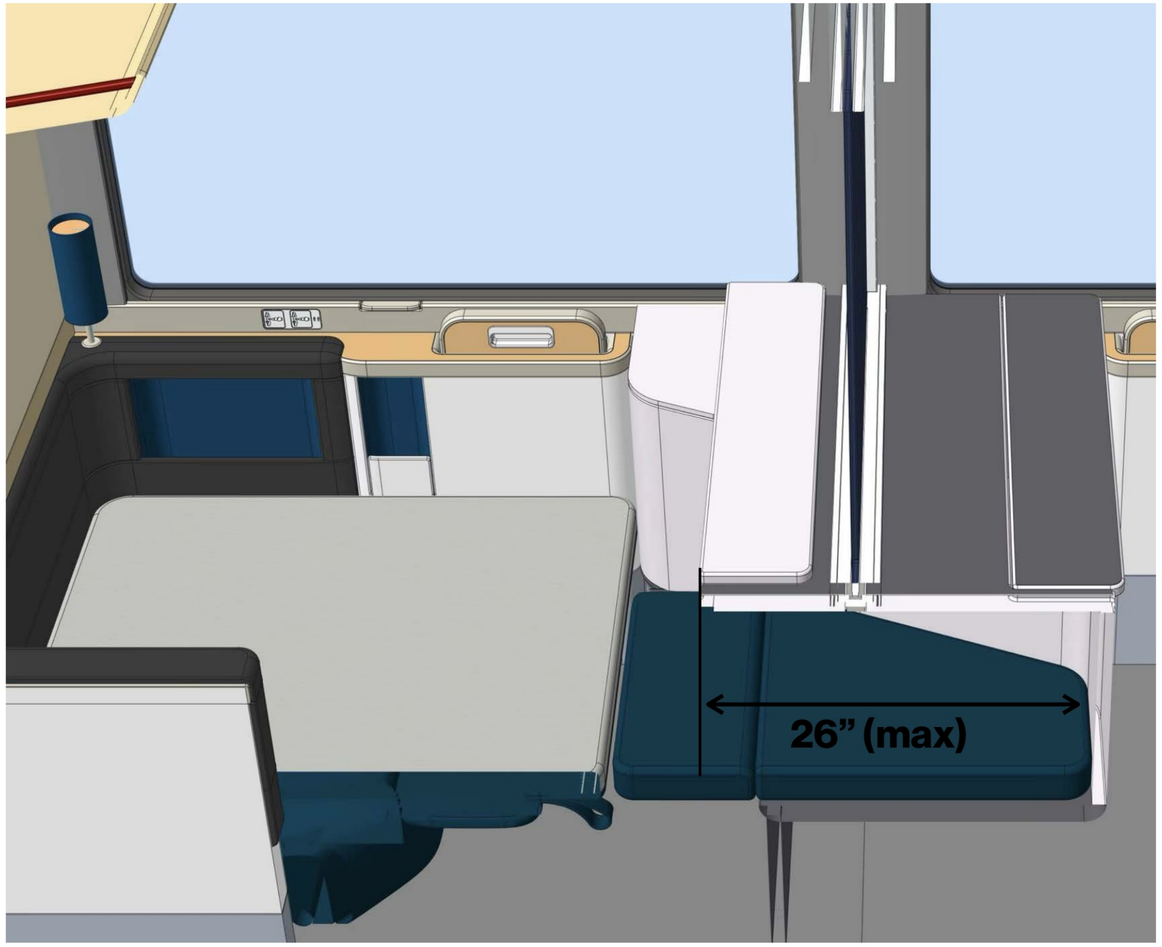
Headboard
The armrest and seat side pad should continue and connect to form a thin soft headboard around the back of the seat when the bed for the lower berth is down.

Bed
Conversion of seat to bed should result in an entirely flat bed surface. The mattress surface should be integral to the seat. Seams between the bed surface and ottoman are acceptable if finished with a single thin topper. There should be no movement in the bed structure when fully loaded when the bed is deployed.



Folding Ottoman Pad
A folding ottoman pad should complete the seat surface between bed and ottoman. The pad should be independently operated. Care should be taken in the design and activation to avoid accidental entrapment or mitigate injury through misuse.

Bed Deployment
A simple unlatch mechanism is required to convert the seats into a lower bed/berth. This should be positioned in a place that is easy for people to use and designed in a way so that people can understand its purpose. The latch should be free from jamming and free from any finger trap hazards.

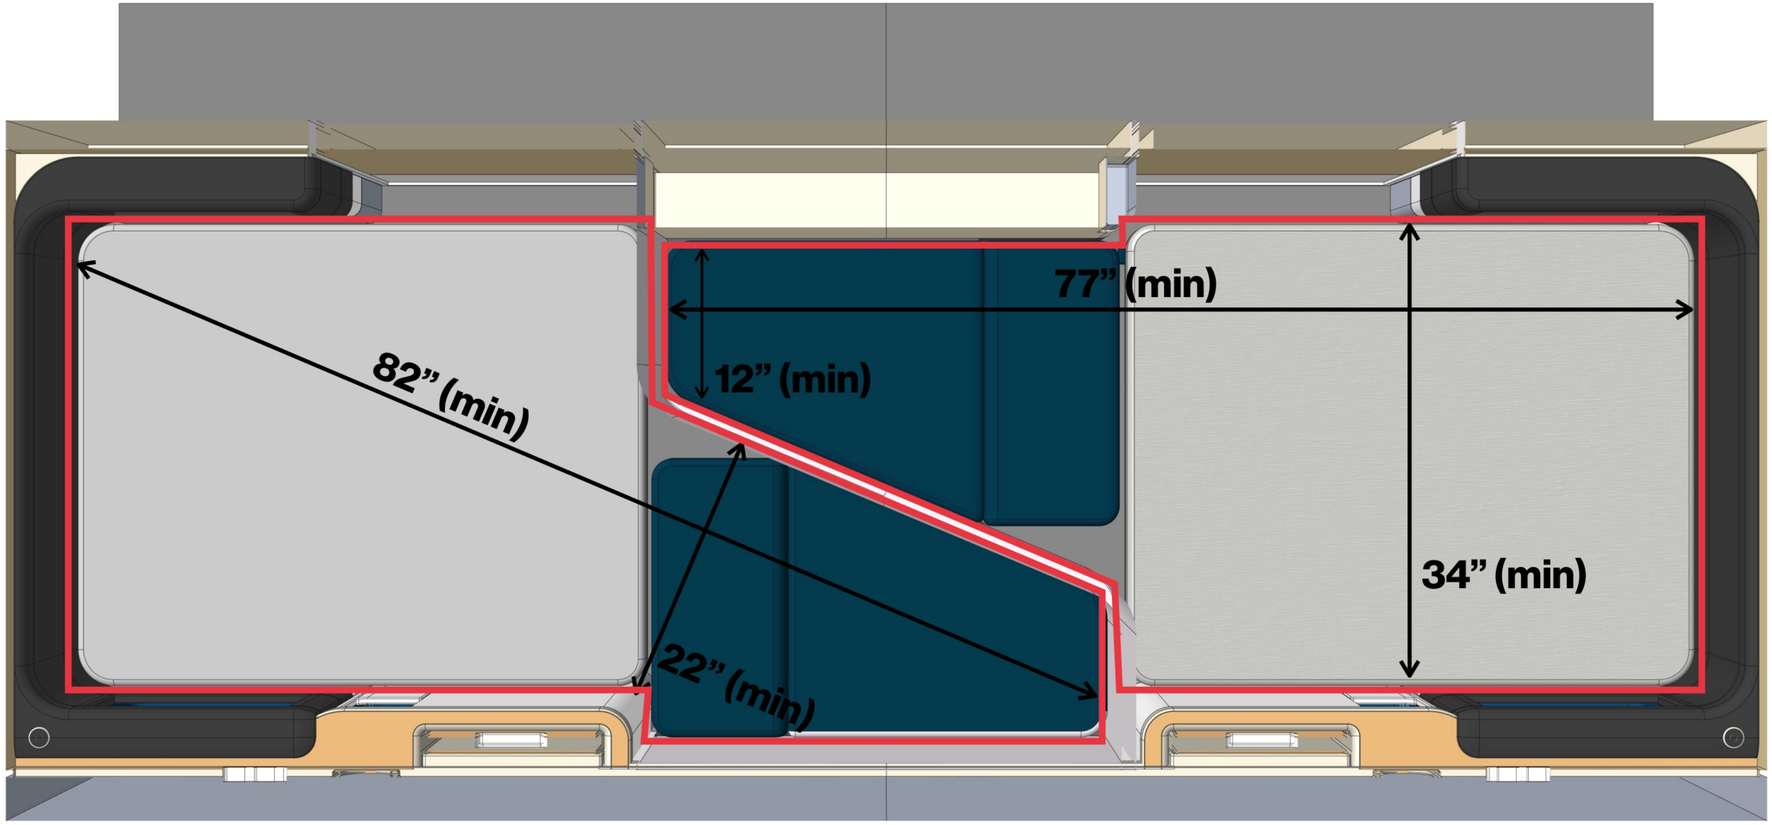


Standing space
The folding ottoman pad and ottoman table leaf should create a space large enough for passenger to stand and deploy and stow the bed while in the room with the door closed.

Solo Suite | Seat to Bed Conversions

Foot-box threshold

There should be a minimum of 14” between the top of the ottoman/bed surface and the underside of the foot-box/table surface. There should be a minimum of 22” between the two sidewalls at the threshold of the foot-box.



Foot-box depth

The foot-box should be a maximum of 24” deep when the ottoman pad table is folded up.

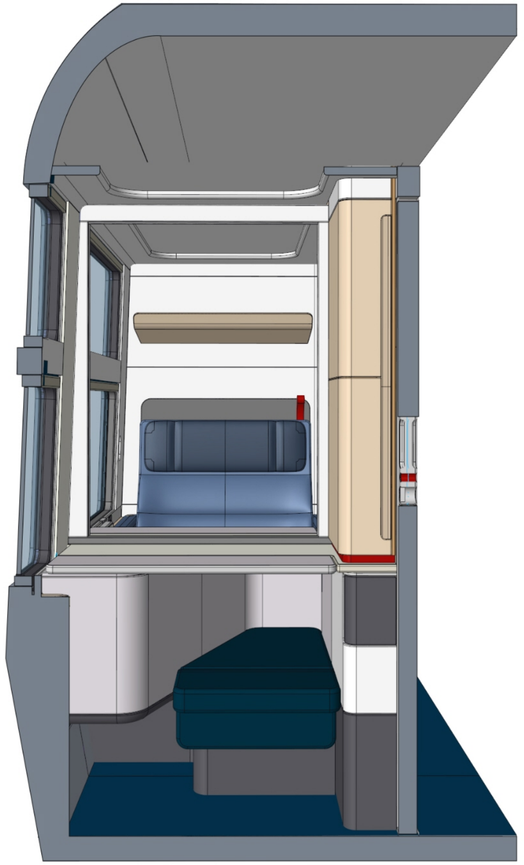
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Solo Suite | Seat to Bed Conversions

Bed dimensions

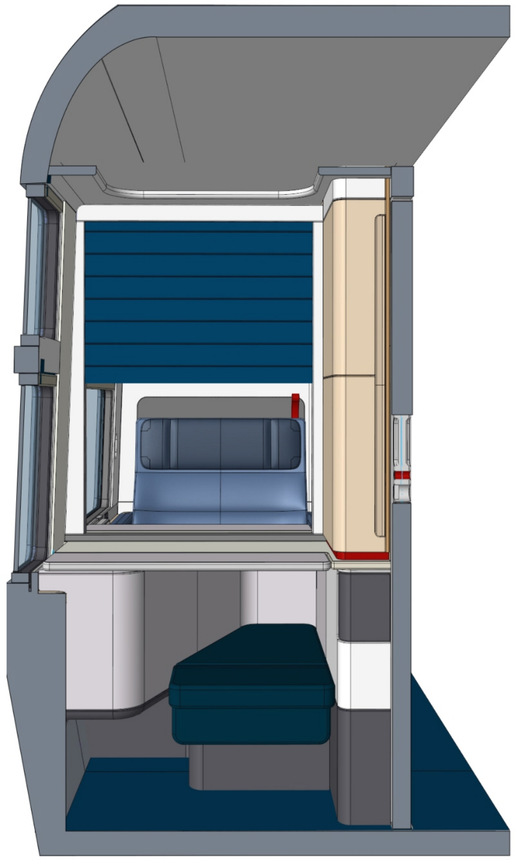
There should be a minimum of 82” between the two opposite corners to account for the tapering bed shape.
There should be a minimum of 22” between the inside surface of the foot-box and any sidewall structure.
Dimensions and usability will be subject to Amtrak approval.

Bed dimensions cont.



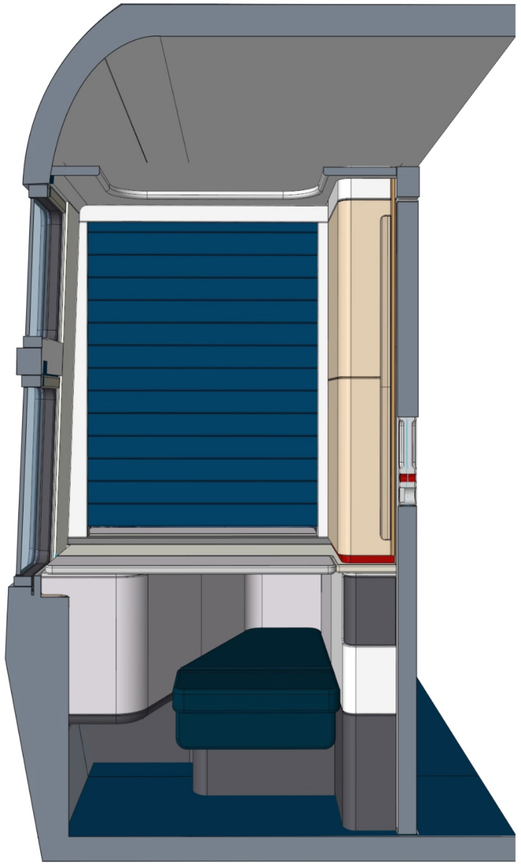
There should be a minimum of 77” bed length.
There should be a minimum of 34” bed width.
Dimensions and usability will be subject to Amtrak approval.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



Solo Suite | Connecting Rooms

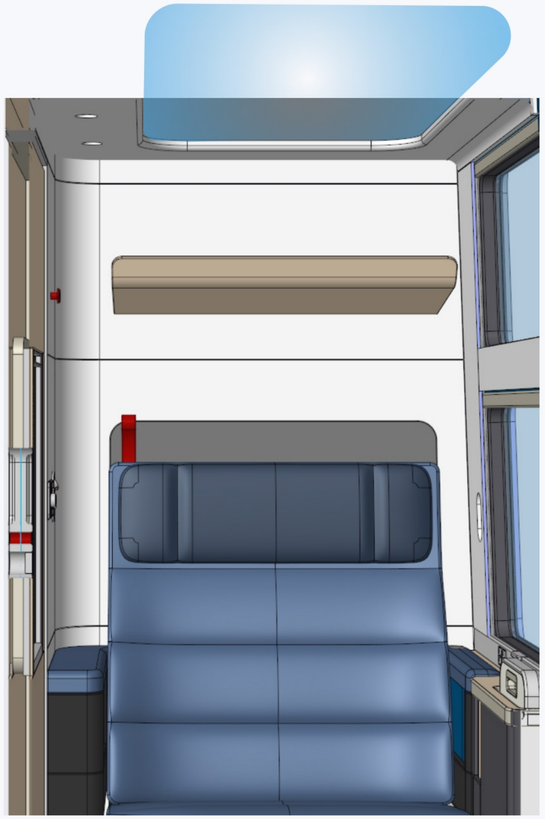
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



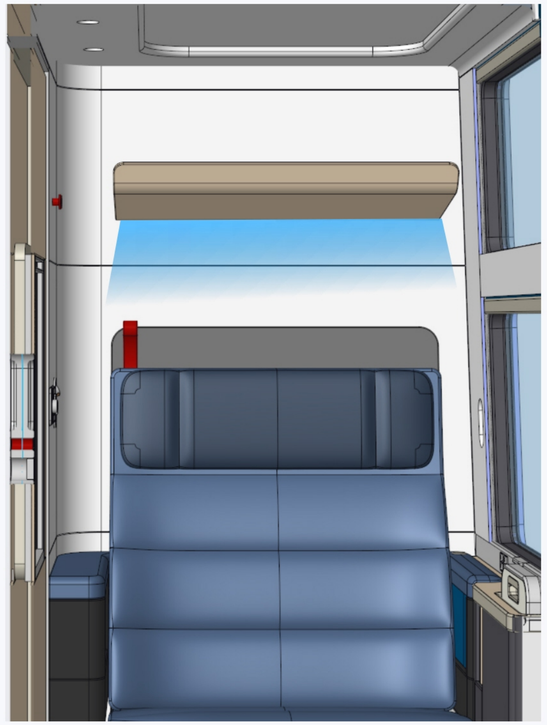
Solo Suite | Connecting Rooms

Open (Stowed)
The divider must stow away neatly into a pocket, wall or ceiling and not protrude into the room. When stowed the divider must be free from rattle and movement and be securely retained in its stowed position. The opening should be maximized and be a minimum of 35” x 35”. The stowed divider must not prevent the use of any other of the room's features or obscure the window or skylight.

Deployed
As the divider is deployed it must be done with a smooth and gliding motion, with little or no noise. The deployment of the divider should be easy to use and be able to be operated safely by passengers independently.



Closed
When divider is in its closed position it must provide good sound insulation to the adjoining room, no less than that of a normal module wall. The divider must be securely locked in place with a visual indicator on both sides of the room to show that it is locked. A solution must be found to prevent one passenger opening the divider without the other's permission, such as a double latch.



When closed the divider must be free from rattle and movement and be securely locked in place along all edges. There should be no light spill from the adjoining room.

Solo Suite | Lighting

Solo Suite | Lighting

Master Ceiling Light
Central light well acts as master ceiling light.

Rack Wash Lights
Indirect wash light running across the width of the room behind the luggage rack

*See lighting spec for detailed definition

Solo Suite | Lighting

Lower Reading Lights

Reading lights should be provided at the seated location. People should be able to adjust the direction and position the light over their lap and in a suitable way to read a book at night. Switches should be located near or on the light.

Under Ottoman Light

Indirect light provides additional light well inside luggage stowage area.

Foot-box light

Indirect light provides additional light well inside the foot-box.

*See lighting spec for detailed definition

The Club Bedroom

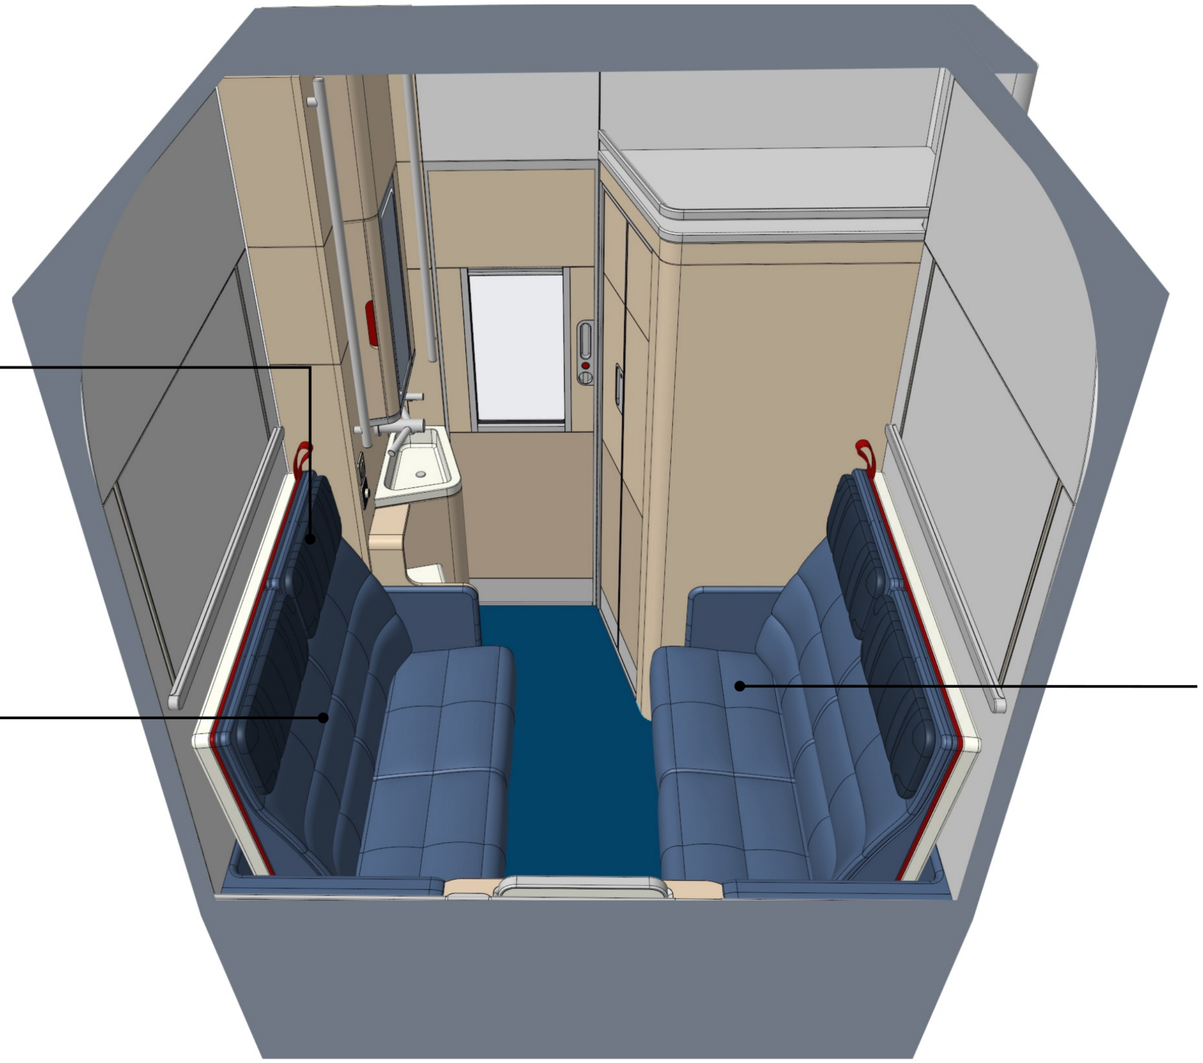
The Club Bedroom should be designed to be a great bedroom for two but also suitable for four people to sit and sleep together. The room should work alongside a 32” accessible aisle. The room comes equipped with a vanity sink and an ensuite toilet and shower.

Club Bedroom | General

Modules
Modules are 81” in length. Rooms are pitched at 81”. The toilets are offset allowing central access to the bedroom.

Aisle Requirements
Works in combination with a 32” accessible aisle

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



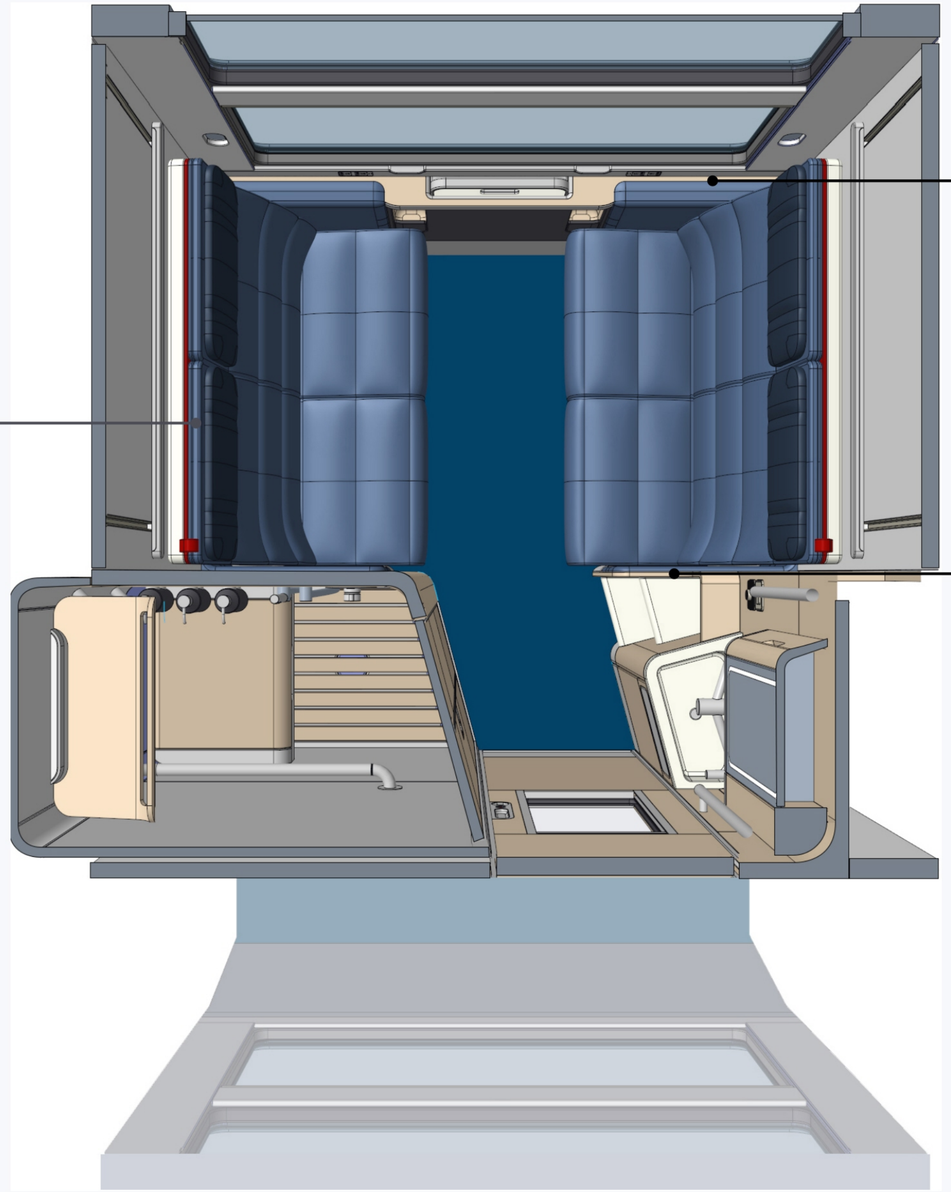
Club Bedroom | Features

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Features

Seat Headrests
Seat headrests should be adjustable in height for a range of people sizes. There should be four headrests in total. They should have adjustable wings that fold outwards to adjust the width of the headrest .

Seat Comfort
Seat cushions should be contoured to aid seat comfort.

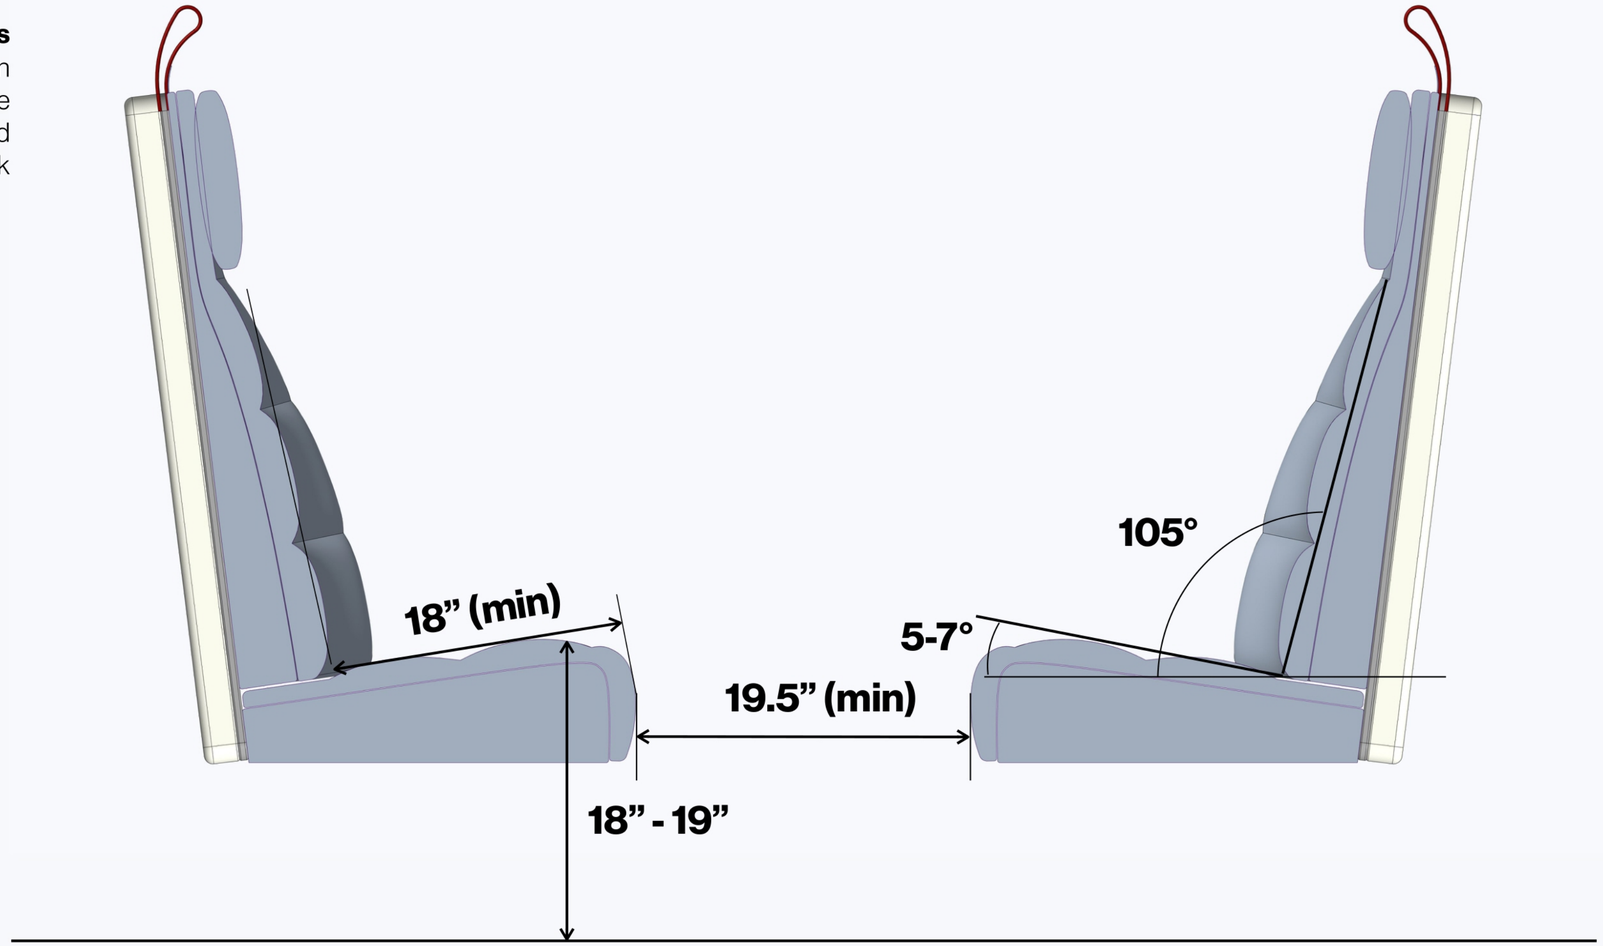


Seats
The Club Bedroom should have four comfortable seats which should also act as two wide couches so people can spread out.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

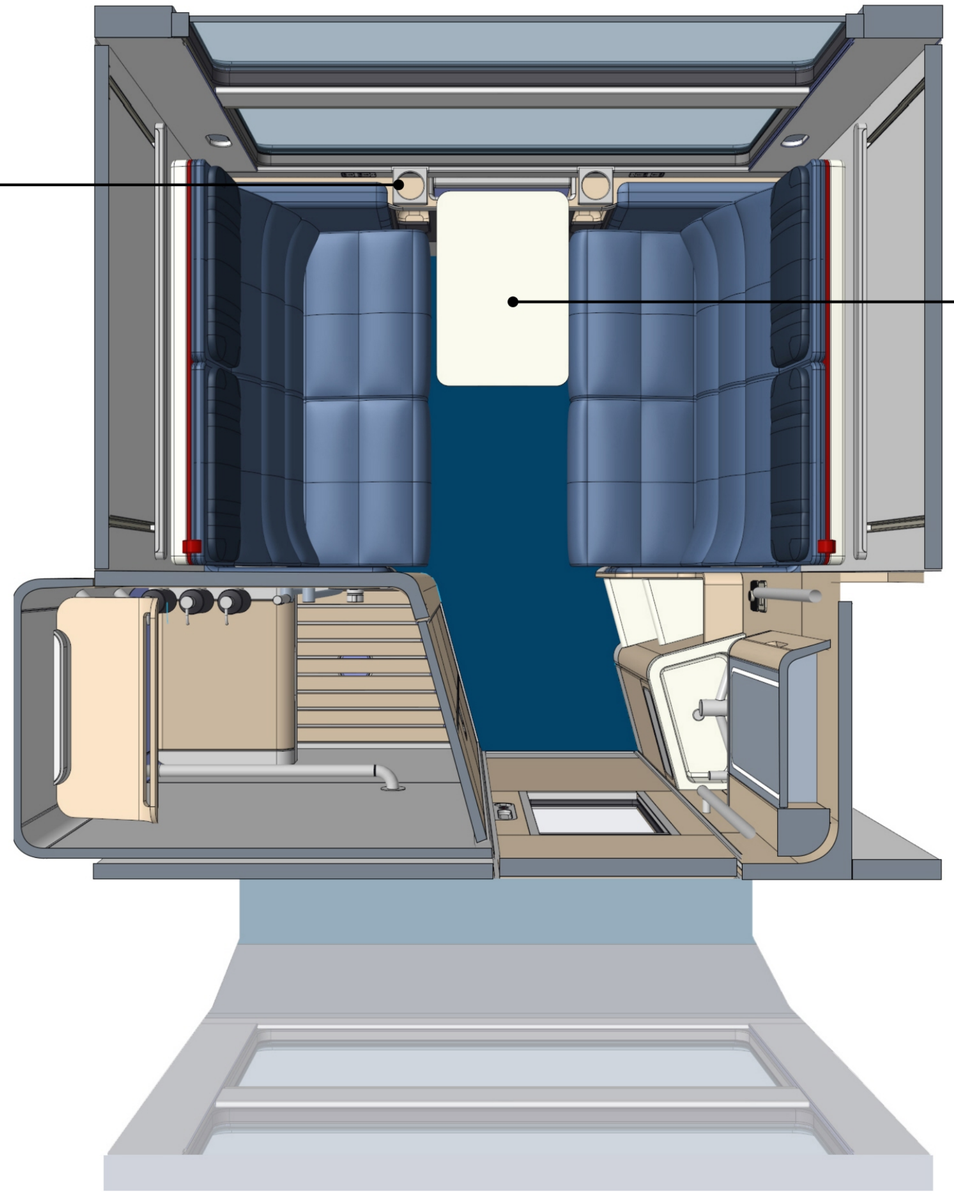
Club Bedroom | Features

Seat Dimensions
A minimum seat width between inside surfaces of armrests should be a minimum of 48”.



Armrest
A full and cushioned armrest of 3.5” should be provided on the window side.

Seat side pad
A soft seat side pad is required on the inside side of the seat to balance the look of the seat and allow some cushioning to the inside edge of the seat and to soften the joining panel work.



Club Bedroom | Features

Seat Dimensions
All seat dimensions, cushion density/ shore hardness will be subject to mockup review and approval by Amtrak

Club Bedroom | Features

Cup Holders
One for each side for the room located so people can use and access the cupholders from a seated position by the window. They should fold away when not in use.

Fold out Table
A single leaf table deployed from side wall should be supplied. The table height should provide good knee clearance for seated people with a height off the finished floor between 27” and 29”. The table should be easy to deploy and stow with an intuitive handle.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Features

Blinds
A single pull-down blind system shall be provided per window, capable of delivering both daytime solar/glare control and full blackout performance.

Window and Window Mask
Window and window mask should be central to the room and overall window size maximized.

At Seat Power
Two power sockets and Two USB sockets should be provided at each seated location by the window.

Cubbies
Cubbies shall be built into available space for stowage of personal items.

Club Bedroom | Features

Power Outlets
Two power sockets and two USB sockets shall be positioned the by the vanity area.

Master Light Switch
Master light switches to be positioned near door.. A second master switch sets a preset condition in the toilet/shower room. A second bank of master switches should be safely accessible by a person in the top bunk.

Temperature Control

Trash
A trash bin should be provided below the sink. Access to the bin should be provided via a swing door. The bin should be watertight in case of a spill to prevent any water escapement.

RH Side

LH Side

Power Outlets
Two power sockets and two USB positioned by the open wardrobe within easy access of seated passengers.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Features

Automatic Water Faucet
Water is automatically dispensed when hands are placed under the faucet. A physical element should be visible so it is clear where water is dispensed from. Water pressure, water flow should not create any water splash or spill outside of the sink area.

Automatic Hand Drier
An automatically triggered hand dryer should be included under the vanity unit. This can be part of the faucet or supplied separately. A physical element should be visible so it is clear how to use the dryer. The dryer should use high velocity air and HEPA filters similar to a Dyson Airblade. The air dryer should not blow water out of the sink.

.

Soap Dispenser
An automatic soap dispenser should be included above the sink area. A physical element should be present to indicate how and where the soap will dispense.

Sink
The sink should have a marine edge so any water spill is captured in the sink area. A splash back behind the sink should protect the surrounding areas from water splashed onto the back wall from the sink area. An area on the side of the sink should be reserved for a refillable hand lotion bottle fixed to the side wall.

Club Bedroom | Features

Door Window and Blind
Door window should be central to door and come equipped with an integrated black out blind.

Door Handle and Lock
Door handles should be positioned to slide door easily open and closed. An accessible manual lock should be included with an indicator to show lock condition.

Door
Door free from rattle, smooth sliding operation.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Storage

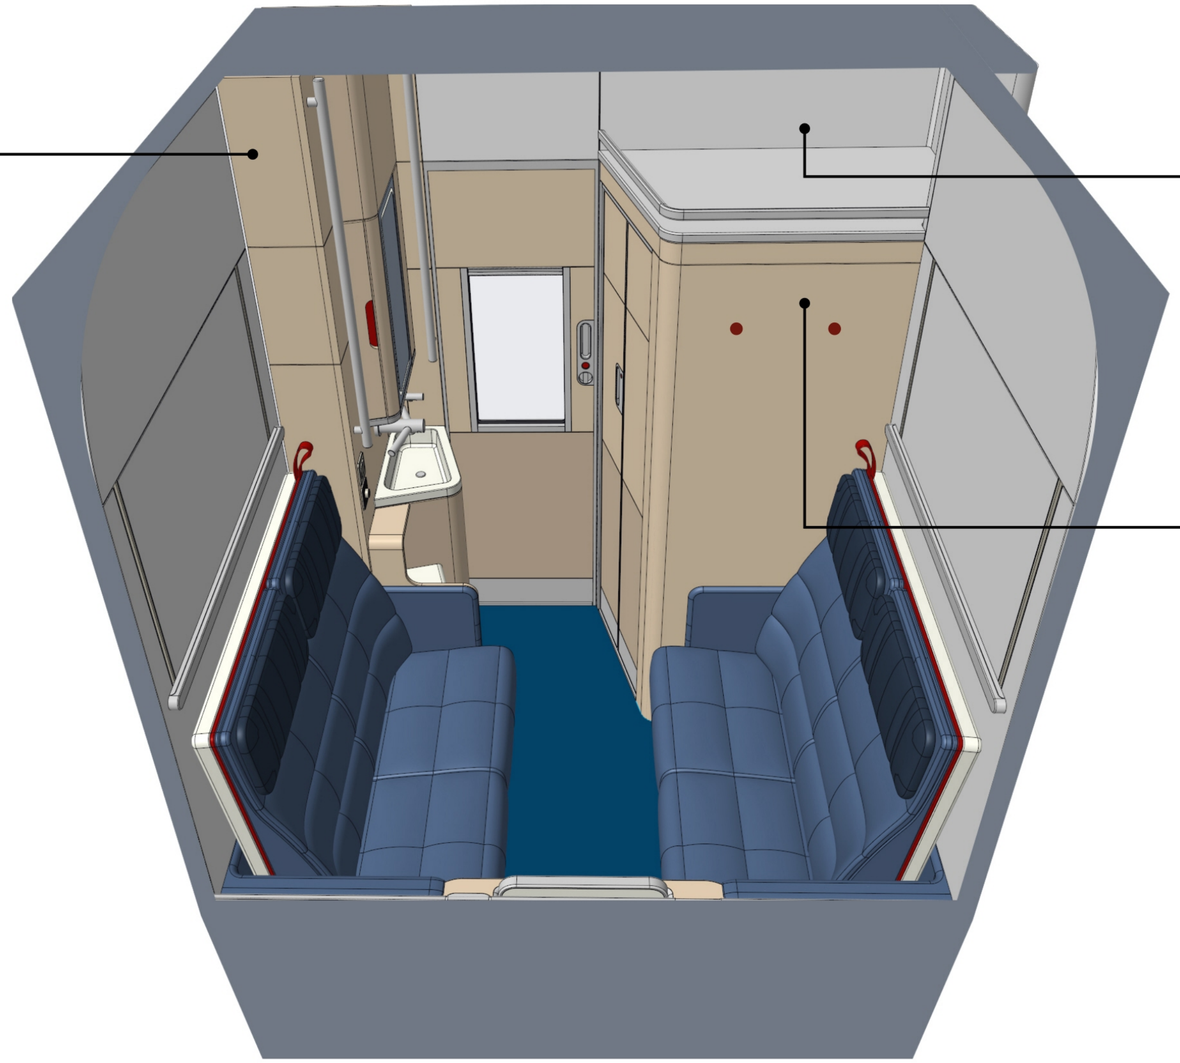
Club Bedroom | Storage

RH Side

Vanity Cabinet

Shelved cabinet for toiletries, hand towels and face cloths (4 of each Amtrak's standard towels supplied). Space required for integrated tissue dispenser. Internal light activated as cabinet is opened. Mirror fronted.

Under Seat Stowage



Space under the both seats should remain free for up to four pieces of carry on luggage. No seat mechanism or structure should preclude the ability to store large carry on bags.

LH Side

Club Bedroom | Storage

Upper Cubbies
Cubbies shall be provide storage for personal items where possible at upper bunk level.

Upper Storage
Upper storage shall be provided for carry on cases above the aisle or bathroom.

Open Wardrobe
At least two coat hooks should be provided within an open wardrobe. The space should be large enough to hang clothes on coat hangers.

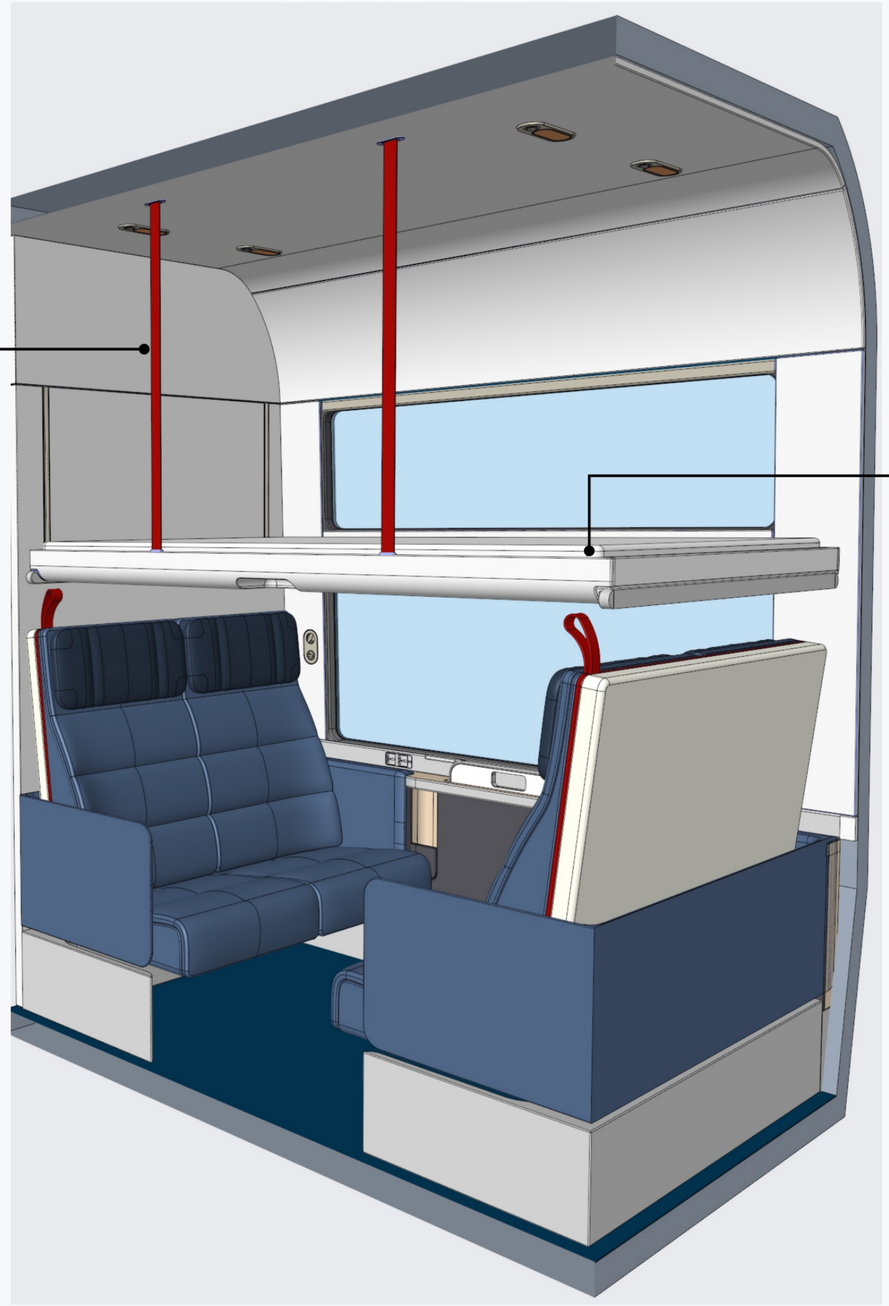
Club Bedroom | Seat to Bed Conversions

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Seat to Bed Conversions

Lower Berth Deployment
A simple unlatch mechanism is required to convert the seats into a lower bed/berth. This should be positioned in a place that is easy for people to use and designed in a way so that people can understand its purpose.

Upper Bunk
Bunk should be stored horizontally in the room. Bunk should not preclude any part of the window when stowed. The bunk's stored height should be optimized in both seated and standing positions.



Upper Bunk Deployment
A simple and easy to use handle, latch and lock mechanism should be within easy reach from a standing position. Successful locking should be visually indicated and safety measures should be put in place to prevent accidental deployment and prevent misuse.

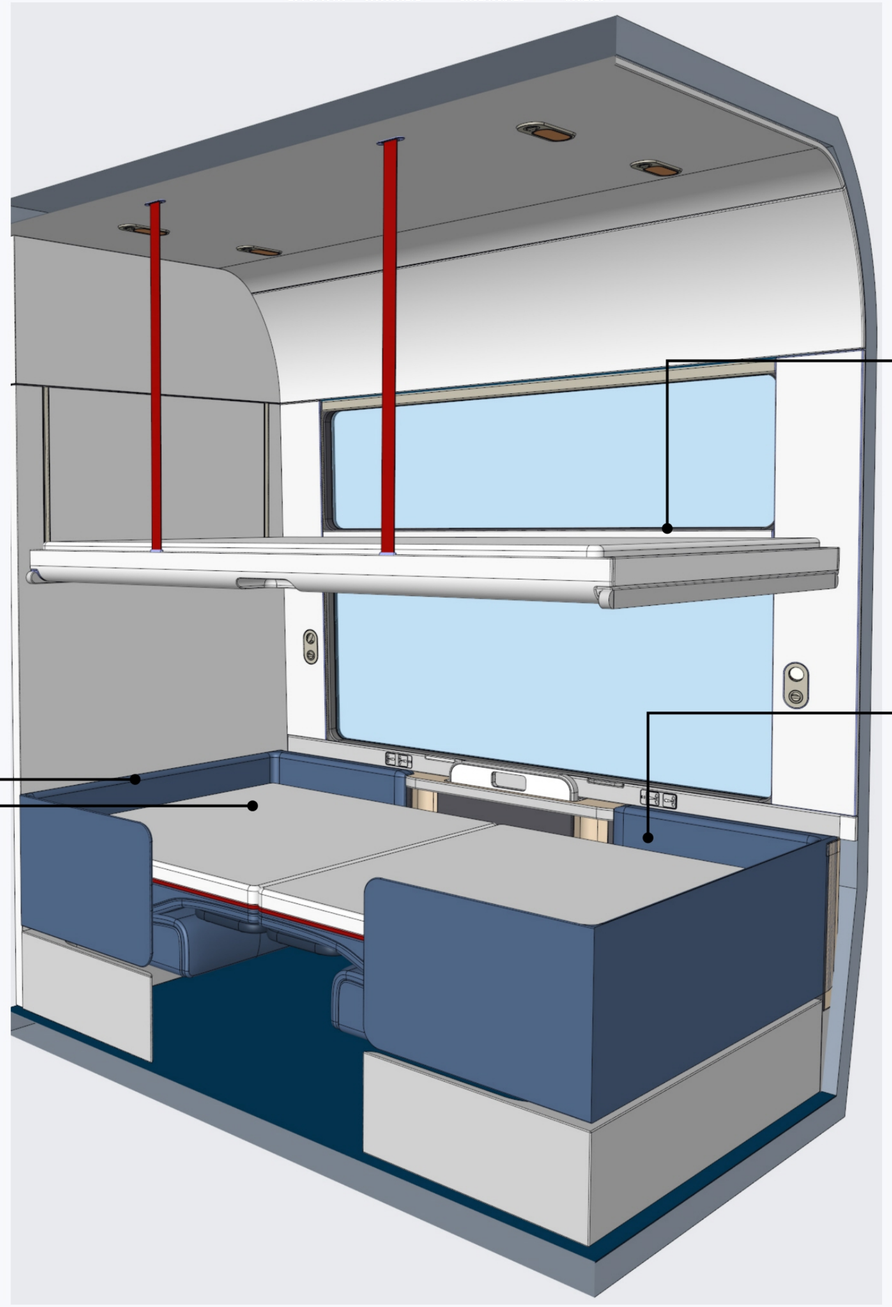
The bunk deployment should be free from jamming and racking and should lower slowly and in a controlled manner. Considerations should be made for assisted movement or counter balances to assist people moving the bunk down and back up into the stowed position.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Seat to Bed Conversions

Bunk Retaining Straps
Retaining straps are required to prevent people from rolling out of the bunk . These should retract into the ceiling and be easily pulled down and click into place using an automatic locking retractor belt system (similar to a car seat belt system).

Bunk Height
The bunk height when deployed will be evaluated and judged carefully during the design review process .



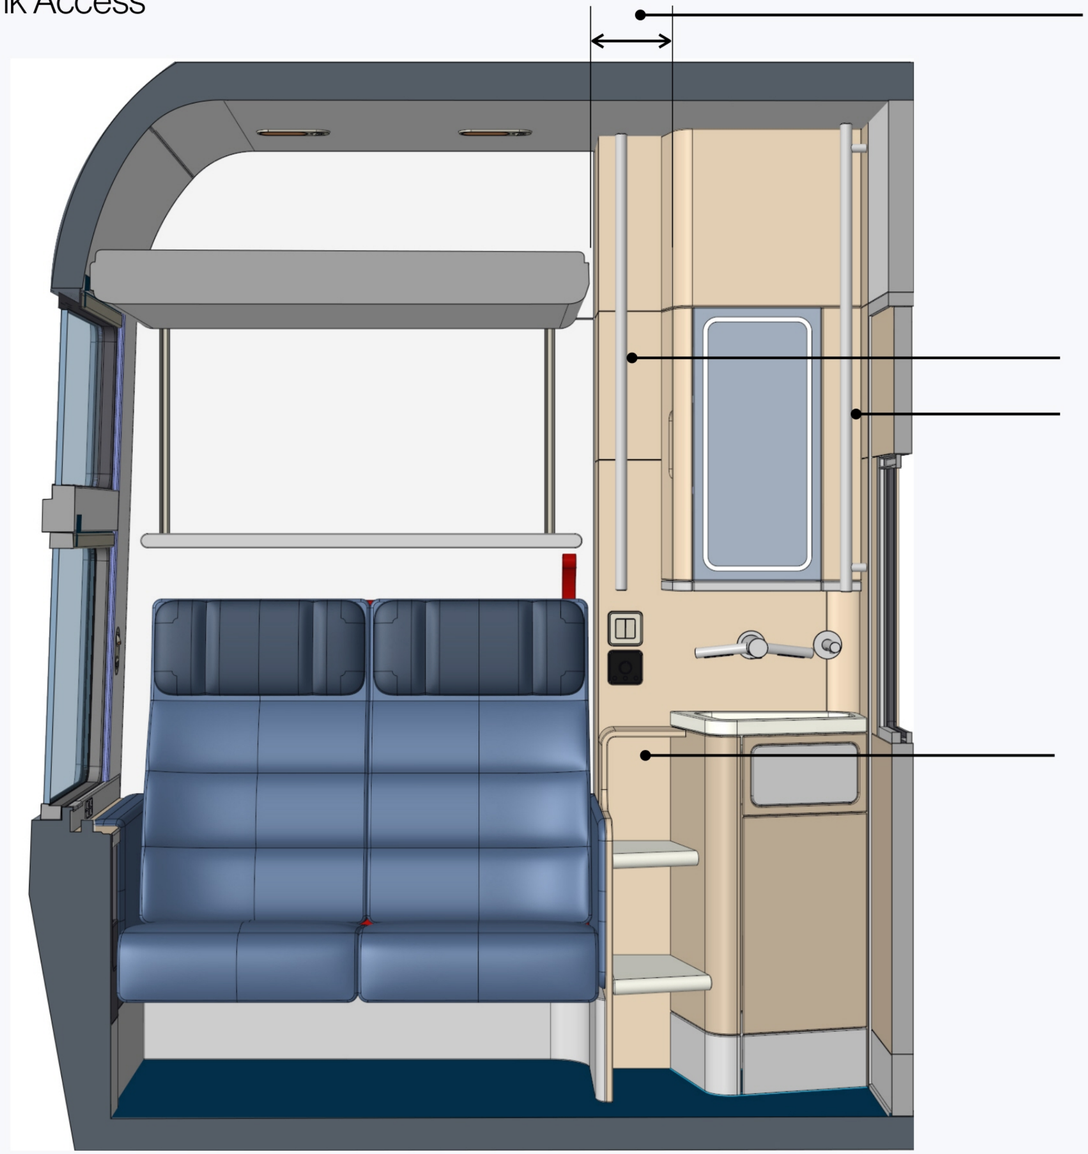
The seated area below the bunk should still be usable by seated passengers when the upper bunk is deployed, the area should still be well lit and tables and other amenities should not be restricted by a deployed bunk.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Seat to Bed Conversions

Head Board
The armrest and seat side pad should continue and connect to form a thin soft headboard around the back of the seat when the bed for the lower berth is down.

Lower Berth
Conversion of seats to bed should result in an entirely flat bed surface. The mattress surface should be integral to the seat . A single seam between the bed surface is acceptable with a single thin topper to finish the bed surface.



Bunk Dimensions
Should be maximized to the available width with a minimum width 44” x minimum length of 77”.

Lower Berth Dimensions
Should be maximized to the available width with a minimum width 48” x minimum length 77”.

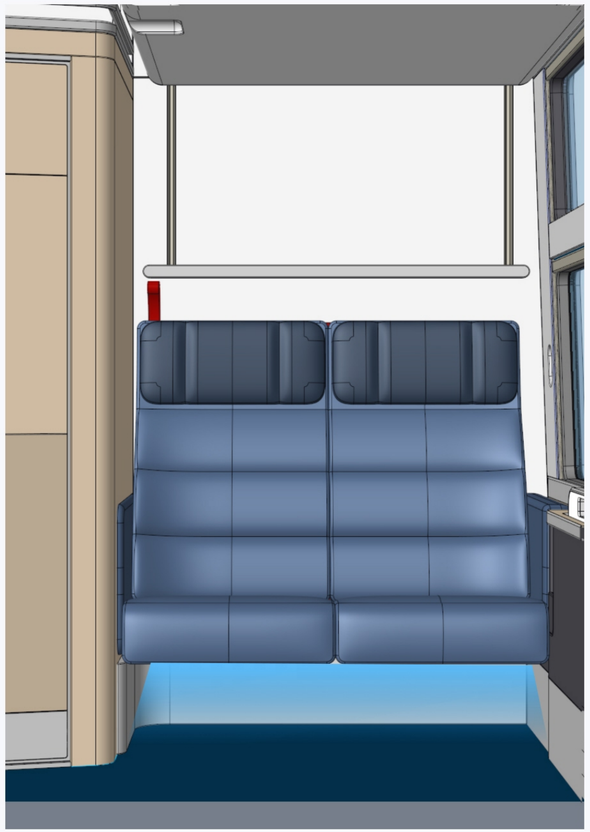
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Upper Bunk Access

Minimum Clear Way
A free clear channel should be provided. Key dimensions and access to the upper bunk will be subject to mockup testing and Amtrak approval.

Handrails and Grabs
Suitable handholds shall be provided to assist people transitioning to the bunk. These should be positioned on both sides of the bunk. Additional handholds may be required to assist people climbing down safely from the bunk, positioned closer to the door of the room.

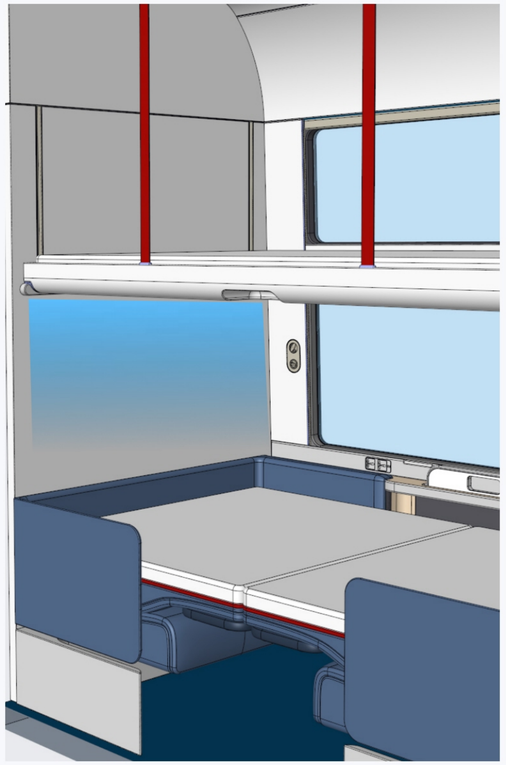
Steps
At least three integrated steps should be built into the area beside the seat to allow people to safely transition to and from the upper bunk. Step width should be at least 15” wide. Step surfaces shall be free from trip hazards and have an anti-slip finish to the tread surfaces. Steps shall be designed in such a way that the seat cushions, armrests, any soft furnishings are protected and clear of tread surfaces. Design of the steps should discourage people from using the sink surfaces as steps. Step design and access to upper bunk will be subject to mockup testing and the approval of Amtrak.



Club Bedroom | Lighting

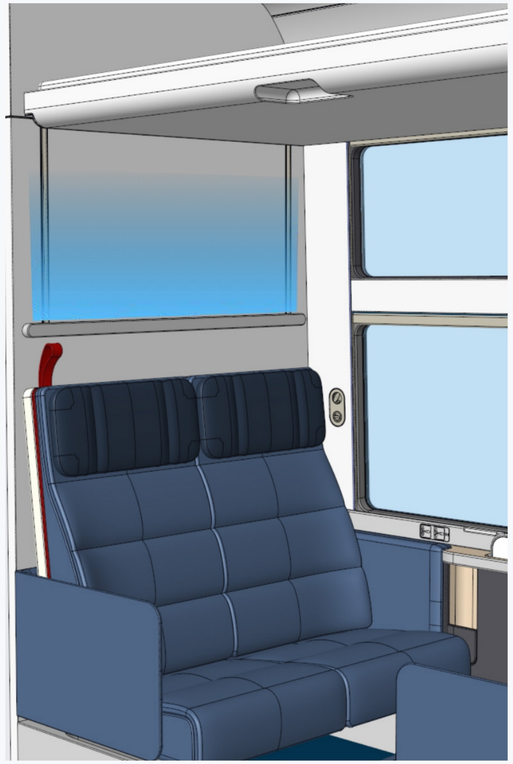
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Lighting



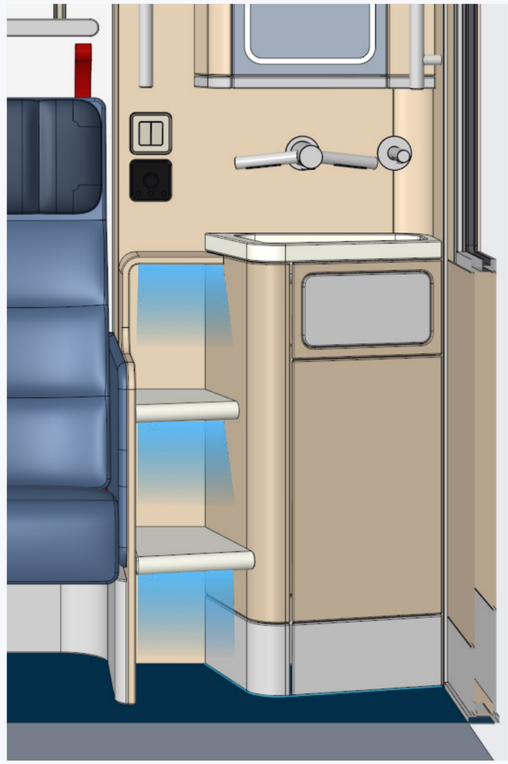
Lobby Lights
Panel lighting provides master ceiling light to the lobby and vanity area.

Under Seat Light
Under seat light should be indirect and spill light out across the floor.



*See lighting spec for detailed definition

Club Bedroom | Lighting

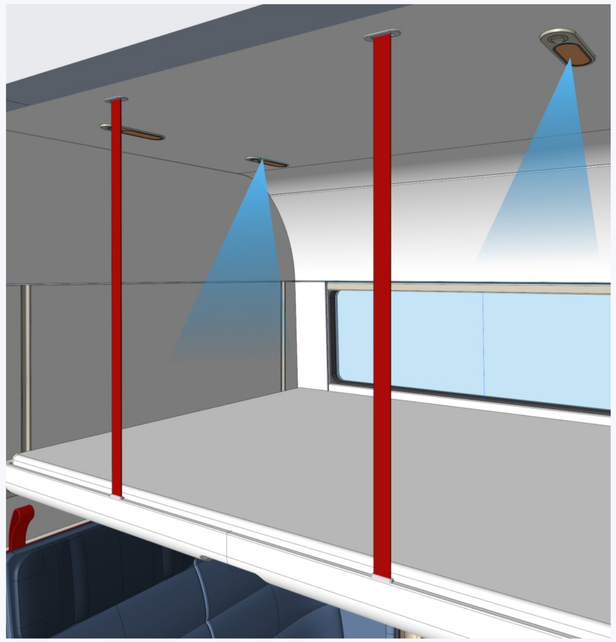


Back Wall Wash Light

Bunk support runner washes indirect light down the end walls on both sides of the room.

Back Wall Wash Light

Bunk support runner washes indirect light up across the end walls on both sides of the room.

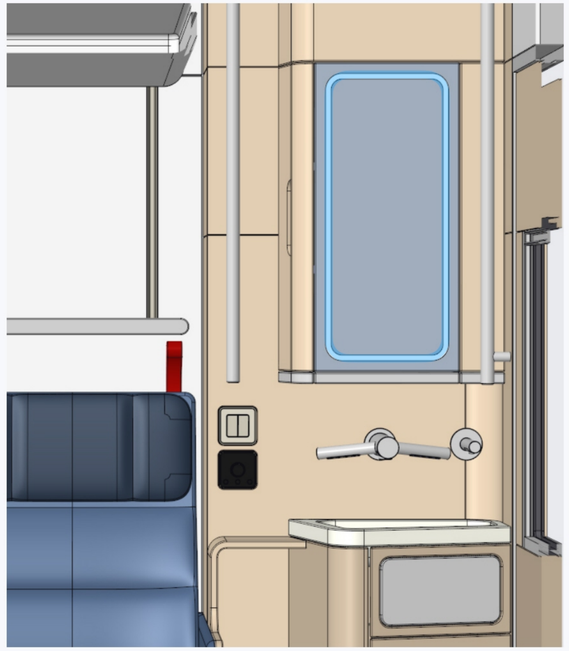


Step Lights

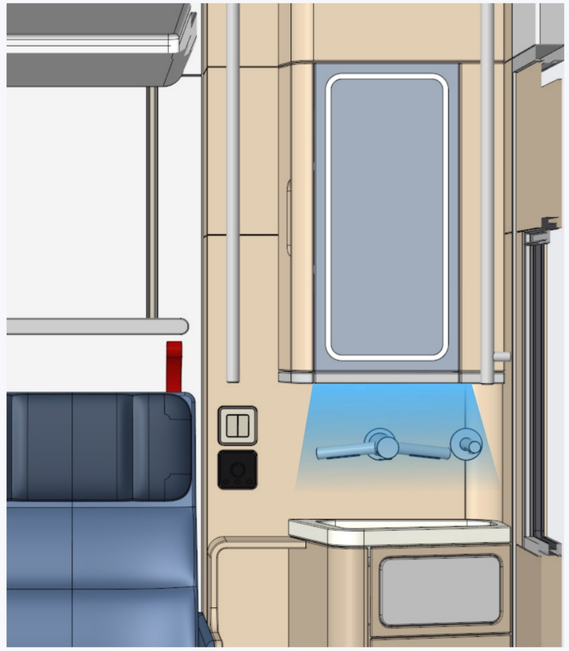
Indirect light provides wash light over each of the steps.

*See lighting spec for detailed definition

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



Club Bedroom | Lighting

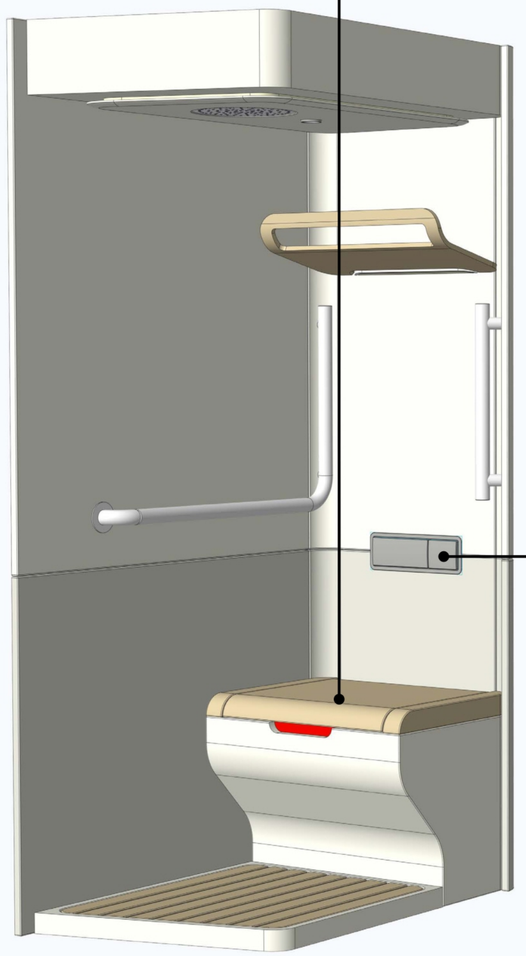


Upper Reading Lights
Reading lights should be provided, embedded in the ceiling above the bunk. These should be mini panel lights. 2 lights in total located at each end of the bed. Light switches should be located next to the reading light.

Lower Reading Lights
Reading lights should be provided at each seated location. People should be able to adjust the direction, position the light over their lap to be able to read a book at night. Switches should be located near or on the light.

Mirror Light
The vanity mirror is illuminated with a back light or similar.

Vanity Light
The vanity surface is illuminated with an indirect lighting.



*See lighting spec for detailed definition

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Toilet & Shower

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Bathroom Features

LH Side

Toilet

The toilet is covered by a lid that covers the toilet seat and also acts as a shower seat.

While the bathroom is being used as a shower the lid should disguise the toilet seat forming a bench across the width of the room. The form of the toilet is undercut at the bottom to maximize standing space in the shower area. The design of the toilet, access and lid design will be subject to testing and ergonomic review during mockup stages and subject to the approval of Amtrak.

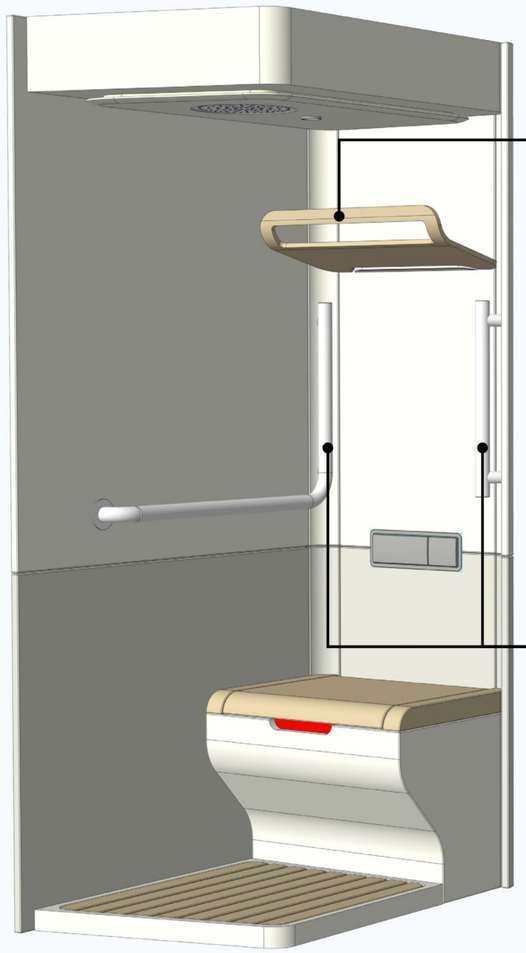
A separate more standard toilet seat and toilet lid may be required with the shower seat acting as an additional layer with the sole purpose of hiding the toilet and providing a shower seat.

Toilet seat, seat lid and shower seat should all have soft close mechanisms.

Toilet Flush

A two button push flush is located on the back wall providing standard and eco flush.

Toilet Paper Storage



The toilet paper should be stored in the wall of the bathroom with a waterproof cover to protect it from getting wet with shower water.

RH Side

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Bathroom Features

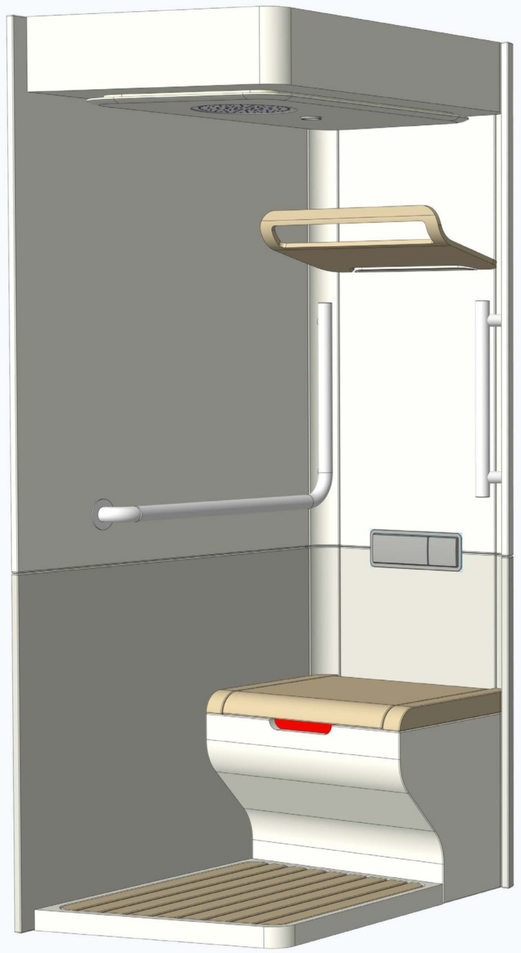
LH Side

Towel Storage

A shelf on the back wall of the bathroom of a suitable size to store a minimum of 4 Amtrak bath towels. The shelf and towels are to be placed high and out of the direction of any shower water when the shower is in use.

Dispensing Bottles

3 refillable Amtrak bottles dispensing shampoo, conditioner and body lotion. Bottles should be fixed to the wall and easily refilled or replaced by Amtrak staff.



Grab Handles

Suitable grab rails should be positioned to aid people while standing in the bathroom for both showering and for use of the toilet. Locations and sizes will be subject to mockup testing and Amtrak approval.

RH Side

Club Bedroom | Bathroom Features

LH Side

Rain Shower

A rain shower in the ceiling provides a shower above head height. Rain shower should be seamlessly integrated into the ceiling in order to maximize head room in the bathroom.

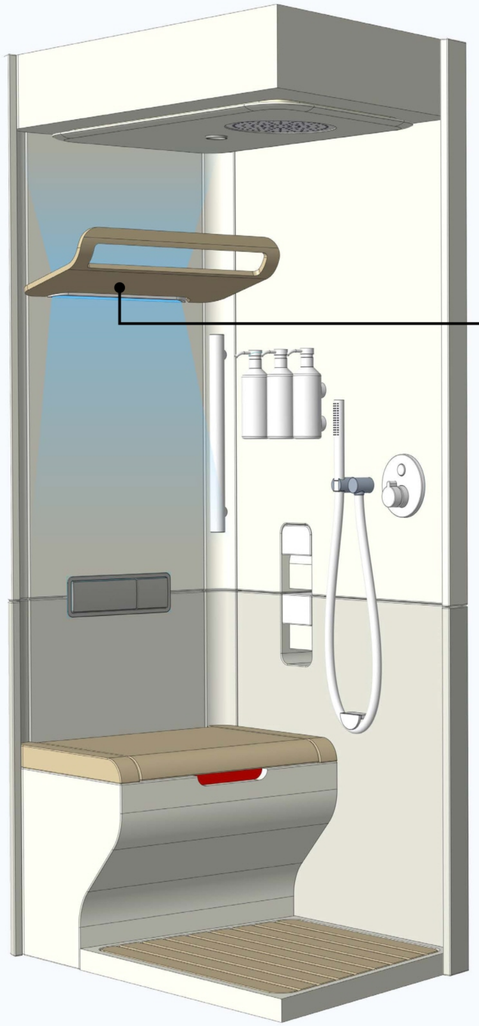
Hand Shower

A second hand shower is located with a slimline design handset. A hose clip should be included to prevent the hose from rattling while the train is in transit.

Shower Control

Shower controls are located on the bathroom wall close to the door. The shower control should prevent any accidental activation when using the toilet.

Drainage



The toilet floor has a built in shower tray with a raised lip. A slatted platform finishes flush with the top of the tray to allow the shower water to drain out underneath and prevent the floor remaining wet after use as a shower. The shower tray should be designed to prevent water from escaping into the main area of the room.

RH Side

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Club Bedroom | Bathroom Lighting

LH Side

Back Wall Wash Light

Shelf runner washes indirect light upwards and underneath the towel shelf.

LED light panel spot

Small circular LED light panels act as spot lights - frame to be color matched.

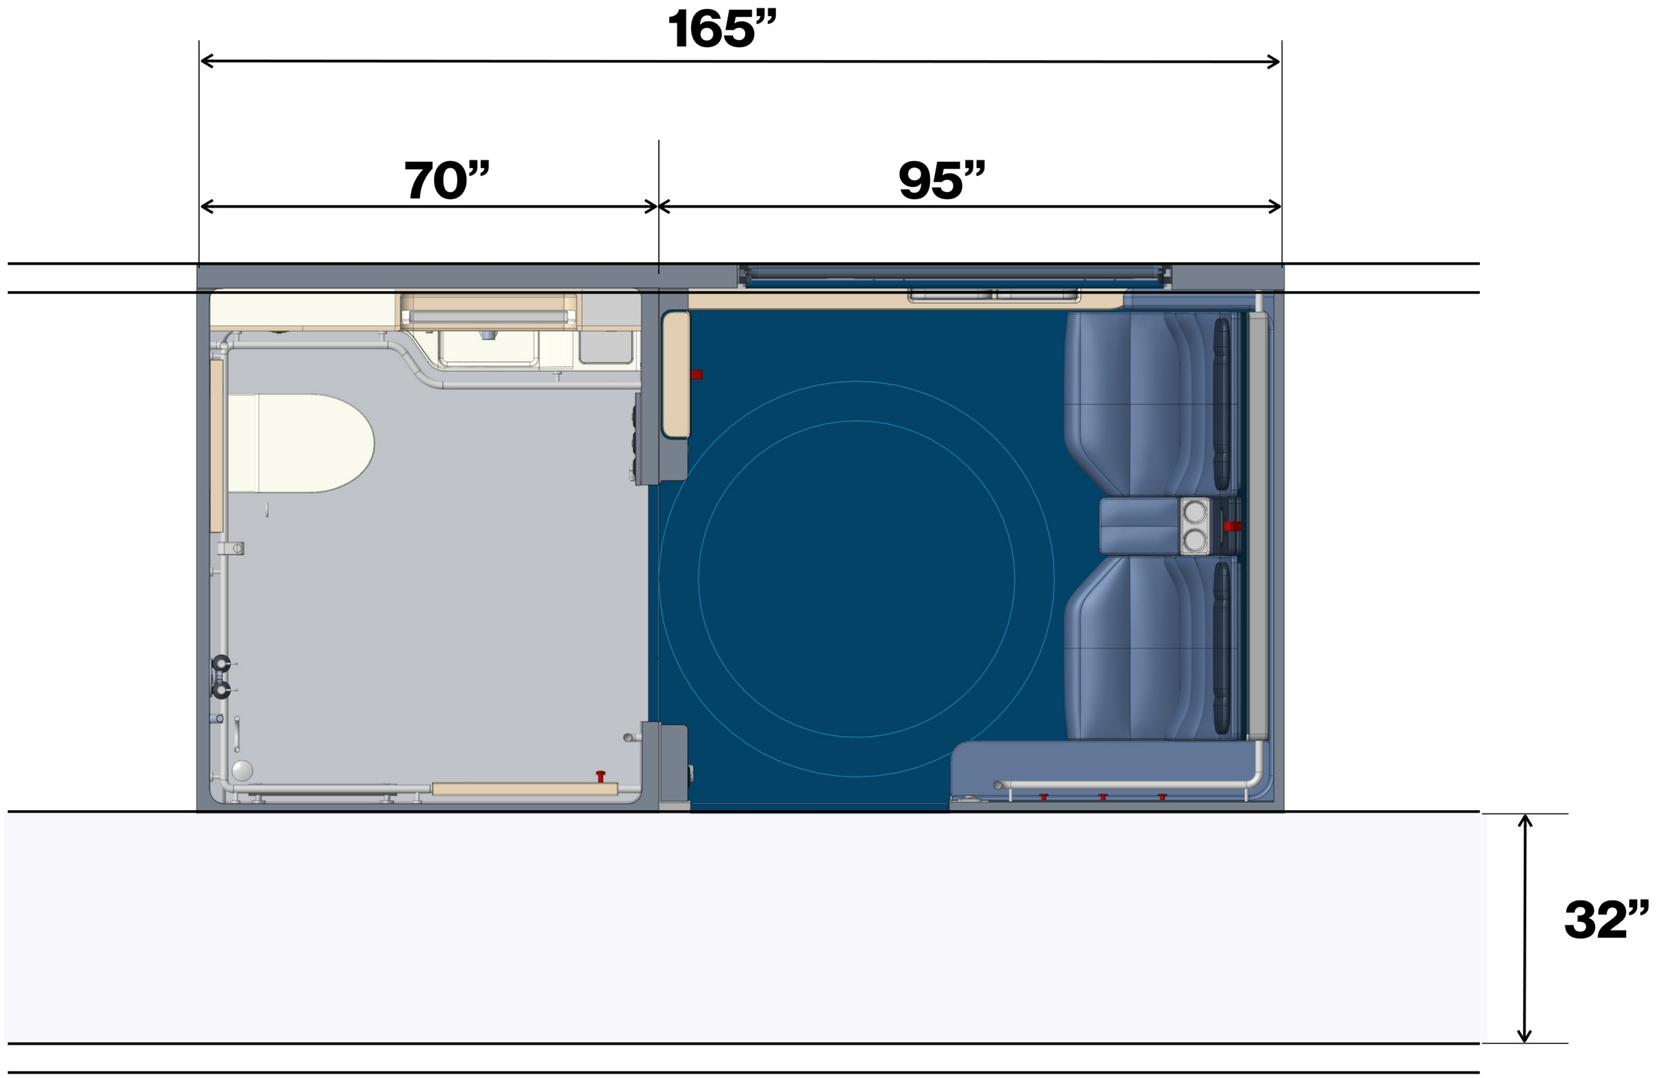
07 | Accessible Bedroom

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom



The Accessible Bedroom is a fully accessible room for three. The room has a double lower berth and a single upper bunk.

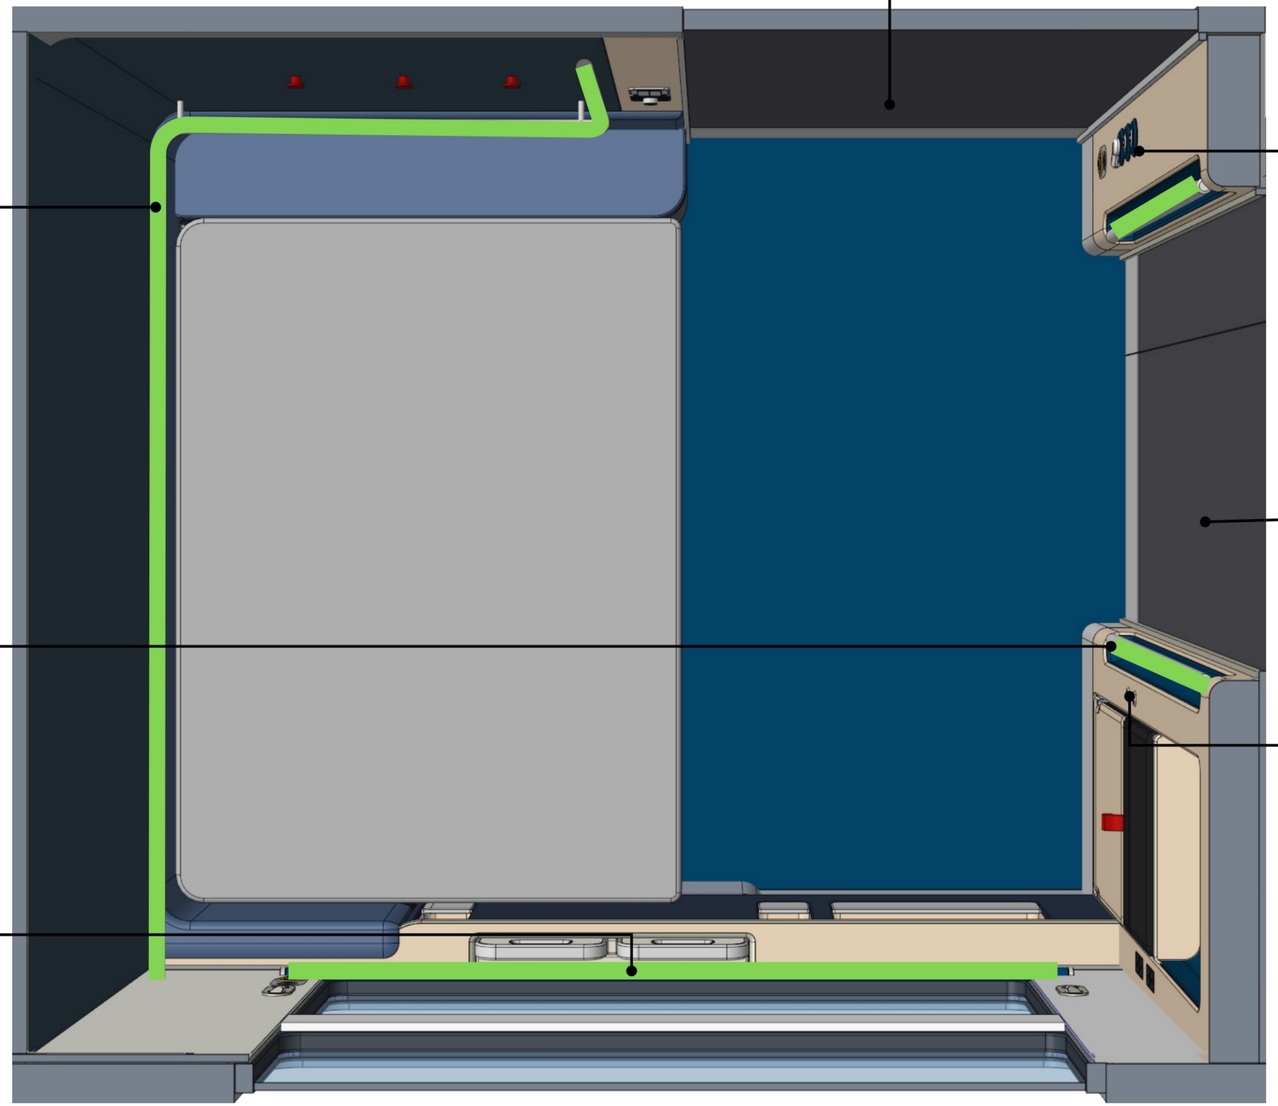
The accessible space is based on the RVACC recommendations to accommodate larger mobility devices. The ability to turn around in the room is facilitated by a clear 60” turning circle.

The room has an ensuite bathroom that is also fully accessible with a lockable door separating it from the living space.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | General

Accessible Bedroom



The Accessible Bedroom should be a maximum of 165” long and designed for a 32” side aisle.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Accessibility

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Accessibility

39” Room Door
Access to the room will be subject to review and mockup user testing. Room doors should be an automatic sliding door.

Room Door controls
The controls for the room door must be ADA compliant in position, size and configuration. The buttons should be easy and intuitive to use. An accessible manual lock should be included with an indicator to show lock condition. The buttons should have visual and haptic feedback.

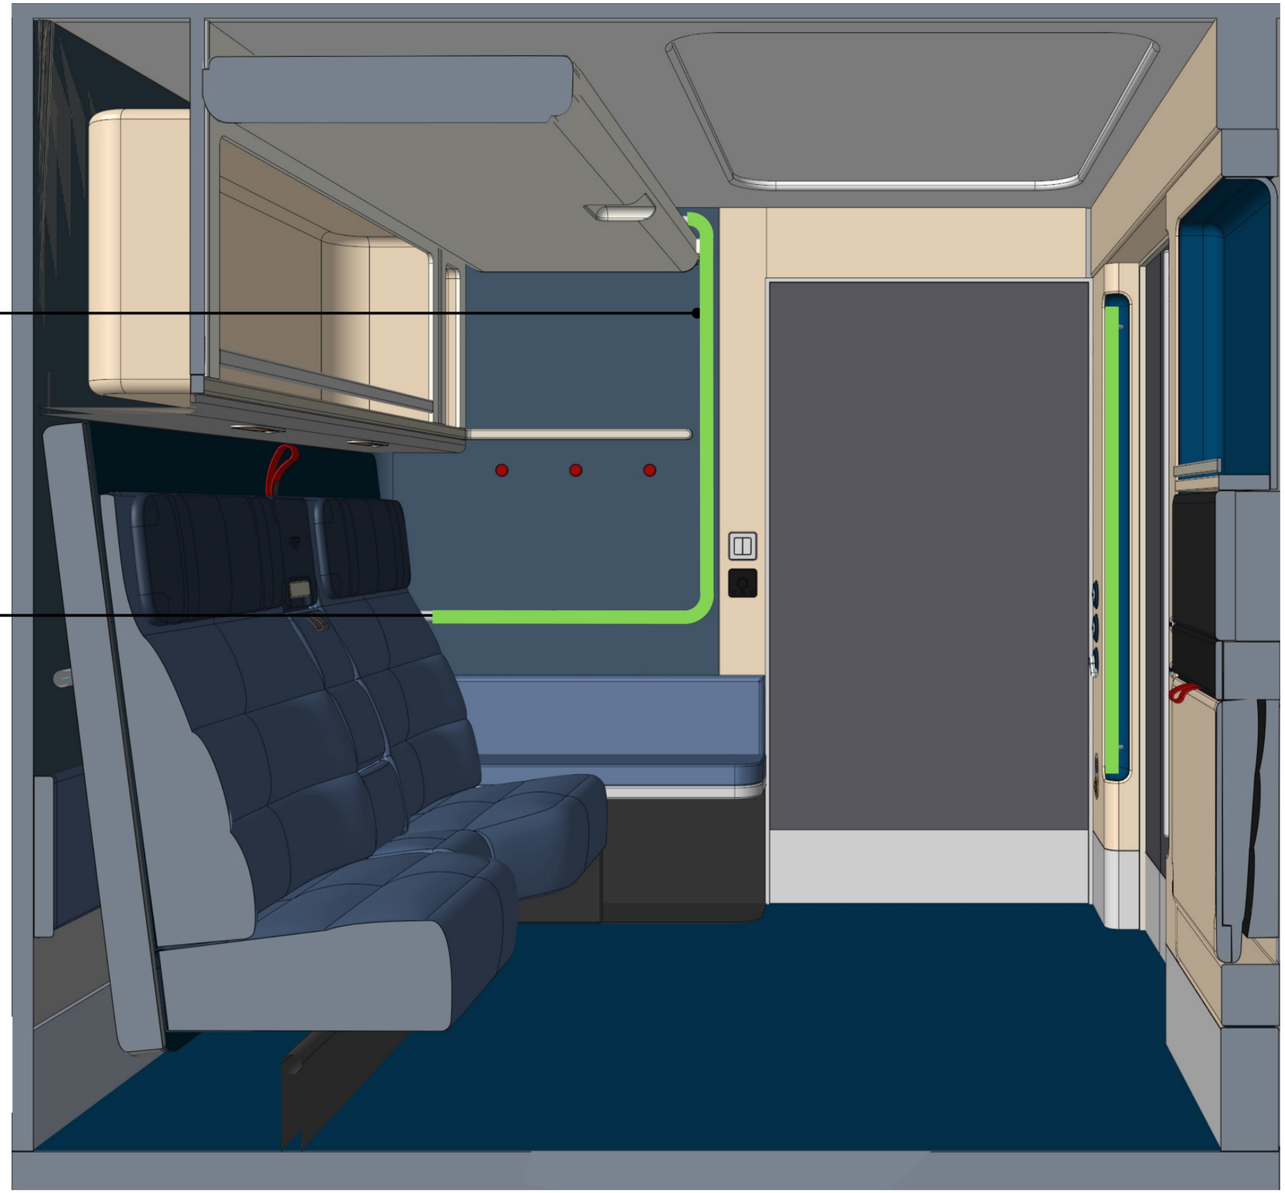
36” Bathroom Door
The Bathroom door should be an automatic sliding door. The door should be positioned to create space for a T maneuver when the door is open and the bed is deployed.

Bathroom Door Controls
The controls for the bathroom door must be ADA compliant in position, size and configuration. The buttons should be easy and intuitive to use. The buttons should have visual and haptic feedback. The controls should be positioned away from the main room controls to prevent confusion. Dimensions, position and usability will be subject to Amtrak approval.

Horizontal Handrail
ADA compliant horizontal handrails positioned adjacent to the aisle side seat to assist transfer into the seat and bed. The handrail should be positioned to maximize the space between the bed and the bottom of the handrail.

Vertical Handrail
ADA compliant vertical handrails positioned either side of the bathroom door to aid transit around the room and into the bathroom.

Horizontal Handrail
ADA compliant horizontal handrails positioned adjacent to the window side seat and accessible space. The handrail should be a minimum compliant distance (33”) above the finished floor to reduce impact on the window views. The handrail should not impede the use of the table and cupholders positioned on the sidewall.

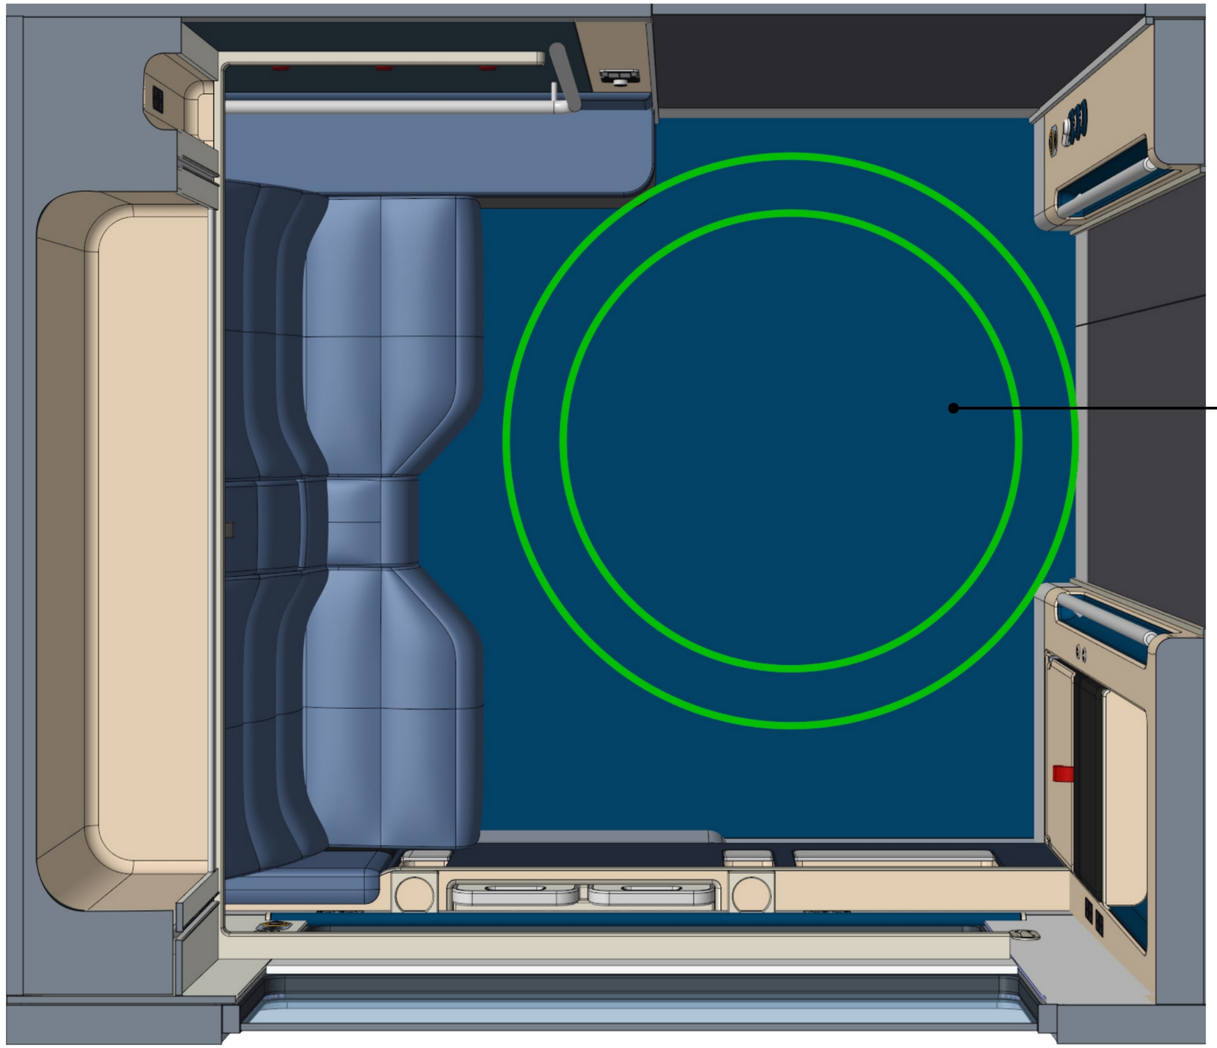


***The position of all Accessible interaction points, turning spaces and clearances will be subject to review, mockups, and user testing**

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Accessibility

Vertical Handrail
ADA compliant vertical handrails positioned on should aid bunk access.



Horizontal Handrail
ADA compliant horizontal handrails should be usable at the threshold of the room and assist people who wish to transfer from a wheelchair.

***The position of all Accessible interaction points, turning spaces and clearances will be subject to review, mockups, and user testing**

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

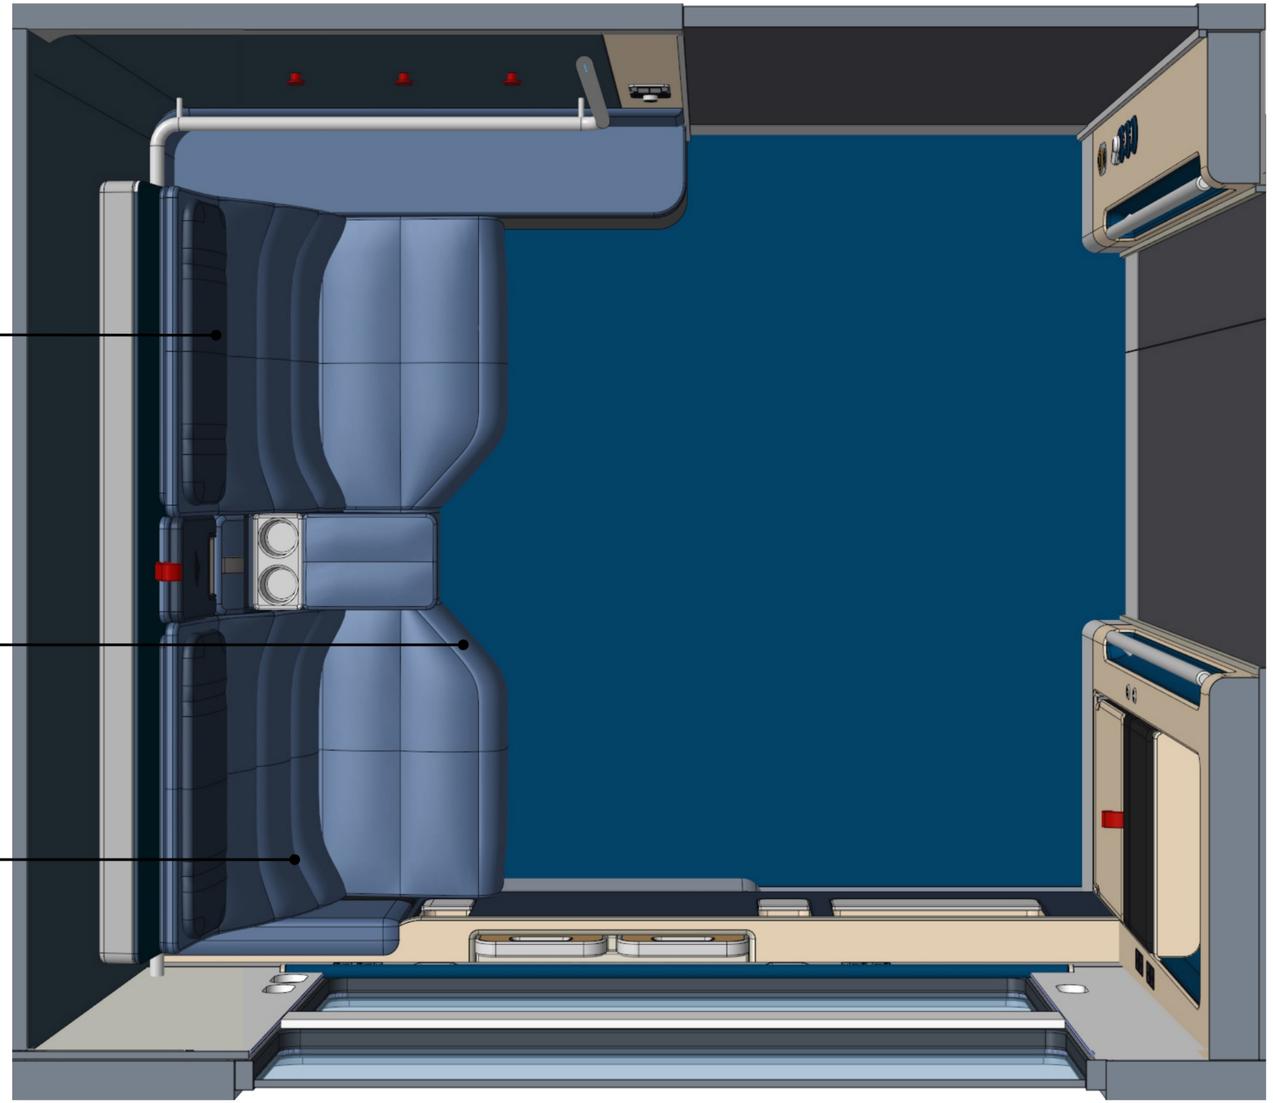
Accessible Bedroom | Features



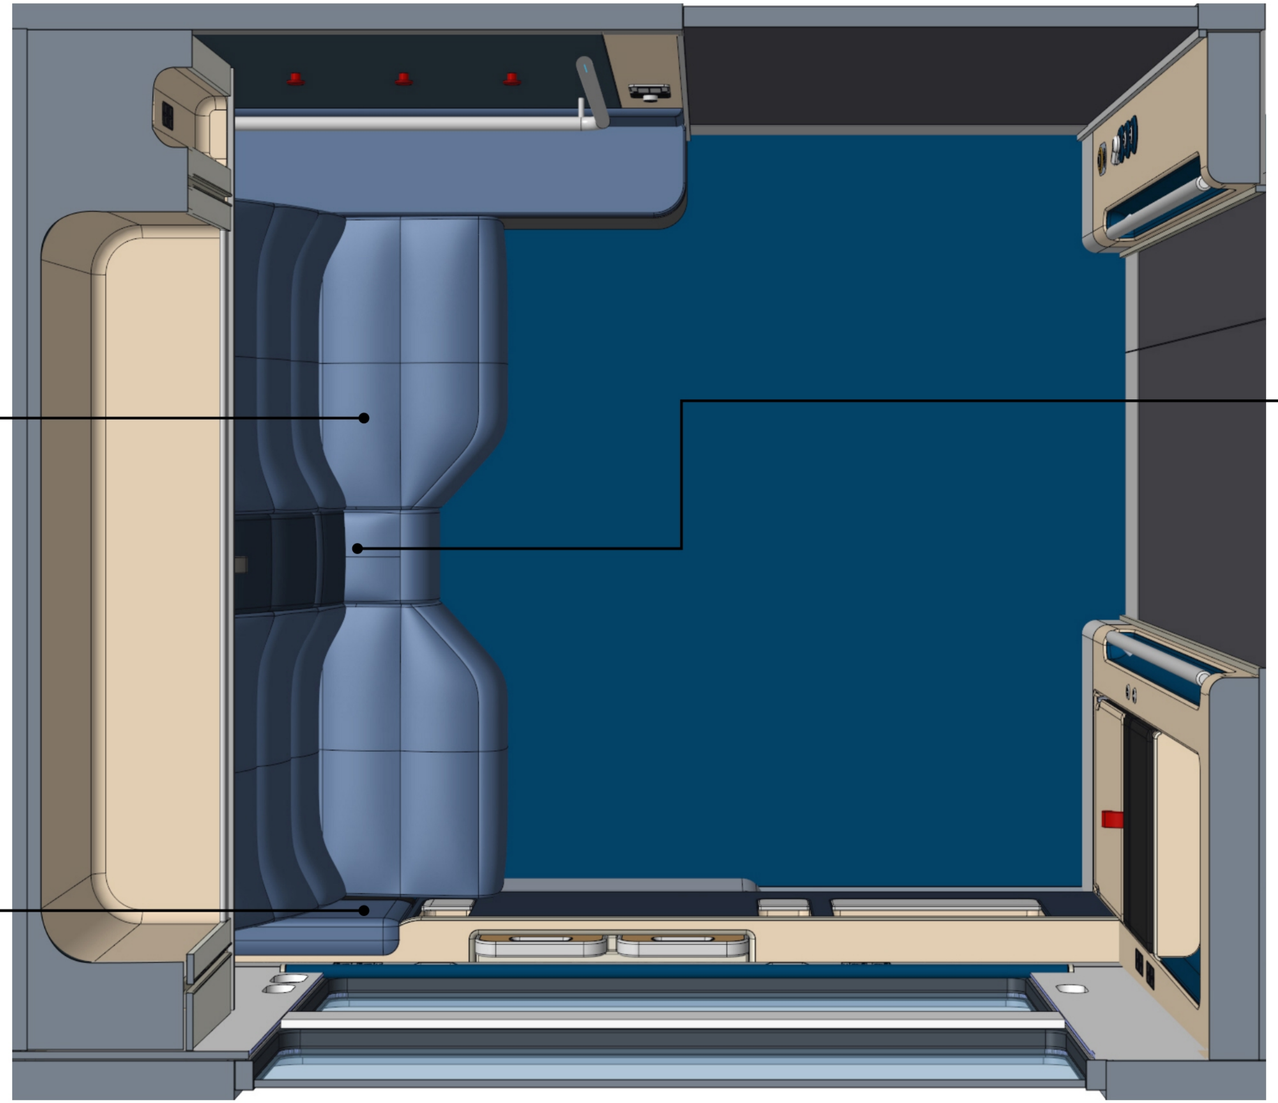
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Features

Seat Headrests
Seat headrest should be adjustable in height for a range of people sizes and have adjustable wings that fold outwards to adjust the width of the headrest .

Seat Shape
The seat shape should be optimized to maximize clear floor area, aid wheelchair transfer, and facilitate an accessible, self-sufficient bed deployment.

Seat Comfort
Seat cushions should be contoured to aid seat comfort.

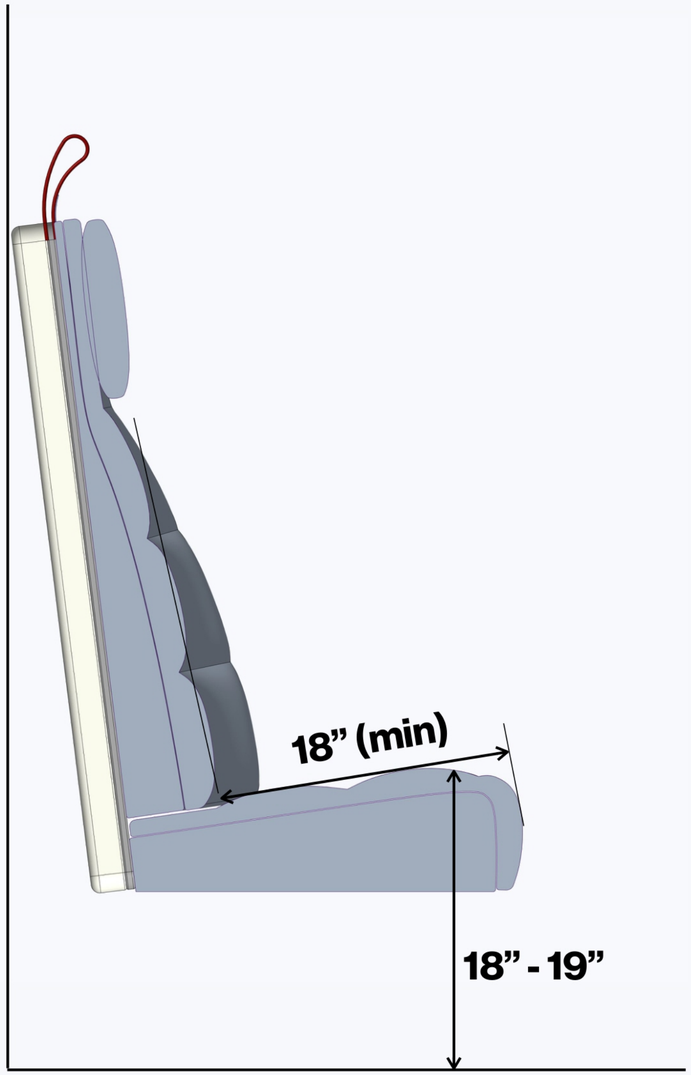


26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

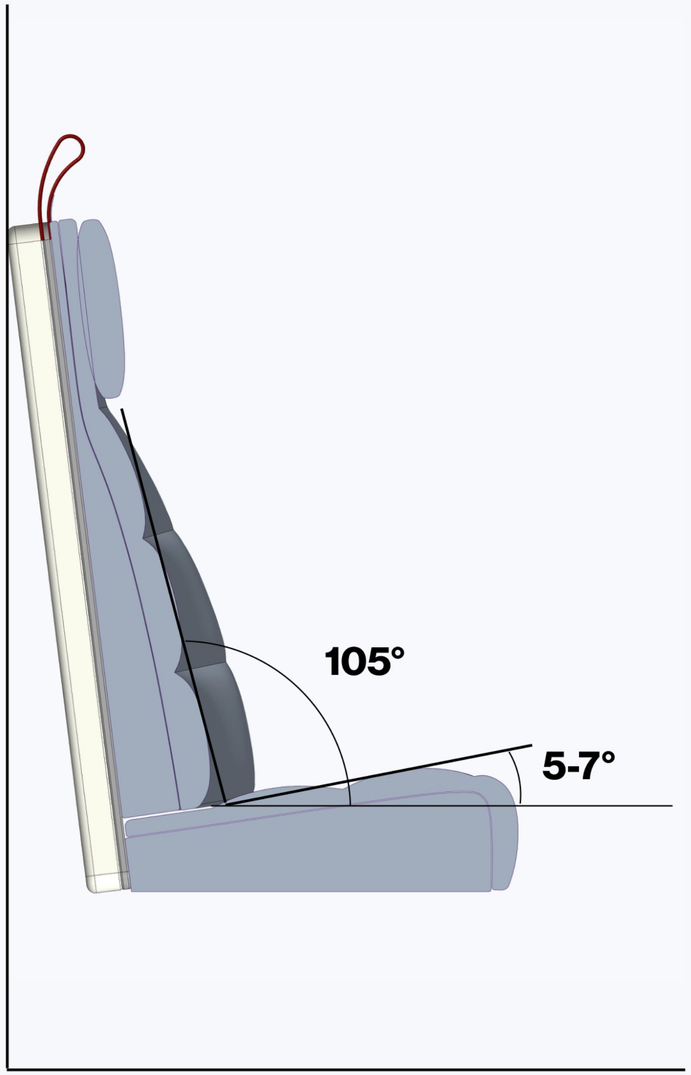
Accessible Bedroom | Features

Seat Dimensions
Each seat should have a minimum width of 28" between the inside armrests and the central armrest.

Armrest
A full and cushioned armrest of 3.5" should be provided on the windows side. The armrest should be of a suitable length for a seated passenger to rest their forearm on the cushioned section.



Center Armrest
A full and cushioned armrest should be provided between the two seats. The armrest should have provision for two cup holders.

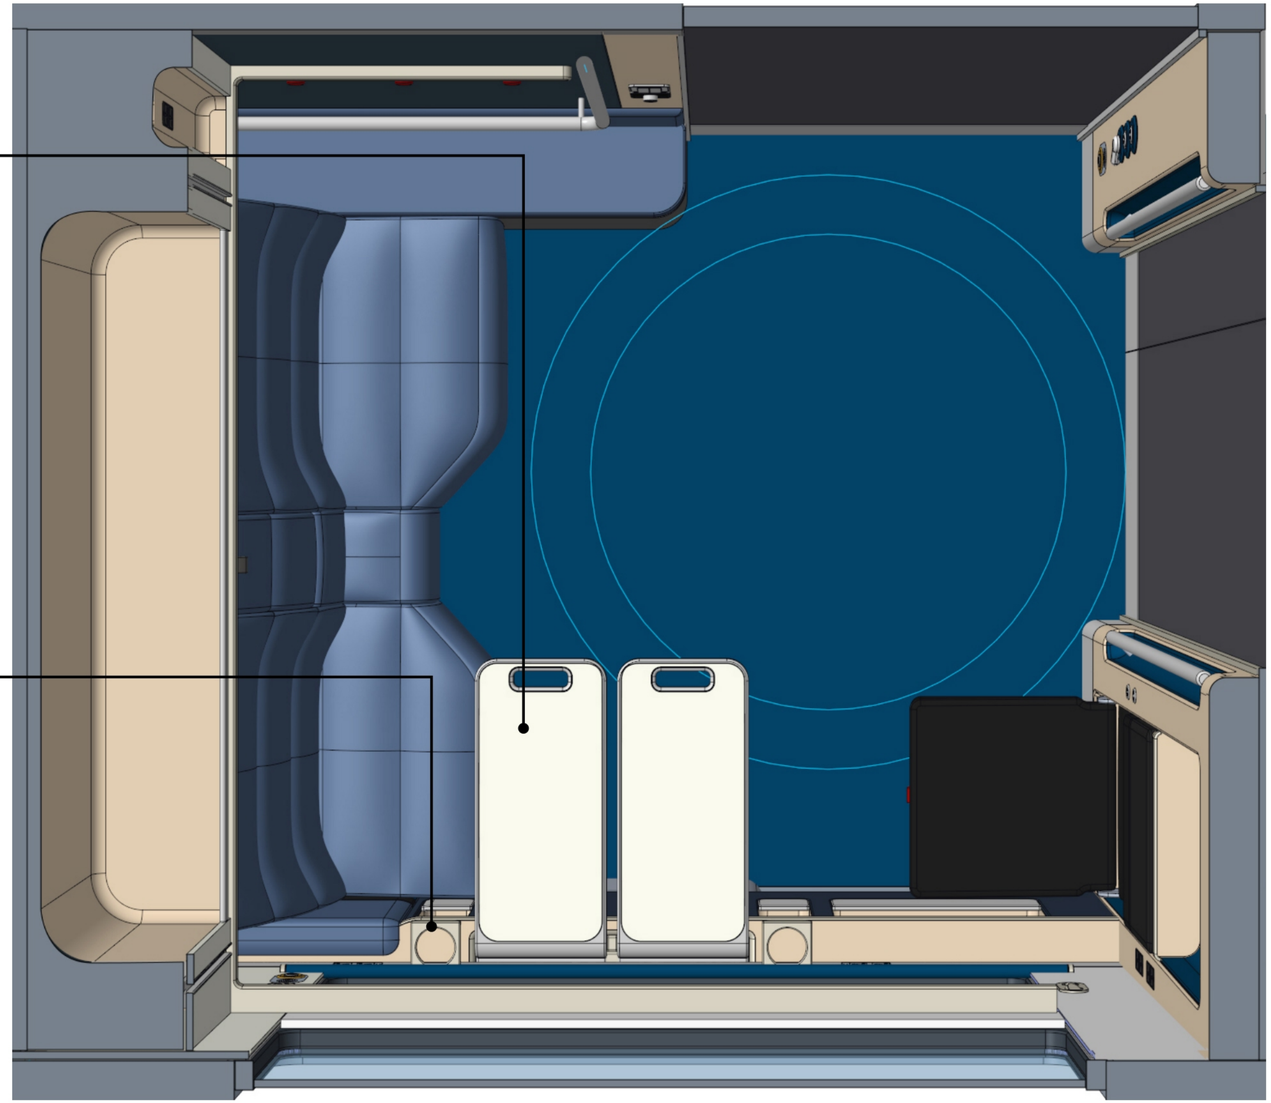


26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Features

Seat Dimensions
All seat dimensions, cushion density/shore hardness will be subject to mockup review and approval by Amtrak.

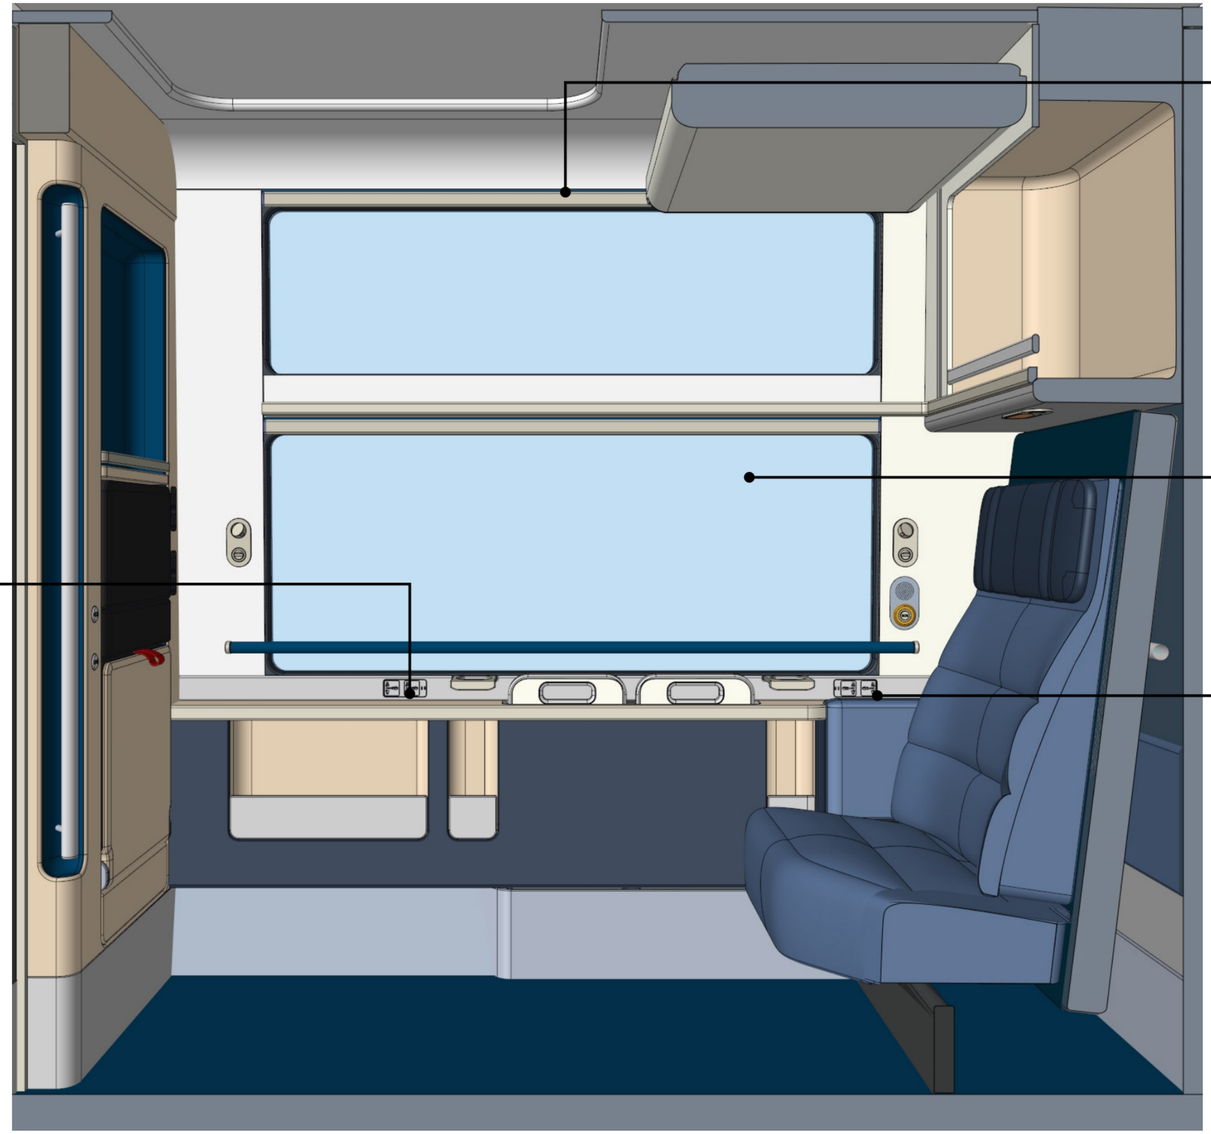
DRAWINGS NOT TO SCALE



DRAWINGS NOT TO SCALE

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Features



Fold Out Tables
Fold out table should be provide clearance for mobility devices of different sizes while also providing a good table surface for a person sat in the fold out seat.

Cup Holders
Two cupholders located so people can use and access the cupholders from a seated position and can fold away when not in use.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Features

Blinds
A single pull-down blind system shall be provided per window, capable of delivering both daytime solar/glare control and full blackout performance.

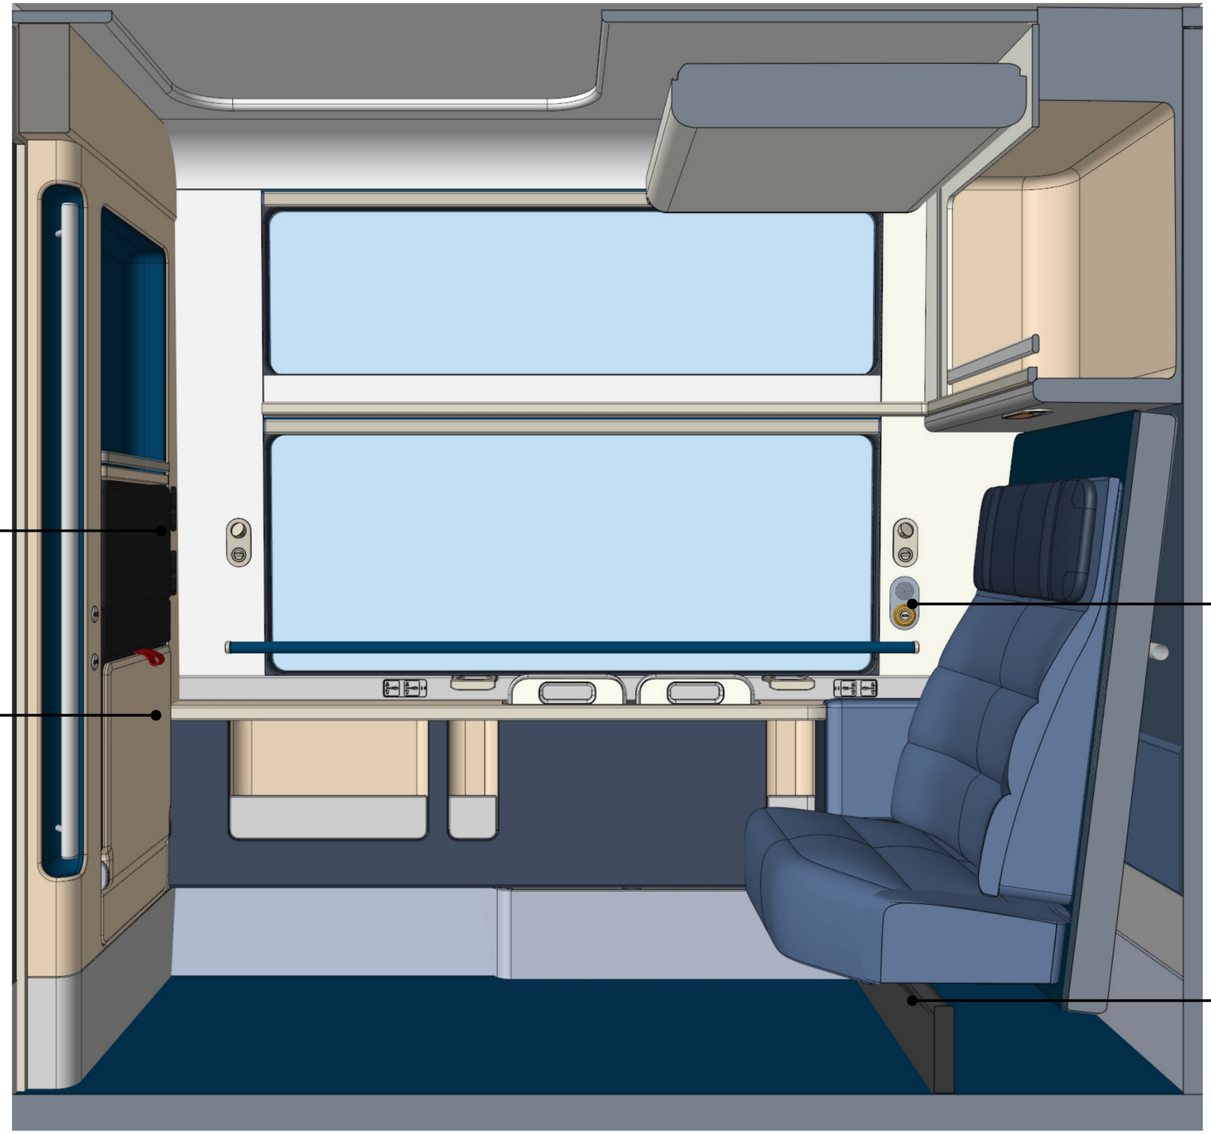
Window and Window Mask
Window and window mask should be positioned so each seated position has clear views with the overall window size maximized.

At Seat Power
Two power sockets and two USB sockets should be provided to each seated location. The position should be above the armrest height and in easy reach of people while seated.

Accessible Seat Power
Two power sockets and two USB sockets should be provided near the accessible space suitable for charging an electric wheelchair. The position should comply with ADA and be clear and intuitive to use.

Accessible Bedroom | Features

Bunk Power Outlet
Two power sockets and two USB ports shall be accessible from the top bunk when the bunk is deployed.

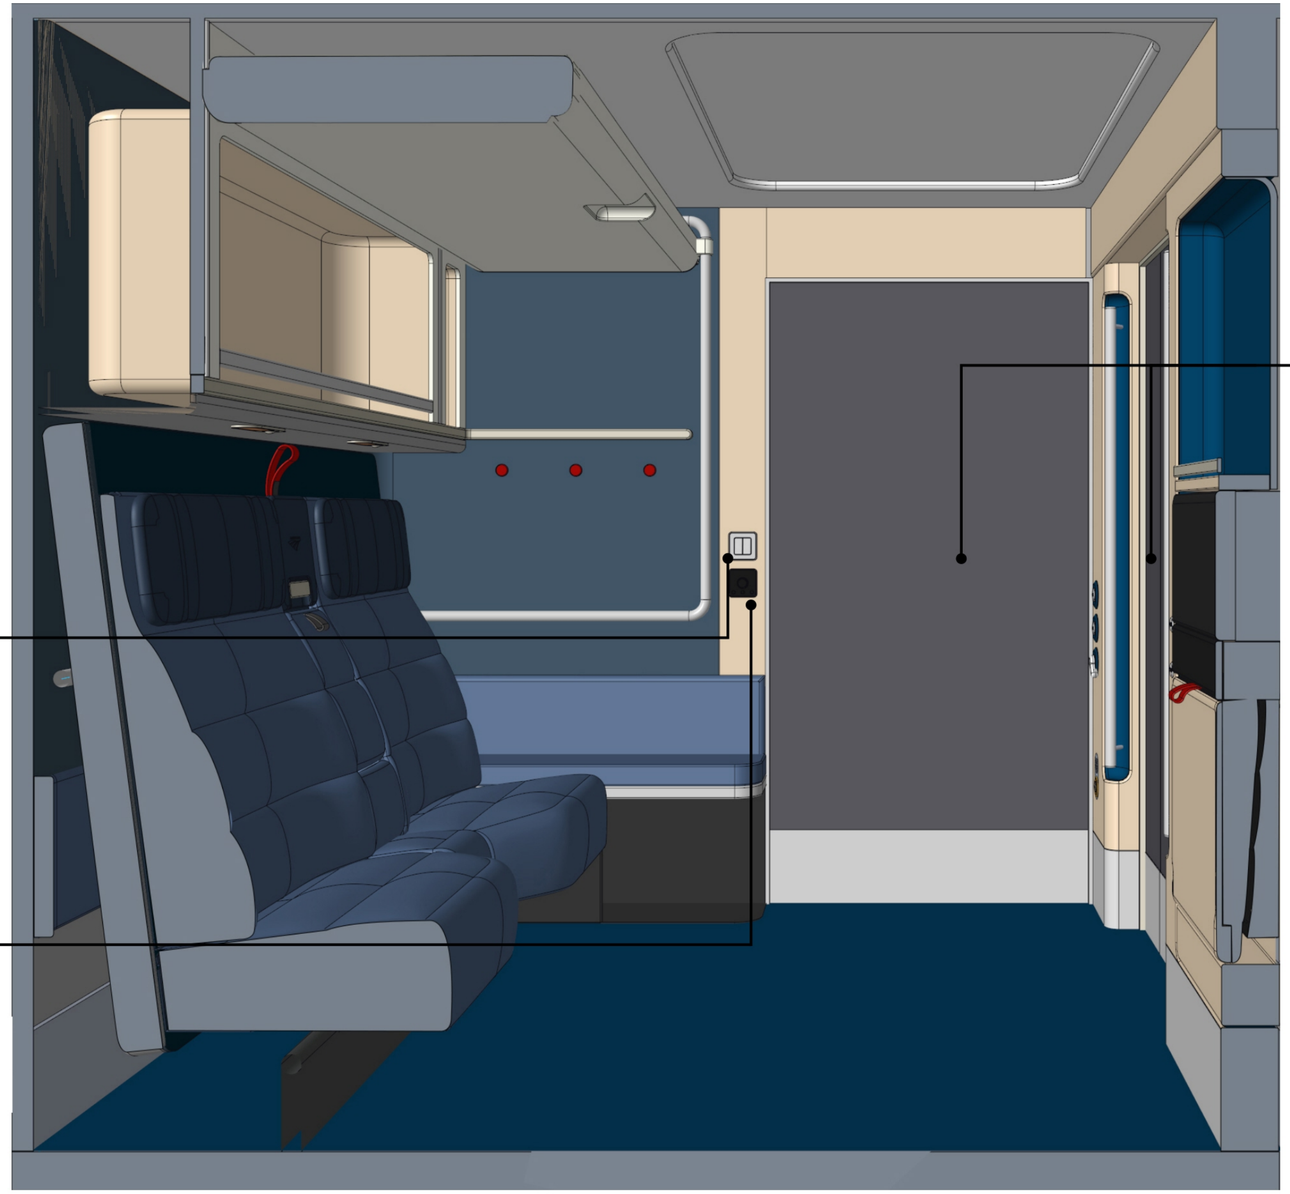


Lower Berth Power Outlet
Two power sockets and two USB ports positioned in the lower cubby. The outlet should be ADA compliant reach when passengers are seated and accessible from the lower berth when the bed is deployed.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Features

Tip-up Seat
Tip up seat should fold up flush with the side wall to provide a clear and unobstructed space for wheelchairs. Spaces when folded should be durable and suitable to back a wheelchair against. When deployed the seat should reveal a soft cushioned seat back and headrest so when deployed should have similar comfort levels as the other seats in the room. The seat should be positioned to have good access to the fold out table with a minimum seat width of 21" and minimum seat pan depth of 19".



Call for Aid
Provision for call for aid by seat - locations for all call for aids are subject for review and in compliance with ADA regulations detailed in technical specification.

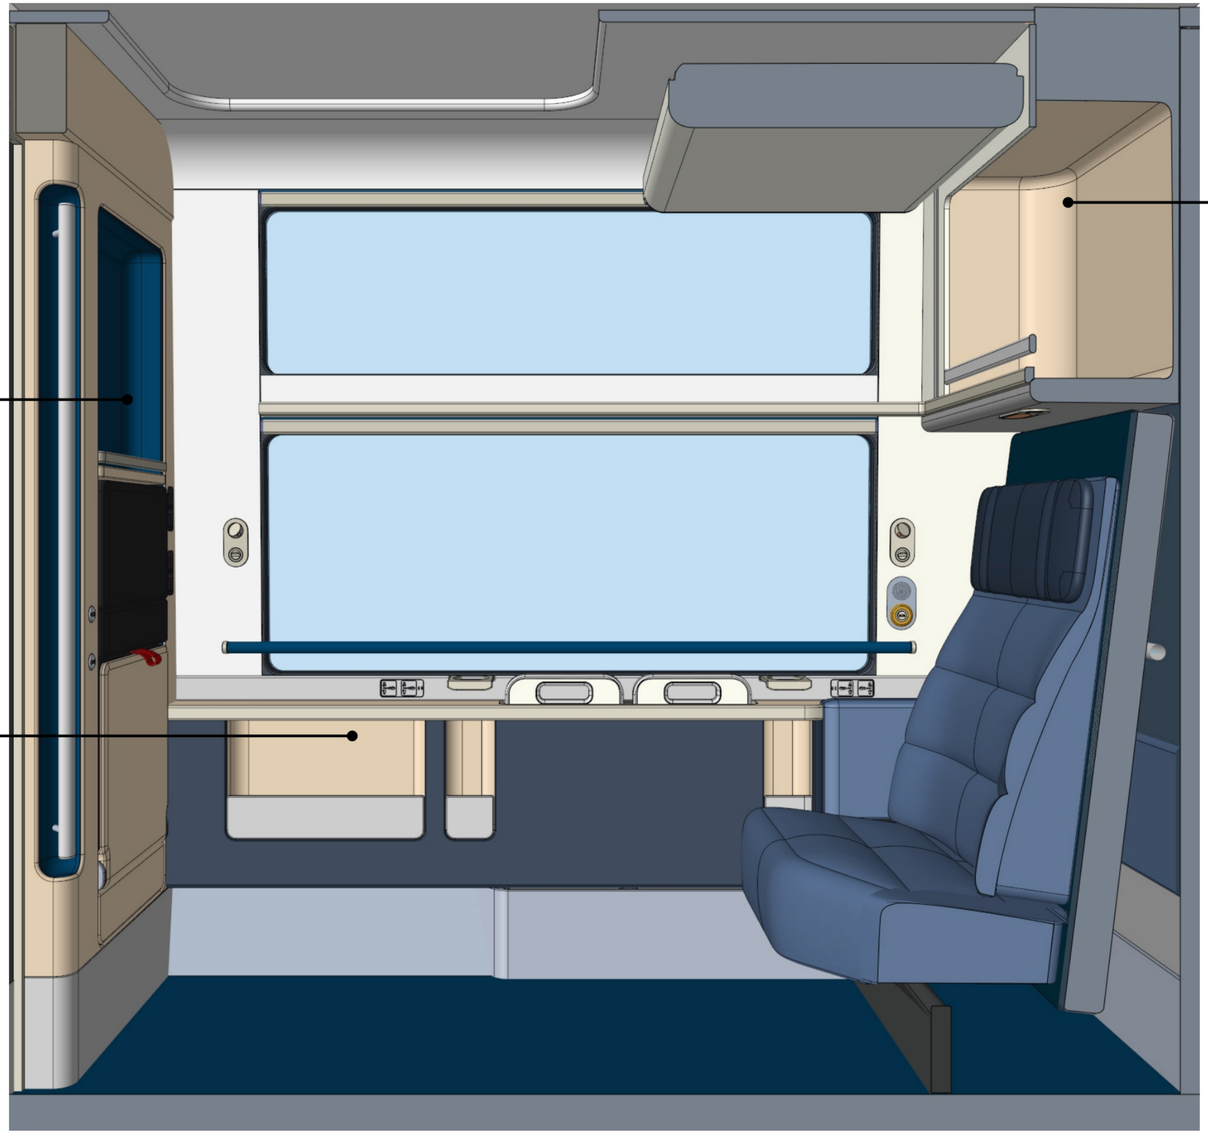
Under Seat Clearance
Space under the seat can be used to provide clearance for wheelchair.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Features

Doors
Door free from rattle, smooth sliding operation.

Master Light Switch
Master light switches to be positioned near the door. A second master switch should be safely accessible by a person lying in the bed. The position of light switches should be ADA compliant.



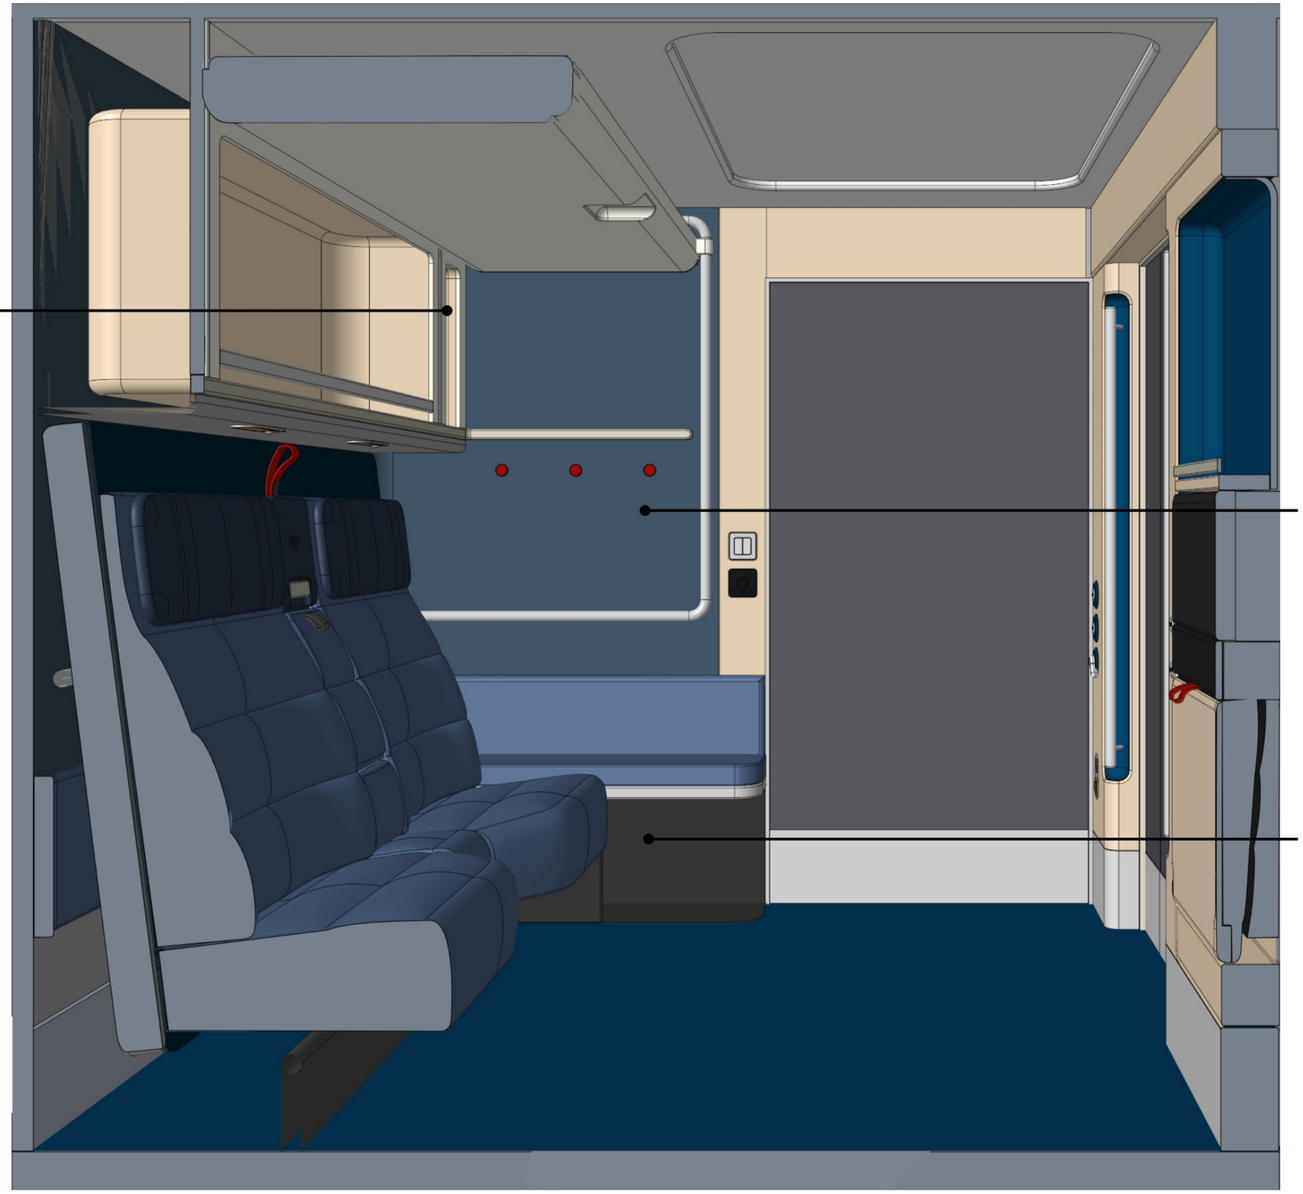
Temperature Control

Accessible Bedroom | Storage

Accessible Bedroom | Storage

Upper Cubbies
Upper Cubbies shall be provided for personal items.

Cubbies
Sidewall cubbies adjacent to the accessible space and seat shall be provided for storage for personal items.

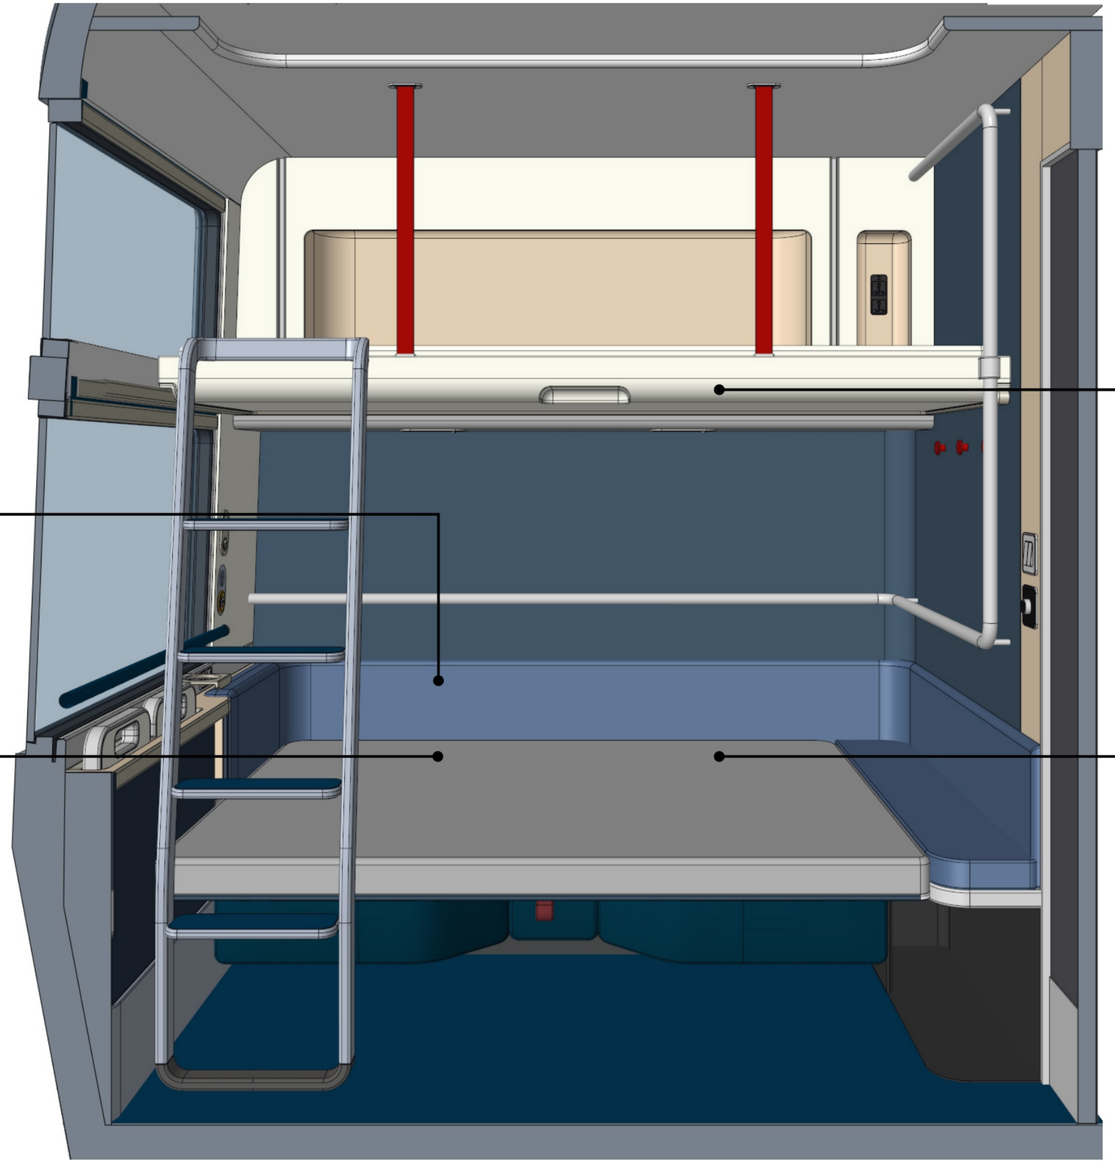


Upper Storage
Upper Storage shall be provided for carry on baggage.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Storage

Bunk Cubby
Bunk cubbies provide storage for personal items. Usable when bunk is stored and also provides storage for upper bunk when bunk is deployed.



Hanging Space
At least two coat hooks should be provided on the inner wall, suitable to hang clothes or provide the function of an open wardrobe. The lower hook should be accessible for a person using a wheelchair at a maximum of 48” from the finish floor.

Lower Storage
Storage for carry on baggage shall be provide at an accessible lower level beside or under the seating area.

Accessible Bedroom | Seat to Bed Conversions

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

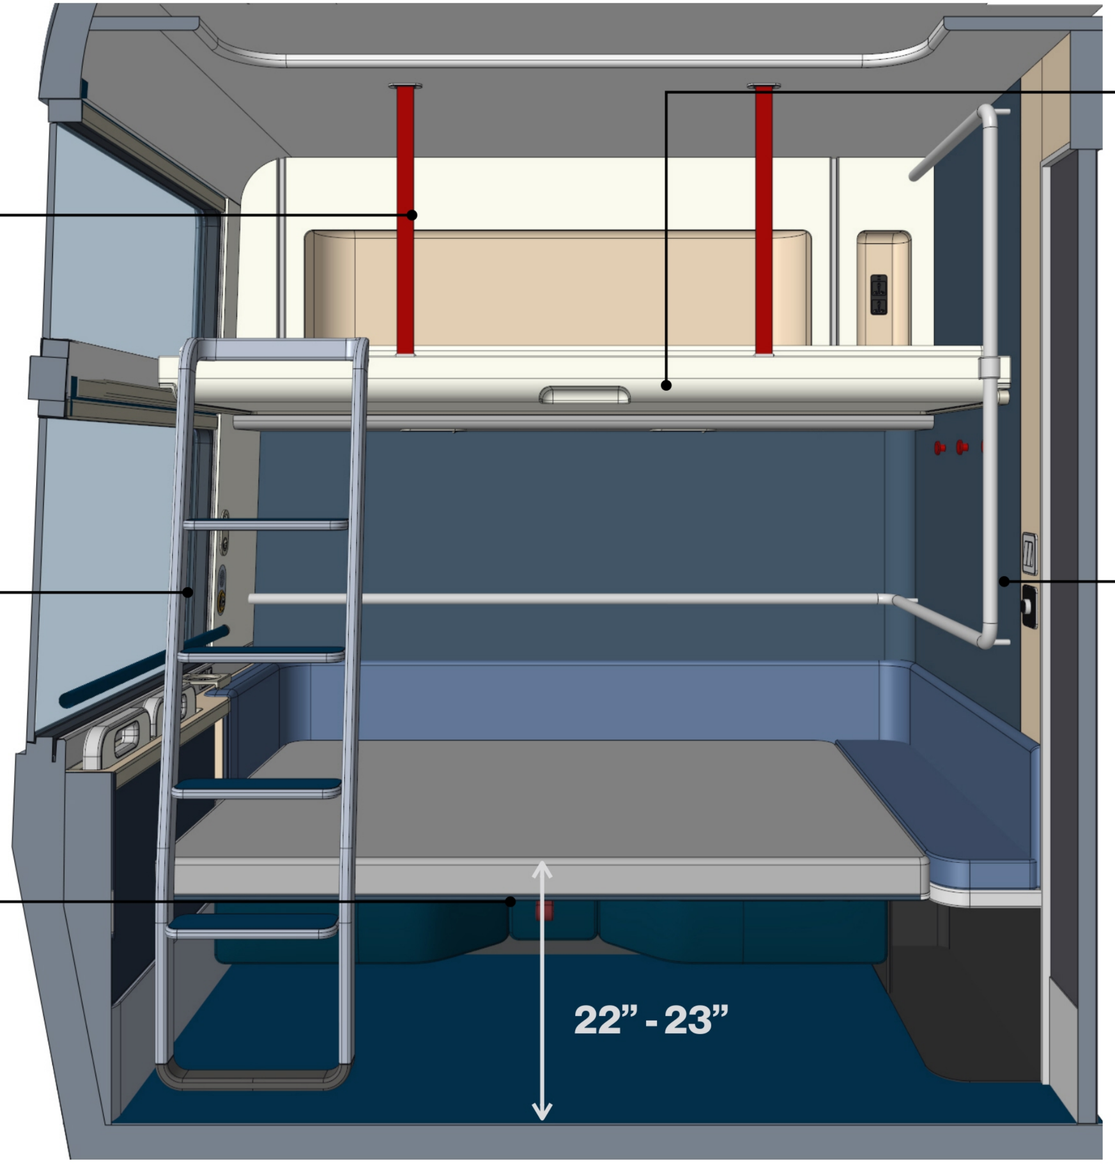
Accessible Bedroom | Seat to Bed Conversions

Bed Headboard
The armrest and ottoman side pad should continue and connect to form a thin soft wrap around the bed.

Lower Berth
Conversion of seat to bed should result in an entirely flat bed surface. The mattress surface should be integral to the seat. A single seam between the bed surface and the Ottoman is acceptable. A single thin topper will finish the bed surface.

Bunk Dimensions
Minimum width 28” x Minimum length 76”.

Lower Berth Dimensions
Minimum width 48” x minimum length 73” when combined with the Ottoman.



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

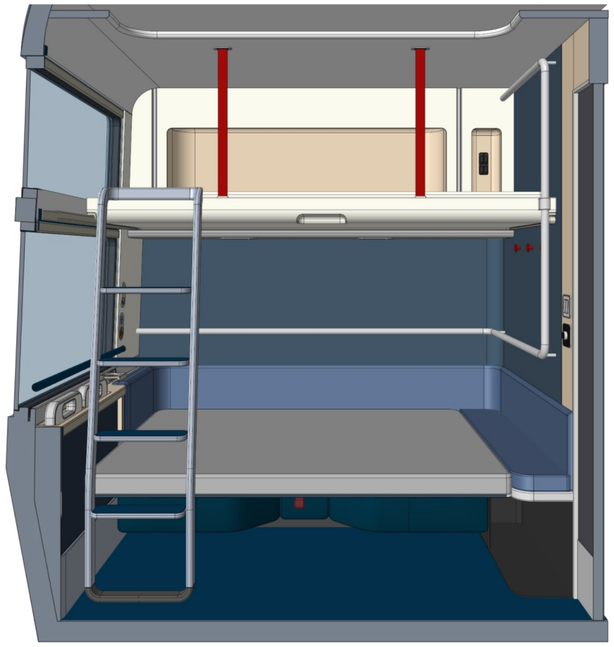
Accessible Bedroom | Seat to Bed Conversions

Bunk Retaining Straps
Retaining straps are required to prevent people from rolling out of the bunk. These should retract into the ceiling and be easily pulled down and click into place using an automatic locking retractor belt system (similar to a car seat belt system).

Ladder Dimensions
The ladder dimensions should comply with the relevant standard.

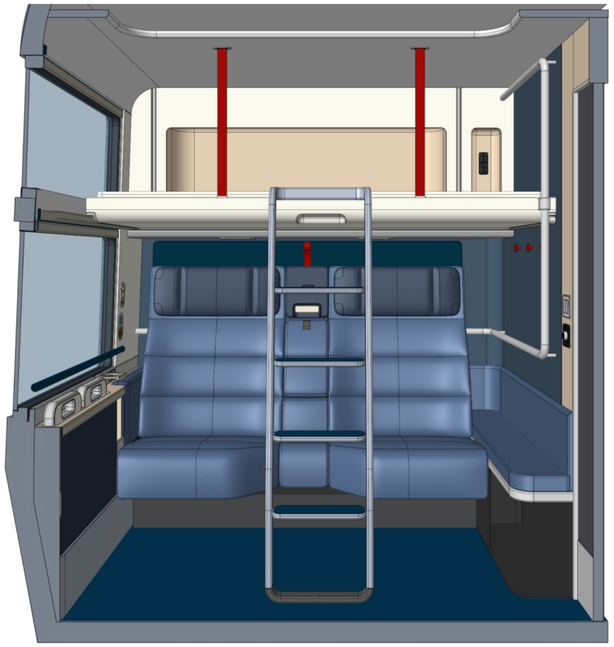
Deployed bed height
The deployed bed height shall be between 22” and 23”

Bunk Height
The bunk height when deployed will be evaluated and judged carefully during the design review process.



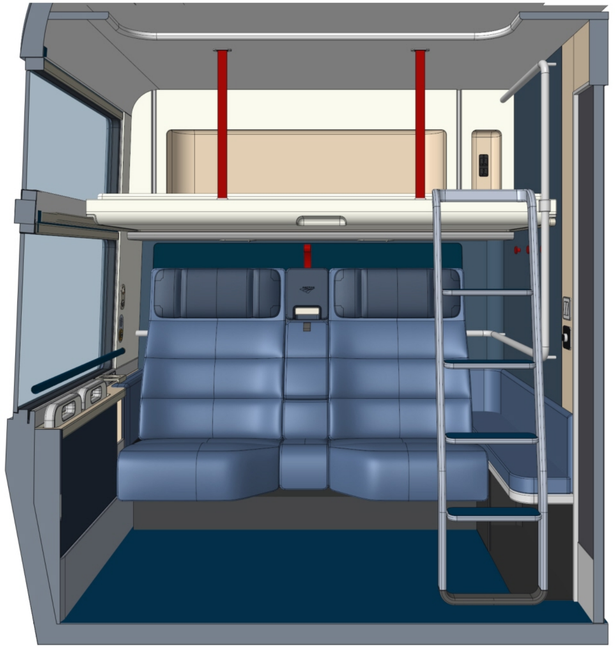
The seated area below the bunk should still be usable by seated passengers when the upper bunk is deployed. The area should still be well lit and tables and other amenities should not be restricted by a deployed bunk bed.

Handrails and Grabs
Suitable handholds shall be provided to assist people transitioning on both sides to the bunk. Additional handholds may be required to assist people climbing down safely from the bunk.



Accessible Bedroom | Seat to Bed Conversions

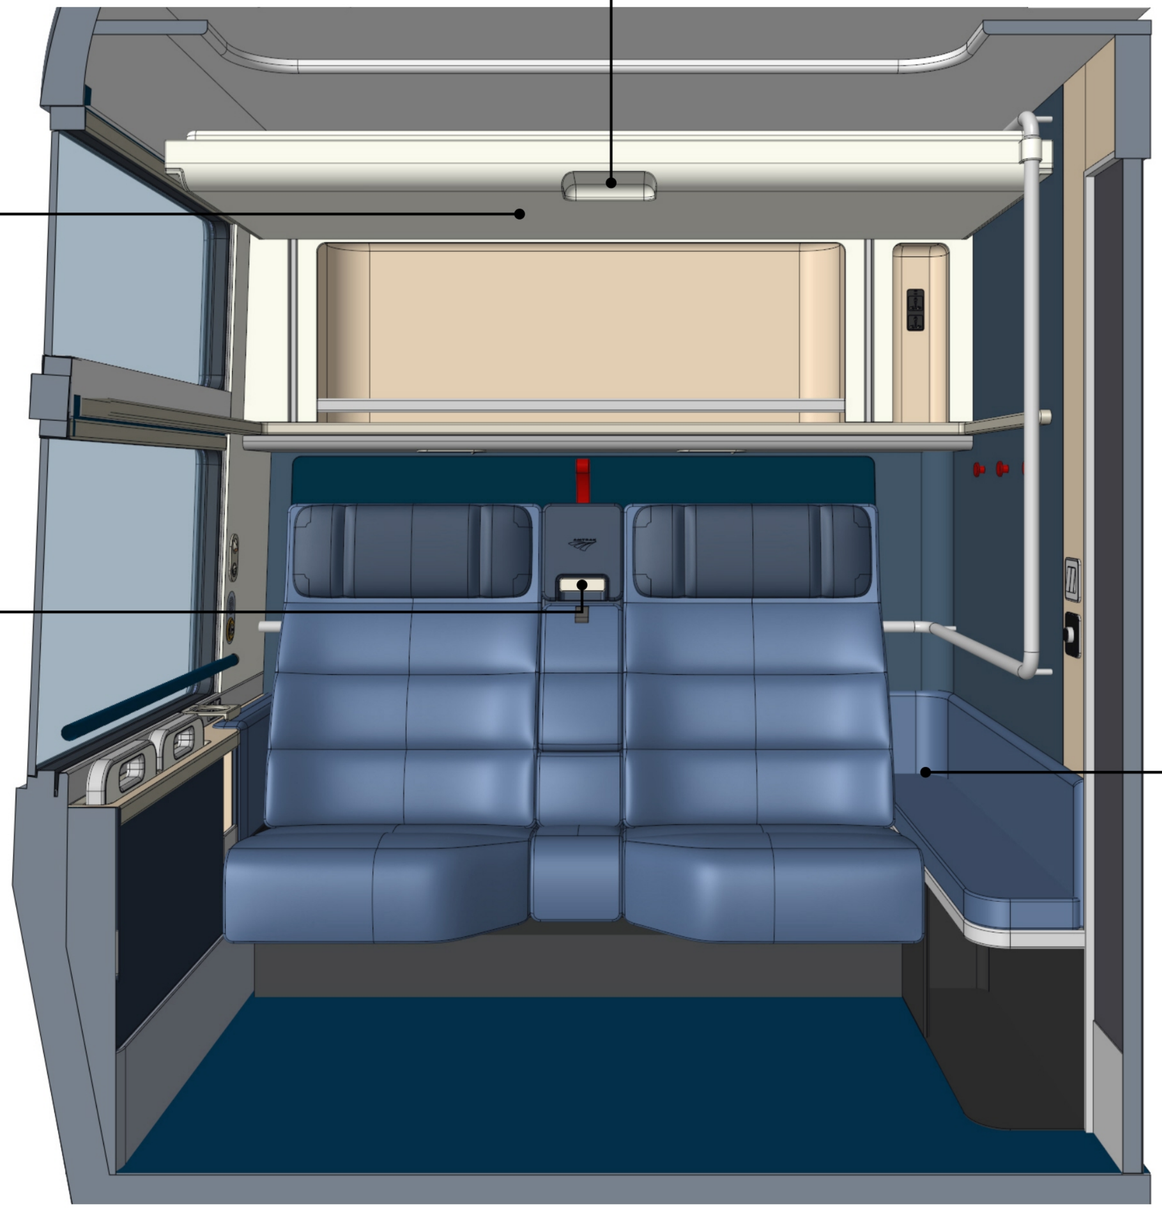
Ladder



The ladder is stored in the bunk. It should be durable and lightweight. It should not have any sharp corners or edges. It must be intuitive to use and locate. The fixation method should be robust and easy to lock and unlock. Successful locking should be visually indicated and safety measures should be put in place to prevent accidental unlatching and prevent misuse. The ladder should be usable in multiple positions based on user specific needs and preference. Each step should clearly contrast the floor and It should also have integrated battery powered lights for safe use during low level light conditions.

Ladder position 1
Maintains a 60” turning circle on the floor.

Ladder position 2
Bunk down and a passenger in both seats.



Ladder position 3
Accessible space clear and one seat occupied.

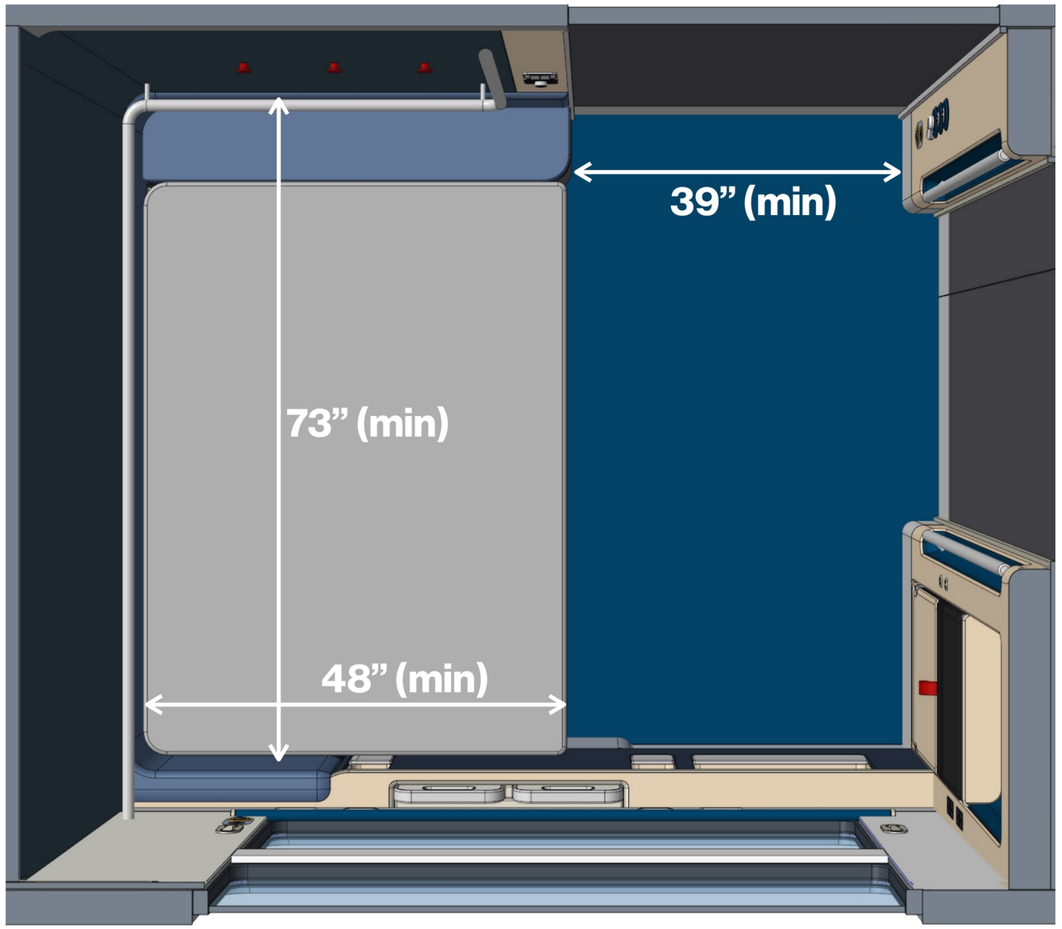
26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom | Seat to Bed Conversions

Upper Bunk
Bunk should be stored horizontally at the maximum height in the room. Bunk should not preclude any part of the window when stowed. The bunk's stored height should be maximized so head clearance is maximized in both seated and standing positions.

Lower Berth Deployment
A simple unlatch mechanism is required to convert the seats into a lower bed/berth. This should be positioned in a place that is easy for people to use and designed in a way so that people can understand its purpose. The position should be ADA compliant and within reach of a person using a wheelchair. Controls and operating mechanisms shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. There should be an assisted mechanism making it easy for passengers of any ability to self-sufficiently and safely deploy and store the bed.

Upper Bunk Deployment
A simple and easy to use handle, latch and lock mechanism should be within easy reach from a standing position. Successful locking should be visually indicated and safety measures should be put in place to prevent accidental deployment and prevent misuse.



The bunk deployment should be free from jamming and racking and should lower slowly and in a controlled manner. Considerations should be made for assisted movement or counter balances to assist people moving the bunk down and back up into the stowed position.

Ottoman
An ottoman can be provided by the side of the seats to form part of the bed surface. The top surface can be used as additional storage during the day. Carry on stowage can be stored under the ottoman.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Accessibility

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Accessibility

Fold Down Handrail
The fold down handrail can be used to aid transfer on to the shower seat and on to the toilet. When stored in the vertical position it should not protrude from the sidewall more than 3” to keep side transfer space clear for the toilet.

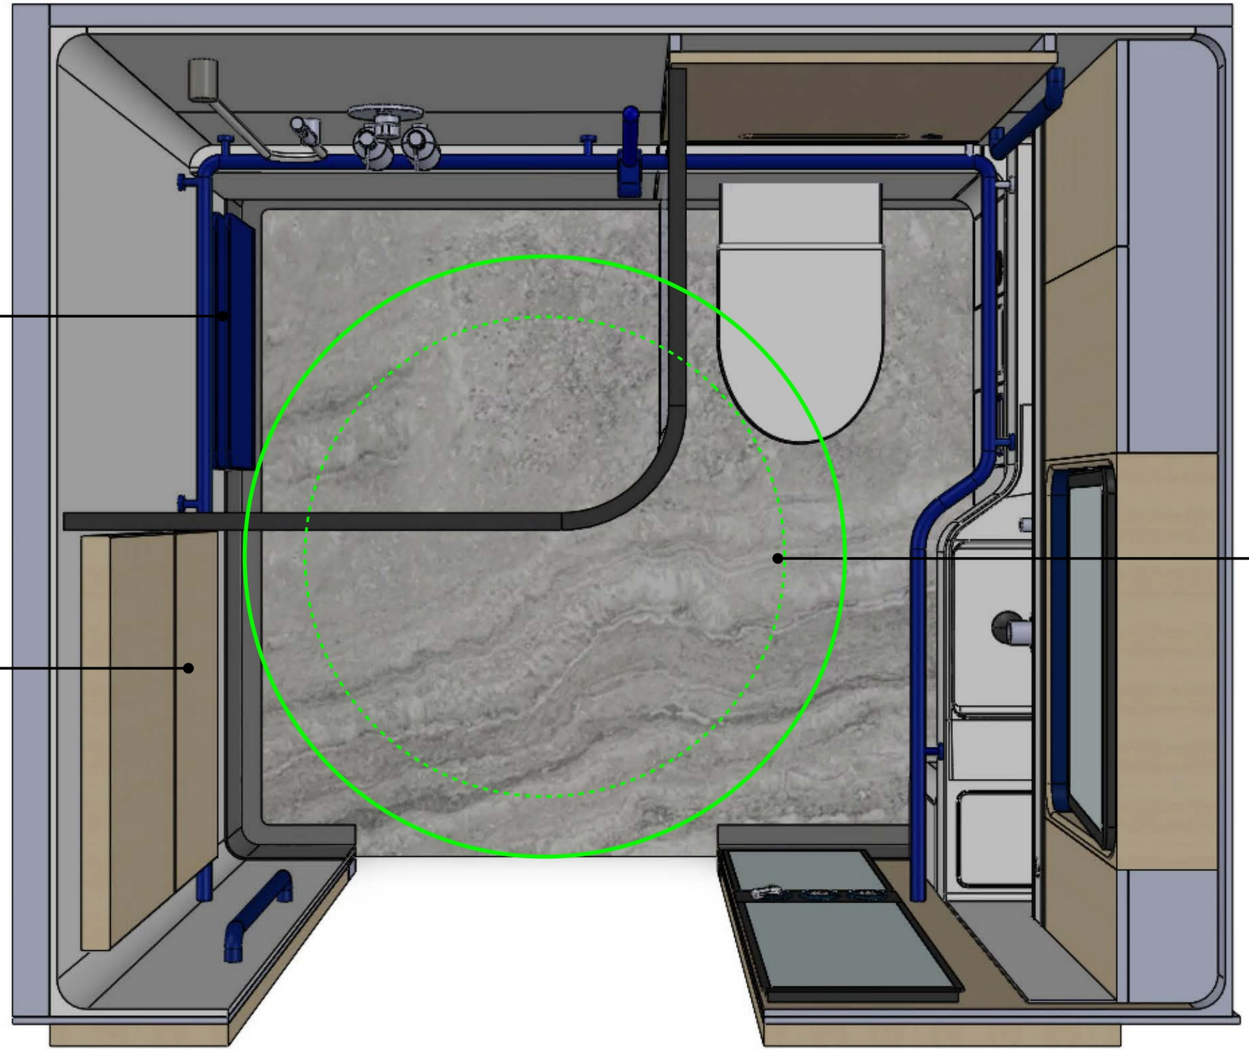
Vertical Handrail 2
ADA compliant vertical handrails positioned in front of the toilet.

Shower Handrail
ADA compliant horizontal handrails positioned in the shower area. The handrail should be a compliant height and length.

Toilet + Sink Handrail
ADA compliant horizontal handrails positioned in the toilet and sink area. The handrail should be a compliant height and length. The handrails should be one continuous loop where possible.

Vertical Handrail 1
ADA compliant vertical handrails positioned adjacent to the bathroom door. It can also be used by baby changing table.

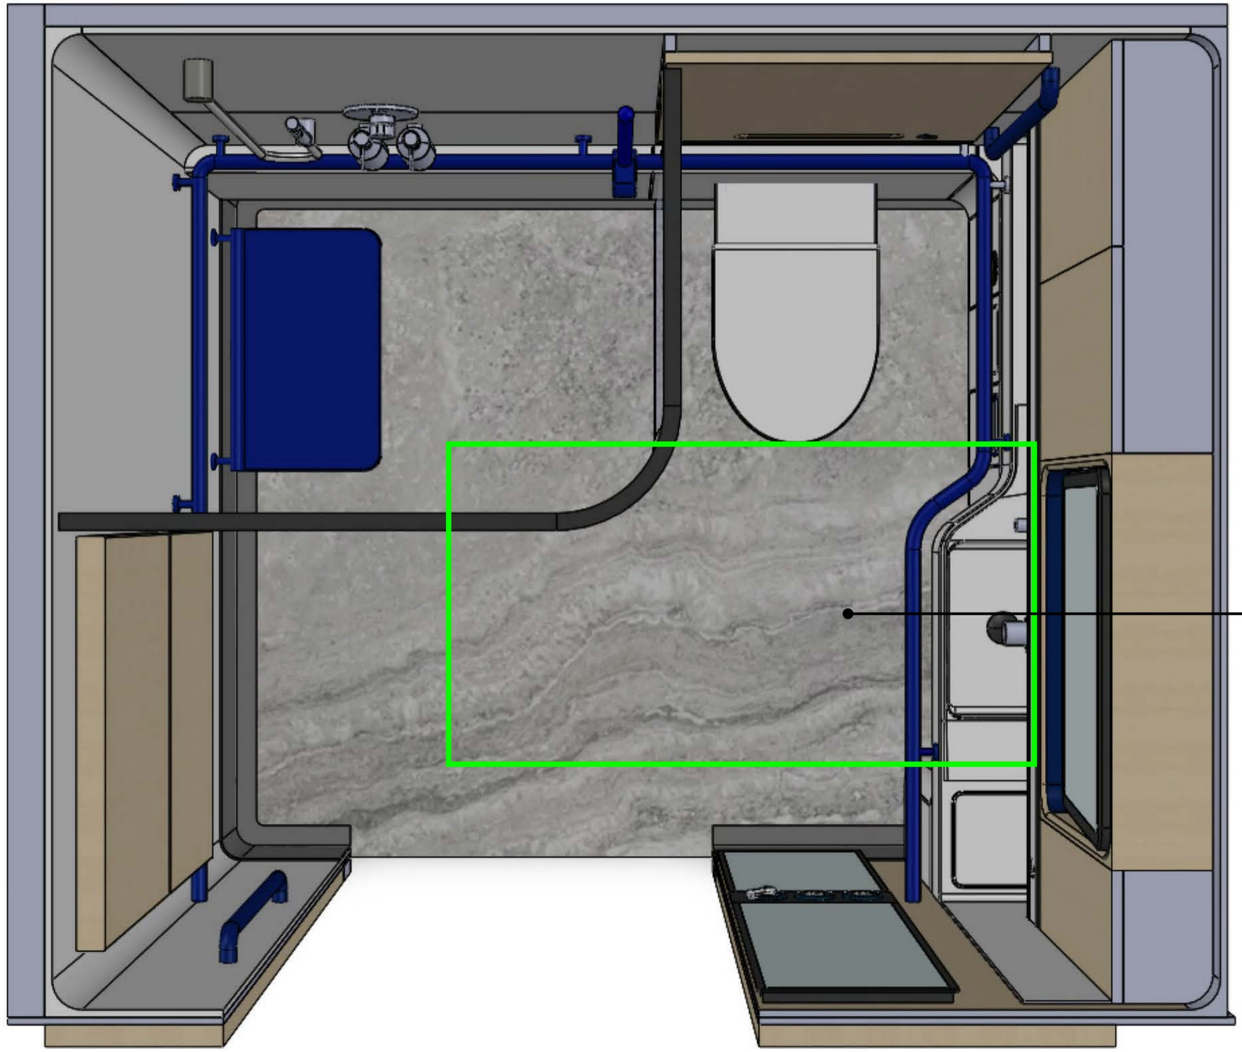
Toilet Door Controls
The controls for the bathroom door must be ADA compliant in position, size and configuration. The buttons should be easy and intuitive to use. An accessible manual lock should be included with an indicator to show lock condition. The buttons should have visual and haptic feedback.



36” Toilet Door
The toilet door should be an automatic sliding door, this can be achieved with two leaves. The door is positioned to create space for a T maneuver when the door is open and the bed is deployed.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Accessibility



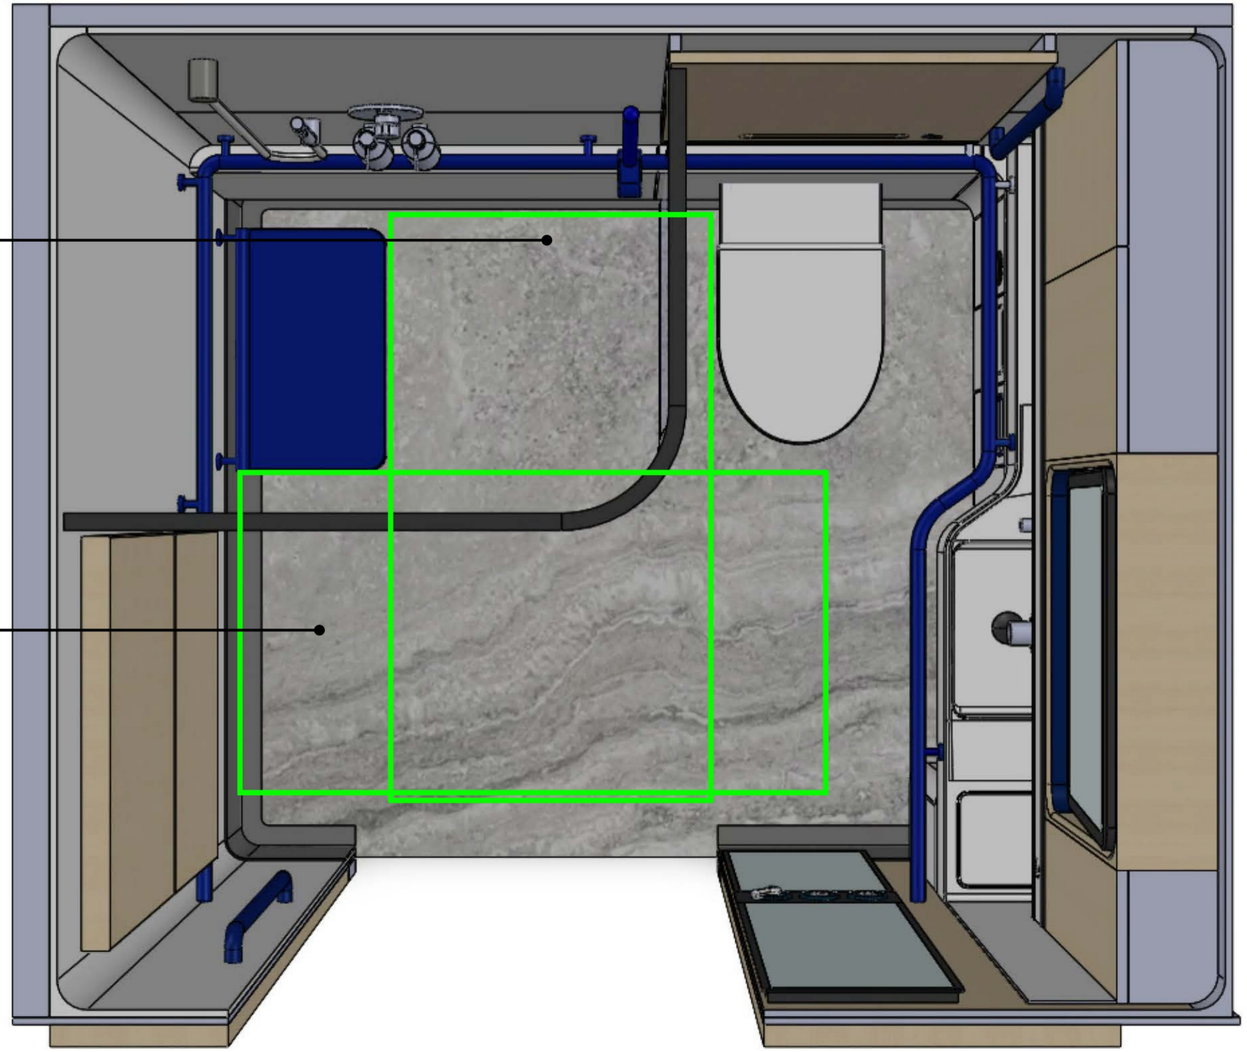
Shower Seat
Shower seat when folded up should be clear of the 60" turning circle.

Baby Changing Table
Baby changing table when stored should clear of the 60" turning circle.

60" Turning Circle
A turning circle should be provided in the Toilet when the door is closed. It is acceptable that a portion of the turning circle at four height can be overlapped in compliance with ADA guidelines.

Accessible Bedroom Toilet | Accessibility

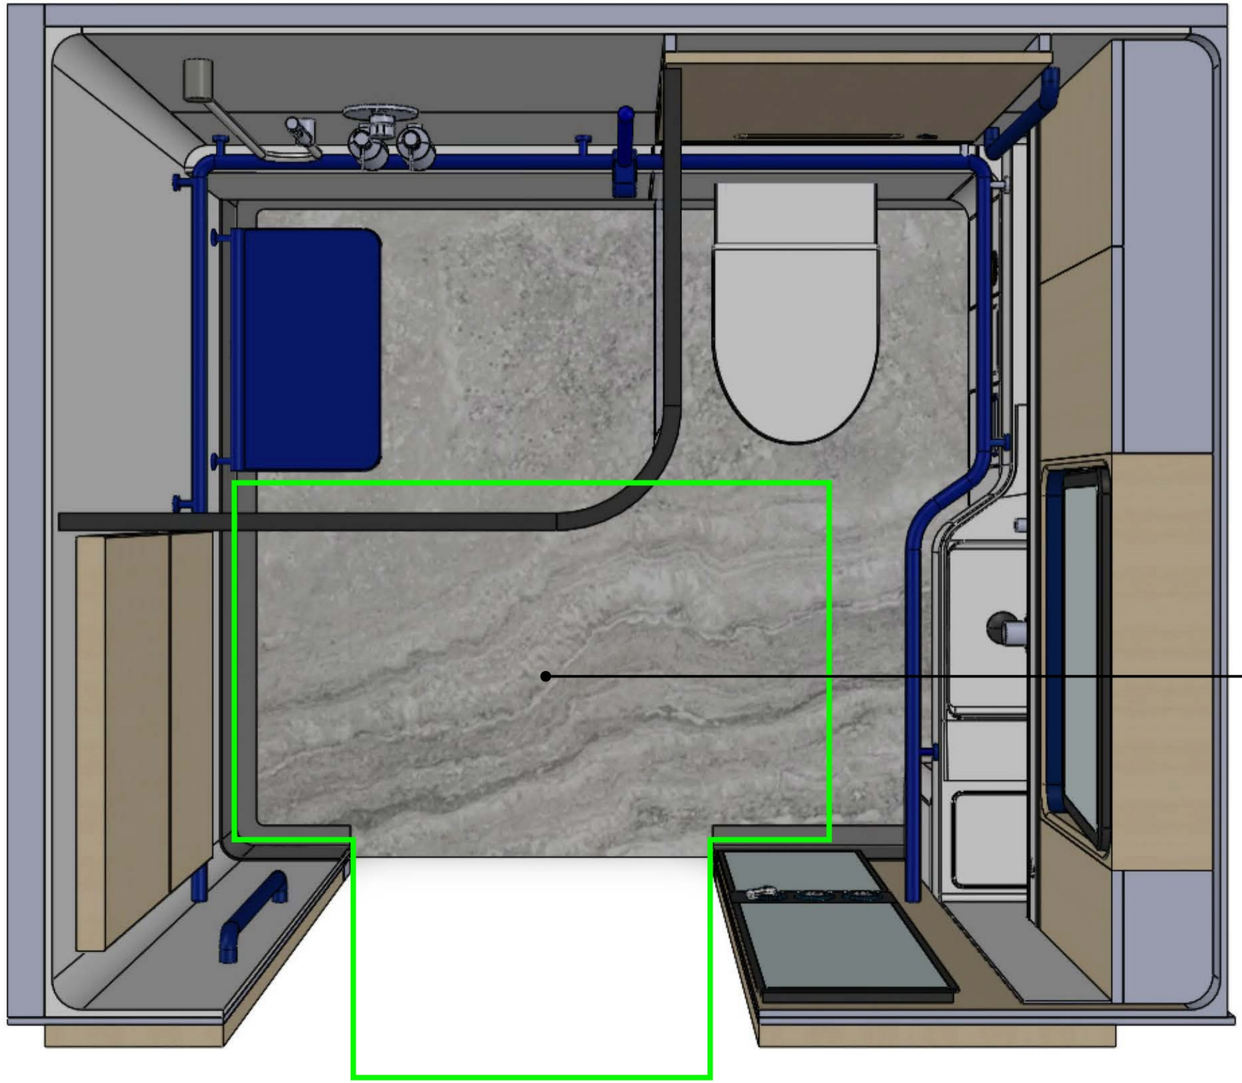
RVAAC Accessible Space 1



There should be clearance directly in front of the sink and vanity unit for an RVAAC accessible space of 59” x 32”. The sink overhang should comply with ADA and RVAAC guidance. Dimensions and usability will be subject to mock-up testing and Amtrak approval.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Accessibility

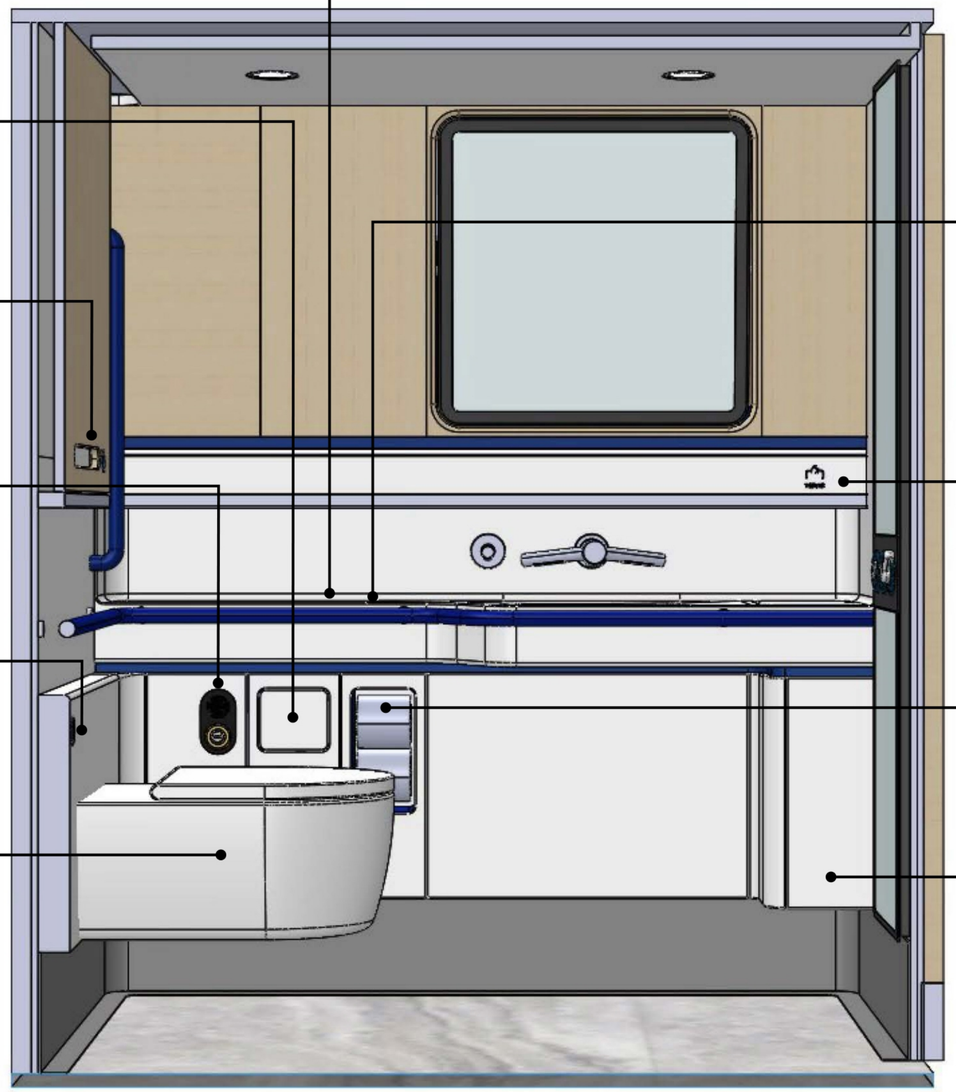


RVAAC Accessible Space 2
There should be clearance between the toilet and shower seat when folded down for an RVAAC accessible space of 59" x 32". This position should be suitable for side transfer to the toilet and the shower seat.

RVAAC Accessible Space 3
There should be clearance between the shower seat when folded down and the door sidewall for an RVAAC accessible space of 59" x 32'. This position should be suitable for side transfer the shower seats and access for the baby changer.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Accessibility



ADA T- maneuver Space
When the shower seat is folded down, there should be clearance for a T-maneuver through the bathroom door.

Accessible Bedroom Toilet | Room Features

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Amenities and Features

Sanitary Waste
A sanitary bin with modesty flap is provided to the right of the toilet. Position and function should comply with ADA.

Toilet Seat Cover Dispenser
A dispenser for paper toilet seat covers should be located by the toilet. Position and function should comply with ADA regulations.

Call for Aid Button
There should be a call for aid button adjacent to the toilet. Position and function should comply with ADA.

Toilet Flush
A two button touch-less flush is located on the back wall providing standard and eco flush. Position and function should comply with ADA.

Toilet
The toilet has a seat and a cover. The form of the toilet is undercut at the bottom to maximize wheelchair clearance. Toilet seat and seat lid should all have soft close mechanisms.

Sharps Bin
Provision for a sharps bin should be provided within the room.

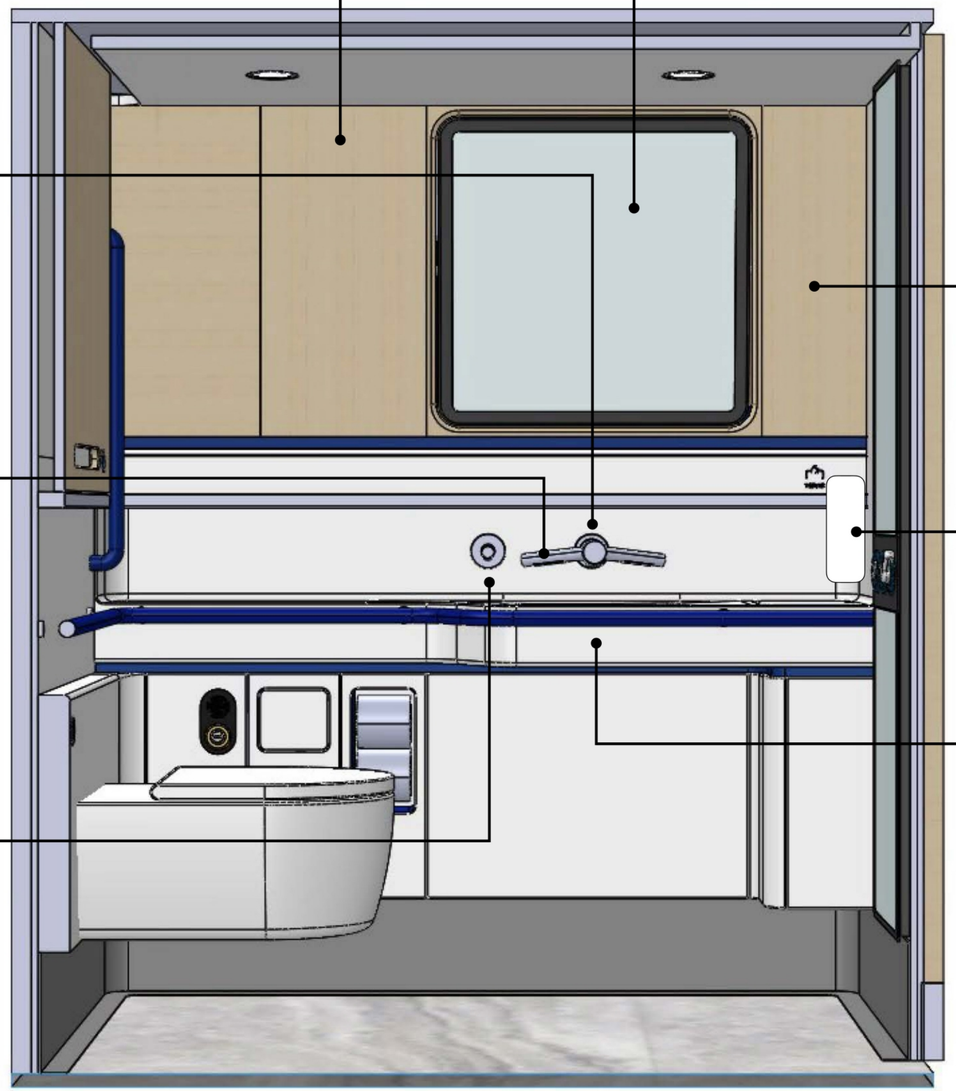
Sink Surface
Sink surface should be large enough to store a wash bag and toiletry items and aid the safe and clean disposal of a colostomy bag . Marine edge should run along entire length and a draining surface angled towards sink.

Tissue Dispenser
Tissue dispenser should be positioned near the trash and sink.

Toilet Paper Storage
The toilet paper should be stored in the wall of the bathroom.

Trash
A trash bin is provided to the right of the sink. The volume should be 14 gallons minimum. Position and function should comply with ADA. The opening to the trash should be a minimum of 8” x 10”.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



Accessible Bedroom Toilet | Amenities and Features

Crew Cabinet
Cabinet storage is provided for crew to store cleaning and bathroom servicing items.

Automatic Water Faucet
Water is automatically dispensed when hands are placed under the faucet. A physical element should be visible so it is clear where water is dispensed from. Temperature of water should be controllable. Water pressure, water flow should not create any water splash or spill outside of the sink area.

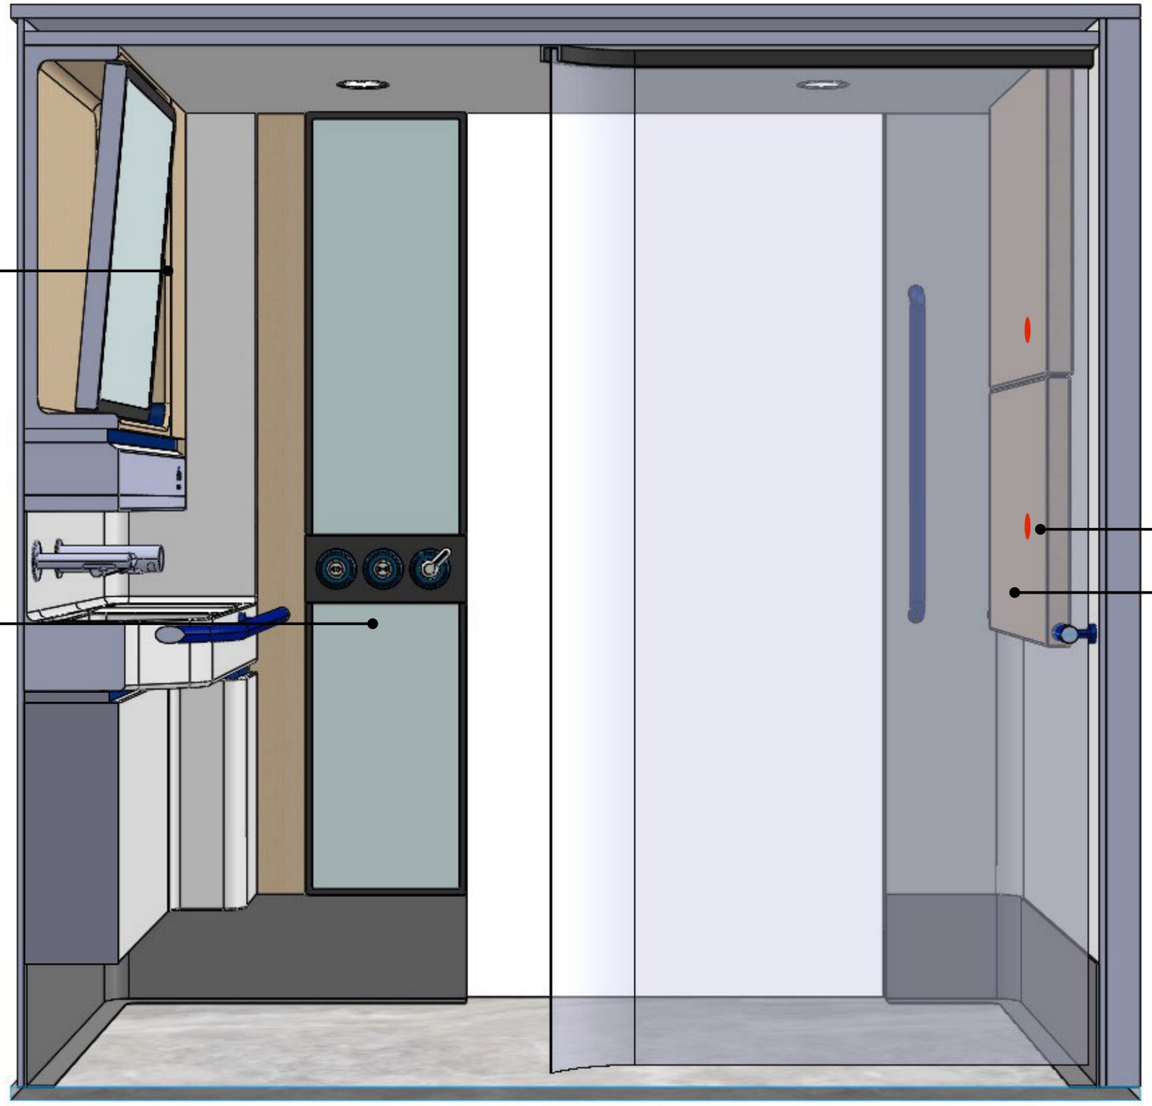
Automatic Hand Drier
An automatically triggered hand dryer should be included under the vanity unit. This can be part of the faucet or supplied separately. A physical element should be visible so it is clear how to use the dryer. The dryer should use high velocity air and HEPA filters similar to a Dyson Airblade. The air dryer should not blow water out of the sink.

Soap Dispenser
An automatic soap dispenser should be included above the sink area. A physical element should be present to indicate how and where the soap will dispense.

Vanity Mirror
A large mirror is positioned in front of the sink. The bottom edge of the reflective surface should be a maximum of 40” above the finish floor. If this is not possible, the mirror should be angled to allow wheelchair passengers to use it.

Passenger Cabinet
A cabinet to the right of the mirror should be provided for passengers to store personal toiletry items. The position of the lower portion of this cabinet should comply with ADA reach rules.

Hand Lotion Bottle
An area on the side of the sink should be reserved for a refillable hand lotion bottle fixed to the side wall.



Sink
The sink should have a marine edge so any water spill is captured in the sink area. A splash back behind the sink should protect the surrounding areas from water splashed onto the back wall from the sink area. The sink should be accessible while sat on the toilet.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Amenities and Features

Towel Storage
A cabinet, surface or hooks should be provided to store bath towels, face cloths and hand towels (2 of each standard Amtrak towels). These should be located in a position accessible for a person using a wheelchair

Full Length Mirror
A full length mirror should be provided in addition to the sink mirror. The bottom edge of the reflective surface should be a maximum of 40” above the finish floor.

Towel Hooks
At least two towel hooks should be provided. One hook must be within the reach range of a person using a wheelchair at a maximum height of 45”.

Fold Down Baby Changing
A baby changing table should be provided with an RVAAC compliant clear space in front of it. The changing table should be easy to deploy and stow with an intuitive handle. The mechanism should be durable, free from jamming and racking. The design should meet abuse loads. It should have a soft opening mechanism. Position and function should comply with ADA.

Accessible Bedroom Toilet | Amenities and Features

Drainage

The floor in the shower area should be designed to minimize water spreading to other parts of the room with a drainage angle directing water towards a covered drain in the corner of the room. The floor must also allow wheelchair passengers complete freedom to turn and maneuver in the room with floor levels compliant with ADA regulations .

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Accessible Bedroom Toilet | Amenities and Features

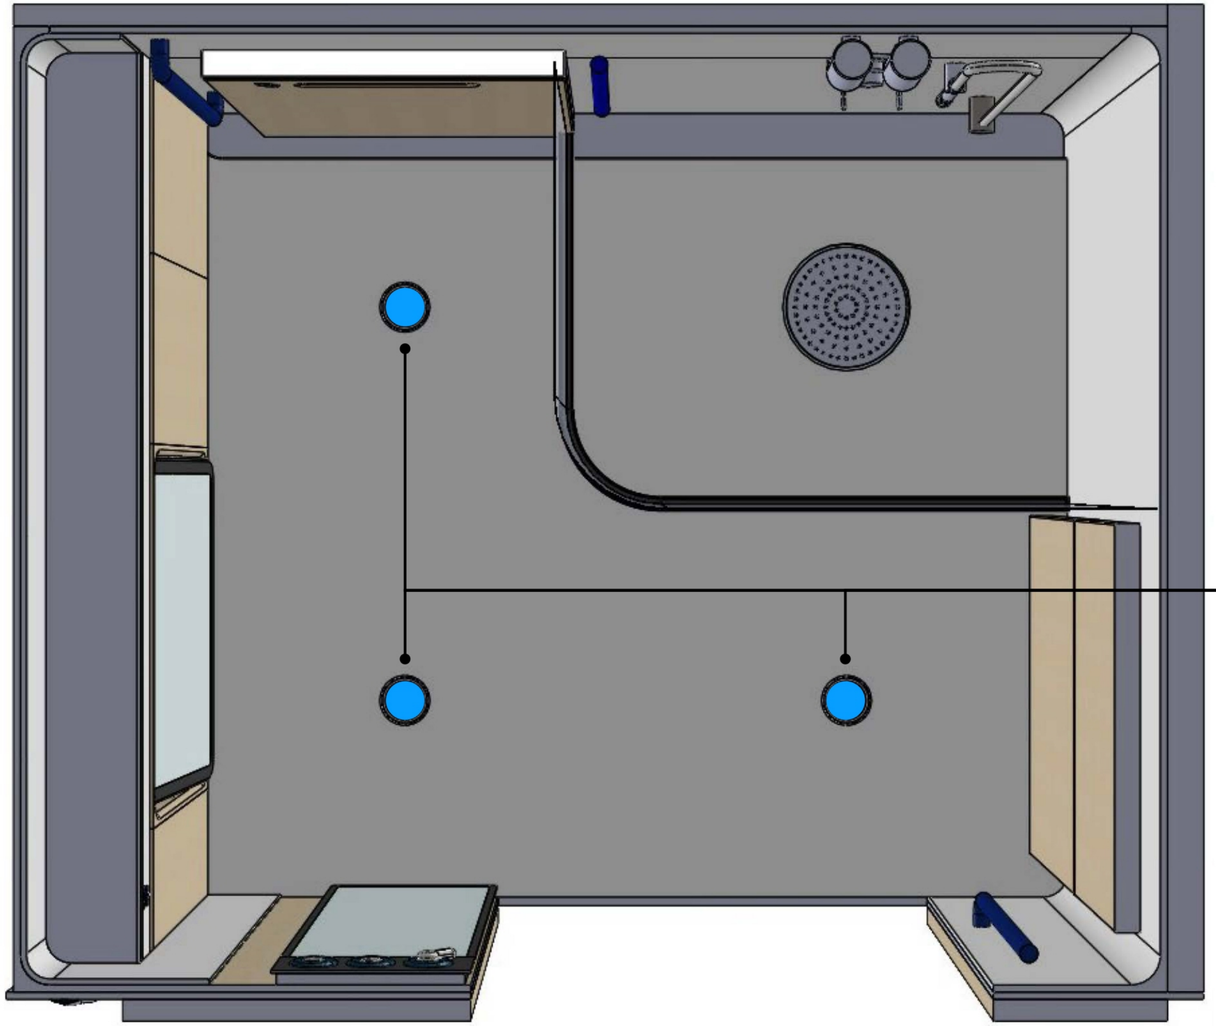
Rain Shower
A rain shower in the ceiling provides a shower above head height. Rain shower should be seamlessly integrated into the ceiling in order to maximize head room in the bathroom.

Shower Control
An on/off button and temperature control are located on the bathroom wall close to the door. The shower control should prevent any accidental activation when using the toilet. Dimensions, position and function should comply with ADA.

Hand Shower
A second hand shower is located with a slimline design handset. A hose clip should be included to prevent the hose from rattling while the train is in transit. Dimensions, position and function should comply with ADA.

Shower Seat
A fold down shower seat should be provided. Dimensions, position and function should comply with ADA.

Fold Down Grab
The fold down handrail should be provided to aid transfer on to the shower seat and on to the toilet seat. When stored in the vertical position it should not protrude from the sidewall more than 3” to keep side transfer space clear for the toilet. Dimensions, position and function should comply with ADA.



Shower Curtain
A shower curtain should be provided to control water spread in the room while the shower is on. It should also provide a modesty screen for users. The curtain should be easy to deploy and stow with an intuitive handle.

Dispensing Bottles
3 refillable Amtrak bottles dispensing shampoo, conditioner and body lotion. Bottles should be fixed to the wall and easily refilled or replaced by Amtrak staff. Dimensions, position and function should comply with ADA.

Accessible Bedroom Toilet | Lighting

09 | Diner & Cafe Features

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Diner & Cafe | Seating Features

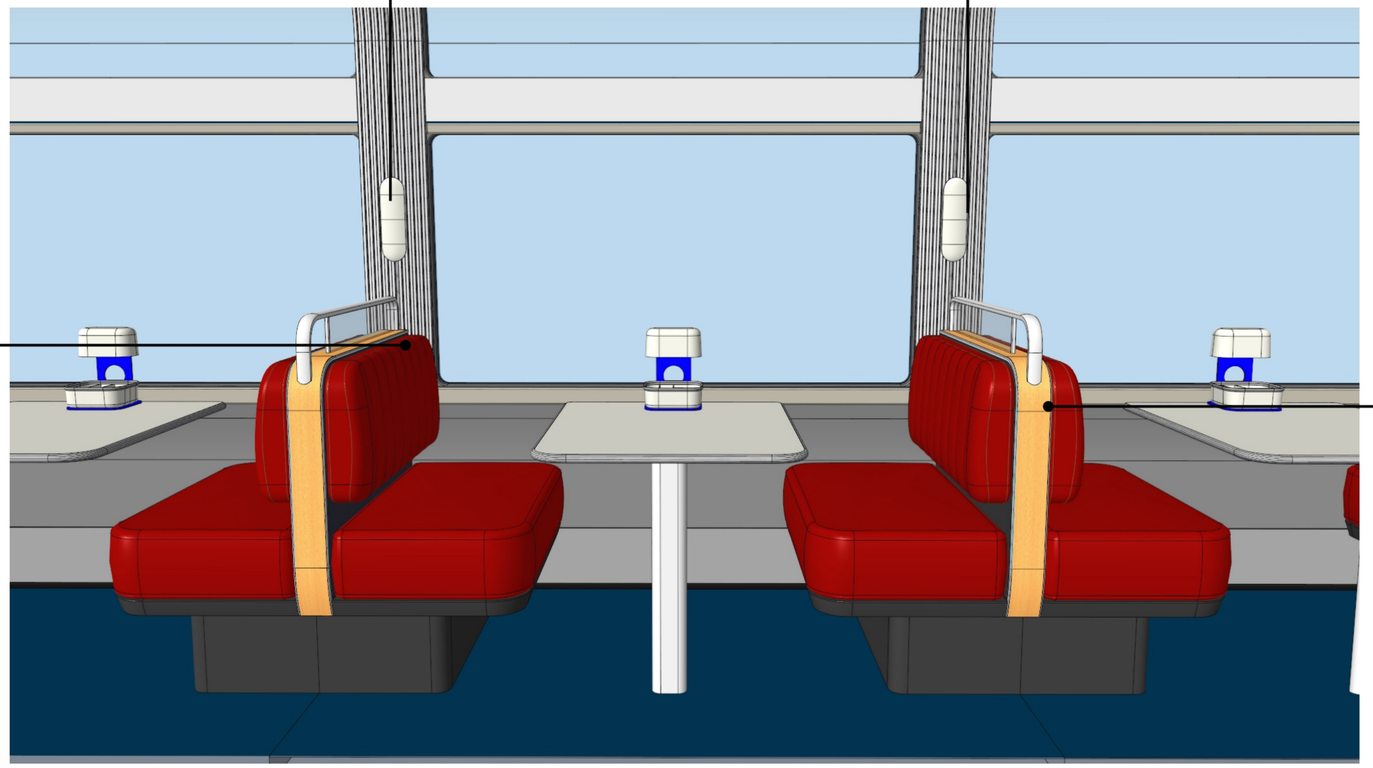
Seat Dimensions

Seat width shall be maximized with a minimum acceptable dimension of 40” wide for a seat suitable for two passengers.

To achieve a 32” accessible path between diner seats, the side wall detail/clearance will need to be minimized and tolerances will need to be tightly controlled. Seat pan height shall be between 18” and 19” with a seat pan depth of no less than 18”. Seat back height from finished floor should be a minimum of 38” with a higher divider no lower than 44”.

All seat dimensions, cushion density/ shore hardness will be subject to mock-up review, testing and approval by Amtrak.

Table Dimensions



A minimum usable table width of 32” shall be provided. Access in and out of the seat should be evaluated carefully. A tapered leading edge may be required to aid access to the seat. Top of table surface should be between 27” and 28” while also allowing 3” clearances in height for the legs of a 95 percentile male. Table leg location shall be positioned as to not provide a knee clash for passengers.

All table dimensions will be subject to mock-up review, testing and approval by Amtrak.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Diner & Cafe | Seating Features

Window Alignment
The center of the table should be central to the window with the center of the diner module in alignment with the window pillar repeating at an 81" pitch.

Seat Comfort
Ergonomics, back support, seat back and seat pan pillowing, cushioning and seat trim and detailing will be evaluated and judged carefully during the design review process and will be subject to Amtrak approval.

Seat Stowage
Booth seats should be designed with trunk type stowage in the base. The intention here is to provide extra stowage for crew only access to store emergency supplies. The access and design of the trunk stowage should not negatively impact the comforter the aesthetic of the seat.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Diner & Cafe | Seating Features

Handholds
Compliant handhold should be provided on the aisle side of every booth seat.

Table Surface
A high quality table surface should have a protective edge trim detail. Split lines should be managed to a high tolerance and sealed to create a flush finish and prevent any potential dirt build up in edges.

Pedestal
Seat pedestals should be seamless with the floor, with no dirt traps or protruding edges to support easy cleaning routines. Pedestals should be undercut from the seat base to provide a floating seat aesthetic.

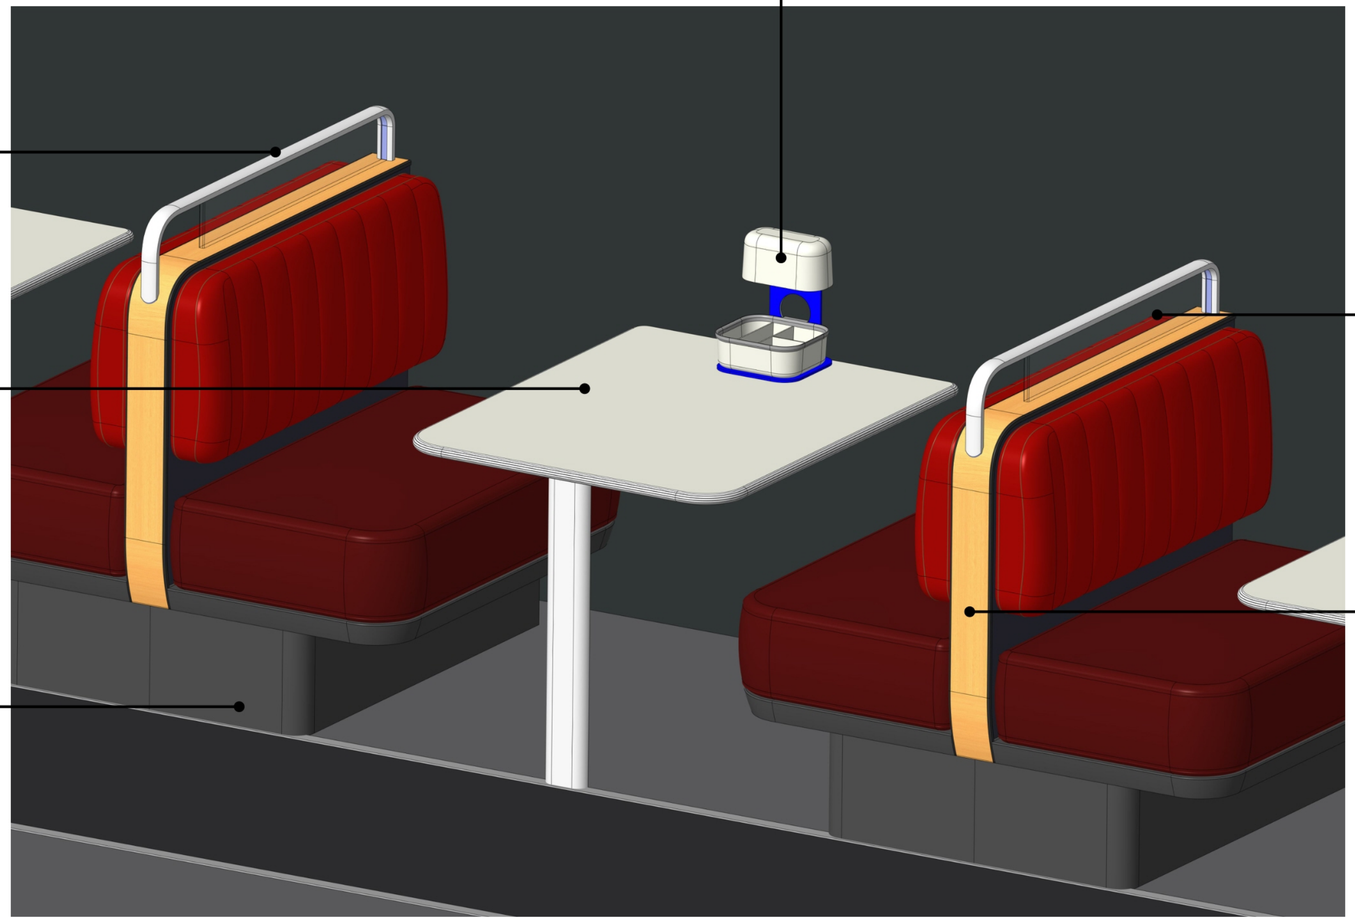


Table Lamp
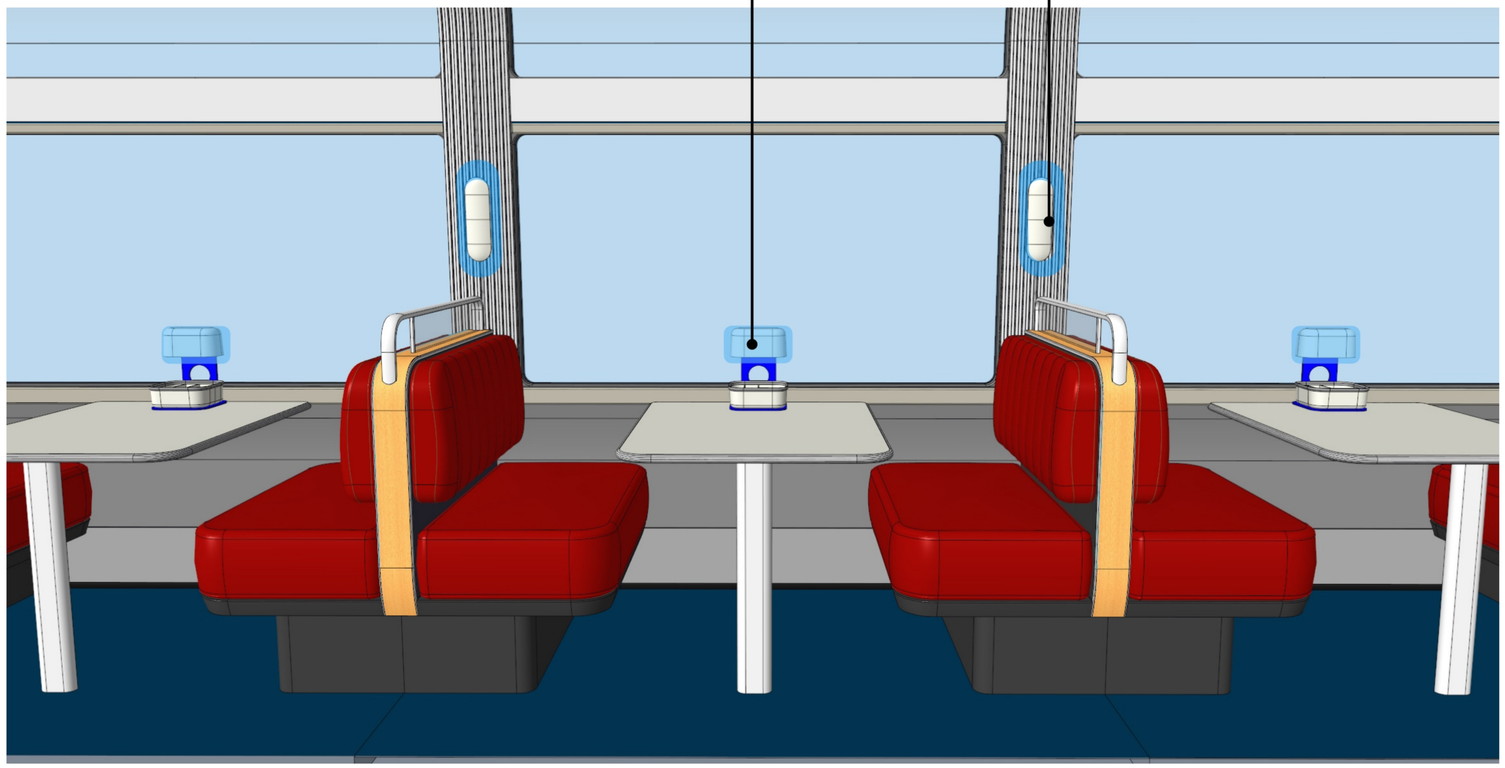
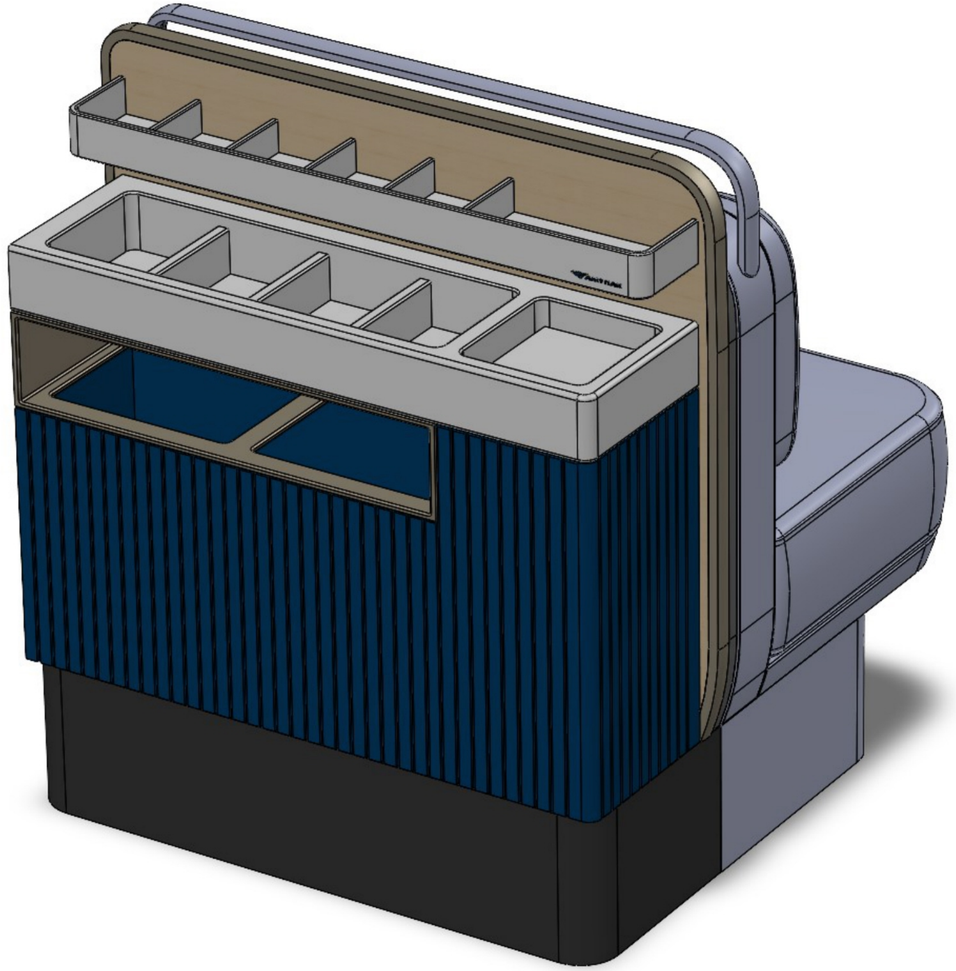
A table lamp shall be provided at every table in the Diner against the side wall. An integrated condiment basket or rail shall be provided on the base of the lamp suitable to store a varied arrangement of condiments to be defined during PDR.

Privacy Divider
A glazed privacy divider should be provided between back to back seats. Divider frame should be integrated with the handholds.



Hardwearing Quality
Seat structure should be finished with high quality, hard wearing laminates and veneers. The form of the seats can be simple providing that the design is delivered using premium materials. Laminate edges should be protected with delicate trim details.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026



Diner & Cafe | Lighting

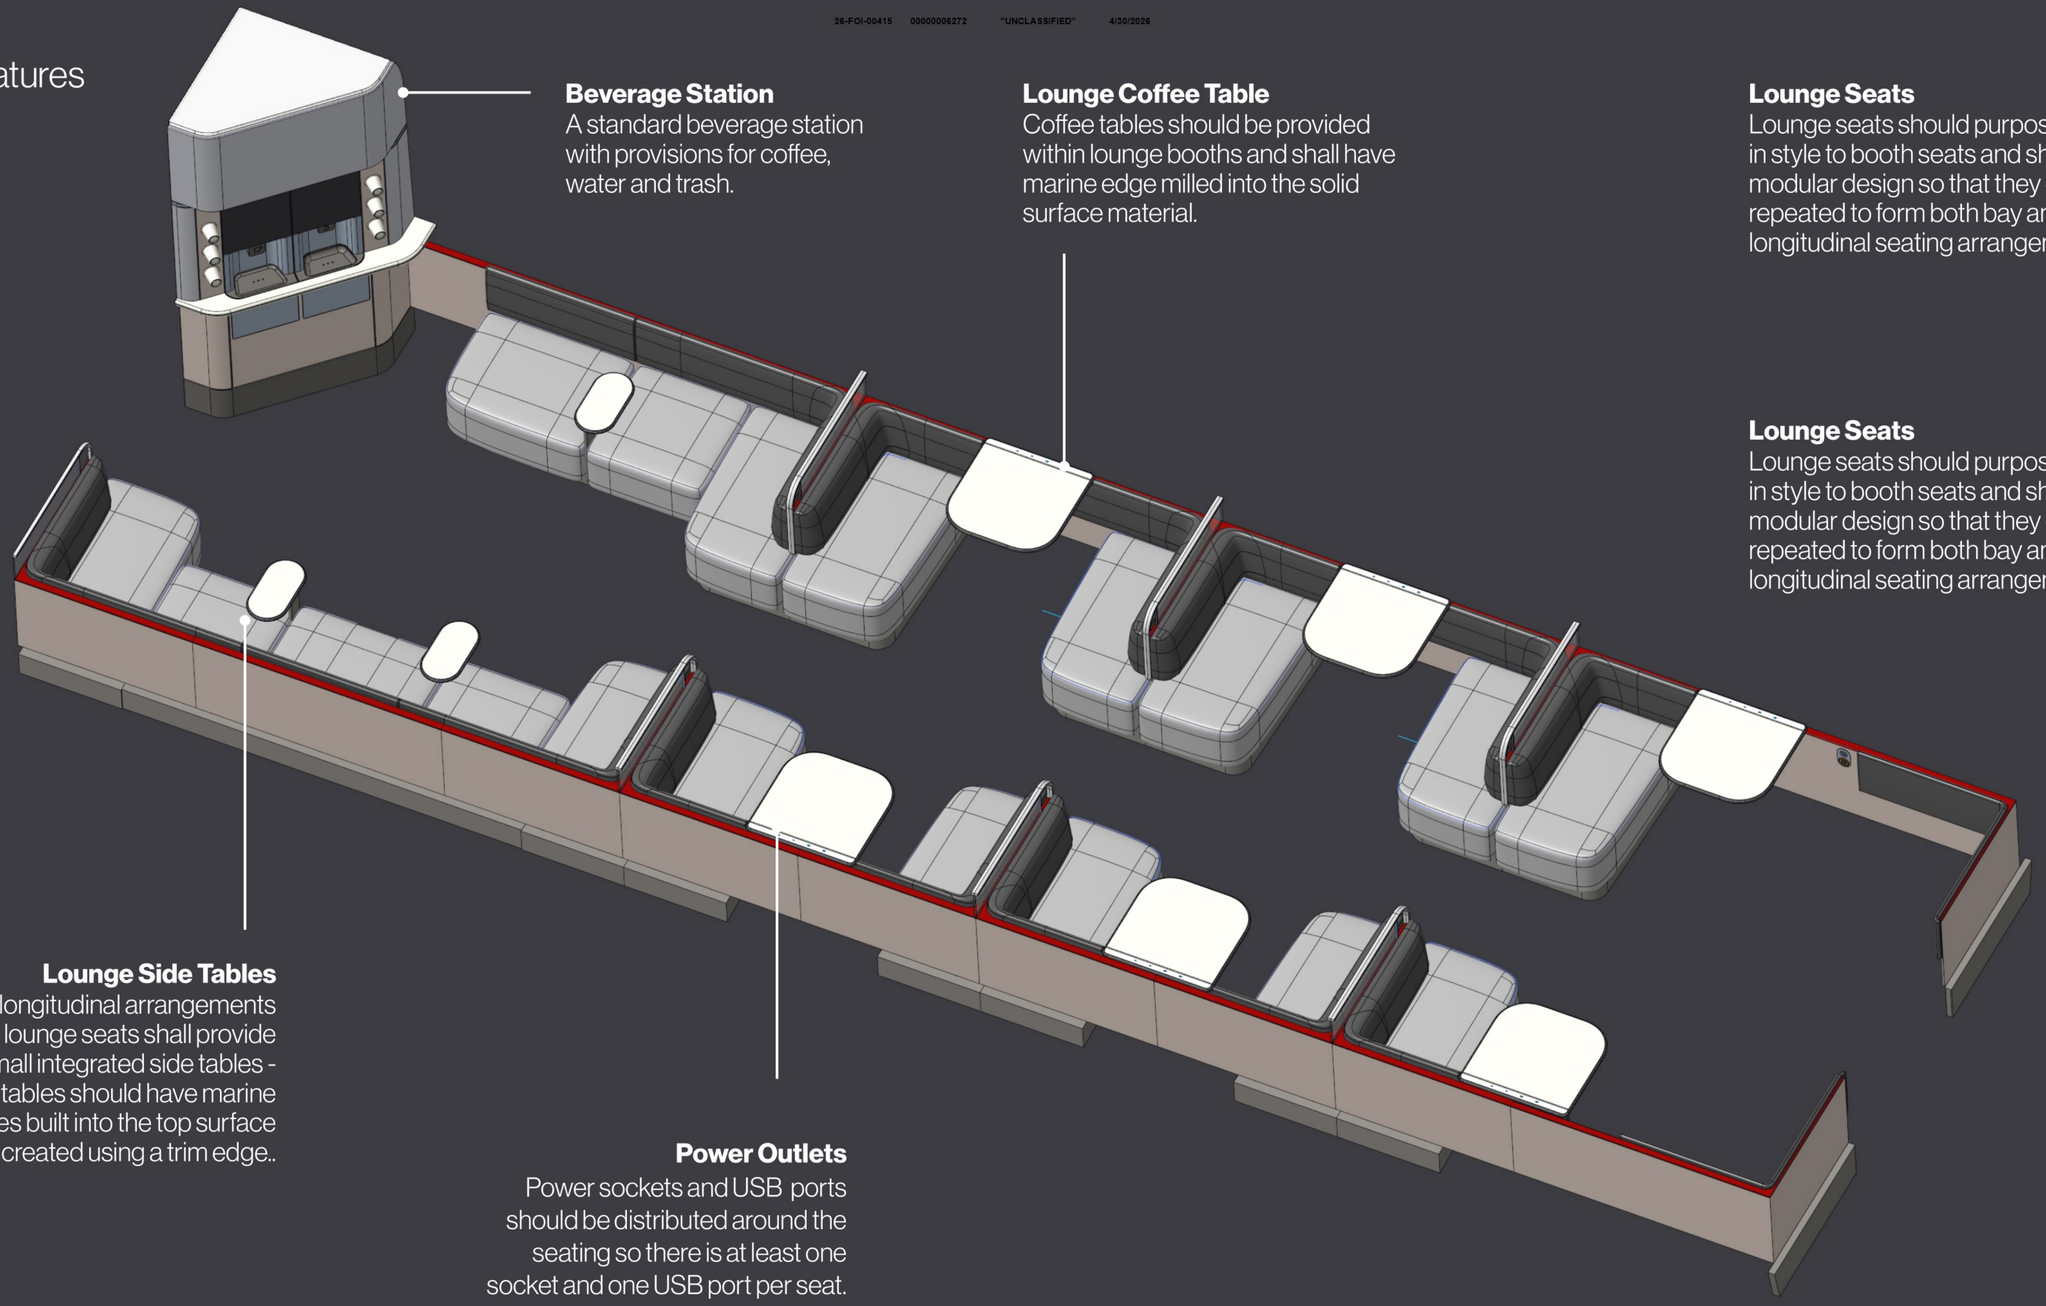
Table Booth Lamp
At each table position in the Diner a table lamp shall be provided. The lamp is intended to be a premium design feature that contributes to the overall lighting levels of the space. .

Wall Lamp
On each window pillar in Cafe, Diner and Lounge areas a wall lamp shall be provided that casts indirect light onto the pillar. The lamp is intended to be a premium design feature that contributes to the overall lighting levels of the space.

Diner | Service Station

Service Station

A service station should be provided within the Diner. The purpose of this station is to assist crew with performing an efficient food service. Crew will use the station to replenish the tables so should be designed to store provisions needed for table settings including cutlery, napkins (standard and small beverage) menus and items to support coffee service. It should have open storage and closed storage and may also require a trash bin.



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Lounge | Features

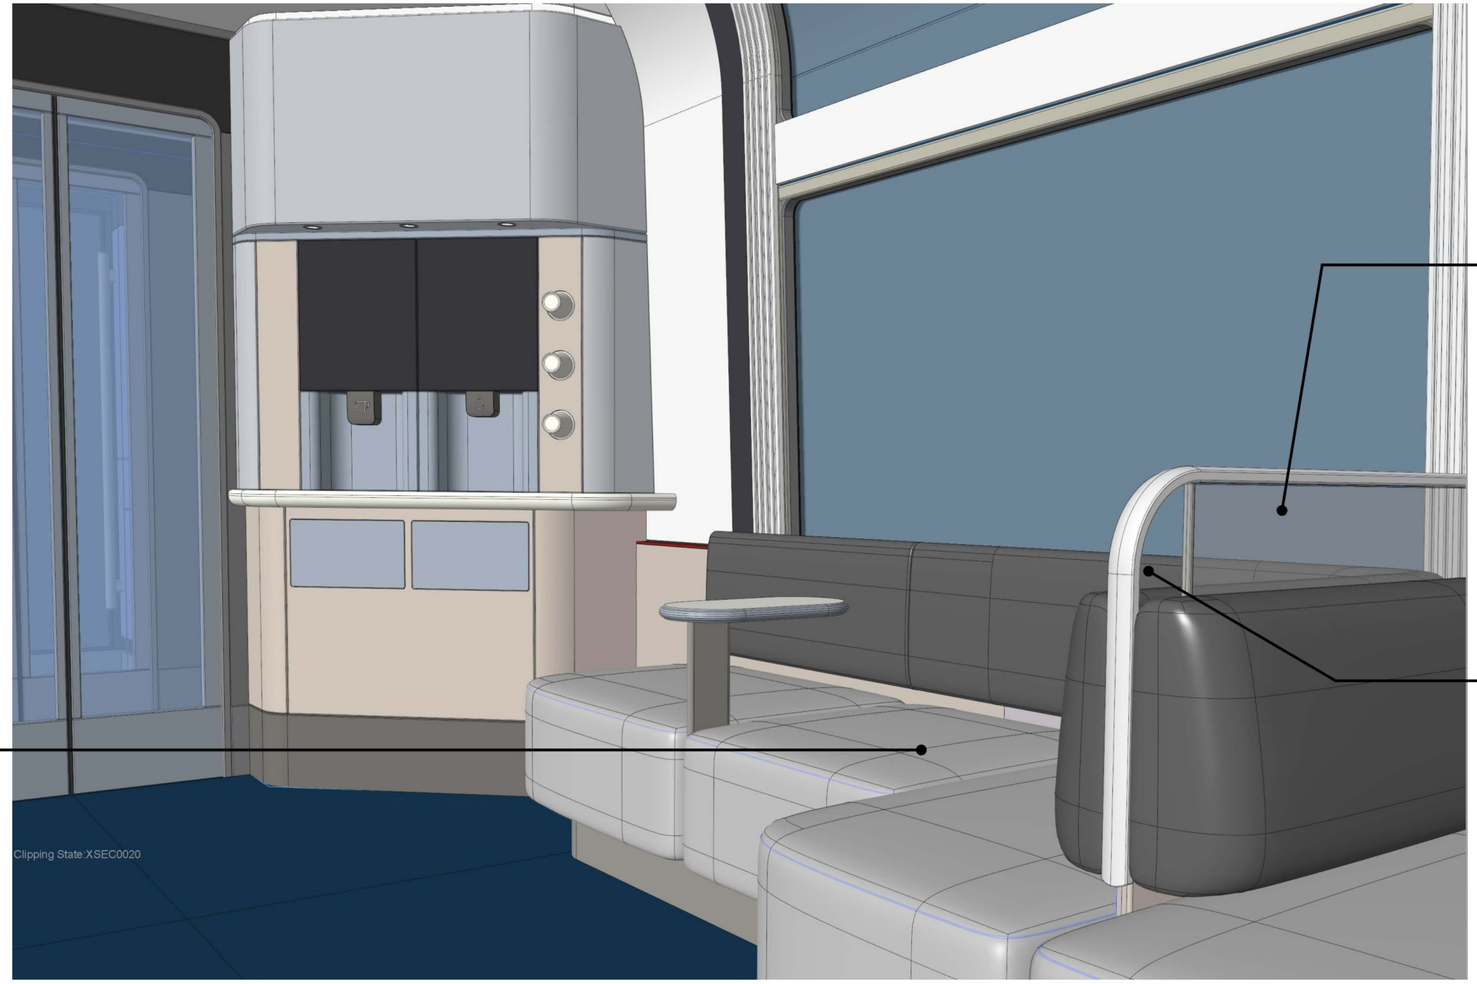
Beverage Station
A standard beverage station with provisions for coffee, water and trash.

Lounge Coffee Table
Coffee tables should be provided within lounge booths and shall have marine edge milled into the solid surface material.

Lounge Seats
Lounge seats should purposefully differ in style to booth seats and should utilize modular design so that they can be repeated to form both bay and longitudinal seating arrangements.

Lounge Seats
Lounge seats should purposefully differ in style to booth seats and should utilize modular design so that they can be repeated to form both bay and longitudinal seating arrangements.

Lounge Side Tables
Any longitudinal arrangements of lounge seats shall provide small integrated side tables - side tables should have marine edges built into the top surface or created using a trim edge..



Power Outlets
Power sockets and USB ports should be distributed around the seating so there is at least one socket and one USB port per seat.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Lounge | Features

Seating Dimensions
Lounge seats should have a minimum seat pan depth of 20” and a minimum seat width of 20”. Seat pan height should be a minimum of 18”.

Seat Comfort
Ergonomics, back support, seat back and seat pan pillowing, cushioning and seat trim and detailing will be evaluated and judged carefully during the design review process and will be subject to Amtrak approval.

Lounge Privacy Dividers
Privacy dividers should be included where seating is back-to-back. The height of the divider shall be low enough not to obstruct view out of the windows, yet high enough to provide some level of privacy for seated passengers.

Grab Handles
Purposeful and compliant handholds integrated with the divider should
be located on entry and exit points to lounge booths.

ATR | Amenities and Features

Paper Tissue Dispenser
A paper tissue dispenser should be positioned near the trash and sink. Position and function should comply with ADA.

Paper Towel Dispenser
A paper towel dispenser should be positioned near the trash and sink. Position and function should comply with ADA.

Toilet Paper Storage
The toilet paper should be stored in the wall of the bathroom. Position and function should comply with ADA.

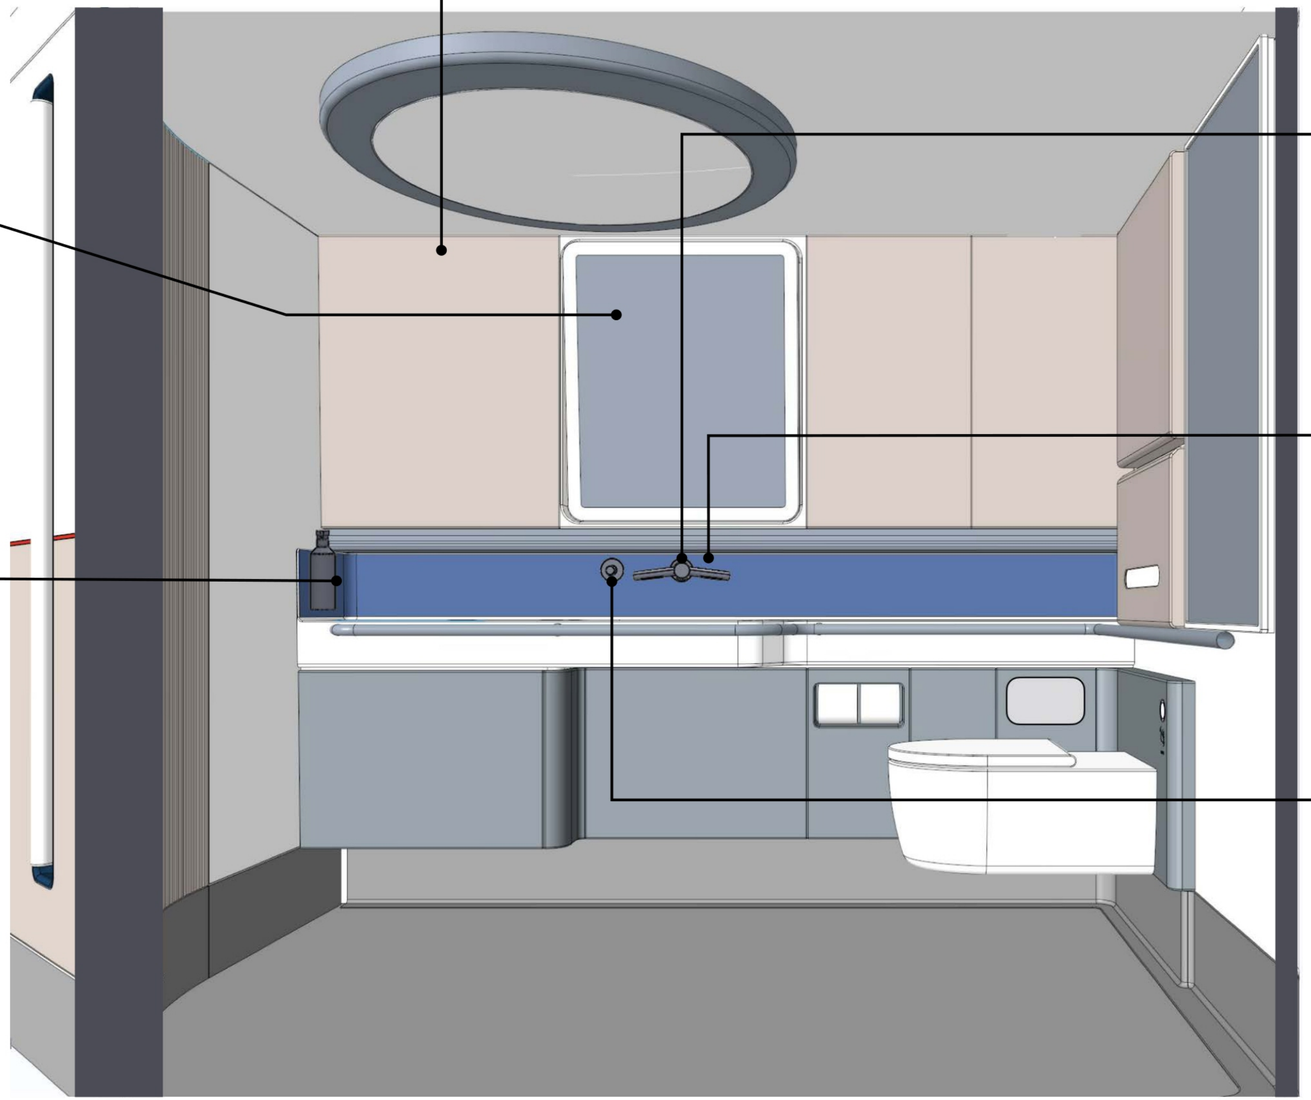
Trash
A trash bin is provided to the right of the sink. The volume should be 16 gallons minimum. Position and function should comply with ADA. There opening to the trash should have a push flap or similar and be a minimum of 10” x 10”.

Sanitary Waste
A sanitary bin with modesty flap is provided to the right of the toilet. Position and function should comply with ADA.

Call for Aid Button
There should be a call for aid button adjacent to the toilet. Position and function should comply with ADA.

Toilet Seat Cover Dispenser
A dispenser for paper toilet seat covers should be located by the toilet. Position and function should comply with ADA.

Toilet Flush
A two button push / touch-less flush is located on the back wall providing standard and eco flush. Position and function should comply with ADA.



Toilet
The toilet has a seat and a lid. The form of the toilet should be floating or undercut at the bottom to maximize wheelchair clearance. The design of the toilet, access and lid design will be subject to testing and ergonomic review during mockup stages and subject to the approval of Amtrak. Toilet seat and seat lid should all have soft close mechanisms.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

ATR | Amenities and Features

Vanity Mirror
A large mirror is positioned in front of the sink. The bottom edge of the reflective surface should be a maximum of 40" above the finish floor. If this is not possible, the mirror should be angled with an accessible lever to allow wheelchair passengers to use. Dimensions, position and usability will be subject to Amtrak approval.

Hand Lotion Bottle
An area on the side of the sink should be reserved for a refillable hand lotion bottle fixed to the side wall.

Crew Cabinet
Cabinet storage should be provided for crew to store cleaning and bathroom provisions.

Automatic Water Faucet
Water is automatically dispensed when hands are placed under the faucet. A physical element should be visible so it is clear where water is dispensed from. Temperature of water should be controllable. Water pressure, water flow should not create any water splash or spill outside of the sink area.

Automatic Hand Dryer
An automatically triggered hand dryer should be included under the vanity unit. This can be part of the faucet or supplied separately. A physical element should be visible so it is clear how to use the dryer. The dryer should use high velocity air and HEPA filters similar to a Dyson Airblade. The air dryer should not blow water out of the sink.

.

Soap Dispenser
An automatic soap dispenser should be included above the sink area. A physical element should be present to indicate how and where the soap will dispense.

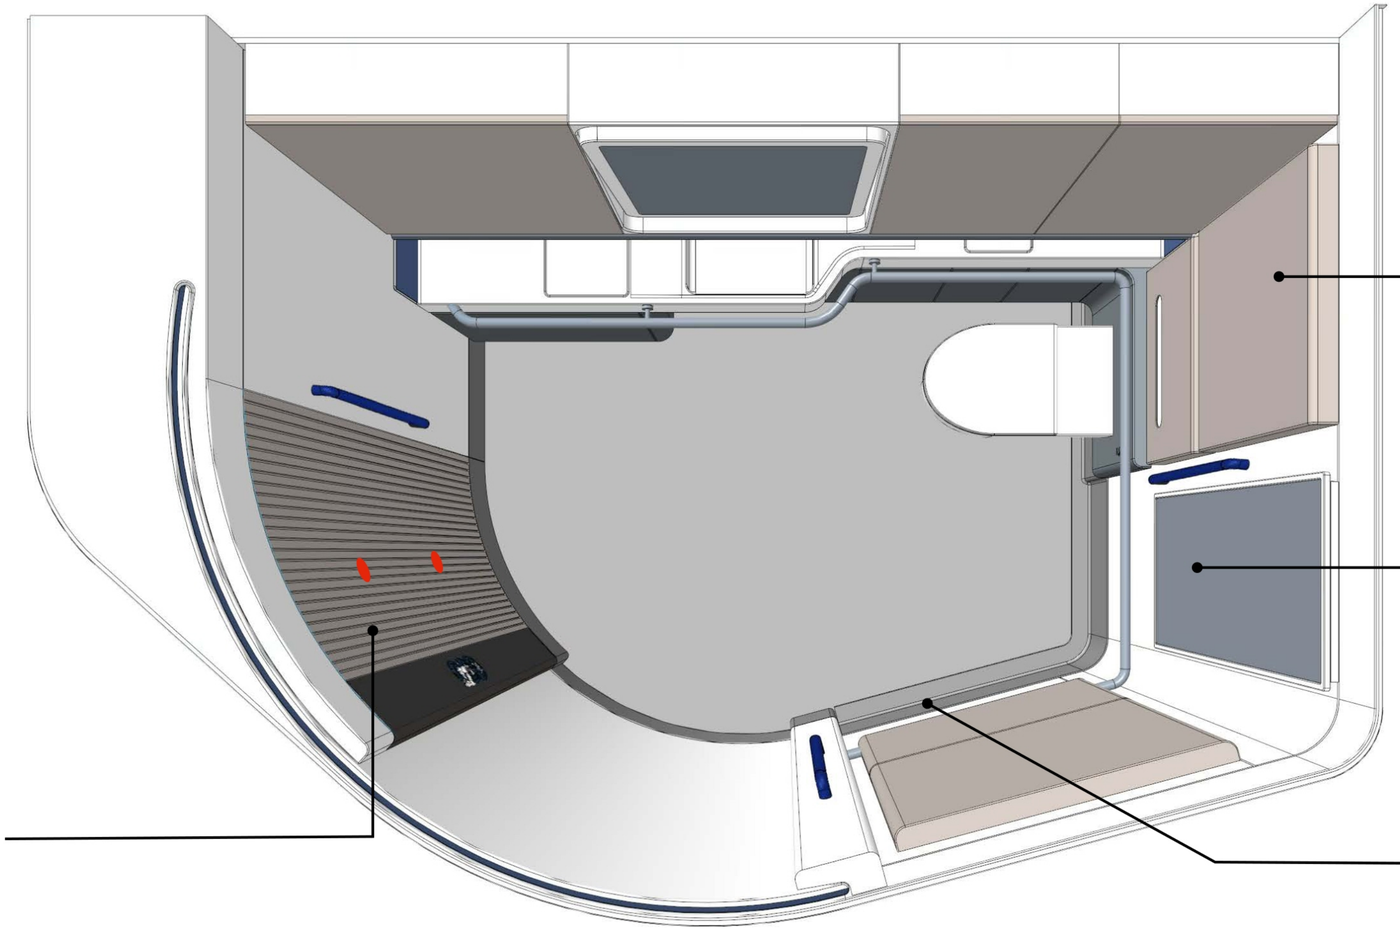
ATR | Amenities and Features

Sharps Bin
Provision for a sharps bin should be provided within the room. The size and position and means of removal of sharps should be agreed and instructed by Amtrak.

Sink Surface
Sink surface should be large enough to store a wash bag and toiletry items and aid the safe and clean disposal of a colostomy bag. Marine edge should run along entire length and a draining surface angled towards sink.

Sink
The sink should be accessible while sat on the toilet. There should be an RVAAC compliant clearance underneath the sink to allow wheelchair passengers to fully access the sink and amenities.



Intercom
A speaker should be provided in the toilet, passengers should be able to control notifications via the in room screen.

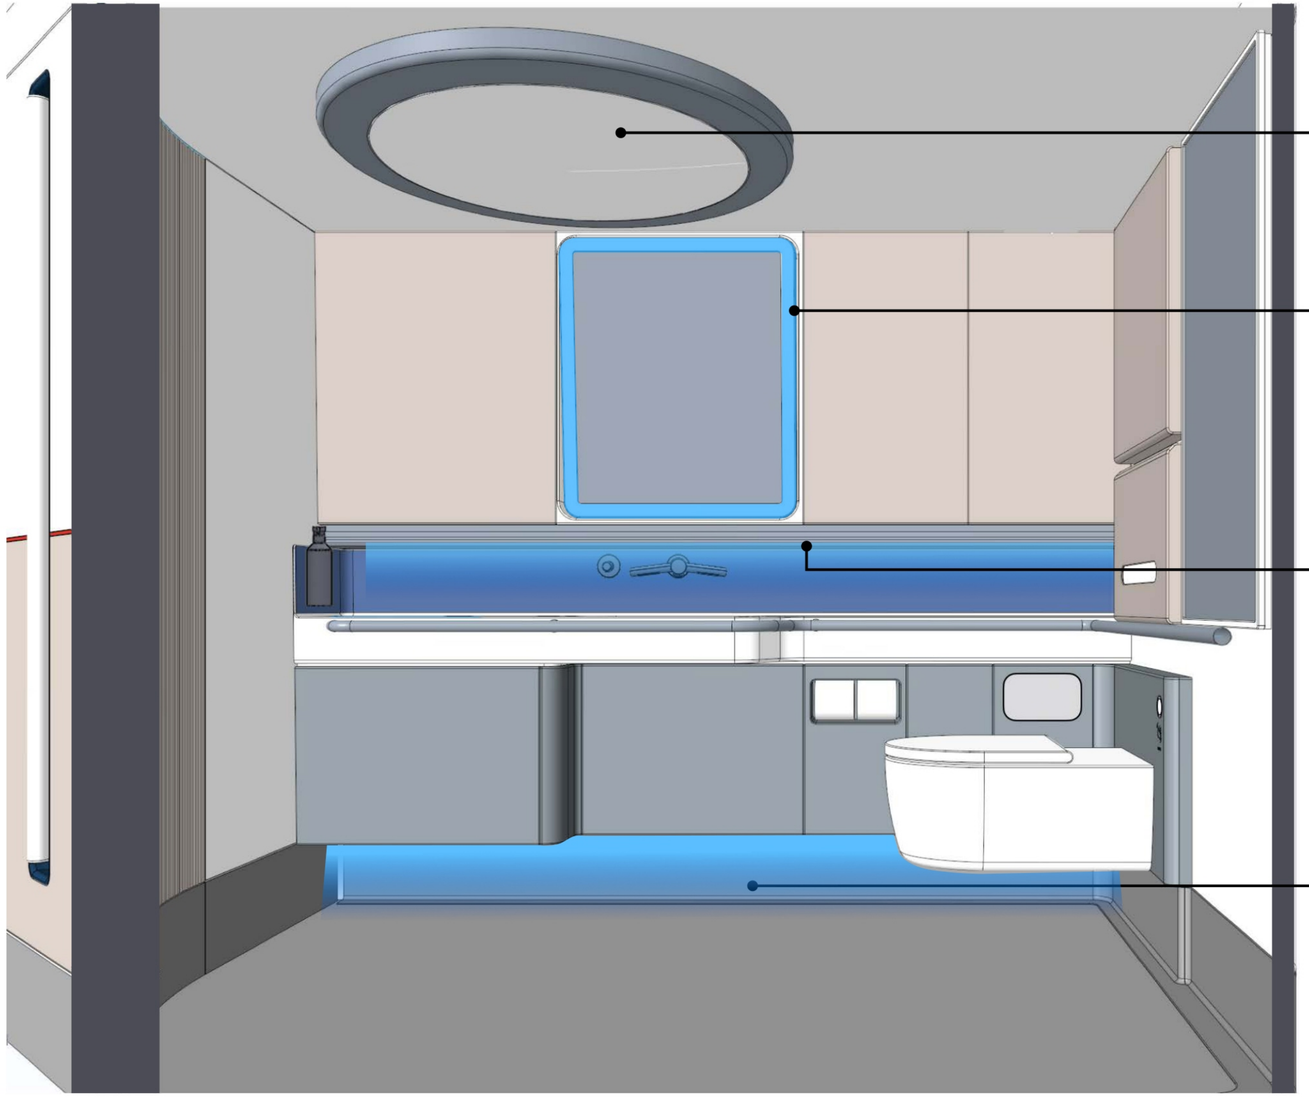
Extraction Fan
A filtered exhaust fan in the bathroom suitable to remove excess moisture, odors, and stale air.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

ATR | Amenities and Features

Fold Down Baby Changing
A baby changing table should be provided with an RVAAC compliant clear space in front of it. The changing table should be easy to deploy and stow with an intuitive handle. It should have a soft opening mechanism. Position and function should comply with ADA.

Full Length Mirror
A full length mirror should be provided in addition to the sink mirror. The bottom edge of the reflective surface should be a maximum of 40" above the finish floor.



Coat Hooks
At least two coat hooks should be provided. One hook must be within the reach range of a person using a wheelchair at a maximum height of 45".

Soft Corners
The bathroom should have soft corners to aid cleaning and maintenance. The profile should not affect any clearance required for accessible space or turning spaces.

ATR | Lighting

Shower Tray
The shower tray should be a minimum of 27” x 40” and be fully sealed and easy to clean.

Changing Area
The standing changing area in front of the changing bench should be a minimum of 24” x 30”

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Amenities and Features

Soap Dispenser
An automatic soap dispenser should be included above the sink area. A physical element should be present to indicate how and where the soap will dispense.

Paper Tissue Dispenser
A paper tissue dispenser should be positioned near the trash and sink.

Hand Lotion Bottle
An area on the side of the sink should be reserved for a refillable hand lotion bottle fixed to the side wall.

Towel Bin
The space under the sink should be maximized for storing used towels with a minimum volume of 30 Gal. The bin should be lined, prevent water ingress and build up of mould.

Crew Cabinet
Cabinet storage should be provided for crew to store cleaning and bathroom provisions.

Vanity Mirror
A mirror is positioned in front of the sink of 18” wide and x 33” in height. The volume behind is reserved for hand dryer and soap equipment .

Automatic Water Faucet
Water is automatically dispensed when hands are placed under the faucet. A physical element should be visible so it is clear where water is dispensed from. Temperature of water should be controllable. Water pressure, water flow should not create any water splash or spill outside of the sink area.

Automatic Hand Dryer
An automatically triggered hand dryer should be included under the vanity unit. This can be part of the faucet or supplied separately. A physical element should be visible so it is clear how to use the dryer. The dryer should use high velocity air and HEPA filters similar to a Dyson Airblade. The air dryer should not blow water out of the sink.

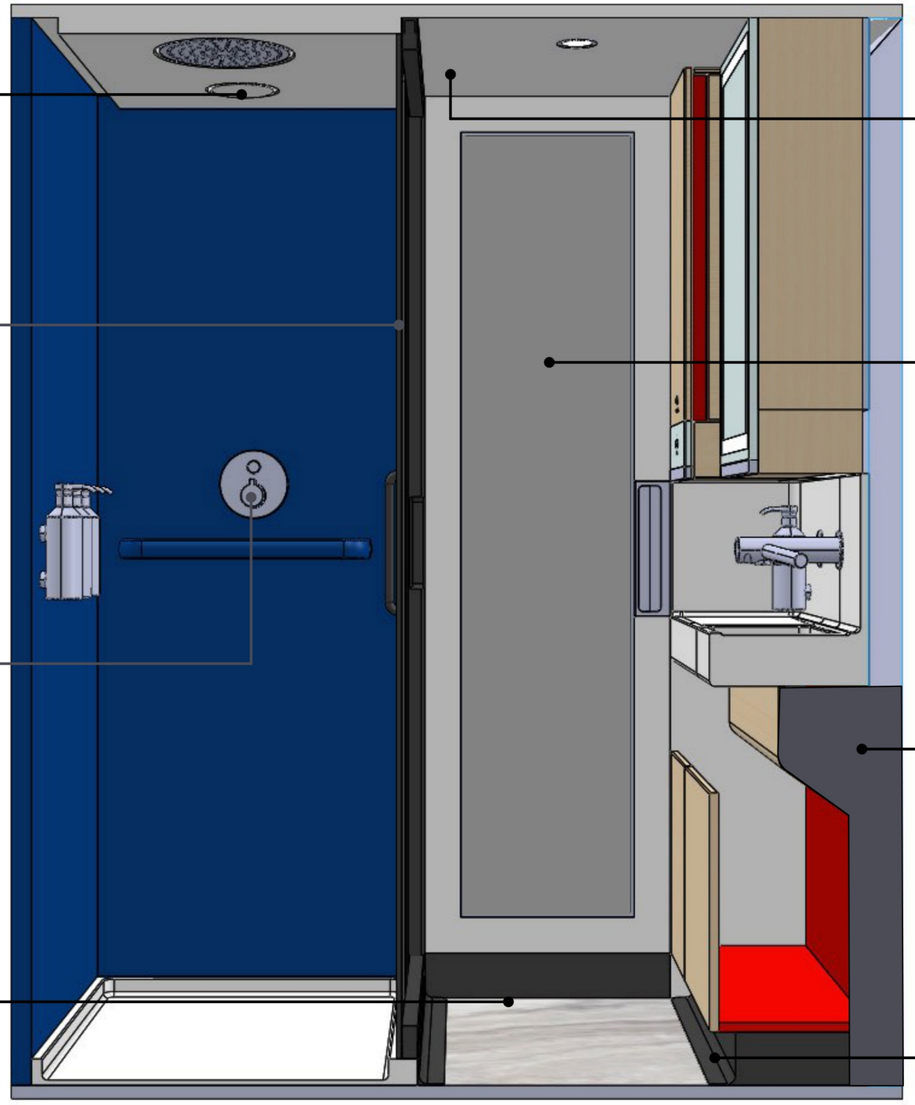
.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Amenities and Features

Bath Towel Cabinet
A cabinet for storing a minimum of 15 clean Amtrak bath towels

Braille Strip
A Braille strip should be provided along the underside of the vanity unit to call out key functions of the vanity area - water, air, tissues, towels etc



Sink Surface
Sink surface should be large enough to store a wash bag and toiletry items . Marine edge should run along entire length with a draining surface angled towards sink.

Hand Towel and Wash Cloth
Space should be provided on the vanity unit to stack hand towels and wash cloths.

Changing Bench
A cantilevered bench should be provided in the changing area with space kept free under the seat for a bag. The bench should have a minimum depth of 11.5” running the full width of the changing area

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Amenities and Features

Extraction Fan
A filtered exhaust fan in the bathroom suitable to remove excess moisture, odors, and stale air.

Shower Hooks
Hooks should be provided inside the shower for hanging wash cloths or wash bags .

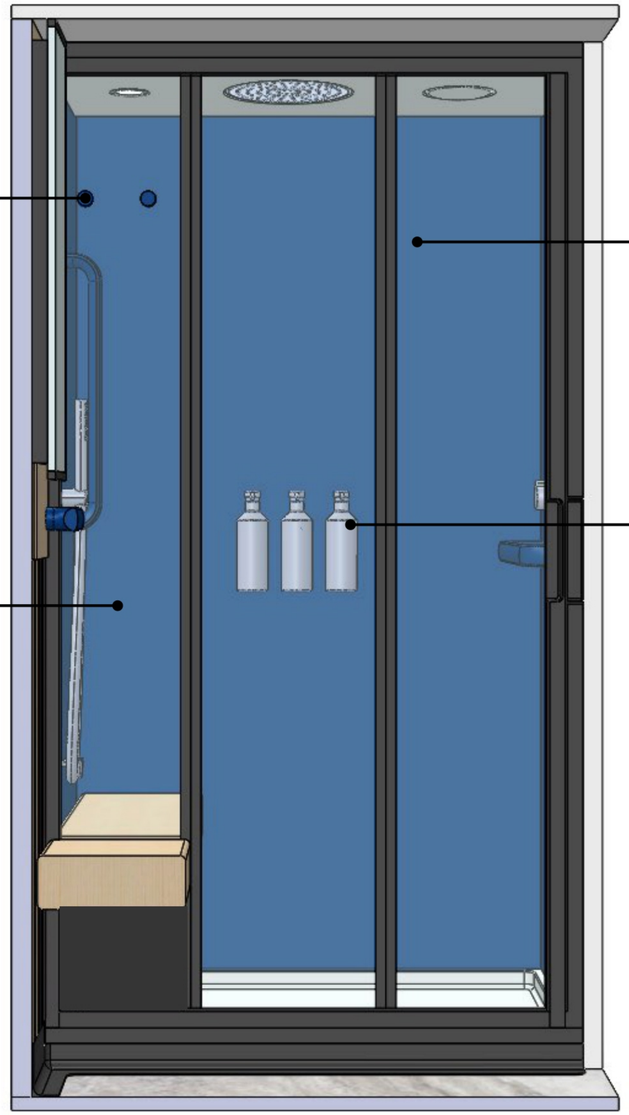
Shower Control
An on/off button and temperature control are located on the bathroom wall close to the shower door entrance. The shower control should prevent any accidental activation.

Floor
The changing area floor should be sealed with a raised edge to prevent water escapement under the door while at the same time not presenting a trip hazard.

Intercom
A speaker should be provided in the shower room.

Shower Room Door
Should be a sliding door and a minimum width of 22”.

Under Sink Cover
Sink pipe work and waste should be covered with a panel that is accessible for maintenance behind the towel bin.



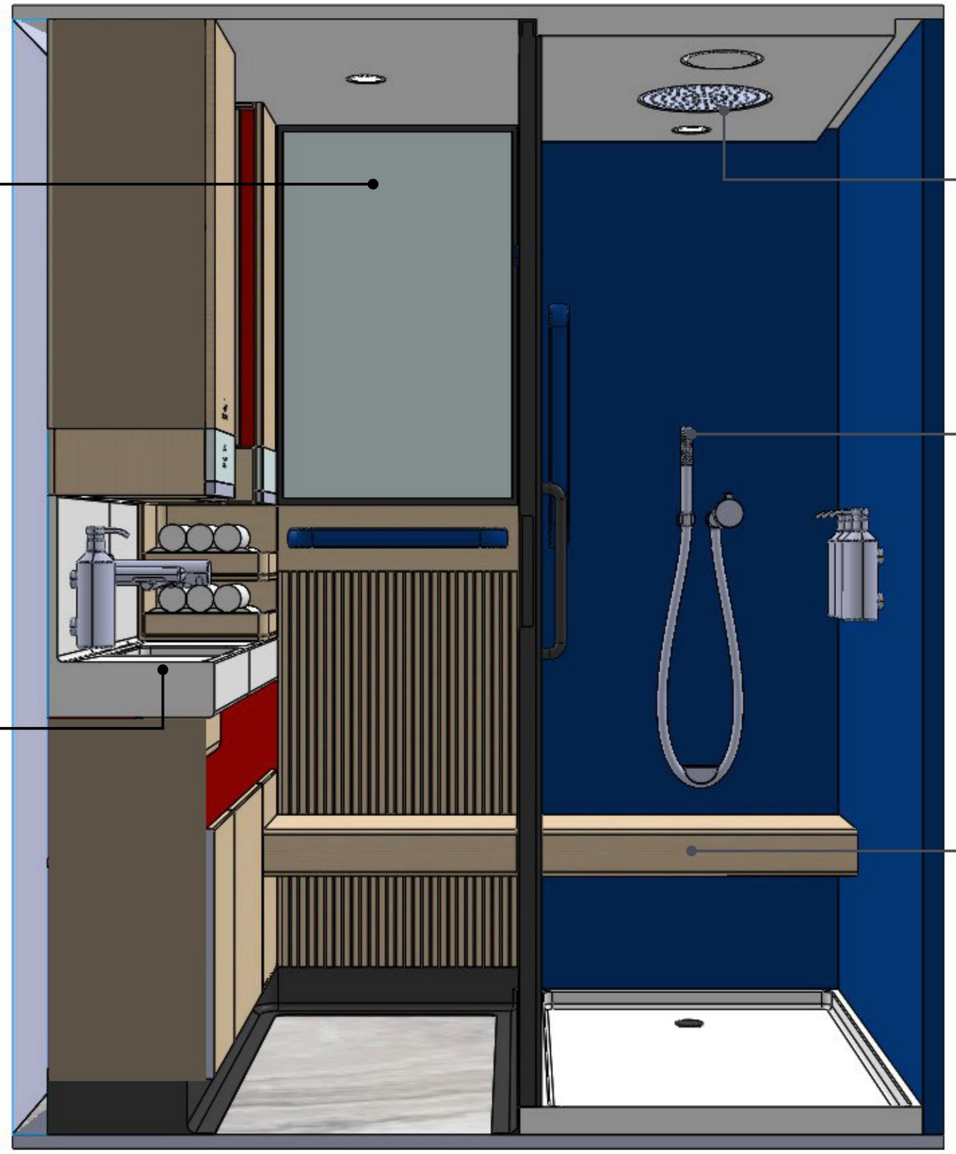
Soft Corners
The bathroom should have soft corners to aid cleaning and maintenance.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Amenities and Features

Coat Hooks
Coat hooks should be provided close to the shower door inside the changing area and protected from shower splash for hanging clothes and towels.

Fixed Glazed Panel
A fixed glaze panel should be used to keep the shower space open and bright. The lower portion can be solid to provide structure for the cantilever benches.



Shower Door
The door should open inwards as a bifold door, similar to an airline toilet door. The door should be sealed to prevent shower water escaping into the internal living space of the room, even when water is sprayed directly onto the back surface of the door.

Dispensing Bottles
3 refillable Amtrak bottles dispensing shampoo, conditioner and body lotion. Bottles should be fixed to the wall and easily refilled or replaced by Amtrak staff.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Amenities and Features

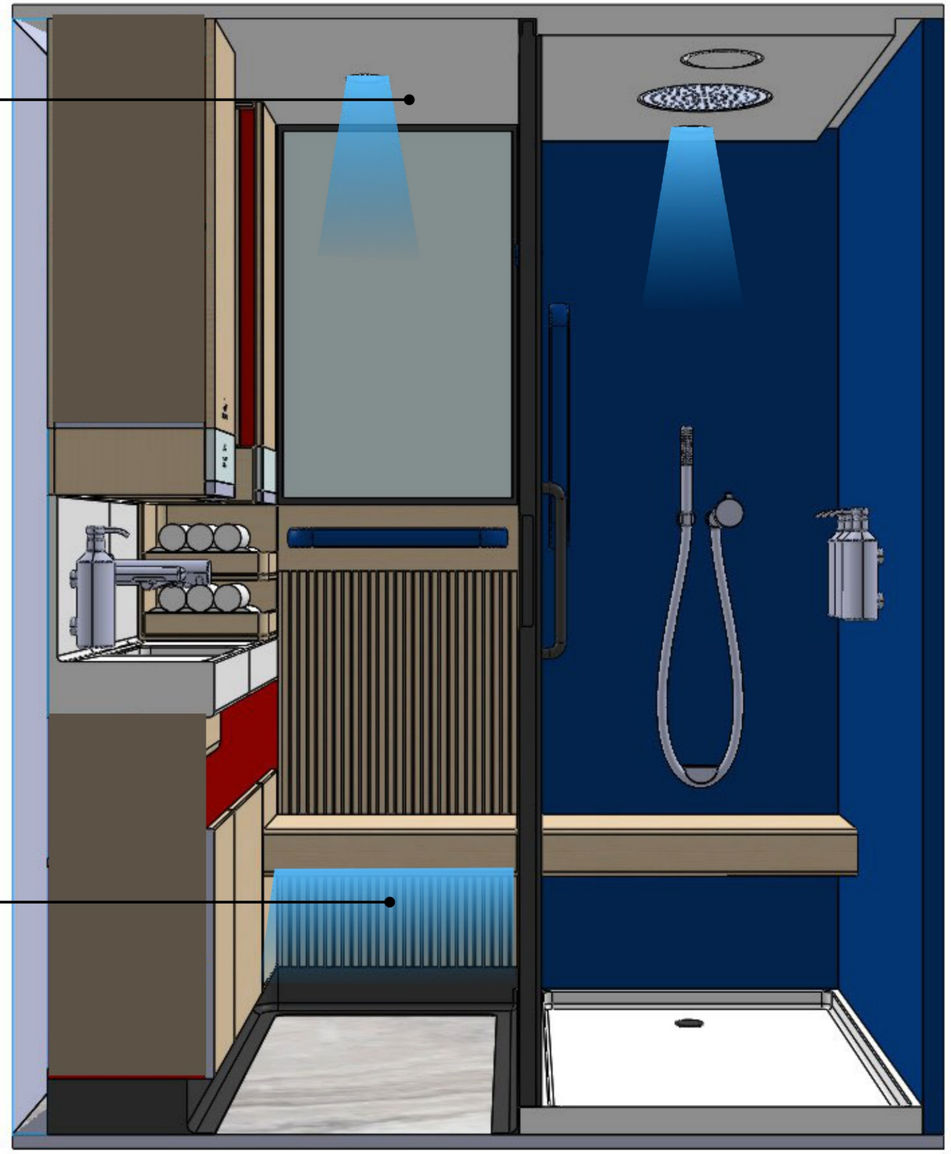
Mirror
A second mirror should be provided in the changing area

Sink
The sink should have a marine edge so any water spill is captured in the sink area. A splash back behind the sink should protect the surrounding areas from water splashed onto the back wall from the sink area.

Rain Shower
A rain shower in the ceiling provides a shower above head height. Rain shower should be seamlessly integrated into the ceiling in order to maximize head room in the bathroom.

Hand Shower
A second hand shower is located with a slimline design handset. A hose clip should be included to prevent the hose from rattling while the train is in transit.

Shower Seat
A fixed cantilevered shower seat should be provided inside the shower with an anti slip finish with a minimum depth of 11.5” running the full width of the shower enclosure.



Shower & Changing Room | Lighting

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Lighting

LED light panel spots
Small circular LED light panels act as spot lights to provide the master lighting conditions for this room - frame to be color matched. At least one in the changing area and at least one in the shower enclosure.

Bench Wash Light
Indirect mood light on to the floor from the underside of the bench. Activated only when the door is locked from the inside.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shower & Changing Room | Lighting

LED Illuminated Mirror
The vanity mirror is illuminated with an LED strip around the border. Activated when the door is locked from the inside.

Splash Back Wash Light
The cabinet washes indirect mood light on to the sink surface. Activated only when the door is locked from the inside.

Handholds
Compliant handholds should be supplied on both sides of each door, at key access point along aisles and on both sides of elevators.

Tide line
There should be a horizontal tide line incorporated into the panel work. The edging between upper and lower panel acts as class identifier.

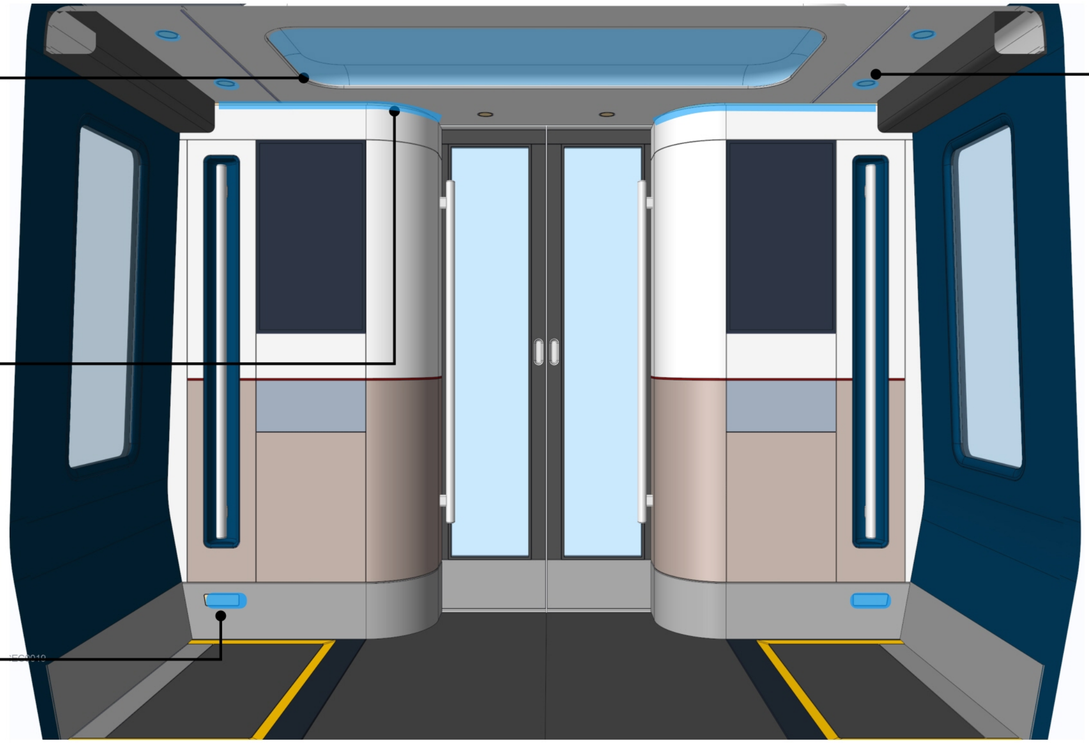
Kick-strips
Stainless steel kick strips at 9” high.

Door Threshold
Should have a slip-free surface and a contrasting floor color to the main vestibule flooring to mark the threshold.

Passenger Information Screens
Display screens should be supplied on both sides of the door.

Trash Bin
Trash bins on both sides vestibule with stainless steel push flaps. Easy access water tight bin liner for quick cleaning routines and maintenance.

Panel Work
Vestibule monuments should be designed to have well fitted clean panel with a high tolerance build to manage split lines and cabinet edging. There should be no protruding equipment, snag point or dirt traps. All equipment cabinets should be accessible under a crew key with discreet locks.



26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Entrance Area | Lighting

Ceiling Pool Light
Central lighting well in the ceiling provides indirect mood wash light in the centre of the vestibule.

Module Wash Lights
Indirect strip lights wash light onto the ceiling from the top of the vestibule monuments..

Step Lights
Step lights should illuminate interior threshold during boarding sequences.

LED Panel Spot Lights
Spot light over door, elevators and along aisles. Size position and number will be subject to Amtrak approval.

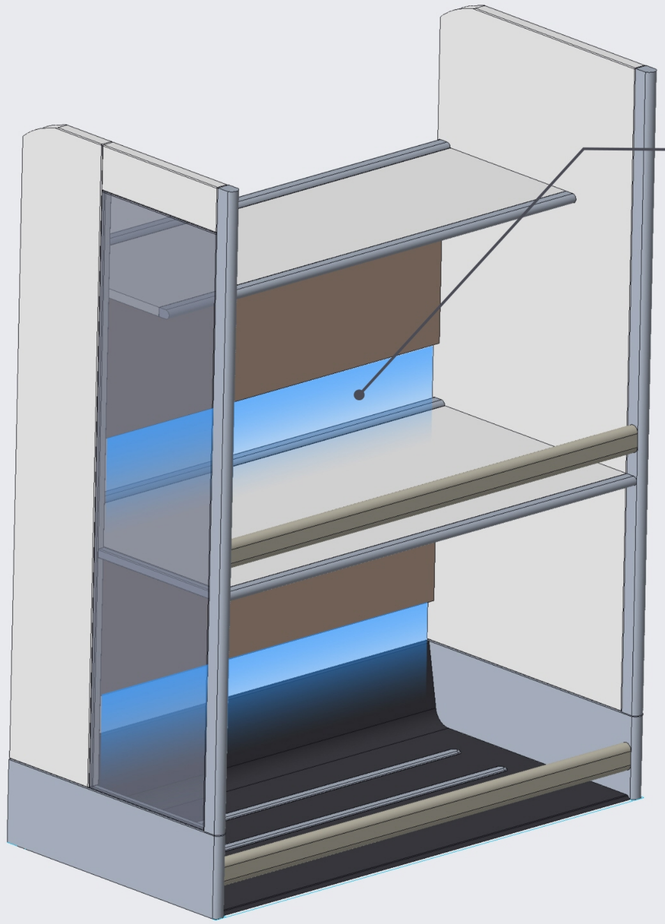
Luggage Shelf
Luggage shelf should be built in modules that align with window placements. Split lines and module length should be consistent and to visually match the window module splits.

Reservation Screens
Passenger information displays, should be integrated with the rack design. The position of the seat reservation module should be designed so they can easily be moved in case seat pitch or density is modified in the future.

Coat Hooks
Coat hooks should be provided for each seated location, integrated with the luggage shelf Hooks should be easy to move if seat positions or set pitch is changed in the future.

***Rotating Seats**
In the case of rotating seats, seat reservation systems, at seat power and coat hooks, locations will need to work in both seat orientations.

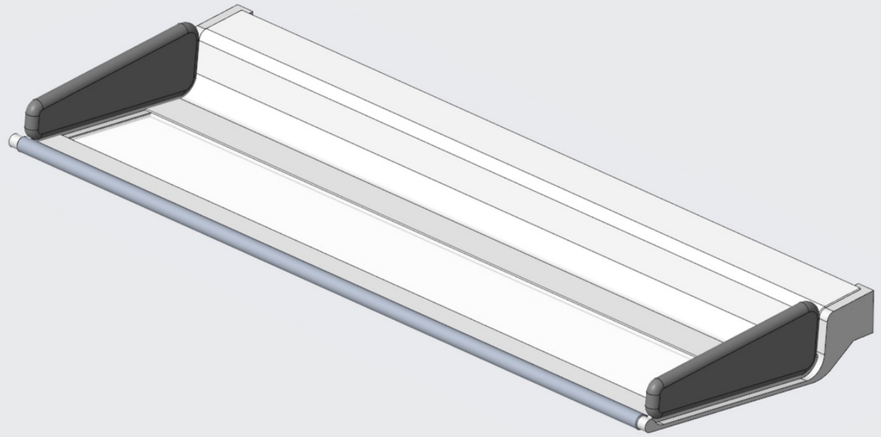
Blinds
A single pull-down blind system shall be provided per window, capable of delivering both daytime solar/glare control and full blackout performance. Blinds should cover the entirety of the window.



Windows
Window size should be maximized with an equal pitch. Window mask should minimize or mask glass corners to create an architectural aesthetic.

Window Pillars
Window pillar width should be minimized. The pillar trim should continue over the side ceiling to create an arched aesthetic.

Lower Side Wall Panel
A lower side wall panel provides a horizontal tideline and material split

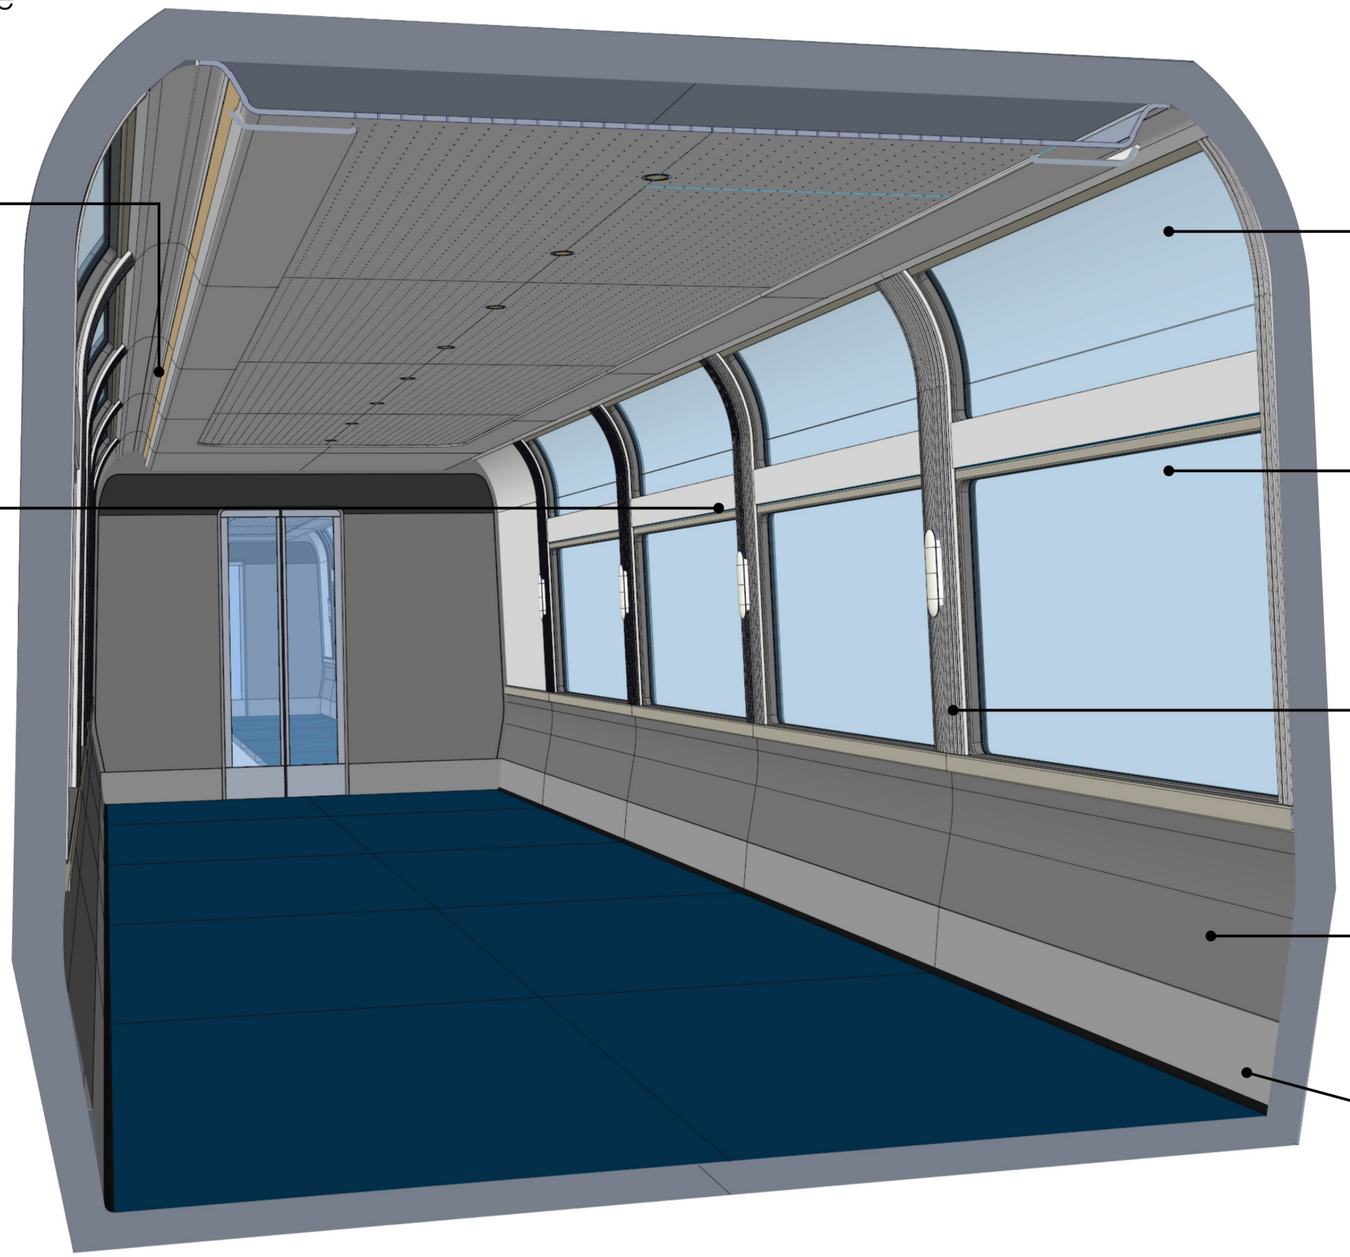


Kick-strips
Stainless steel kick strips at 9” high.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Shelf Lighting
Luggage towers shall have shelf lighting integrated within the tower.

Luggage Tower
Luggage towers shall be constructed as a modular system allowing various tower lengths. Glass side panels shall be provided to allow passengers to view their luggage



Luggage Shelf
Overhead luggage racks shall be modular and constructed using extruded aluminum to allow different length segments. Rack modules and split lines shall align with window placements and visually correspond with the window module divisions. Coat hooks shall be provided for each seated location and integrated within the luggage rack assembly.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Interior Structures | Cafe, Diner, Lounge

Blinds
A single pull-down blind system shall be provided per window, capable of delivering both daytime solar/glare control and full blackout performance. Blinds should cover the entirety of the window. Skylight blinds to be crew controlled

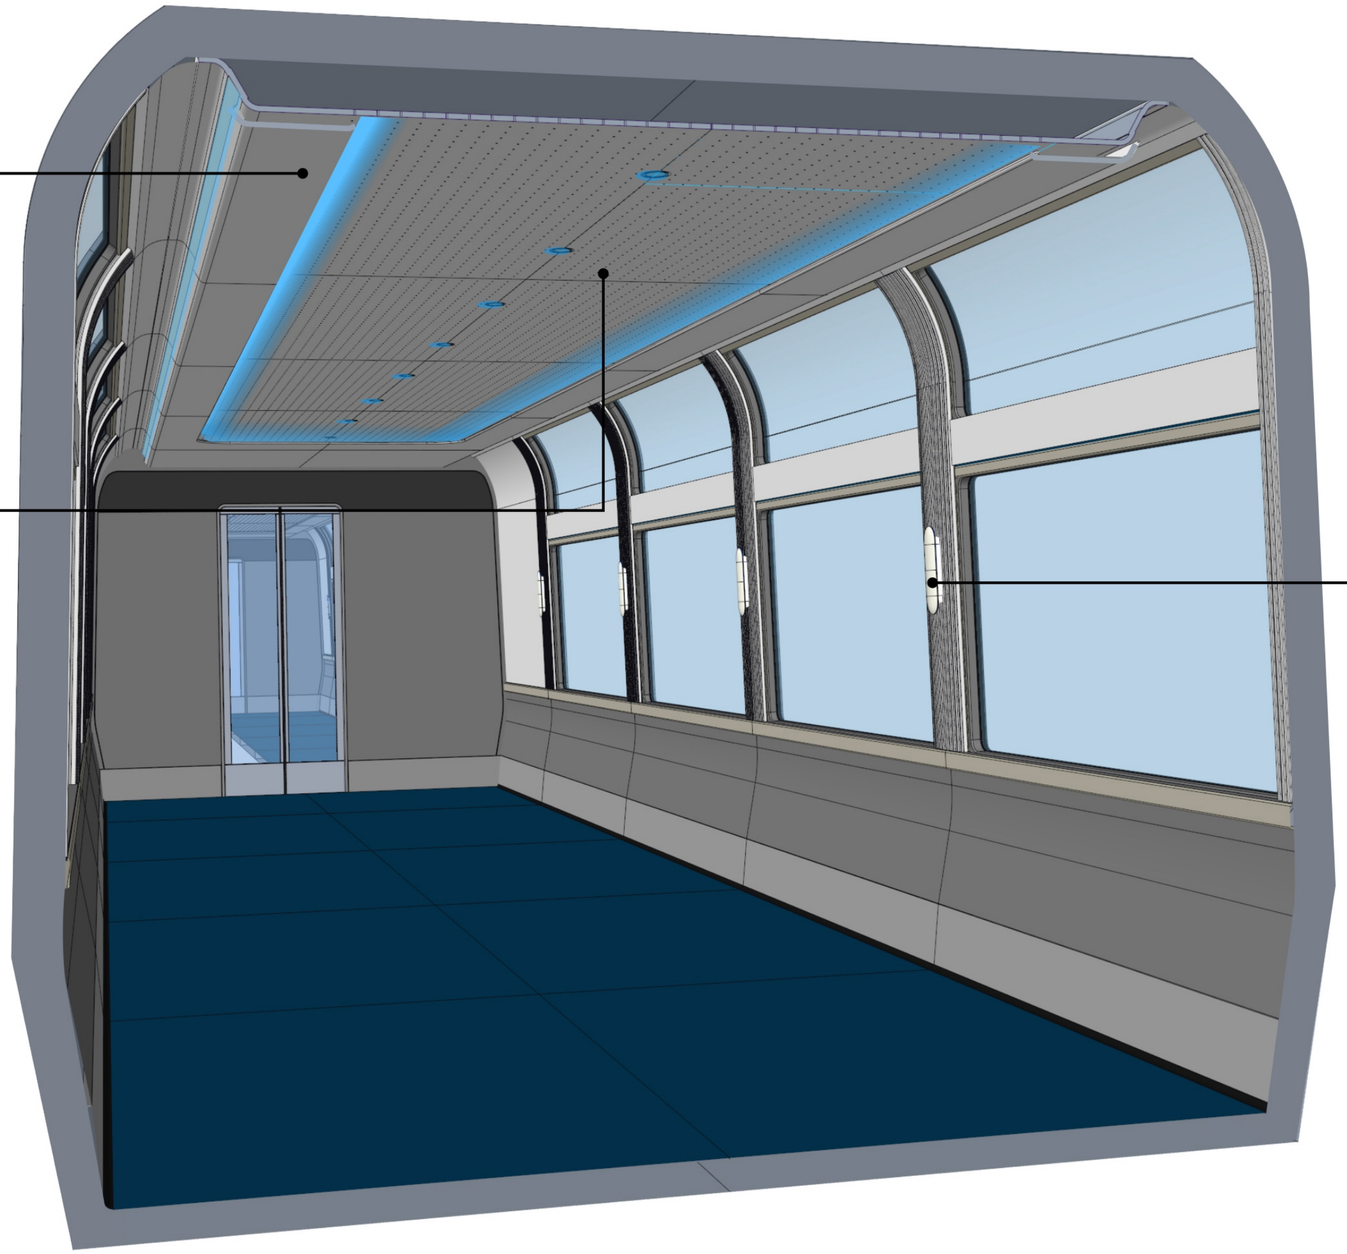
Blind Pelmet
Blinds shall be stored in a pelmet so that they can easily be accessed for maintenance. to be crew controlled

Skylights
Options provided for Skylights in Cafe,

Windows
Window size should be maximized with an equal pitch. Window mask should minimize or mask glass corners to create an architectural aesthetic.

Window Pillars
Window pillar width should be minimized. The pillar trim should continue over the side ceiling to create an arched aesthetic.

Lower Side Wall Panel
A lower side wall panel provides a horizontal tideline and material split



Kick-strips
Stainless steel kick strips at 9” high.

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Interior Structures | Lighting

Ceiling Lighting
Ceiling lighting should be consistent across all car types . Wash lighting from both sides of the lighting gondola lights central panel and side ceiling.

Spot Lighting
LED panel spot lights. Downlighting spots light the aisle.

Wall Lights
Additional wall lights shall be provided in Cafe, Diner and Lounge areas

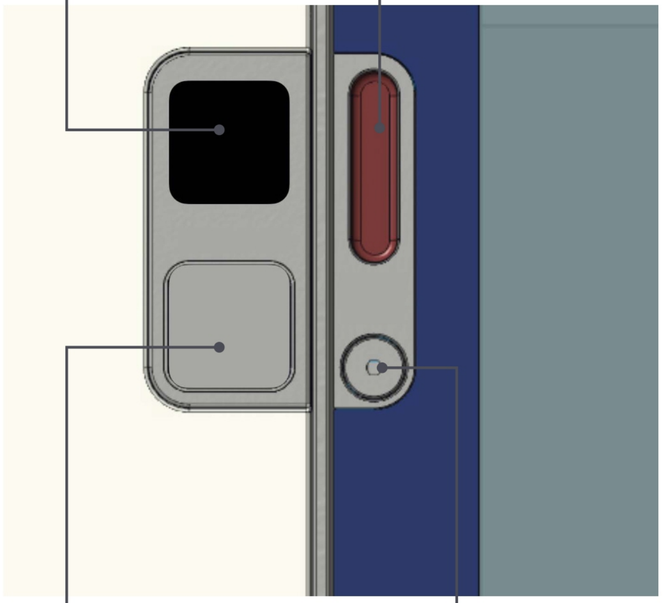
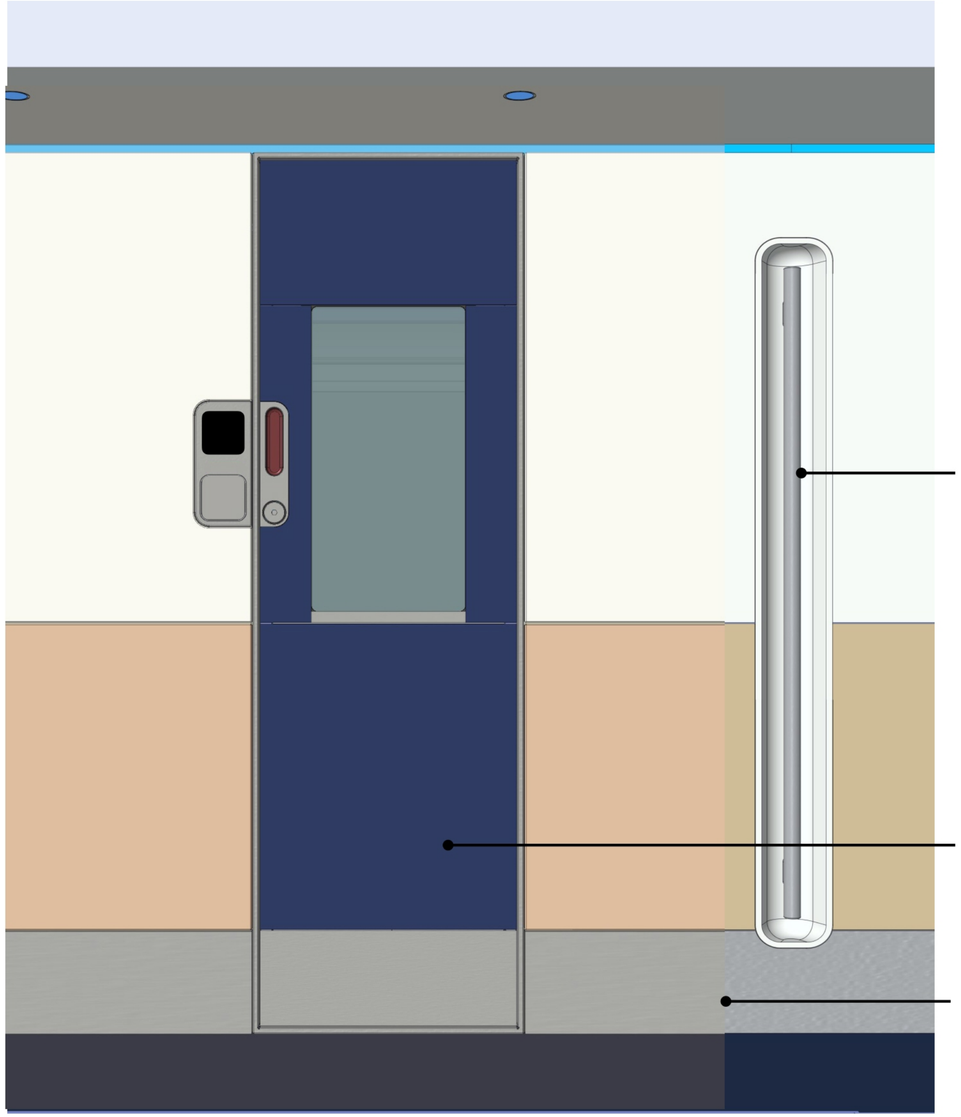
Amtrak® Long Distance Product Features



16 | Hallways

26-FOI-00415 00000006272 "UNCLASSIFIED" 4/30/2026

Hallways | Room Doors



Room Badge
Room numbering, room state signaling.

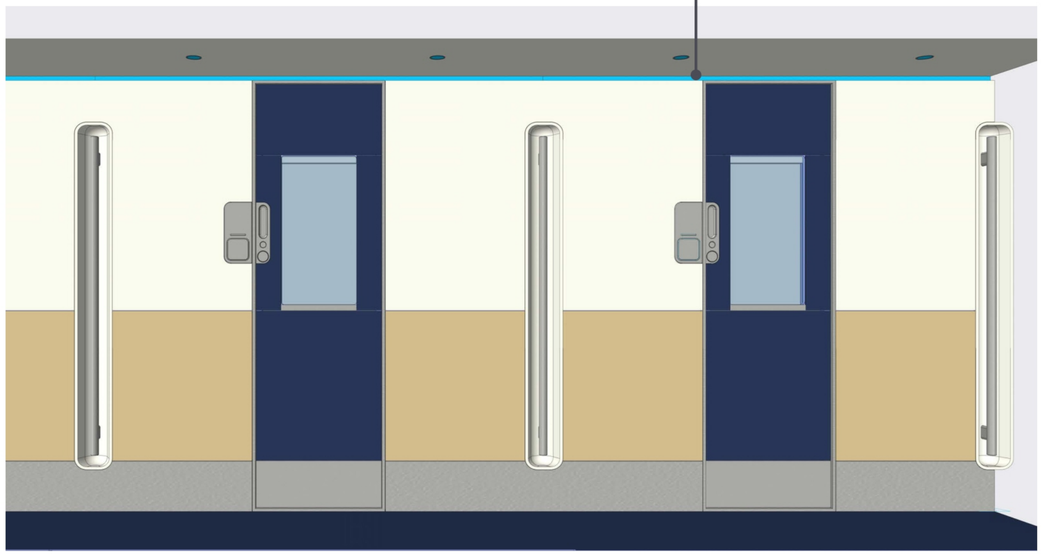
Handle
Accessible grip with called out contrasting color in class signifier

Keyless Entry
Technology defined elsewhere. Modular approach to panel so tech can be updated and swapped in the future.

Manual Override
External manual lock override with crew key.

Handholds
Hallways should provide handholds either at junction between bedroom modules or along the side wall.

Doors
Sliding doors should be called out in a separate color in line with CMF attachment.



Kick-strips
Stainless steel kick strips at 9” on both sides of the aisle and across bottom top the door.

Hallways | Lighting

Panel Spot lights
Spot lights provides downlighting

Module Wash Lights
Indirect strip lights wash light onto the ceiling from the top of bedroom monuments..

CMF Schedule

26-FOI-00415 00000006235 "UNCLASSIFIED" 4/30/2026

CMF **STRATEGY**

The proposed material palette on the following page is indicative and intended to communicate the breadth, variety, and quality of applications expected across the new vehicles. While final colors and finishes will be developed and refined through the design process, the current palette sets out the ambition in terms of material diversity, durability, and overall customer experience.

Suppliers will be expected to accommodate this range through rounds of sampling and refinement to support performance, compliance, and aesthetic cohesion, as well as to align with iterative feedback and approvals from the Amtrak team.

THE OPPORTUNITY

Amtrak has a strong legacy as the proud national rail carrier with a mission to connect people across America.

Designing the future of Amtrak's Long Distance trains is a once in a generation opportunity to transform the service into an accessible, sustainable and futureproofed experience that will last another 50 years. This document sets out the Customer Experience Vision for life onboard our future trains.

26-FOI-00415 00000006278 "UNCLASSIFIED" 4/30/2026

THE LONG DISTANCE EXPERIENCE

To ride on a long distance Amtrak train is to have an experience like no other.

As we traverse diverse landscapes, our service is designed to cater to passengers of varied abilities and backgrounds. Embracing the eclectic nature woven into the fabric of America, the long distance service unites communities, turning each journey into a seamless and enriching experience.

The Amtrak Long Distance Train experience is earthly and grounded with customers traveling through the landscape, not above it. Passengers are able to see America in ways that they have never seen before.

Amtrak's crew are the heroes and heroines of our service. They do a fantastic job of providing a high standard of customer service and support the passenger at every step of their journey.

Our unique service demands distinctive spaces. On extended routes, our diners and cafes deliver culinary excellence. In our observation cars, panoramic views become more than just scenery—they become opportunities to connect with fellow travelers, transforming every moment into a destination in itself.

.

26-FOI-00415 00000006278 "UNCLASSIFIED" 4/30/2026

OUR PEOPLE

At Amtrak, our commitment to excellence extends beyond the tracks; it's woven into the fabric of our culture and the hearts of our people. To embark on a journey with us is to embrace the unique tapestry of experiences and needs that define our onboard crew, the dedicated individuals who ensure the seamless operation of our long-distance services.

Understanding our people goes beyond a surface-level exploration—it's about immersing oneself in their daily lives, gaining insight into the challenges and triumphs they encounter on their journeys. We invite those who work with us to delve into the distinct needs of our staff, forging a connection that goes beyond professional collaboration.

This journey of understanding extends to our engineering team, where comprehension of operational intricacies, maintenance requirements and the collaborative efforts of cleaning crews is paramount. To truly contribute to the Amtrak legacy, a comprehensive grasp of these facets is essential.

Our brand is more than a logo; it's a promise, a commitment to delivering exceptional experiences. Those who collaborate with us must engage with our branding, product development, and design teams to ensure that every touchpoint resonates with the core values that define Amtrak.

Inclusivity is at the heart of our services, and our Accessibility Office stands as a testament to this commitment. Collaborators are encouraged to comprehend and address the diverse needs of all travelers, irrespective of their abilities. By working closely with our Accessibility Office, a more inclusive and accessible future for rail travel can be forged.

Finally, innovation propels us forward. Those working with Amtrak must navigate the intricate processes of testing and validation. From user testing to focus groups, utilizing mockups, and embracing cutting-edge technology like collaborative virtual reality—innovation is the vehicle through which we drive progress.

In essence, to work with Amtrak is to embark on a journey of understanding, collaboration, and innovation—a commitment to shaping the future of rail travel by embracing the richness of our people, the heart and soul of Amtrak. Welcome aboard.

Design DNA

26-FOI-00415 00000006278 "UNCLASSIFIED" 4/30/2026

DESIGN DNA

Amtrak's Long Distance design DNA has been created to inspire outstanding developments as we design the future long distance rail fleet.

The Design DNA brings to life how the Amtrak long-distance brand personality can be translated into a distinctive rail experience. It is created from a deep understanding of our passenger and crew's needs across the varied products we'll offer onboard. This will create a higher level of emotional engagement between our passengers, crew and our brand.

What is DNA Model?
A Design DNA is a tool that embodies a clear, unequivocal understanding of a brand and how it is expressed through design.

How does the model work?
In the very centre of the DNA model is the Heart. This is the central creative idea that inspires every expression of the brand and captures the distinctive magic of the Amtrak long distance experience. It expresses the feeling that we want our passengers and crew to have whenever they ride our long-distance trains.

Supporting the Heart are four key Values that add direction and colour to how the long distance brand should behave. They are inextricably linked to one another, but can be dialed up or dialed down depending upon their relevance to any design elements onboard the train. Think of them as four individual notes that together create a perfect harmony... it is possible to amplify one of the notes to make a point, but not without the other two in the background to create the harmony.

26-FOI-00415 00000006278 "UNCLASSIFIED" 4/30/2026

HEART

FEELING FREEDOM

Feeling Freedom fills the Heart of our Design DNA.

Our long-distance trains offer all Americans a rare opportunity to escape the burdens of daily life. To be free to explore without the constraints of time. To choose a journey that supports the environment. To be yourself and make new friends.

Whether for a few days revelling in the vast glory of the shifting American landscape, or for a few hours... of simply kicking back and relaxing... Amtrak long distance trains' design empowers people to discover our Land of Liberty on their own terms.

26-FOI-00415 00000006278 "UNCLASSIFIED" 4/30/2026

AMERICAN ICONIC

American Iconic celebrates the Amtrak Long Distance Trains as a destination wholly in themselves.

It inspires us to imbue our vehicles with the optimistic spirit of American design; creating enduring meaning and value so that the memories made on board last a lifetime. It reminds us of the history of the rails we ride and challenges us to question the archetypes of the past, so that we pioneer better long-distance experiences for the future.

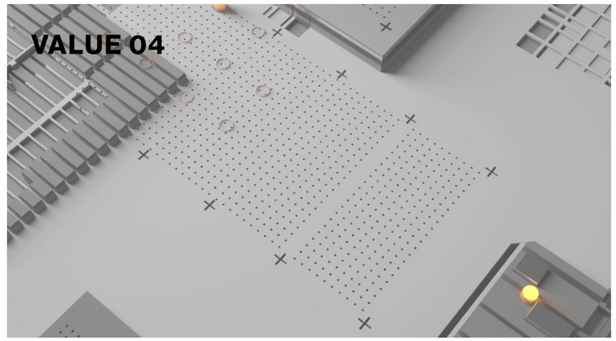
American Iconic asks us to make good design available to all, by exploring the notions of ease and comfort. It encourages us to focus on the essential, so that each part is necessary and contributing to the whole. It challenges us to be brave, to shoot for an iconicity that can inspire a new generation to choose ‘the best way to travel’.

HOME TO ALL

Amtrak long distance trains provide common ground. We create empathetic interiors that allow all Americans, no matter their ability, to ride with equal dignity and grace.

Our long distance trains create dynamic communities. To support these communities we consider the social function of our spaces, allowing privacy and peace where it’s needed - and conviviality where it is desired.

This approach encourages the serendipitous moments of connection that add joy to our on board experience. Whether passengers or crew, all are supported by our desire to travel with comfort and ease. Come on in!



WILDERNESS WITHIN

Whether it’s a private view from a roomette or a shared experience from coach, our Long Distance trains offer passengers a seat at one of the greatest shows on earth; the American landscape.

Wilderness Within reflects the awe that is kindled when seeing the American landscape gently slip by from dawn through to dusk. We find beauty in both the remarkable and the mundane moments, in the outskirts of cities and the rhythms of small town life. In the vastness of the Plains and the expansive Pacific Coast. In the low lying shadows of canyons and high treelined mountains.

We honour these landscapes by echoing their beauty onboard, and cherish them by taking a sustainable approach to design that ensures we do our bit to preserve and protect it for tomorrow.

READY FOR TOMORROW

Ready for Tomorrow represents our commitment to face the difficulties of tomorrow with grit and grace.

No matter the freezing lows of winter or the scorching highs of summer, we anticipate tomorrow so we can move forward with unwavering purpose.

Solid, safe and reassuring in challenging times, we build resilience into our rolling stock through adaptability. Designing our trains around pragmatic, robust and coherent systems that can be evolved over time.

HICH CAPACITY COACH (37" pitch) - 66 C / 1 MOB *2x DOORS

Option Car

Accessible path in accordance with equivalent facilitation

ENTRANCE WAYS

Our new trains extend a warm welcome to all passengers. Handholds are strategically placed to enhance stability as passengers move through the car and access their accommodations. The interior design is crafted to feel more like a hotel lobby, featuring a central light, wood finishes, and an open layout.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

SEAMLESS ACCESS

The vestibule is designed as an open and intuitive space. Soft corners and carefully crafted architecture guide natural passenger movement, supporting safe and efficient flow even at busy times. Seamless surfaces maintain visual clarity and simplify cleaning and maintenance. Carefully selected colors and materials introduce gentle contrast to enhance openness and aid navigation for visually impaired passengers. Vertical and horizontal handrails are integrated throughout, providing reassurance, accessibility, and support from the moment passengers step on board.

SLEEPER
HALLWAYS

Sleeper hallways are bright and open, with simple way-finding and clear room numbering. Each sleeper car also features a well-appointed beverage station offering coffee and fresh water.

COACH

The Heart of Our Journey

Our coach passengers are the heart of Amtrak's long-distance service. They are the driving force behind our mission to connect people across America. Their choice to ride with us fuels the journey that brings our nation closer together. We understand the importance of offering an affordable travel option while ensuring that our coach customers feel valued and appreciated.

The interior should be thoughtfully designed to reflect the significance of this market and should echo the value we place on their experience.

PREMIUM COACH

Elevating the Long-Distance Coach Experience

In response to the demand for elevated comfort on our long-distance trains, we proudly introduce 'Premium Coach.' Our customers are at the forefront of a new era in Amtrak's long-distance service. 'Premium Coach' represents an exciting step forward, designed to elevate our passengers' journey with spacious, larger seats, more space, fantastic views, and enhanced privacy. With 'Premium Coach,' our customers can expect the same fantastic features as in our standard coach, but with the added luxury of enhanced seating and increased space. Together, we embark on this journey, redefining long-distance travel with 'Premium Coach'.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

TRANQUIL SPACE

Premium Coach features a generous seat pitch that increases legroom and personal space. The 2 × 1 seating configuration allows for wider seats and a more comfortable passenger experience. Large headrest wings add privacy and support.

CRADLE COMFORT

Premium Coach seats recline to the renowned “Lazy Z” position, designed to enhance comfort. This ergonomic recline supports a more relaxed sitting and sleeping posture, making long journeys more comfortable for passengers.

26-FOI-00415 0000000627 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/10/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

FULLY EQUIPPED

The Premium Coach seat offers a high level of personalization, with an adjustable center console table and “Lazy Z” recline providing fully customizable seating positions. Practical features include a device holder, cup holders, USB, and power outlets for added comfort and convenience.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

THE LAZY Z

The “Lazy Z” position is designed to enhance comfort during long periods of sitting. In this position, the seat reclines to support the upper body while raising the knees, reducing pressure on the lower back and undersides of the legs. The result is a more ergonomic and comfortable posture for extended travel.

ROOMETTE

Setting the New Standard for a Classic Format

Introducing our revamped Roomettes for the new generation of long-distance travel. These classic accommodations have received a modern makeover, seamlessly blending the timeless comfort of leather seats with a contemporary aesthetic. As you step inside, you'll discover a private space designed for relaxation and rest, complete with the familiar format you know and love. Our upgraded Roomettes redefine the art of travel, providing an elevated experience that marries classic charm with a fresh, sophisticated style.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

HOME FROM HOME

Each space is designed to feel like a true home away from home. A carefully curated palette of inviting, high-quality materials such as wood, metal, and leather creates a warm and approachable tactility. Lighting is thoughtfully balanced to support both function and ambiance, resulting in environments that feel comfortable and enriching for passengers.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

BETTER BEDS

The seats are ergonomically designed with a contoured form, side bolsters, lumbar support, and adjustable headrests, optimized for daytime comfort. When converted to a lower berth, they form a fully flat surface for a restful night's sleep. The intuitive conversion allows passengers to easily switch between seating and sleeping configurations. Slide-down upper bunks provide additional accommodation for sharing and families.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 [illegible] "UNCLASSIFIED" 4/30/2026

IN ROOM STORAGE

Storage is thoughtfully integrated throughout the rooms, with discreet cabinets keeping the space uncluttered. Dedicated locations for carry-on luggage, including convenient storage beneath the seat, ensure belongings remain easily accessible while maintaining a calm, organised environment.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

AMTRAK

CLUB BEDROOM

Versatility in a New, Spacious Format

The Club Bedroom is a groundbreaking addition to our accommodation options.

This innovative format provides ample room for two passengers but with the added flexibility to comfortably sleep a family of four. With four seats that convert into a double bed and an additional slide down double bunk, the Club Bedroom ensures a restful journey for our customers seeking that little extra space and versatility.

Complete with an en-suite bathroom, vanity sink, and ample storage, this spacious bedroom represents the next level of travel comfort.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

CONVIVIAL SPACE

The Club Bedroom features two face-to-face sofas, creating a comfortable space for relaxation, conversation, or seating up to four passengers. With a double lower berth and a double upper bunk, it provides generous sleeping arrangements for two or a cosy option for families.

26-FOI-00415 000000006271 "UNCLASSIFIED" 4/30/2026

FEELING COMFORT

Enjoy exceptional comfort with wide seats, carefully designed with ergonomic precision and enhanced by plush cushioning for a supportive, contoured fit. Soft leather upholstery provides a refined finish that elevates the travel experience. Additional features include an extra-large table, multiple power outlets for personal devices, and convenient cup and bottle holders.

BETTER BATHROOMS

Our bedrooms feature well-appointed vanity areas, and the Club Bedroom includes a modern en-suite shower and toilet. Vanity units are equipped with mirrors, storage cabinets, and fresh towels. The bathrooms offer modern conveniences such as a large rain shower, separate shower handset, touch-less flush, and complimentary shower gel, shampoo, conditioner, and lotion.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

IN ROOM STORAGE

Storage is thoughtfully integrated throughout the room, making intelligent use of vertical height and otherwise unused spaces. Open storage cubbies built into sidewalls and corners provide convenient places for smaller personal items. Dedicated locations for carry-on luggage, including storage above the bathroom and beneath the seat, ensure belongings remain easily accessible.

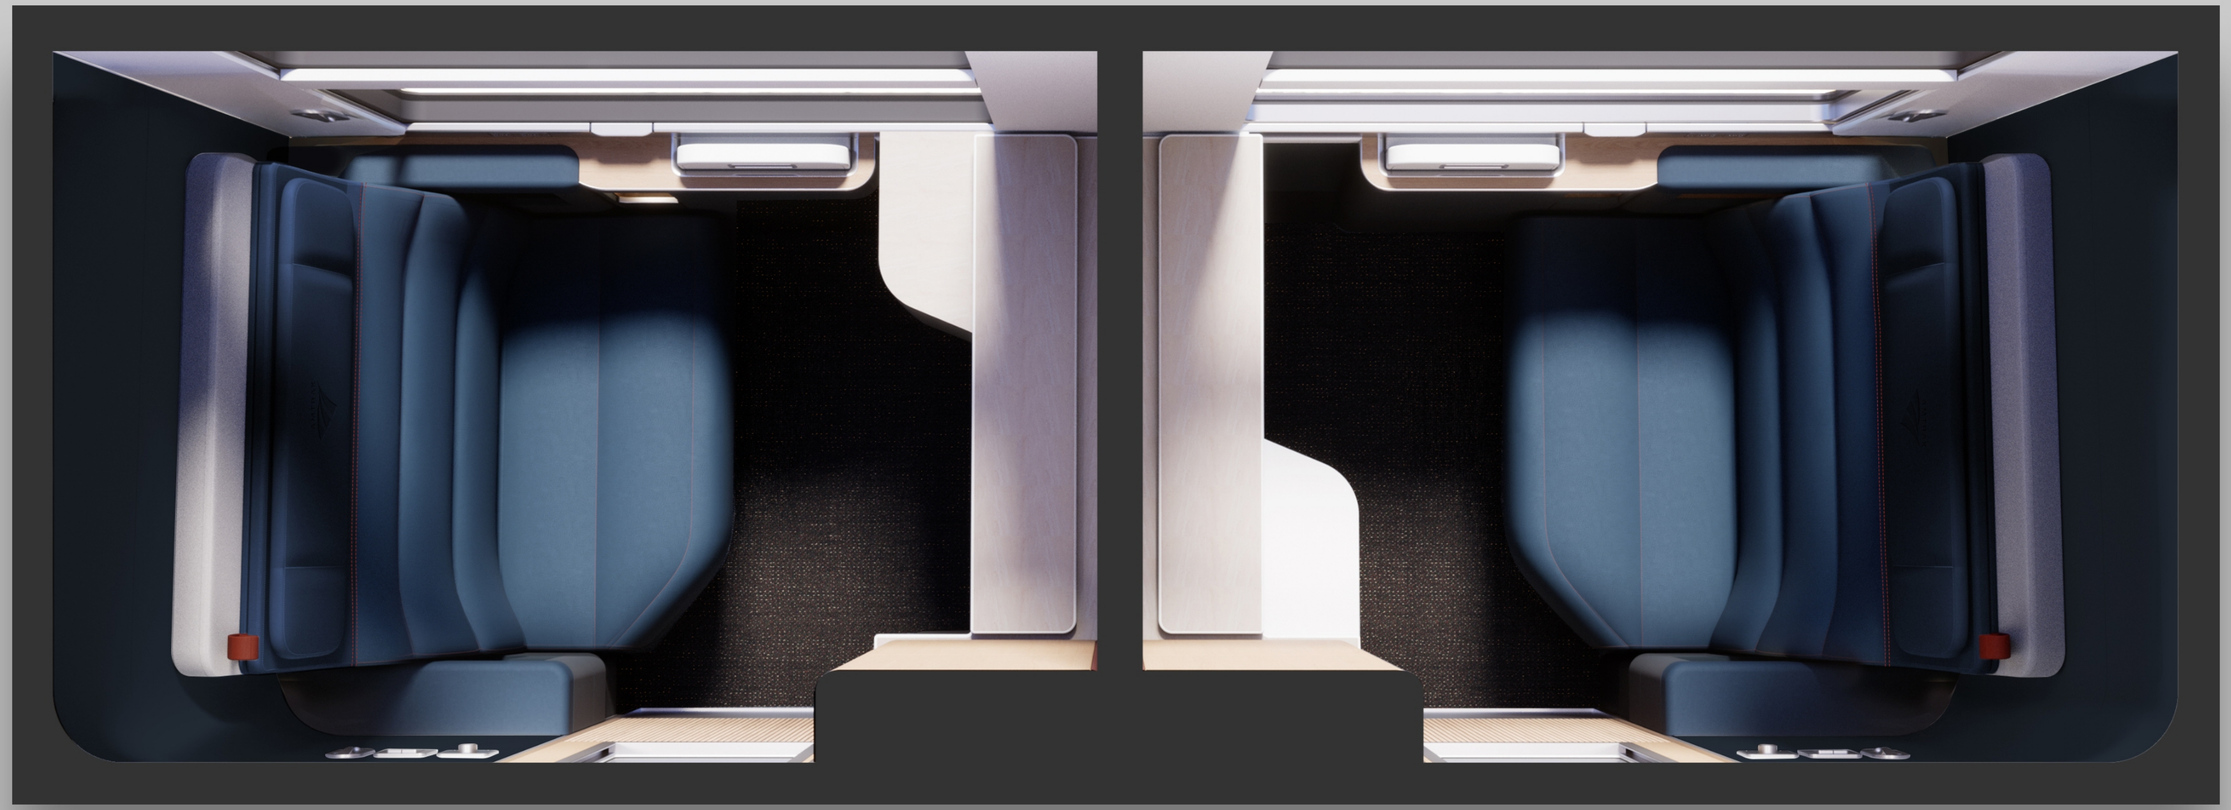
SOLOSUITE



Where Solo Comfort Meets Shared Adventures

Introducing 'SoloSuite,' our versatile accommodation designed to cater to the unique needs of solo travelers, with the flexibility to accommodate two passengers when desired. 'SoloSuite' offers a comfortable solo retreat with a spacious single bed and all the amenities and conveniences you'd expect from our bedrooms. For those seeking the companionship of a fellow traveler, ‘SoloSuite' can be transformed into a premium twin room, ideal for sharing.

With ‘SoloSuite,' passengers can enjoy the flexibility to choose between privacy and conviviality, ensuring a tailored travel experience.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

VISTA VIEWS

The bedrooms are centred around large windows that frame the passing landscape and bring the outside world into the room. The architecture and layout are designed to celebrate these views, keeping them at the heart of the experience. When desired, blinds can be deployed to soften daylight or provide complete privacy.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 0000006271 "UNCLASSIFIED" 4/30/2026

FLEXIBLE FORMAT

The room features a spacious seat and bed, with the layout centred on the experience of a single passenger. The design opens up the room's vertical space, creating a bright, airy atmosphere while allowing additional storage above. Dual windows further enhance the sense of light and openness. A central divider can open to connect two Solo Rooms, creating a distinctive suite with a spacious central table for shared activities or meals.

ACCESSIBLE BEDROOM

Comfort without Boundaries

Introducing the 'Accessible Bedroom', a fully inclusive accommodation designed to cater to passengers with diverse mobility needs. This spacious room features two beds, including a lower accessible double berth and an upper bunk, ensuring that everyone can enjoy a comfortable journey. In addition to all the standard amenities, the 'Accessible Bedroom' boasts an en suite accessible bathroom, providing convenience and comfort.

The room offers ample space for passengers who use wheelchairs to easily navigate and access all features, making it a welcoming and inclusive option for a diverse range of travellers.

A room meticulously designed with our passengers' needs in mind, ensuring that mobility and comfort are equally prioritized, resulting in an inclusive and welcoming space.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

BETTER BEDS

The beds have been carefully designed for flexibility and ease of use. The upper single berth provides comfort and safe access, with a flexible ladder and integrated handrails to support passengers climbing in and out. The lower double berth offers a spacious, accessible sleeping space that can be used in either orientation, with handrails on three sides and well-placed lighting to ensure confidence and comfort. Together, the arrangement balances accessibility, convenience, and a restful journey.

DINER

Traditional Dining, Timeless Delights

Continuing the tradition of Amtrak dining cars, our new long-distance trains offer the classic format with contemporary flair. Step aboard to savor freshly prepared meals against the backdrop of breathtaking scenery. In our dining cars, you'll embrace a communal spirit, sharing tables and stories with fellow travelers, making every journey unforgettable. As part of Amtrak's tradition, we provide a unique dining experience that enhances the magic of long-distance travel, turning your meal into a memorable voyage.

ACCESSIBLE FOR ALL

In the Diner, accessibility is paramount, allowing everyone to relax and enjoy its comforts. An accessible pathway, designed to accommodate passengers who use wheelchairs, extends throughout the entire diner car. Handholds on every booth provide stability for passengers as they navigate the car. Handrails seamlessly transition into the glass dividers which enhance the sense of security and privacy.

26-FOI-00415 00000006271 "UNCLAS

CURATED AMBIANCE

Curated lighting and skylight blinds are used to curate an ambiance that transforms throughout the day, creating an inviting, calm, and sophisticated atmosphere during daylight hours and transitioning seamlessly into an intimate, sumptuously cozy setting in the evening. A captivating and adaptable dining experience designed to kindle feelings of romance and indulgence as passengers dine with us. Our signature table and wall lamps add a touch of restaurant-like charm, ensuring a delightful dining experience tailored to your every need. We are committed to crafting memorable moments during every meal in our Diner car.

A TOUCH OF CLASS

Our dining cars are more than places to enjoy a great meal; they are a destination space that lives at the heart of the journey. The design of the diner on our new long-distance trains respects the heritage of these spaces with refined elegance, evoking a warm and inviting ambiance. Red booth seating symbolizing a first-class service and fostering a sense of warmth and connection. Bold blue accents in the table lamps add a contemporary touch, creating a timeless yet captivating atmosphere. Confident textural lines on seats, dividers, and window pillars break up the space, accentuate the height, and add a sense of grandeur to the interior architecture.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

CRAFTED MATERIALS

In our Diner, simplicity in form and construction allows us to prioritize premium materials and exceptional build quality. Our solid surface tables feature refined marble finishes, complemented by booth seating wrapped in rich wood veneers. These thoughtful choices not only enhance the ambiance but also ensure durability and comfort, reflecting our dedication to an elevated and dependable dining experience.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

DESIGNED FOR SERVICE

The Diner is designed to support efficient, premium at-seat service. A wide aisle allows crew to move easily through the car, while strategically placed service stations provide storage for cutlery, condiments, table service items, and waste. This allows crew to serve passengers smoothly and efficiently without unnecessary trips to the galley.

AMTRAK

LOUNGE

Where Tradition Meets Inclusivity

Inspired by Amtrak's iconic observation and lounge cars, the new long-distance trains introduce a modern lounge designed for passengers to connect, relax, and enjoy the journey. Expansive windows frame panoramic views, while the fully accessible layout creates an inclusive space for everyone. A beverage station provides a natural place to pause and socialize. The lounge continues the legacy of memorable journeys, bringing passengers together and celebrating the experience of travel.

THE SOCIAL HUB

The lounge offers a variety of seating settings designed to support different ways of using the space. Booth seating, long sofas, and open lounge areas allow passengers to choose between privacy and social interaction, while integrated power, coffee tables, and clear accessible pathways support comfort and convenience. The result is a welcoming, flexible environment where passengers can relax, connect, and enjoy the journey

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

HERO THE VIEW

In the lounge car, the view takes center stage. Expansive windows and skylights frame panoramic vistas of the American landscape, filling the space with natural light and a strong connection to the journey outside. The architecture and interior layout are carefully arranged to keep sightlines open, ensuring passengers can enjoy the scenery from every seat.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

A WELCOMING RETREAT

The lounge car is designed to transform throughout the journey. Natural light, adjustable blinds, and carefully balanced lighting shift the atmosphere from bright and open by day to warm and relaxed in the evening, creating a comfortable space to unwind, connect, or simply enjoy the view.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

CAFE

Savor the Journey

The Cafe is more than just a place to purchase refreshments; it's a destination for passengers to explore and unwind during their Amtrak long-distance journey.

Its welcoming, accessible counter, bold geometric design, and patterned wall finishes create a contemporary coffeehouse aesthetic.

Striking feature lights set the ambiance, while digital menu screens offer up-to-date information.

The thoughtful design ensures an attractive and passenger-friendly experience while maintaining an efficient space for the crew to work.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

CAFE
COUNTER

The café features a spacious open counter at an accessible height, creating a welcoming and passenger-friendly point of service. The counter is intentionally kept clear of equipment to support future food service options such as grab-and-go. Digital menu screens, positioned at queuing and point-of-purchase locations, connect to live data to provide up-to-date menus, promotions, and passenger information.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

OPTIZIMED OPERATION

The back-of-house design follows a forward-thinking, modular approach that allows equipment to be upgraded or reconfigured as service models evolve. Equipment is arranged to support efficient and safe staff operation.

Areas closest to passengers are designed with a premium aesthetic to support point-of-purchase sales. Visual merchandising and food displays are carefully positioned to highlight fresh, appetizing options.

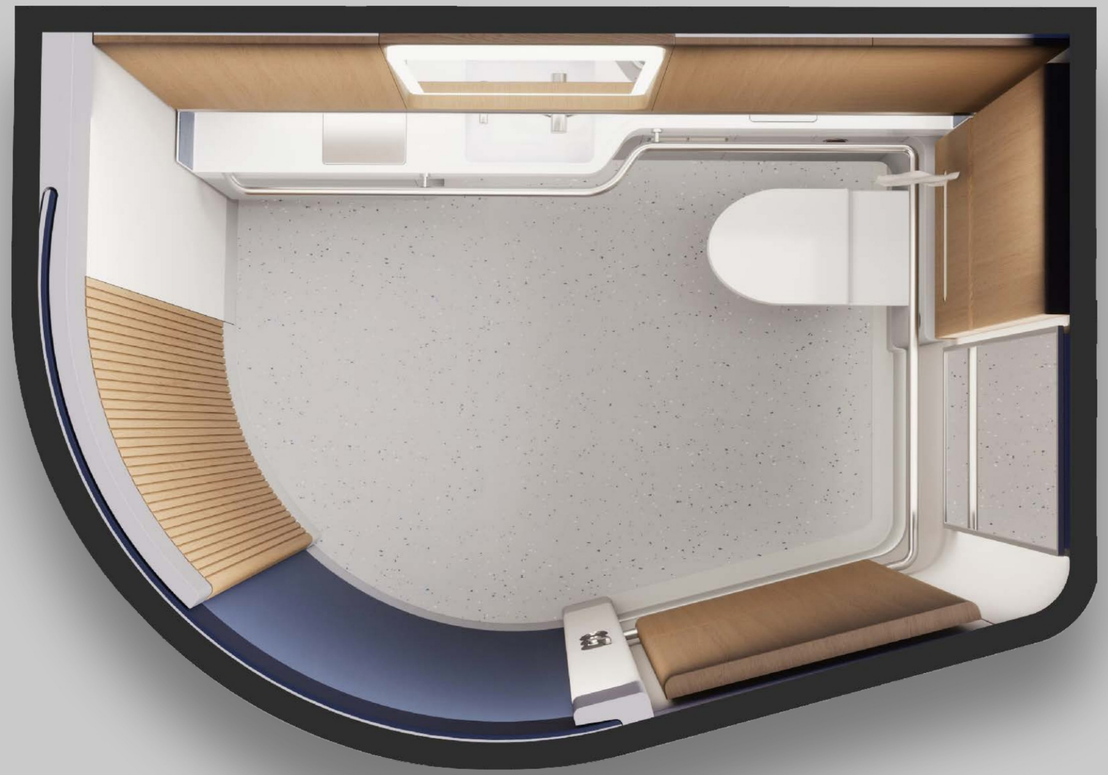
26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

EQUITABLE EXPERIENCE

The seating in the Cafe has been thoughtfully designed with premium finishes, mirroring the quality and comfort found in the Diner while also providing a fully accessible space. This means our coach customers can experience the same levels of luxury and relaxation while enjoying their journey without exceeding their budget.

26-FOI-00415 00000006271 "UNCLASSIFIED" 4/30/2026

TOILETS & SHOWERS



Ensuring Refreshing Comfort for Your Journey

A range of thoughtfully designed restrooms and showers have been designed on board to ensure that every passenger's needs are met with comfort and convenience. Our commitment to passenger satisfaction is reflected in the carefully curated design of each facility, ensuring a refreshing and comfortable experience throughout your journey.

AMTRAK

CREW QUARTERS

Where the Heartbeat of Amtrak Resides.

Recognizing the pivotal role our crew plays in ensuring a seamless travel experience, we've crafted crew car that is purpose-built for the extended periods our crew spends on our trains. Our new trains will boast a crew rest area equipped with crew lockers, seating and a kitchenette, creating a space specifically designed to prioritize their well-being.

At Amtrak, we value our crew, and our Crew Quarters reflect our commitment to their satisfaction and overall quality of life on the rails.

CREW REST

A designated crew rest area will provide a space for socializing, fostering camaraderie among staff, while a small private kitchen allows them to prepare meals and unwind during well-deserved breaks.

G.1 Overview

a). This statement of work details the scope of services to be provided by the Contractor under the Technical Support and Spares Supply Agreement ("TSSSA").

b). The TSSSA includes Technical Support for all maintenance activities as well as materials management and supply, including but not limited to procurement, inventory planning, delivery, and quality assurance.

c). The TSSSA requires the Contractor to support Amtrak's implementation of the Maintenance Plan provided as part of the provision of the Universal Single Level Equipment.

d). The Contractor shall have dedicated TSSSA personnel in attendance at all design reviews to provide input from a maintainability and reliability perspective.

e). A Responsibility Matrix is provided in Appendix A summarizing the breakdown of responsibilities between Amtrak and Contractor with respect to TSSSA and maintenance tasks. Additional responsibilities may be listed throughout the Statement of Work and TSSSA.

G.2 Definitions

a). General

i). Capitalized terms used in this Statement of Work without definition shall have the meaning ascribed to them in this section or in the General Provisions in Exhibit A-1.

ii). Certain additional capitalized terms may be defined elsewhere in the TSSSA Contract or Equipment Contract documents.

iii). Capitalized terms that are defined in the TSSSA Contract and/or Equipment Contract documents shall have their plain meaning or usage unless the context indicates otherwise.

iv). Unless the context otherwise requires, the singular shall include the plural, and the masculine gender shall include the feminine and neuter genders and vice versa.

v). Definitions are as follows:

(1) **"Active Equipment"** shall mean a Car, or Spare for which Amtrak has issued either a Certificate of Acceptance or Conditional Acceptance under the terms of the Equipment Contract and made available for Revenue Service, and that is not Inactive Equipment.

(2) "**Amtrak Depot**" or "**Depot**" shall mean an Amtrak facility where maintenance is performed, and Material is provided, as shown in Section G.10.

(3) "**Amtrak Enroute Depot**" shall mean an Amtrak site or host facility where inspection, Turn-around Service and cleaning takes place and where consumable and regularly consumed Materials are stocked.

(4) "**Amtrak Terminal Depot**" shall mean an Amtrak maintenance site or facility where inspection, Scheduled and Unscheduled Maintenance, heavy repair, and Material stocking takes place.

(5) "**Annual Maintenance Schedule**" shall mean that portion of the Life-Cycle Maintenance Schedule that represents all maintenance activities by Car, Depot and date that are intended to be conducted on the Equipment for the applicable calendar year as noted in Section G.6.

(6) "**Annual Service Payment**" shall mean the amount paid or payable to the Contractor under the TSSSA in a one (1) year period.

(7) "**Bad-order Awaiting Material**" or "**BAM**" shall mean the Equipment status condition used in Amtrak's enterprise asset management system to describe the occurrence when, due to lack of Material, work cannot be completed or progressed. "**Car**" or "**Cars**" shall mean the railroad passenger Cars to be provided by the Contractor pursuant to the Equipment Contract.

(8) "**Car Held for Material**" or "**CHFM**" has that meaning ascribed to it in Section G.11

(9) "**Component Overhaul**" shall mean the inspection, cleaning, servicing, and application of new parts or remanufactured parts where deemed appropriate to Material to bring it to a new or like new state for use on the Equipment.

(10) "**Consumable Material**" shall mean consumable or expendable items of Material, as identified by part number and description by Contractor and agreed to by Amtrak.

(11) "**Contract**" or "**Equipment Contract**" means the entire agreement between Amtrak and the Contractor for the manufacture and supply of new Cars, Spare Vehicles, and other related supplies.

(12) "**Contractor**" means the individual, entity, or authorized representative of same, identified as such in the Contract.

(13) "**Data**" shall include the records of all Equipment maintenance activities but not limited to:

(a) Car status by date, location, mileage, hours, cycles, or condition as recorded by Car monitoring devices;

(b) Material requests where the time periods for the Material requests and receipts are to be measured to evaluate CHFM;

(c) Failures evaluated under Failure – Type I, Failure – Type II, Failure – Type III, and Failure Type IV;

(d) Other information that may be required to monitor, enhance, or improve the performance of the Equipment, the TSSSA Contract, and/or the Equipment Contract.

(14) "**Degradation of Capabilities**" shall mean when a system or component operates or functions below its design criteria.

(15) **"Equipment"** means any physical device that is part of the Car or Spare Vehicle and/or is the object of maintenance actions. Equipment may also refer to one or more of the Cars and/or Spare Vehicles.

(16) "**Equipment Specification**" shall mean the Amtrak Universal Single Level Fleet Replacement Technical Specification #1139 for the Cars.

(17) "**Excluded Matter Damage**" means, other than due to normal wear and tear, any damage to or breakage of a Car, Equipment, Spare, Material or other Supplies, which is principally caused by:

(a) the occurrence of a Force Majeure Event;

(b) improper use;

(c) vandalism, collision or accidental damage while the Equipment is not under the control of Contractor, or any of its Subcontractors, suppliers, employees, agents or representatives acting in such capacity, other than:

(i) any such event for which Contractor or any of its Subcontractors, suppliers, employees, agents, representatives or any entity or individual acting on Contractor's behalf is directly responsible; or

(ii) where such event has not been repaired by Contractor pursuant to an obligation it has to so repair the damage caused by such event under this Agreement or the Equipment Contract, including without limitation, pursuant to a Change Order;

(d) the negligence or willful misconduct of Amtrak; or the Failure of Amtrak to maintain the Equipment in accordance with the agreed upon Maintenance Plan.

(18) **"Failure"** means that the Equipment or a unit thereof, a component, or other supplies, instructions, Technical Support, software, or any service supplied by Contractor or Contractor Party under the Contract or the TSSSA did not comply with the requirements or specifications or violated any applicable law, did not perform as designed or its intended purpose or the use to which it was put, or if a service, was improperly delayed or omitted, in all such cases, whether in consequence of faulty

design, faulty Materials, poor workmanship, improper handling, security, storage or installation, negligence, willful misconduct or strict liability, or other errors or omissions or for any other reason attributable to the Contractor.

(19) **"Failure – Type I"** shall mean a Failure that results in either one of below:

(a) A Car being Unfit for Revenue Service within one (1) hour of the scheduled departure due to but not limited to a trainline failure resulting in loss of train line communications or power transmission resulting in Amtrak making modifications to a scheduled consist to operate the train in Revenue Service, or a Car causing an en-route delay of the Revenue Service train more than sixty (60) minutes at a scheduled departure or arrival at any scheduled station, or a failure requiring a Car to be removed from the train consist en-route.

(b) A loss of fifty percent (50%) or more of food service in any of the food service cars due to equipment failure that results in a loss of food storage, refrigeration, cooking, increased meal prep times and/or food delivery, etc.

(c) The loss of the water and/or waste system in a Car during Revenue Service and/or the loss of any restroom in a Car during Revenue Service.

(d) The loss of one (1) HVAC unit in a Car during Revenue Service.

(e) The loss of 50% of any one passenger amenity in any Car type (i.e. convenience outlets, etc.). A list of all amenities will be determined prior to Contract Award.

(f) The failure of the Passenger Emergency Intercom (PEI) or Public Address/Intercom (PAIC) system in any Car.

If vehicle options are exercised, this failure type will be updated and revised to reflect the unique components associated with those cars.

(20) **"Failure – Type II"** shall mean a Failure that results in:

(a) A Car being Unfit for Revenue Service within four (4) hours of the scheduled departure due to but not limited to a trainline failure resulting in loss of train line communications or power transmission resulting in Amtrak needing to make modifications to a scheduled consist, or a Car causing an en-route delay of the Revenue Service train of less than sixty (60) minutes but more than fifteen (15) minutes of a scheduled departure or arrival at any scheduled station.

(b) The failure or impacted operation of any door that adversely affects boarding and/or alighting, passenger comfort and/or any passenger or crew accommodations.

(c) The loss of any passenger amenity including but not limited to, lighting, seating, etc. that affects ten percent (10%) or more of the seating capacity in that given Car.

(d) The loss of wayfinding capabilities in a Car during Revenue Service, i.e., any passenger information screen.

(e) The loss of connectivity in a Car during Revenue Service due to a defect or failure of Contractor supplied Material. The Contractor won't be held responsible for the following interruptions due to failures out of its control (I.E. network provider Failure, network coverage, weather, geographic factors, tunnels) but must provide evidence of the failure when out of their control.

If vehicle options are exercised, the Failure type will be updated and revised to reflect the unique components associated with those cars.

(21) **"Failure – Type III"** shall mean a Failure that results in an actual repair time that exceeds one-half (0.5) labor hour and does not meet the criteria of a Type I or a Type II Failure. Type III Failures constitute Unscheduled Maintenance and can typically be repaired without causing delay to the scheduled departure or arrival of a Car or requiring the movement of the Car to a repair track or facility. I.E. cabinet latch, drawer slide, display screen not fully illuminated, loose trim, etc. not causing a safety issue.

(a) If component design has redundancy built-in, and the component still performs as intended no performance guarantee shall be assessed. The failed component shall be repaired during the next maintenance event.

(22) "Failure - Type IV" shall mean any Failure that leads to a train being annulled or unable to be placed in Revenue Service.

(23) "**Fleet**" means all Cars and Spare Vehicles ordered under the Contract, including all options for additional Cars or Spare Vehicles exercised.

(24) "**Fleet Modification Program**" or "**FMP**" shall mean the corrective action requested by Amtrak to address a fleet defect and shall have that meaning ascribed to it in Section G.15.

(25) "**Fragmented Continuous Maintenance**" shall mean a maintenance and inspection approach utilizing shorter regularly scheduled intervals to perform all maintenance requirements. These maintenance activities shall be a comprehensive set of all maintenance requirements including but not limited to those normally captured under preventive, predictive,

life-cycle or condition-based maintenance, mileage based, time based, or regulatory requirements.

(26) "**Inactive Equipment**" shall mean a Car, or Spare that Amtrak has removed from coverage under the TSSSA Contract in accordance with Section G.4. and not reinstated in accordance with Section G.4.

(27) "**Job Analysis**" shall mean the detailed examination of the tasks that make up a job or work, the conditions under which the job is to be performed, standard labor hours it takes to perform the job, and what the job requires in terms of knowledge, skills and training of an employee. In addition, the Job Analysis defines what procedures, Materials, tools and infrastructure are required to perform the job or work.

(28) "**Life-cycle Maintenance Schedule**" shall mean the mutually agreed upon baseline schedule described in Section G.4. for maintenance activities including component or system overhaul events required to maintain the Equipment to Contractor's specifications over the design life of the Equipment. This schedule shall be included as part of the Maintenance Plan.

(29) "**Line Replaceable Unit**" or "**LRU**" shall mean an essential support item which is removed and replaced at the field level or operating location to quickly return the Car or Spare Vehicle to an operationally ready condition.

(30) "**Line Replaceable Unit List**" or "**LRU List**" shall mean that list described in Section G.10.

(31) "**Maintenance Plan**" shall mean the comprehensive plan which includes all activities, schedules, and documentation recommended by Contractor and/or required by regulatory agencies or Amtrak to maintain, inspect, and restore the Cars and/or Spare Vehicles and to maintain intended design function over the design life of the Equipment.

(a) The Maintenance Plan shall be a detailed documented process describing all Scheduled Maintenance and corrective maintenance activities that are required for the Equipment throughout its life.

(b) It shall include, among other things, the Annual Maintenance Schedule and the Life-Cycle Maintenance Schedule. It shall be reviewed and approved on an annual basis against the performance of the Equipment.

(32) **"Material"** shall mean spare parts, supplies, Equipment, components, Material for Minor Debris Damage, and Consumable Material for use on the Car and/or Spare Vehicles supplied by Contractor, excluding special tools, test equipment or fixtures.

(33) **"Measurement Period"** shall mean the one hundred eighty-three (183) days period commencing on the date that Amtrak issues a Certificate of Conditional Acceptance to Contractor for the first Car and subsequent one hundred eighty-three (183) days period thereafter until the end of the TSSSA Contract term. Amtrak may elect to reestablish the start of the Measurement Period to align with the start of Amtrak' s fiscal year. If after the end of the last full Measurement Period there is less than one hundred eighty-three (183) days remaining until the end of the TSSSA Contract term, the Measurement Period shall be however much time remains under the TSSSA Contract.

(34) "**Minor Debris Damage**" shall mean damage to a unit of Equipment as a result of striking debris along the railway. This damage is mild in that repairs can be made relatively quickly with simple tools. Materials, including but not limited to: ladders, grab irons, angle cocks, gangways, diaphragms, light assemblies, windows, hoses, cables, display screens and other exterior components which are susceptible to Minor Debris Damage.

(35) "**Mobilization Plan**" shall have the meaning ascribed to it in Section G.4. of this TSSSA Statement of Work.

(36) **"Modification**" means any variation, modification or addition to the Equipment Contract.

(37) "**Non-Rotable Material**" shall mean Material that is expendable after use because it is not economically viable to rebuild or overhaul the item.

(38) "**Original Equipment Manufacturer**" or "**OEM**" shall mean a company that produces parts and equipment that may be marketed by another manufacturer.

(39) "**Passenger Amenity**" shall mean a feature or service provided to enhance the comfort, convenience, and overall experience of passengers while they are traveling. These amenities include things like comfortable seating, sleeping facilities, Wi-Fi, refreshments and entertainment options.

(40) "**Performance Guarantee**" shall have that meaning ascribed to it in Section G.11.

(41) "**Performance Incentive**" shall have that meaning ascribed to it in Section G.11.

(42) "**Project Manager**" shall mean the individual assigned by Contractor to supervise Contractor's Work hereunder and serve as Amtrak's point of contact for the resolution of issues.

(43) "**Quality Gates**" shall mean a collection of completion criteria and testing standards representing the satisfactory execution of a Scheduled or Unscheduled Maintenance activity.

(44) "**Reusable Shipping Container**" shall mean the containers that are used to issue Rotatable Material to Amtrak.

(45) "**Revenue Service**" means the time when a unit of Equipment is available to the general public and there is a reasonable expectation of carrying passengers that either directly pay fares, are subsidized by public policy, or provide payment through some contractual arrangement. Equipment operated in fare free service are considered in Revenue Service.

(46) "**Rotable Materia**l" shall mean Material that can be rebuilt, remanufactured or overhauled and restored to a fully serviceable condition (same form, fit and function). Rotable materials will include high cost / long lead time items typically associated with Capital Spares (i.e.: complete truck assemblies, gangway assemblies, couplers, etc.) and shall be pre-positioned at geographic locations to support Amtrak service and maintenance needs. Rotable Material stocking levels shall be submitted to Amtrak for review and approval, and shall include levels to address unplanned maintenance events, such as defects, accidents/damage, etc.

(47) "**Scheduled Maintenance**" shall mean the preventive or predictive maintenance required by Amtrak, the Equipment Contractor, or the Code of Federal Regulations (CFR). Scheduled Maintenance can also describe the corrective repairs or inspections for deteriorating conditions identified from diagnostic data and predictive analytics, provided they are identified no less than 48 hours prior to the need for maintenance. The Scheduled Maintenance activities are listed in the Maintenance Plan.

(48) "**Scheduled Trip**" shall mean a scheduled train trip from start to finish.

(49) "**Service Price**" shall mean dollars paid monthly to Contractor for the work performed under this Statement of Work.

(50) "**Spare Vehicle**" means either a Vehicle purchased under the Equipment Contract as a spare or a Vehicle purchased under the Contract but not in operation.

(51) "TSSSA" shall mean Technical Support and Spares Supply Agreement or means the agreement entered into between Amtrak and Contractor for the provision of technical support and spares.

(52) "**TSSSA Contract**" shall mean Contract No. TBD for the technical support and spares supply for the Equipment between Amtrak and Contractor dated as of TBD.

(53) "**Technical Support**" shall mean the provision of those services set forth in Section G.9 and any other activities agreed to by Amtrak and Contractor.

(54) "**Transition Period**" shall mean the timeframe one hundred and eighty (180) days prior to the termination of the TSSSA Contract, where the Contractor will be responsible for turning over all of the necessary information, Materials, technical guidance and assistance to ensure that Amtrak's ability to effectively manage and ensure service operation of the Fleet is not negatively impacted.

(55) "**Turnaround Service**" shall mean the calendar day inspections, Scheduled Maintenance, resolution of minor repairs, and cleaning designed to support the Car for the duration of travel.

(56) "**Unfit for Revenue Service**" shall mean a Car is unable to operate from the terminal depot and/or deliver the level of Revenue Service for which it was designed.

(57) "**Unscheduled Maintenance**" shall mean those unpredictable maintenance requirements or activities that were not previously planned or programmed, but require prompt attention and must be added to, integrated with or substituted for previously scheduled workloads. This includes, but is not limited to, maintenance that restores operability to the Equipment that is performed after a Failure, defect or problem emerges in Equipment.

(58) **"Vehicle"** means the same as Car.

(59) **"Warranty Period"** shall have the meaning ascribed to it in the General Provisions in Exhibit A-1.

(60) **"Work Instructions"** shall mean step by step instructions on how each maintenance activity or work is to be completed as noted in Section G.6. Each Work Instruction shall be contained in a single comprehensive document, subject to Amtrak approval.

(61) **"Work Management System"** or "**WMS"** shall mean the Amtrak enterprise asset management (EAM) system to create, track, document, and archive Work Orders and Work Order Templates for the Amtrak Fleet. In the event Amtrak intends to change its work management system, Amtrak shall provide notice to Contractor and provide the appropriate training to Contractor personnel. The term shall be used interchangeably with enterprise asset management system.

(62) **"Work Order"** shall mean one or more work request(s) initiated with a completed EAM Jobplan that has/have been launched through the Enterprise Asset Management system as noted in Section G.6.

(63) **"Work Order Template"** shall mean a EAM Jobplan that, once filled in and completed with all the required Job Analysis outputs such as maintenance scope, safety hazards and mitigations, tools, bill of Material including part numbers, labor requirements, WBS Elements (if and when provided by Amtrak), and Work Instructions for the completion of an maintenance activity or combination of maintenance

activities, allows the creation of an executable Work Order as noted in Section G.6.

G.3 Coordination with Equipment Contract

a). The Management Teams for the Equipment and the TSSSA contracts shall both be overseen by a single Fleet Director.

b). The Fleet Director shall be maintained through the delivery of the final piece of equipment on the base Equipment contract.

c). The Fleet Director shall attend, at a minimum, all monthly status meetings.

d). The Equipment and TSSSA Teams shall present to Amtrak as a single entity with conflicting priorities between the groups never impacting the progress of the program as a whole.

e). The Fleet Director shall ensure that both teams are working cohesively optimizing system reliability and transitioning to TSSSA technical services.

i). The Fleet Director shall ensure TSSSA Technical staff are in attendance at Design Review meetings to ensure long-term maintenance concerns are considered.

ii). The Fleet Director shall ensure that the TSSSA technical services personnel have extensive experience gained through the production of the Equipment Contract.

G.4 Mobilization

a). Mobilization Activities

i). Within one (1) year after NTP of the TSSSA Contract, the Contractor and Amtrak shall hold a kick-off meeting to discuss the expectations of the Mobilization plan and mobilization process in general.

ii). Three (3) years prior to the scheduled Conditional Acceptance of the first car, Contractor shall develop and submit a Preliminary Mobilization Plan per Section G.4. for review and approval by Amtrak**. [CDRL G-01]**

iii). No less than two (2) years prior to the scheduled Conditional Acceptance of the first Car, Contractor and Amtrak shall hold an Interim mobilization meeting. **[CDRL G-02]**

(1) Thirty (30) days prior to the interim mobilization meeting, the Contractor shall develop and submit to Amtrak an agenda and a recommended list of participants for both parties. **[CDRL G-03]**

(2) At that time, the Contractor shall also submit any documentation expected to be reviewed at the meeting.

iv). One (1) year prior to the scheduled Conditional Acceptance of the first Car being delivered to Amtrak, Contractor shall submit the Maintenance Plan required by Section G.4. **[CDRL G-04]**

v). Thirty (30) days prior to the scheduled delivery of the first Car to Amtrak, Contractor shall stock all Amtrak Terminal Depot warehouse sites and Enroute Depot locations with sufficient Material needed to support the agreed upon Maintenance Plan. **[CDRL G-05]**

vi). Unless otherwise agreed to by Amtrak, Contractor shall staff all sites as shown in Section G.10 and Figure G-1 prior to delivery of the first Car.

vii). Contractor is required to make seamless transition to TSSSA coverage and provide staffing levels as described in Section G.5.

b). Mobilization Plan

i). The Mobilization Plan shall be a single, comprehensive, cohesive document which details the path from NTP to initiation of TSSSA services.

ii). The Mobilization Plan shall include all the assumptions made by the Contractor for its development.

iii). The Mobilization Plan shall be submitted to Amtrak in three phases:

(1) Three (3) years prior to the scheduled Conditional Acceptance of the first car, the Contractor shall submit a Preliminary Mobilization Plan. **[CDRL G-01]**

(a) The plan shall include the Contractor's assumptions and plan to progress from that point until the initiation of service.

(b) The plan shall include all steps, working groups and activities projected to achieve TSSSA mobilization.

(c) After the submission of the Preliminary Mobilization Plan, the Contractor and Amtrak shall initiate meetings and working sessions to collaboratively help the Contractor to progress Mobilization and refine the plan.

(2) No later than two (2) years prior to the scheduled Conditional Acceptance of the first Car, the Contractor shall resubmit an interim Mobilization Plan **[CDRL G-02]** that includes progress towards the initiation of services.

(a) The Interim Mobilization Plan shall include additional detail with regard to staffing levels, training schedules, Material quantities and procurement status, LRU lists and the Maintenance Plan.

(b) The Interim Mobilization Plan shall include a detailed training schedule and regimen that outlines how the Contractor intends to develop the technical support team. This training plan shall

include, at a minimum, the training courses, hours for each course, internal shadowing with the production floor, and review of all FMI. The training plan needs to include hands on training with similar products provided by the Contractor.

(3) No later than one (1) year prior to the scheduled Conditional Acceptance of the first Car, the Contractor shall resubmit the Final Mobilization Plan **[CDRL G-06]** which would include details of LRU and Material stocking quantities, the comprehensive Maintenance Plan, detailed training scheduled and all other maintenance information necessary to initiate service.

iv). The Mobilization Plan shall include all information required by the Contractor from Amtrak and the meetings and schedule to obtain that information.

v). The Mobilization Plan shall present a roadmap of the assumptions made and processes necessary to prepare for the development and completion of all that is required for the delivery of TSSSA services.

vi). The Mobilization Plan shall include, at a minimum, the following elements:

(1) A descriptive plan which presents and details the process for the mobilization of personnel, processes, procedures, Material and equipment necessary for the provision of TSSSA services.

(2) A comprehensive schedule including milestones, decision points, working sessions, meetings, procurements, design reviews, hiring, training and testing of systems and processes.

(3) The schedule shall be a chronological representation of all the required activities detailed in the balance of the Mobilization Plan.

(4) The Mobilization Plan shall include the discussion on how the Contractor shall address and/or implement the following elements and criteria as they impact the initiation of TSSSA services.

(5) Depot Site Visits – A presentation of when the Contractor would like to schedule a visit(s) to each of the Maintenance Depots applicable to this contract. The plan should also include what the Contractor would like to see and who should be made available during those visits.

(6) Car delivery – A presentation of the impact of the Car delivery schedule on the mobilization of the TSSSA services including:

(a) Monitoring the delivery schedule by the TSSSA Team.

(b) Addressing changes to the delivery schedule in the TSSSA mobilization schedule.

(c) Assumptions made which tie the delivery schedule to key activities in TSSSA mobilization.

(7) Car Deployment Plan – A presentation of the plan to support the implementation and deployment of the equipment, especially for each Car and at each Depot.

(8) TSSSA Staffing Plan – The plan for the mobilization of staffing to support the TSSSA services.

(a) The Staffing Plan shall detail the strategic process which shall enable the Contractor to understand and engage the number and types of employees necessary to provide the TSSSA services.

(b) The staffing plan shall include:

(i) Recruiting

(ii) Training

(iii) Scheduling

(9) Training Plan – shall include all requirements for training both Contractor personnel and Amtrak employees. The training plan will outline the process for regular updates and assessments that are intended to define when, where and who should be getting training.

(10) Materials – The plan for the identification, procurement and availability of Materials required to support the TSSSA services.

(11) Communication Plan – The plan to develop and implement the communication processes and procedures necessary to meet the relevant requirements of the TSSSA contract.

(12) Data management systems deployment – The plan to develop and implement the servers and software that will support the remote monitoring of the safety critical components and alert Amtrak.

(a) In addition to presenting the technical and functional description of the various components that make up the system, it shall detail the planned process to achieve full operation to support the deployment of the pilot equipment.

(13) Maintenance Plan – Details the plan for the development of the maintenance plan to ensure its completion and implementation on a schedule to support Car deployment.

(a) The Maintenance plan shall include all task plans and related documentation needed for all Scheduled and Unscheduled Maintenance.

(14) Maintenance/Reliability/Availability tracking – Details the approach on how the Contractor will track equipment reliability, availability, and maintainability targets, as required by the TSSSA contract. The plan will

also include the process to have those mechanisms in place and operation in support of the deployment of the equipment.

(15) Diagnostic & remote maintenance monitoring – Details the approach on how the Contractor will perform diagnostics and remote monitoring as required by the TSSSA contract. The plan will also include to process planned to have those alert mechanisms when it's out of tolerance by segregating the alerts and data/predictive analysis plan on fixing equipment.

(a) This plan will outline the methods and resources that will be deployed by the Contractor to incorporate progressive proactive means for identifying when maintenance should be planned to eliminate line of road Failures.

(16) Warehousing and logistic arrangements shall include the plan to develop and implement the following activities and processes:

(a) Material handling processes (requests, receipts, deliveries)

(b) Material Quarantine

(c) Storage Procedures

(d) Tracking Procedures

(i) Identification of hazardous material and handling procedures

(e) Material Management shall also include the following information:

(i) Material inventory list

(ii) A list of Rotable Material

(iii) A list of Reusable Shipping Containers that are expected to be returned

(iv) Space required for Material and personnel at each site.

(17) Data and information sharing interfaces and processes – Shall detail the planned information sharing as well as the plan to develop, test and implement all required interfaces prior to the deployment of the equipment.

(a) Integrations to provide the visibility, trackability, liability and accountability of inventory to both Amtrak and Contractor of what has been stocked, received, requested and consumed. Maintenance of the asset will be handled in Amtrak EAM system by Amtrak/Contractor Technician

(18) Life-cycle Maintenance Schedule, to be updated sixty (60) days prior to the agreed upon date for the delivery of the first production unit of each Car type and then updated annually as part of the Maintenance Plan.

c). Document Control

i). Amtrak shall use its Document Management System (DMS) as the documentation control system for the TSSSA program.

(1) While the Contractor may opt to use its own document control system internally, it shall use the DMS when submitting documents and contract letters to Amtrak and shall adhere to the processes inherent to that system.

(2) During the course of the TSSSA program, Amtrak will have the right to transition to a different documentation management program.

ii). The Contractor shall be responsible for the development of the following TSSSA documents. These documents shall be submitted to Amtrak for review and acceptance. The documents shall be reviewed, revised and resubmitted to Amtrak at least annually.

(1) Maintenance Plan

(2) Repair/Maintenance Procedures

(3) Work Instructions or task plans

(4) Illustrated Parts Catalog

(5) Communication and TSSSA Process Plan

(6) TSSSA Staffing Plan

(a) Three (3) years prior to the scheduled Conditional Acceptance of the first car, the Contractor shall develop and submit to Amtrak a list of defined roles, responsibilities, and reporting structures (organization chart) for the Team Leads and team personnel required for the TSSSA. **[CDRL G-07]**

(i) This list shall be subsequently incorporated into the Contractor's Staffing Plan.

(ii) The Contractor's Team Leads shall develop the Mobilization Plan and schedule to detail and present the goals and milestones necessary through the mobilization process.

(iii) Requested changes to Contractor's TSSSA leads and key staff must be submitted to Amtrak for review and approval. Amtrak, at its sole discretion, may reject proposed key staff.

d). Mobilization Status Review

i). Contractor shall develop and submit to Amtrak for review and acceptance, a written progress report at least monthly. **[CDRL G-08]**

(1) The written report shall describe the activities and progress since the last report, schedule adherence, risks and mitigations, challenges and upcoming major activities.

(2) The monthly report shall be accompanied by a current version of the TSSSA mobilization schedule.

e). Management of Cars and Spare Vehicles

i). Removal of Cars and Spare Vehicles

(1) Within three hundred sixty-five (365) days of execution of the TSSSA Contract, Amtrak and Contractor shall meet to discuss and develop a process for removing and reinstating Equipment that includes terms which are consistent with the TSSSA Contract and this scope of work.

(2) Upon written notice to Contractor, Amtrak may, at its sole discretion, reduce the number of Active Equipment for which the Contractor is obligated to perform the Work under this TSSSA Contract.

(a) Amtrak shall notify the Contractor by written notice specifying the Car(s) or Spare Vehicle(s) affected.

(b) Cars or Spare Vehicles shall only be considered removed from active status if the duration of inactive is at least thirty (30) consecutive days and inactive status shall last as long as determined by the Contracting Official, in his or her sole discretion.

(c) Upon removal of a Car or Spare Vehicle, Contractor shall not be required to perform any of the services covered under this TSSSA Contract, nor shall Contractor be subject to any associated Performance Guarantees or Incentives under this TSSSA Contract, with respect to such Inactive Equipment while it is removed.

(d) Amtrak shall have no further obligation to pay for the services covered under this TSSSA Contract with respect to such Inactive Equipment while it is removed from the first day of the Equipment being removed, which may have occurred up to sixty (60) days preceding the notice.

(e) For any Car or Spare Vehicle removed from service, the Scheduled Maintenance interval(s) shall be adjusted in accordance with the time removed from service.

(f) The associated Annual Maintenance Schedule and Life-Cycle Maintenance Schedule shall be updated accordingly as part of the Maintenance Plan.

(g) At no time is the Contractor permitted to remove any part, component or system from any Inactive Equipment, without the written permission of the COTR. Any item removed will be tracked by the Contractor in the Amtrak System of record and shall be replaced with a new part, component or system as soon as practicable.

ii). Reinstatement of Cars or Spare Vehicles

(1) Amtrak shall have the right, at its sole discretion, to reinstate Inactive Equipment removed from service by giving written notice to the Contractor.

(2) Upon reentry into service, the Contractor shall re-initiate the Work required under this TSSSA Contract on the affected Equipment

(3) The Car shall again be considered Active Equipment.

(4) Prior to the re-initiation of work performed under this TSSSA Contract for any Car or Spare Vehicle previously removed from service, the Contractor and Amtrak shall conduct a joint inspection solely for the purpose of determining the Equipment's state of repair.

(5) If Scheduled Maintenance events are required, then the Parties shall adjust the schedule for Scheduled Maintenance events to add such Cars or Spare Vehicles previously removed from service and shall schedule such events accordingly.

(6) Material for any such events shall be covered under the TSSSA Contract.

(a) If the joint inspection determines that additional Materials are required due to improper adherence by Amtrak to the Contractor's storage guidelines and conditions as included in the accepted maintenance manuals, Amtrak will cover the cost of the Material, and the schedule shall be adjusted accordingly. Contractor's storage guidelines and conditions shall be submitted during design review for Amtrak review and approval.

(7) In addition, upon reinstatement of a Car or Spare Vehicle, the Parties shall meet to discuss whether any changes to the Annual Maintenance Schedule are appropriate.

(8) As directed by Amtrak, Contractor shall make any applicable modifications and submit a revised Annual Maintenance Schedule to Amtrak.

(9) Upon re-instatement of the Car or Spare Vehicle, Contractor shall be eligible to receive a one-time cost adjustment to cover needs for Scheduled Maintenance for such reinstated Car or Spare Vehicle.

(10) Within thirty (30) days of such reinstatement or as otherwise agreed to by Amtrak, Contractor shall submit its claim for a one- time cost adjustment with such supporting documentation as may be requested by Amtrak.

(11) Amtrak shall review Contractor's claim and make a determination as soon as practical.

(12) Amtrak shall pay the agreed upon one-time adjustment in accordance with the payment terms in the TSSSA Contract.

(13) If the parties are unable to agree to the one-time adjustment, it shall be considered a dispute and resolved in accordance with the Claims and Disputes provision of the terms and conditions of the TSSSA Contract.

G.5 Project Management and Staffing

a). Organizational Structure

i). Contractor shall provide a dedicated TSSSA Project Management Team to manage the TSSSA.

ii). Key Personnel shall be designated in accordance with Article 10 of the General Provisions in Exhibit A-1, Contractor Key Personnel, of the General Provisions of the TSSSA Contract.

iii). The Project Management Team shall be fully staffed and trained during mobilization to perform the functions described in this section.

iv). Responsibilities will include:

(1) Coordinating all logistics;

(2) Providing management for all aspects of the TSSSA;

(3) Quality assurance and management of all quality requirements;

(4) Management and deployment of engineering and Technical Support; and

(5) Oversight of Materials management.

b). Contractor Personnel and Personnel Change Requests

i). Contractor shall employ competent and qualified personnel that meet the minimum requirements outlined in the TSSSA Contract and satisfy Contractor's obligations set forth herein.

ii). Contractor shall staff its Technical Support team with qualified personnel that includes specialized engineering and maintenance experts having design experience of the Car as well as a strong maintenance background. All Contractor Technical Support personnel shall be qualified through the technical training plan that as outlined in this document.

iii). The Contractor shall develop its staffing plan to achieve a continuity of personnel from the Car design, production and testing phases of the project through Technical Support to be provided under the TSSSA.

iv). All personnel identified by the Contractor in the TSSSA Program Management and Staffing Plan shall work full time (at least 40-hours/week) and be fully dedicated to this TSSSA Contract.

(1) For example, Contractor may need to extend work schedule to continue supporting an Unscheduled Maintenance event.

v). Staff hourly schedules and relief days shall be flexible to meet the operational needs of Amtrak. The staffing plan and schedule will be updated as necessary and shared with Amtrak no less than monthly.

vi). Contractor shall ensure that all Contractor personnel work in a collaborative and professional manner with Amtrak staff.

vii). As set forth in the General Provisions of the TSSSA Contract, Amtrak has the right to require Contractor to replace any employee, including Key Personnel.

c). TSSSA Program Management and Staffing Plan

i). Three (3) years prior to the scheduled Conditional Acceptance of the first car and as part of the Mobilization Plan, the Contractor shall submit a detailed TSSSA Program Management and Staffing Plan to Amtrak for its review and approval. **[CDRL G-09]**

(1) All Terminal depots are staffed 24/7.

ii). This plan shall demonstrate sufficient staffing and management for the management and delivery of TSSSA services including operations, Material Management, quality, engineering, and technical support.

(1) During performance of the TSSSA, Contractor shall ensure that each of these areas have dedicated personnel to adequately manage and supervise the assigned Contractor personnel.

iii). Contractor’s Program Management and Staffing Plan shall be developed based on the Amtrak Terminal Depots and Enroute Depots defined in this Statement of Work.

iv). The specific staffing levels for each location will be determined after the number of Cars at each location has been finalized (i.e., at the time of Notice to Proceed).

d). Technical Support

i). The Contractor will supply support technicians as outlined in Section G.5. These technicians will offer on-site support at each of Amtrak's Terminal Depots, as specified in Section G.10 and in accordance with the TSSSA Scope of Work.

ii). These on-site support technicians will support Amtrak maintenance employees in developing their skills in fault finding and fault rectification and conduct fault finding on complex faults.

iii). During the Mobilization Phase and through the initial Car acceptance, the on-going training for Amtrak maintenance staff will primarily be delivered through the on-site support technicians who will be at the disposal of Amtrak to investigate any Car Failures, incidents and accidents, including derailments, anywhere on the Amtrak system.

iv). The Contractor shall also provide around the clock, uninterrupted Technical Support coverage at Amtrak's CNOC Help Desk and remotely to all Amtrak Enroute Depots as detailed in Section G.10.

e). Material Management

i). Under this TSSSA, the Contractor is responsible for Material Management.

ii). The Contractor shall use Material and maintenance projections developed as part of the Car design and testing process to plan Material needs.

iii). The Contractor will fulfill these Material needs by finding and qualifying sources for existing or replacement Materials as necessary and procuring Materials from these suppliers.

(1) Planning and stocking shall be based on the resource availability and demand.

iv). Contractor will arrange for Materials to be shipped to and from suppliers as necessary for use and repair or overhaul and will coordinate with Amtrak the different warehouse locations for the project.

v). The Contractor will arrange to ship Material to the Amtrak managed Amtrak Terminal Depot warehouse space allocated at each site in addition to any required off-site Contractor managed sites.

vi). Amtrak Enroute Depot Materials shall be located in storage containers at each site or Amtrak approved alternative. The Contractor shall be responsible for managing, maintaining and all costs associated with the storage containers

(1) En-route depots typically have select shifts when personnel are present on site that correspond with train arrival/departure at each location. The Contractor will be responsible for material logistics and will work with Amtrak's material control when necessary.

vii). Contractor will coordinate with Amtrak and manage all aspects of Material Management and report to the Project Manager.

viii). The Materials group will consist of dedicated resources.

ix). Any Material repairs and overhauls that will not be performed by suppliers will be performed by Contractor at a Contractor's off-site location, unless otherwise approved by Amtrak.

x). The Contractor's Materials Management responsibilities shall include:

(1) Provide daily written reports to Amtrak describing any Material issues affecting Scheduled or Unscheduled Maintenance.

(2) Provide monthly written reports to Amtrak summarizing the performance statistics (e.g. on time delivery), showing trends and driving improvement actions.

(3) Manage the forecast and execution of the Material supply process and to interface with Contractor's organization.

(4) Ensure Material kits are in stock at the Amtrak warehouses and ready to disperse to Amtrak maintenance technicians as required.

(5) Manage and adjust Material inventory and stocking locations based on the analysis of service Failures and on-board diagnostic and monitoring systems for Scheduled and Unscheduled Maintenance.

(6) Manage and control the availability of Materials between Contractor's warehouse and the identified Amtrak Terminal Depots and Enroute Depots.

(7) Interface with supplier quality assurance and manage warranty activities.

(8) Investigation into root cause analysis for all component Failures not within 5% of the end of their scheduled replacement.

(a) Root cause analysis reports shall be completed and submitted to Amtrak within 60 days of the Failure.

(9) Any other report as determined by Amtrak as necessary to ensure delivery of the TSSSA.

(10) Creation of Amtrak part numbers for all Material within Amtrak's SAP system.

xi). Warehousing and Materials Handling

(1) Contractor's personnel assigned for Materials handling at each Amtrak Terminal Depot will coordinate with Amtrak to manage the flow of Materials in/out of Amtrak managed warehouse.

(2) Incoming Materials will be received by Amtrak at the Amtrak Terminal Depots and moved by Amtrak to storage locations based on size, shape, immediacy of need, and any special storage requirements.

(3) As Work Order requests come in or Contractor identifies need for Material from the planners, software, or technicians, Contractor's warehousing and Materials handling personnel will create maintenance kits as required for each day's maintenance tasks and coordinate with Amtrak to draw the necessary Material from the Amtrak warehouse or from Contractor maintained off-site storage.

xii). The Contractor's Maintenance Planning Personnel will be responsible for all maintenance planning activities which shall include the following:

(1) Conduct the initial screening of incoming incidents and Work Orders

(2) Identify scope and analysis of required level of planning

(3) Create Work Orders based on Scheduled and Unscheduled Maintenance

(4) Identify specific safety hazards that may be encountered in the performance of the proposed work

(5) Estimate required hours of work for Work Order tasks

(6) Determine work duration and skills required to perform the tasks

(7) Determine and incorporate QA/QC requirements on jobs

(8) Review work procedures and make recommendations where required

(9) Determine and communicate to stores department the Material required to perform the work, as well as delivery time and location

(10) Coordinate and set priorities with the Amtrak team(s) placing emphasis on obtaining the input of the operations personnel in the setting of priorities

(11) Ensure all Work Orders and maintenance log items are closed properly when work is finished. The maintenance planner shall be the first line of support for the Consolidated National Operations Center (CNOC) Mechanical desk

xiii). Scheduled Heavy Repair

(1) Scheduled heavy repair refers to the Contractor's unit exchange and component exchange of spare or replacement Material as defined in the Maintenance Plan.

(2) Under the unit exchange and component exchange process, Material may be exchanged with a new or rebuilt Material, while the removed

Material is either overhauled/repaired off of the Equipment or sent back to a supplier for refurbishment or replacement.

(3) It is expected that the majority of the Fragmented Continuous Maintenance Activities are developed to be performed within the anticipated eight (8) hours of maintenance touch time that the Cars will see.

(a) Any exceptions must be clearly detailed within the Maintenance Plan and included in the schedules for the Annual Maintenance Schedule and the Life-Cycle Maintenance Schedule.

(4) For planning purposes, eight (8) hours of touch time at an Amtrak Terminal Depot shall be made available for maintenance on a jointly agreed upon periodicity.

(a) Any Scheduled Maintenance activities that require a Car to be set out longer than eight (8) hours shall be clearly identified by the Contractor and incorporated into the Annual Maintenance Schedule and Life-Cycle Maintenance Schedule as part of the Maintenance Plan.

(b) Amtrak shall attempt to allow for 8-12 hours of touch time for maintenance and planning purposes, however, for the intent of this contract only 3.5-8 hours should be planned for maintenance work depending on the deployment of the equipment.

(5) Contractor’s personnel are responsible for coordinating with Amtrak prior to the scheduled heavy repair work on the Equipment and Materials, as well as working with suppliers to perform system and component repairs and overhauls that cannot be performed by the Contractor on site.

(6) Spares/Components shall be tracked by position and serial number. All locations for all parts shall be identified by the Contractor. The subcomponent should provide any structure that may have an impact on the replacement of any part.

(7) Contractor’s personnel will coordinate with Amtrak and work with Contractor’s engineering and technical support personnel to manage the on- and off-train scheduled heavy repair work required by the Maintenance Plan.

(8) The Contractor will manage external Material repair and overhaul work, including work performed off-site at Contractor’s supplier’s site. In conjunction with the engineering team, Contractor will review supplier technical specifications, repair times, and monitor quality of performance.

(9) In anticipation of the scheduled heavy repair work, Contractor will identify specific location(s) subject to Amtrak approval and assign a

specific team dedicated to scheduled heavy repair activities and to design, industrialize, and perform the scheduled heavy repair work.

G.6 Maintenance Information Management

a). Contractor's Maintenance Information Management

i). Contractor will advise Amtrak about the Maintenance Plan and that will be set in Amtrak's EAM for the frequency of Scheduled Maintenance.

ii). Contractor shall utilize Amtrak's EAM system while ensuring a detailed method of managing all relevant maintenance information is available. The method and additional system that is employed may include an integrated database which is synchronized and interfaced with Amtrak's own system Amtrak's EAM will be used to record all maintenance activities, Material movements and any updates to existing documentation.

iii). The Maintenance information management shall include all aspects of the Maintenance Plans and information that comes in from technicians, inspection, monitoring, diagnostic system, and Fragmented Continuous Maintenance work.

iv). Contractor will provide access to the web-based portal for all data, KPI's and reliability reports along with Failures.

v). All documentation produced and used by Contractor throughout the project will be in the American English language.

vi). All information technology firmware and in some cases versions of the software to be tracked by the Contractor, and data shall fully comply with Amtrak Universal Single Level Fleet Replacement Technical Specification #1139.

vii). Contractor shall ensure that the maintenance information includes the following:

(1) The necessary information to monitor and report on the reliability and maintainability of all parts of the Equipment

(2) Work performed by part number, individual serialized part number, and child and parent pointers to facilitate detailed root cause analysis

(3) Updates to technical documentation and an archival system that allows for the retrieval of information.

(4) Detail sufficient to allow planners to monitor and plan maintenance activities and verify that maintenance policies are applied. This includes organization definition, activity planning, work distribution, activity prioritization, finished task recording, and workflow management.

(5) Amtrak and the Contractor shall have access to technical data related to the maintenance of the Equipment through Amtrak's EAM system.

Facilitate the operation of the Work Management System, including interfaces with field tablets.

(6) Monitor the current and long-term health of on-board digital systems and digital control systems via on-board monitoring through a link with Contractor's diagnostic and monitoring database, and a data repository of condition-based monitoring results

(7) Based on the severity of the event, to be defined by Amtrak, faults should be sent to Amtrak's EAM system for further analysis and technician to troubleshoot through data lake.

(8) Obtain a high level of economic performance through optimization of economic flows and capital mobilization (i.e., sourcing, orders and delivery, logistics and storage levels)

(9) Provide consolidated information regarding the maintenance activity through required performances follow-up and production reporting

(10) Include secure back-up storage for all data and documentation

(11) Interface with Contractor's diagnostic and monitoring system(s) to enable the gathering and recording of data for analysis. Both raw and curated data to handle the data analysis and predictive analysis shall be provided.

(12) Predictive models must be sent to Amtrak data lake to support data analysis on Amtrak agreed upon intervals and integration formats.

b). Maintenance Management

i). Contractor shall update the Maintenance Plan using Amtrak's EAM system.

ii). Work Order execution by Amtrak will occur in Amtrak's enterprise asset management platform which will provide workers with a consistent user interface to simplify training and avoid complexity with multiple sets of technology in each shop.

iii). Contractor will utilize a Fragmented Continuous Maintenance approach and real- time monitoring devices on the Cars to provide information to its own developed system.

(1) Contractor shall use real-time data gathered through remote diagnostics and monitoring to anticipate and predict the maintenance needs, ensuring that the required maintenance support is accomplished quickly and effectively. The intent is also to provide the useful life of the asset along with any reliable measurements of diagnostics.

iv). For some components and systems where the continuous, running monitoring of diagnostic and monitoring systems is not practical, other methods will be used to support the Fragmented Continuous Maintenance.

(1) This may include performing regular testing before, during, and after the anticipated Failure date of a component.

(2) This regular testing detects components that are at risk of failing prematurely and prevents costly components from being replaced or overhauled too early or too late in their individual life cycles, thereby optimizing both performance and availability of the Cars.

c). Implementation

i). The maintenance, operation, and Materials personnel will utilize the Amtrak approved Material information system and work management system utilizing its data to provide the following service deliverables:

(1) Scheduled Maintenance including Fragmented Continuous Maintenance and spares supply for guaranteed performance of the system

(2) Unscheduled Maintenance and spares supply to rectify any Failures

(3) Scheduled heavy repair services using a Fragmented Continuous Maintenance approach to manage traditional overhaul requirements while reducing the need for long Vehicle down-time preventive maintenance.

ii). Detailed feedback from all Failures especially in service will be recorded in Contractor's information system to analyze the Failure occurrence, determine root causes, and prevent repeated Failures. Updated to the LRU lists may be necessary during this analysis.

(1) In the event of a major incidents and Failures, the Contractor shall be required to perform detailed inquiries and develop and submit written reports.

(a) Details of the report contents to be mutually agreed during mobilization.

(b) This feedback will additionally be provided to Amtrak in approved electronic formats.

iii). As maintenance work is scheduled or performed, relevant information about the work performed will be recorded in Amtrak's EAM system and moved via electronic interface to Contractor's system.

iv). Corrective actions shall be documented beginning with the issuance of a Work Order but can also be submitted by Contractor Help Desk personnel.

(1) The data entry and reporting shall not conflict with Amtrak's enterprise asset management system.

(2) Amtrak's enterprise asset management system shall be considered the master system of record.

d). Maintenance Planning

i). Contractor shall work collaboratively with Amtrak's planners to ensure that both Scheduled and Unscheduled Maintenance activities are forecasted in a way to optimize maintenance and increase reliability and availability without affecting scheduled Revenue Service.

(1) Maintenance planning shall optimize Equipment availability within the limits of staff and resource constraints.

(2) Additional details pertaining to Fragmented Continuous Maintenance activities are detailed in Section G.6.

ii). Contractor's Fragmented Continuous Maintenance schedule, which may include mileage or time- based maintenance activities, shall be coordinated with Amtrak.

iii). Individual Car diagrams/schedules shall be optimized to level-load the maintenance requirements of the overall Fleet while ensuring that the scheduled Amtrak Revenue Service is met.

e). Maintenance Plan

i). The Contractor shall develop and submit to Amtrak for review and approval a comprehensive Maintenance Plan. **[part of CDRL G-04]**

ii). The Maintenance Plan shall be updated and submitted annually for review and approval.

iii). The Maintenance Plan shall include all activities, schedules, and documentation required by Contractor, regulatory agencies and Amtrak to maintain, inspect, and restore the Equipment to maintain intended design function over the design life of the Equipment.

iv). The Maintenance Plan shall be a detailed documented process describing all Scheduled Maintenance activities that are required for the Equipment throughout its life and must be reviewed and approved on an annual basis against the performance of the Equipment.

v). The Maintenance Plan shall include the frequency and duration of each activity required and provide a scheduling tool to demonstrate how the Equipment will be maintained throughout the life of the project.

vi). The list of activities shall be considered an all-encompassing and complete list of every inspection, testing, and maintenance requirement.

vii). The Maintenance Plan must incorporate all regulatory inspections, Amtrak procedures, Amtrak Mechanical Bulletins and guidance from Contractor, related to the reliability and safety of the Equipment.

viii). The Maintenance Plan shall include the submittal of the Life-Cycle Maintenance Schedule and Annual Maintenance Schedule(s) per Section G.4.

ix). The Maintenance Plan shall fulfill all requirements of 49 CFR 238.107.

x). The Maintenance Plan development and updates are to be the responsibility of Contractor and are subject to approval by Amtrak.

xi). The Maintenance Plan shall include:

(1) All Material/systems identified for a duration of twenty (20) years or the life of the TSSSA Contract, whichever is longer.

(2) Logistic efforts to ensure the Material is available to schedule as jointly agreed upon.

(3) Investment in and management of spares pool required to support the Fragmented Continuous Maintenance approach and the Life-Cycle Maintenance and Annual Maintenance Schedules.

(4) Coordination with suppliers, engineering and regulatory authorities to research and support continuous efforts at extending the maintenance periods without compromising safety or reliability.

(5) Joint determination of quality expectations, controls, inspections or tests to apply to equipment before Contractor acceptance back into Material pool.

(6) An agreeable re-commissioning process at the conclusion of the TSSSA Contract to ensure state of good repair.

(7) Detailed description of Inspection procedure, intervals and criteria.

(8) Detailed test procedures and intervals

(9) Scheduled preventive maintenance intervals

(10) Detailed maintenance procedures

(11) Detailed description of special testing equipment or measuring devices required to perform inspections and tests. Calibration of these devices shall be the responsibility of the Contractor.

xii). For the purposes of planning, the Contractor shall include in the Maintenance Plan and all submittals of maintenance schedules any anticipated changes in Amtrak labor requirements exceeding ten percent (10%).

(1) Contractor shall notify Amtrak of these changes no less than one hundred eighty (180) days prior to the anticipated start date.

(2) For the purposes of level-loading labor and Material supply, the Contractor shall make every attempt to minimize extreme variations in maintenance activity.

xiii). Fragmented Continuous Maintenance

(1) The Contractor shall support Amtrak's Fragmented Continuous Maintenance philosophy for the Cars.

(2) The Contractor's Maintenance Plan shall address the intervals and requirements to support the Fragmented Continuous Maintenance of the Cars, Spare Vehicles, systems, and Materials throughout the design life of the Equipment.

(3) Three and a half (3.5) hours for NEC Operation and Eight (8) hours for Long Distance operation of touch time at an Amtrak Terminal Depot shall be made available for maintenance on a jointly agreed upon periodicity. Any Scheduled Maintenance activities that require a Car to be set out longer shall be clearly identified by the Contractor and incorporated into the Annual Maintenance Schedule and Life-Cycle Maintenance Schedule as part of the Maintenance Plan.

(4) The majority of the Fragmented Continuous Maintenance Activities shall be developed to be performed within the anticipated three and a half (3.5) hours for NEC Operation and eight (8) hours for Long Distance operation of maintenance touch time that the Car will see.

(a) Any exceptions must be clearly detailed within the Maintenance Plan.

(5) It is the intention for both parties to optimize, expand, and extend the maintenance intervals in order to maximize availability, yet not impact the overall Car performance or reliability.

(a) The Contractor shall employ the use of diagnostic monitoring and predictive maintenance analysis, discussions, agreements and appropriate field test analysis to ensure changes to maintenance practices are appropriate and taking the associated risks into account.

(b) Amtrak is open to the concept of sharing documented cost savings that can be realized over the course of the TSSSA as defined in Section G.14.

xiv). Life Cycle Maintenance Schedule

(1) Contractor shall develop and submit to Amtrak for review and approval a Life-cycle Maintenance Schedule **[CDRL G-10]** listing of all Fragmented Continuous Maintenance activities including component or system overhaul events required to maintain the Equipment to Contractor's specifications.

(a) The Life-cycle Maintenance Schedule shall list the maintenance support requirements, maintenance activity, note whether it is a regulatory requirement, the maintenance interval in years which is the frequency or periodicity of when the maintenance activity should occur, the amount of Material or kits (maintenance activities), the number of the times the maintenance activity should be performed, for the life of the Equipment, maintenance activity task time, specialized tooling, and facility requirements (i.e. crane, drop table).

(2) The Life-cycle Maintenance Schedule shall address the time period from the delivery of the first Car to the end of the design life of the Equipment.

xv). Annual Maintenance Schedule **[CDRL G-11]**

(1) The Annual Maintenance Schedule represents the schedule of the maintenance activities that, barring unforeseen circumstances, will actually be conducted on the Equipment for the applicable calendar year as a subset of the Maintenance Plan activities.

(2) The initial Annual Maintenance Schedule shall be developed and submitted to Amtrak as part of the Maintenance Plan.

(3) At least ninety (90) days prior to the end of each Amtrak fiscal year or as otherwise agreed to by Amtrak, the Contractor shall provide the 12-month look-ahead schedule which includes all Scheduled Maintenance, inspection, and overhaul activities for the subsequent calendar year by Equipment, depot and date along with required purchase order requests.

(4) This Annual Maintenance Schedule shall be included as part of the Maintenance Plan.

xvi). Annual Maintenance Schedule Change Proposal

(1) Contractor or Amtrak may propose schedule changes which improve performance, reduce maintenance, and/or minimize out of service time.

(a) These changes shall be considered pursuant to Section G.14.

(b) It is possible that during the course of performing Unscheduled Maintenance, Material on Equipment that is scheduled for an upcoming maintenance activity may be replaced.

(i) The parties shall meet and discuss whether the maintenance activity still needs to take place given the recent replacement under the TSSSA Contract.

(ii) To the extent the parties do not agree, the parties shall utilize the communication process set forth in Section G.13.

xvii). Work Orders/Job plans

(1) Contractor shall develop a Work Order Template for each maintenance activity which will be launched through Amtrak's Enterprise Asset Management system to create Work Orders. The Job plan shall include, at a minimum, the following types of information:

(a) Description

(b) Safety Hazards and Mitigations

(c) Detailed Work Instructions

(d) Labor Requirements

(e) Planned Material

(f) Planned Tools

(g) Measurements (if needed to be recorded by technician)

(h) Maintenance Activity Periodicity

(i) Quality Gates

(2) A sample Work Order Template has been provided in Appendix C; however, it should be viewed as reference only.

xviii). Work Instructions

(1) Contractor shall be responsible for delivering single, independent, Work Instructions for Amtrak to validate.

(a) These Work Instructions should be delivered to Amtrak in an electronic format via a standard interface.

(b) A sample Work Instruction has been provided in Appendix D.

(2) Each regularly scheduled maintenance activity in Contractor’s Maintenance Plan shall have an associated detailed Work Instruction, which shall be subject to Amtrak review and approval.

(a) Each Work Instruction shall be contained in a single comprehensive document and shall include associated drawings, schematics, and a bill of materials that may be required in execution of the work.

(b) For clarity, the Contractor shall not simply provide cross references to other documents or section thereof. The text of the reference should be included in the Work Instruction.

(c) Amtrak is responsible for executing the work, including trouble shooting for corrective interventions.

(d) Contractor will station skilled on-site support technicians at each maintenance Depot to support the Amtrak staff.

(e) Contractor support may include physical assistance with technical repairs.

(f) Amtrak will remove and replace Material.

f). Work Order Entry to Enterprise Asset Management System

i). Amtrak considers the creation and entry into the enterprise asset management system of Work Orders for maintenance activities critical to the success of this TSSSA Contract.

ii). Contractor shall submit all Work Order Templates **[CDRL G-12]** to Amtrak.

(1) The Contractor and Amtrak will validate the Work Order Templates, and any necessary changes will be made at that time.

(2) After obtaining Amtrak approval, Contractor shall create Work Orders in Amtrak's EAM.

(3) Amtrak shall provide the proper accounting WBS Elements for each Work Order.

iii). Up-to-date and correct Work Orders are of vital importance to Amtrak's operations, as out-of-date or incorrect Work Orders can result in additional labor costs, backlog of maintenance tasks, and unnecessary operational challenges.

(1) The Contractor shall use due diligence and best efforts to ensure that all Work Orders are updated, revised, or corrected as appropriate or as the need arises.

(2) If Contractor fails to update, revise, or correct a Work Order(s), Contractor shall notify Amtrak in writing as soon as possible. Contractor shall then exercise best efforts to promptly update, revise, or correct the Work Order so that the Work Order can be completed as scheduled or as soon thereafter as reasonably possible.

g). Work Order Execution

i). Once the Work Order is generated, Contractor shall assist Amtrak in identifying the Material required for the task and issuing a Material request to the warehouse. Amtrak will pull the necessary Material from stock, if available, and issue the Material to Amtrak for resolution of the maintenance task.

h). Remote Diagnostics and Predictive Analytics

i). In order to provide predictive analysis to enable scheduling necessary maintenance activities and avoiding potential Unscheduled Maintenance

work, Contractor will implement a plan for gathering and interpreting remote diagnostic information from the Equipment.

(1) The plan shall include monitoring of all equipment that reports to the Central Diagnostics Unit, i.e. batteries, HVAC, refrigeration, water & waste, lighting etc.

ii). The Equipment will have all diagnostics reported out to a centralized database and will be available for viewing remotely as well as provided in an approved electronic interface to Amtrak's back-office system in near real time.

(1) This information will allow the maintainers and engineers to receive real time information from the Equipment in service.

iii). Contractor shall provide details of its remote diagnostic and monitoring system and capabilities to Amtrak for its review and approval as part of the design review process for the Equipment.

(1) The system shall also allow the Help Desk representatives to assist the on-board crew in recovering a defective Car, and to also facilitate the planning of Unscheduled Maintenance to eliminate surprises during daily inspections or other Scheduled Maintenance.

iv). The diagnostic data from the Equipment will be remotely shared with Amtrak in near real time through an agreed-upon interface, at no cost between Amtrak and Contractor.

(1) The system will be used to parse the Contractor data that is shared with Amtrak into useful information in making decisions or recommendations about maintenance, utilization, and troubleshooting.

(2) All information generated from the Equipment as well as any derived data from the system will be freely shared with Amtrak.

(3) The Contractor shall develop a summary report of all faults and Failures on a trend analysis basis and the resulting recommended predictive maintenance for the fleet.

(a) Report shall be submitted to Amtrak on a monthly basis and discussed at the monthly meeting.

(4) The Contractor shall provide a dedicated resource to evaluate diagnostic data.

v). The predictive software system must be capable of precise pattern recognition and statistical confidence levels that will be used to assess risks and identify early-onset conditions that are either abnormal or precursors to Failure.

(1) When a Failure occurs, Contractor's system must generate a Failure signature that is immediately shared and compared with other fleets of the same type to prevent similar instances from occurring.

(2) The system must be continuously monitored and updated by Contractor to detect the onset of Failures by utilizing feedback and recommendations from industry experts, analyzing Work Orders for trends, or performing advanced analytics.

vi). When predicting potential Failures, the indication will require the leading indicators, data values, and an accurate time to Failure to allow operating personnel sufficient time to mitigate the issue(s) in advance.

(1) If a potential Failure or undesired condition exists that requires corrective attention, an Amtrak Work Order shall be generated and shall incorporate a severity code such as “Critical: Immediate Repair” or “Abnormal: Address Next Scheduled Shopping.”

(2) The predictive system must have a comprehensive set of views and dashboards that present real time health monitoring information and runtime statistics.

(3) If any signature patterns have been created and verified, the system will allow the pattern to be monitored “live” and compared to historical data as well as other beneficial diagnostics mutually agreed to by the parties.

(4) Contractor’s predictive system and health monitoring shall identify signature patterns and detect repeated signature patterns for analysis, provide predictive Failure trends, and allow potential design improvements to improve reliability.

vii). The comprehensive diagnostic exchange must allow for both Contractor and Amtrak hardware and software expansion.

i). Data Collection

i). Contractor shall be responsible for collecting storing and sharing all Equipment related fault reporting, diagnostics, maintenance records, and technical documentation relating to maintenance activities.

ii). Through review and manipulation of the captured data, Contractor’s engineers will use the information to drive the continuous improvement activities required in Maintenance Plan.

(1) Key outputs of this activity are used to support continuous reliability growth activities and to refine the Maintenance Plan.

(2) The data collected by Contractor shall define and record the configuration of the Cars, Spare Vehicle(s), sub-systems and components.

iii). At Amtrak's discretion the technical documentation will be housed in Amtrak's distributed document management system, or an Amtrak approved Contractor server and will be populated with relevant technical support information that is generated for the life of the Equipment Contract.

(1) This information will be updated or supplemented by any new technical support information that is developed during the execution of the TSSSA Contract.

(2) As new information is produced by Contractor or its subcontractors, Contractor will upload the information to the technical documentation and notify Amtrak of the change. All additions or changes to the technical documentation will be recorded.

iv). An index of all technical documentation will be developed in the form of an electronic catalog. This catalog will be delivered to Amtrak and updated as needed. Each element of information will be cross-referenced or hyperlinked to the technical documentation.

v). Contractor will establish a standard interface with Amtrak to access the technical documentation. Amtrak will have access to the technical information related to the maintenance of the Equipment. At the termination of the TSSSA Contract, the updated technical documentation will be delivered to Amtrak.

G.7 Point of Sale Support (Option)

a). If Amtrak exercises the option for the Contractor to provide a POS system as part of the Equipment contract, the Contractor shall also be responsible for supporting the on-board Point of Sale system for Food Service.

b). The Contractor shall support hardware and software both on-board the rolling stock and wayside (back-office).

c). During Mobilization, the Contractor shall coordinate with Amtrak the routing of POS sales to Amtrak accounts.

d). The system shall also support real time inventory management of on-board food service items.

i). Shortages shall be announced to on-board crew as well as transmitted wayside for mitigation by Amtrak Food and Beverage Services.

(1) Details of the wayside messaging shall be clarified during mobilization.

e). The Contractor shall provide monthly electronic reports detailing all on-board POS purchases.

i). These reports shall be searchable by all relevant criteria to all Amtrak to fine tune its food and beverage service.

G.8 Wi-Fi Service Support (Option)

a). If Amtrak exercises the option for the Contractor to provide an on-board passenger Wi-Fi system as part of the Equipment contract, the Contractor shall also be responsible for supporting the on-board equipment providing that service.

b). The Contractor shall support on-board hardware and software.

c). The system shall support train to wayside connectivity throughout Amtrak's service area and would be expected to incorporate at least cellular and satellite connectivity.

d). At 3-year intervals, the Contractor shall evaluate the available Wi-Fi, cellular and satellite technologies and shall develop and submit to Amtrak a proposal to upgrade the on-board equipment.

e). Connectivity outages shall be announced to on-board crew as well as transmitted wayside for mitigation the Contractor.

f). The Contractor shall provide monthly electronic reports detailing cellular, satellite and Wi-Fi.

G.9 Technical Support Services

a). Technical Support

i). Contractor shall provide Technical Support at Amtrak Terminal Depots as described in Section G.10.

(1) Until and unless Amtrak modifies the maintenance capabilities and capacities, Technical Support at Amtrak Enroute Depot shall be provided by unrestricted 24/7 telephone and e-mail communications.

ii). Contractor shall provide support to handle technical issues related to the Equipment. This includes, but is not limited to, the following:

(1) Assisting Amtrak in performing inspections, maintenance and repairs;

(2) Tutoring Amtrak employees on the proper maintenance procedures;

(3) Providing support in analyzing symptoms, troubleshooting, and diagnosing problems;

(4) Assisting in helping to identify Material, including the level of LRU that requires replacement;

(5) Assisting in the documentation of reported problems and remedies. (This ensures the proper Equipment data logging and issue tracking in the proper systems and applications.);

(6) Using major or complex repairs as opportunities for impromptu hands-on demonstration;

(7) Providing technical Help Desk support at CNOC, including support of Cars experiencing en-route defects or Failures;

(8) Providing technical expertise to support investigations, performance monitoring, obsolescence management, and Fleet improvement programs;

(9) Assist Amtrak in the coordination of Equipment Fleet management and planning;

(10) Providing Technical Support to investigate and resolve systemic Fleet problems;

(11) Maintaining and providing version control for applications of FMPs, Material and software to Equipment and Material supply;

(12) Generating, validating and maintaining all required maintenance work instructions/procedures in accordance with OEM specifications;

(13) Provide on-site support technicians to assist Amtrak in fault finding and to generate key performance indicators and Failure analysis to support continuous improvement;

(14) Providing reviews, updates and recommendations to maintenance practices and maintenance work instructions/procedures;

(15) Analyzing data logs and events and providing software updates as required;

(16) Upon completion of work, communicate with Amtrak's personnel regarding ideas and procedures that will make future work more efficient;

(17) Assist with the further development of troubleshooting procedures and documentation as required by Amtrak;

(18) Assisting in helping to identify Material called out in the repair manuals and assigning missing part numbers;

(19) Creating and tracking of reliability Fleet performance report with data provided by Amtrak and by Contractor;

(20) Identifying common or repeated maintenance errors and including information on these errors in the training of Amtrak's Trainers; and

(21) Performing, and providing equipment or tooling for, specialized inspections, screening or scanning of Car or systems as required by Contractor, such as ultrasonic testing (UT).

iii). Contractor shall provide pricing option for train rider coverage support on each long distance train for a monthly or annual basis. Train riders shall be well versed in all car systems, maintenance, troubleshooting, and repair.

Train riders shall address in-service Failures reported, implement repairs and corrective actions when possible, and provide detailed diagnostic or maintenance work order requests for open Failures. Experienced engineers/technicians from local depot or Contractor locations may additionally be requested to provide short-term train rider coverage at Contractor direction or within 24-hours of Amtrak's request.

iv). In addition, Contractor shall be required to revise and maintain an up-to-date Operator's Manual as required in the Technical Specification and originally provided under the fleet procurement.

(1) The Operator's Manual shall contain Car troubleshooting procedures and steps for recovery of train operations when a fault or Failure has occurred.

(2) The Operator's Manual shall be continuously updated and reviewed bi-annually with Amtrak over the life of the TSSSA Contract **[CDRL G-13]**.

b). Help Desk Representatives & Monitoring and Diagnostics Technicians

i). Contractor shall implement a decision procedure for deploying on-call Contractor Technical Support personnel as follows:

(1) When a call for support comes in, Contractor's help desk representative will attempt to work through the problem with Amtrak.

(2) If that is not possible, the help desk representative will, in conjunction with the caller, Amtrak, and established protocols, determine if the affected Car can continue the route, with or without certain limitations or adjustments.

(3) If the Car can finish the route, the Car will continue its route, and the help desk representative will alert Amtrak and Contractor's Fleet and maintenance planners to the problem on the particular Car.

ii). If it is determined that the Car cannot finish the route, the passengers on the Car will detrain.

(1) Amtrak will decide whether a spare Car will be required to be deployed to the location or if the Car will be set out of revenue service.

(2) Then, the help desk representative and Amtrak will determine whether the Car can move, possibly with certain adjustments. Amtrak will make the final decision.

(3) If the Car can move, Amtrak will move it to the nearest agreed Amtrak facility for maintenance.

(4) If Contractor's technical support is needed, the on-call Technical Support person assigned to the facility for that time will be dispatched to the necessary location for support.

(5) If the Car cannot move and Contractor's technical support is needed, the help desk representative will contact an on-call support technician assigned to the nearest site will be dispatched to head to the stalled Car to provide technical support.

iii). Contractor's help desk representatives will be located at Amtrak's CNOC site and will coordinate directly with Contractor's TSSSA Project Manager.

(1) Contractor's assigned help desk representatives will provide backup to the Project Manager in case of absence.

(2) Contractor's help desk representative will also be the single point of contact for Amtrak managers, supervisors or employees seeking advice or assistance or reporting train defects or Material issues by telephone, e-mail and/or other electronic communications.

(3) Their location at Amtrak's CNOC site allows direct interaction with Amtrak controllers communicating with train crews.

(4) The help desk representative will record and log issues, create Work Orders, and communicate with Contractor's TSSSA Project Manager or appropriate Contractor personnel on Material issues.

iv). In addition to the Help Desk tasks, Contractor's representative will monitor the outputs from the Equipment's monitoring and diagnostic system tools and respond to fault messages and values approaching critical thresholds.

(1) Contractor's representatives and technicians assigned to the CNOC Help Desk shall have access to the remote diagnostic data repository and will provide inputs for Contractor's systems engineers to carry out Failure trend analysis per sub-system and create the necessary reports for Contractor's and Amtrak's engineering groups.

v). Help desk representatives will review monitoring and diagnostic data and feedback from Amtrak on the health status of the Equipment. When an event with potential or immediate impact to Revenue Service occurs, Contractor representative will provide a recommendation to Contractor's Project Manager and to Amtrak if the issue requires:

(1) Immediate attention and the Car should be removed from service as quickly as possible and a corrective maintenance action scheduled,

(2) Urgent attention and the Unscheduled Maintenance action should be scheduled at the next appropriate occasion, or

(3) Investigation/attention at the next appropriate Scheduled Maintenance interval.

vi). In general, the role of the help desk is to facilitate availability of the Fleet, by organizing Scheduled and Unscheduled Maintenance activities and giving support to engineers or on-board crew in the case of a service-affecting Failure.

(1) Contact regarding service-affecting Failures between the help desk and engineers/crew will be always subject to authorization by the Amtrak Fleet Manager.

(2) The final decision about actions to be undertaken during service will remain Amtrak's, assuming in particular that safety-related instructions in case of degraded mode are covered by Contractor's manuals, and do not require a call to the support desk.

c). Central Functions

i). In addition to the Contractor's back office administrative support, it is expected that Contractor shall have off-site support personnel who are dedicated solely to the performance of the TSSSA Contract.

ii). These functions may include project management, commercial management, product management, quality management, as well as engineering support from Contractor's design engineers and procurement.

iii). These functions may be supported by personnel located at various Contractor locations.

iv). Periodically, Contractor may be required to have these personnel on site to support the TSSSA Contract.

v). Contractor shall assign resources to:

(1) Lead purchasing activities (Material identification, supplier selection, quotation analysis, TSSSA Contract negotiation) for Material requirements;

(2) Identify potential areas of risk or opportunity;

(3) Ensure negotiation with suppliers and subcontractors takes into account life cycle cost and new build purchasing power and future Material prices;

(4) Negotiate and enter into the appropriate supplier agreements based on the TSSSA Contract;

(5) Manage the supplier base and review ways with the supplier to improve performance levels (quality of products, delivery times and lead times, cost, reliability); and

(6) Assist the Contractor's quality manager to establish supplier approval ratings, supplier auditing, monitoring supplier performance and recommend improvement actions.

(7) Monitor, track, and report on system and car reliability including MDBF calculations.

d). Obsolescence Management

i). If Material or software is no longer supported by the manufacturer or licensor and, the performance or availability of the Equipment will be negatively impacted by the Failure of the manufacturer or licensor to support the Material or software, Contractor shall develop a suitable succession plan, subject to Amtrak approval, and develop a suitable replacement for the impacted Material or software.

(1) Contractor is responsible for the design, development and replacement of any obsolete Material or software to ensure the contractual performance of the Fleet.

(a) Any redesign or replacement of any obsolete Material or software which results in a change to special tools or diagnostic equipment shall also be the responsibility of the Contractor.

(2) The cost will be covered by the Contractor as part of the TSSSA Contract throughout the TSSSA Contract term.

(3) The vendor would be expected to work with Amtrak to find a suitable process and electronic interfaces to ensure Amtrak's Product Lifecycle Management ("PLM") tool is used to track and record changes to ensure Amtrak has an accurate record of changes to specifications related to the Equipment.

ii). The obsolescence management process consists of all steps required to manage the manufacturing of discontinued discrete components, manufacturing of discontinued complete systems or sub-systems, Material, and Software.

iii). Obsolescence Management Activities

(1) Continuous observation and surveying of the market and Materials;

(2) Periodic reporting to the maintenance team and Amtrak (as the owner of the Fleet);

(3) Mitigating the impact of obsolescence by proposing appropriate solutions or actions; and

(4) Evaluating and implementing the technical and economic solutions to handle obsolescence.

iv). For every specific case of obsolescence, typically various options will be available to manage it.

(1) Contractor will undertake all measures to mitigate the negative effects of obsolescence for Material and software until the end of the TSSSA Contract term.

(2) Specifically, Contractor agrees to issue formal reporting to Amtrak no less than fifteen (15) days after receiving notice of obsolescence and

additional reporting no less than seven (7) days after mitigating solutions have been determined.

(3) In addition, Contractor shall issue formal reporting consisting of a report status of all identified obsolete or potentially obsolete Materials and software with mitigating solutions and their respective status of action during annual review meetings.

v). Those situations impacting long-term Material availability, i.e., beyond the years covered under this TSSSA Contract will be brought to Amtrak's attention for its consideration.

(1) In those cases where Amtrak agrees to implement actions with impact beyond the current TSSSA Contract, those services will be performed under a separate agreement.

G.10 Material Supply Services

a). Material Supply

i). In addition to the other obligations specified herein, subject to the Specific Exclusions set forth in Section G.12, within the timeframes set forth herein, Contractor shall supply to Amtrak all Material, required for Scheduled Maintenance, turnaround service, and Unscheduled Maintenance.

(1) Sufficient quantities of Rotable Material, including but not limited to Axle sets, shall be included in the Material to be supplied by the Contractor.

(2) Contractor shall also supply to Amtrak all Material required to repair Minor Debris Damage to the Cars or Spare Vehicles. Contractor is also responsible for stocking all Material required to repair Excluded Matter Damage for accessible replacement by Amtrak.

(3) If Contractor fails to provide Material by the prescribed delivery times identified in the TSSSA, Contractor shall be subject to Performance Guarantees as set forth in Section G.11.

ii). A Material Supply diagram is provided in Appendix B for reference.

iii). Material supplied by Amtrak shall not be part of the TSSSA requirements.

(1) Amtrak supplied Material will be identified during the kickoff process.

b). Line Replaceable Unit (LRU)

i). Material to be supplied by Contractor under the TSSSA Contract shall be identified and replaced at the mutually agreed-upon designated LRU, unless otherwise approved by Amtrak.

(1) As an example, if an assembly has an internal computer board that fails, but the LRU is the assembly, the whole assembly will be exchanged, not the computer board.

(2) The LRU list shall be defined and approved by Amtrak during design reviews and finalized prior to delivery of the first Car. The tracking of serialized LRU's shall be identified on this list.

(3) Annual meetings shall be performed for the review of the LRU list by the parties and modified as mutually agreed.

(a) This may include alterations to the LRU level as well as additions or subtractions from the LRU list.

(b) If the parties do not agree on subsequent adjustments to the LRU list, those LRUs that are not agreed to shall revert to the prior LRU level.

c). Excluded Matter Damage

i). Contractor is responsible for purchasing, stocking, and supplying to Amtrak all Material required to address Excluded Matter Damage.

(1) For the avoidance of doubt, Contractor shall be responsible for stocking all Material required due to Excluded Matter Damage regardless of the cause, including, but not limited to, accident or vandalism.

(2) Except as otherwise set forth herein, Contractor shall deliver Material for Excluded Matter Damage to Amtrak within 48 hours of Amtrak's request for the Material. The Contractor can submit for Amtrak approval additional delivery times depending on the size of the shipment. Requests will be considered on a case-by-case basis.

ii). If Contractor provides Material to Amtrak and Contractor believes or asserts that Amtrak's request is due to Excluded Matter Damage, Contractor shall, within five (5) days of receiving Amtrak's request, provide Amtrak in writing with evidence, to Amtrak's reasonable satisfaction, that Amtrak's request is due to Excluded Matter Damage.

(1) If Amtrak concurs with Contractor's assertion, the cost of the Material provided due to Excluded Matter Damage shall be chargeable to Amtrak at rates to be agreed upon by the parties, which shall take into consideration and not exceed the mark-ups for Excluded Matter Damage Material in the pricing schedule at Exhibit I-2 submitted by Contractor and accepted by Amtrak and the payment and pricing provisions of the TSSSA Contract

iii). If after receipt of such evidence, Amtrak does not agree with Contractor and no agreement can be reached on whether Amtrak's request for such Material is a result of Excluded Matter Damage, the dispute shall be resolved in accordance with the Claims and Disputes provision of the terms and conditions of the TSSSA Contract.

(1) If the Dispute is resolved in Contractor's favor, the cost of the Material provided due to Excluded Matter Damage shall be chargeable to Amtrak at the rates described above.

(2) Notwithstanding any such dispute, Contractor shall deliver the requested Material to Amtrak within the timeframes set forth herein and any delayed deliveries may result in the assessment of Performance Guarantees.

iv). Contractor shall invoice Amtrak for any payments due under this provision in accordance with the payment provisions of the General Provisions in Exhibit A-1. Contractor and Amtrak will agree on a formal process for addressing those instances where Contractor asserts that Amtrak requested Material due to Excluded Matter Damage.

d). Amtrak Labor

i). All maintenance work performed on Amtrak property shall be performed by Amtrak with Amtrak labor. Amtrak shall retain responsibility for its labor, i.e. the management, recruitment, discipline, availability, work assignment, and training of its workforce. Except as otherwise specified herein, Contractor's role is limited to providing Technical Support services and Material Supply Services.

e). Depot Levels

Figure G-1: Depot Levels

Terminal Depots	Washington DC
	New Orleans, LA
	Chicago, IL (All Locations)
	Hialeah, FL
	New York, NY
	Boston, MA
	Seattle, WA
	Oakland, CA
	Los Angeles, CA
	Sanford, FL (Auto Train)
	Lorton, VA (Auto Train)

Enroute Depots	St. Louis, MO (Option)
	Kansas City, MO (Option)
	Minot, ND
	Denver, CO
	Albuquerque, NM
	Portland, OR
	San Antonio, TX
	Spokane, WA
	Savannah, GA
	Albany, NY

f). Material Kits

i). Contractor shall develop kits of Materials to be issued and used for all Scheduled Maintenance activities over the life of the equipment while under contact.

(1) The Materials kits will be reviewed and updated on a continual basis.

(2) The Material kits of Material shall be developed and stocked for normal repair activities such as windshield replacement, compressor overhaul, etc.

(3) Kits shall be subject to the Performance Guarantees. Kits and maintenance activity frequency shall be approved by Amtrak.

ii). Scheduled Maintenance Material kits shall be available fifteen (15) days prior to scheduled maintenance activity date.

g). Amtrak's Rights in Event of Untimely Delivery of Material

i). In the event that Contractor fails to deliver Material within the time periods set forth in the TSSSA Contract, Amtrak shall have the right to correct the defective Material or to obtain replacement Material from another source so as to minimize the potential impact on its train operations without any risk to warranty.

(1) The performance of such right by Amtrak shall not relieve Contractor of its obligations to deliver replacement Material in a timely manner and to continue to pay the Performance Guarantees as provided herein until replacement Material is delivered. Any replacement Material obtained or installed by Amtrak under the terms of this section shall be covered under the same warranty or TSSSA coverage of this TSSSA Contract if the Material is provided from the OEM or is demonstrated by Amtrak to be form, fit, and functionally equivalent to the OEM Material.

ii). In the event replacement Material cannot be provided by Contractor in a reasonable timeframe, the cost of the replacement Material shall be deducted from the monthly invoice as part of the reconciliation process described in Section G.11.

h). Aesthetic Material Replacement

i). Contractor shall identify, subject to Amtrak approval, the recommended replacement life for soft good items or aesthetic Materials subject to wear and degradation such as carpets, seat coverings, windows, interior panels, low-level exit path marking, decals, etc. Contractor is responsible for purchasing, stocking, and supplying to Amtrak all Material required to address Aesthetic Material Replacement.

(1) Any interior or exterior painted surfaces shall fall under the requirements of this Statement of Work. Contractor's Maintenance Plan will account for the periodic replacement or refurbishment of such

Material as an ongoing refresh effort to coincide with the life expectancy defined by Contractor or as deemed necessary by Amtrak inspection personnel following an agreement on inspection standards.

(2) Replacement materials shall include, but not be limited to, walk-off carpets utilized in high traffic areas and manageable car sections that can be quickly and easily removed and replaced. The replaced carpets will be taken off-vehicle and thoroughly cleaned and renewed for a rotating pool or replaced if their condition warrants. At a minimum, all walk-off carpets shall be replaced every 6-months and incorporated into the normal maintenance schedule. The interval may change pending the season and routes the cars operate on. Contractor shall review and propose a replacement plan.

(3) These inspection standards shall be agreed upon during Mobilization.

(4) Premature degradation of these Materials shall be cause for Amtrak to require Contractor to re-establish the replacement periodicity to ensure that timely refresh efforts of the affected Materials adequately address Amtrak's concerns.

(5) Two (2) years prior to the scheduled Conditional Acceptance of the first Car and during mobilization, the Contractor shall develop and submit to Amtrak for review and approval a Book of Wear and Appearance Standards **[CDRL G-14]** which details the periodic and condition-based triggers for soft- good items or aesthetic Material replacement.

(a) The Book of Wear and Appearance Standards shall include the triggers for replacement as well as the time allowed to complete the replacement.

ii). The Book of Wear and Appearance Standards shall include, but not be limited to:

(1) Carpets

(2) Seat coverings and cushions

(3) Windows and window shades

(4) Seat tray tables

(5) Workstation Tables

(6) Interior panels

(7) Low-level exit path marking

(8) Signs and decals

(9) Restrooms

iii). Periodic replacement shall indicate the mandatory time-based replacement of applicable components and shall not exceed the expected service life.

(1) Each component or Material in the Book of Wear and Appearance Standards shall have an associated time-based replacement trigger.

(2) The following are mandatory changeout periods unless an extended service life can be demonstrated to Amtrak. The acceptance of an extended service life shall be solely at Amtrak's discretion.

(a) Carpets – maximum ten (10) years

(i) Aisle carpets/heavy traffic areas – maximum four (4) years

(ii) Walk-off carpets – maximum six (6) months interval can vary based on season and car route contractor to review and provide proposal.

(b) Seat coverings – maximum five (5) years

(c) Seat cushions - maximum ten (10) years

(d) Windows – maximum seven (7) years

(e) Window shades – maximum five (5) years

(f) Interior panels – maximum fifteen (15) years

(g) Signs and decals – maximum two (2) years

iv). Condition-based triggers for replacement shall include any and all aspects which unsatisfactorily impact the usefulness or aesthetic appeal of a component.

(1) Each trigger shall be presented with a distinct range that will be used to indicate if a component is suitable for continued service or must be replaced.

(2) Condition-based triggers shall include, but not be limited to, the following as well as similar indicators of component degradation.

(a) Unsightly stains which cannot be cleaned

(b) Perceptible odor from age, mildew, etc.

(c) Significant color or pattern loss or fading

(d) Fabric or carpet matting, ripples or wrinkles

(e) Rips or tears

(f) Scratches

(g) Water damage

(h) Loss of support (e.g. seat cushions, bedding)

(i) Clouding (e.g. windows)

v). Initial Depot stocking strategy, recommended replacement interval, and proposed inspection standards shall be provided to Amtrak no later than one hundred eighty (180) days before delivery of the first Car and shall be reviewed biannually with Amtrak over the life of the TSSSA Contract.

(1) Material shall be primarily stocked at all Amtrak Terminal Depots and small amounts of regularly consumed Material shall be stocked at Amtrak Enroute Depots along with Consumable Material.

i). Material Delivery and Distribution

i). Within two (2) hours of the time Amtrak notifies Contractor of the need for Material at an Amtrak Terminal Depot (either by an Amtrak enterprise asset management system generated request or some other agreed method, i.e.: e-mail), Contractor shall make the requested Material available at the Amtrak Terminal Depot store for Amtrak pick-up or Contractor shall deliver the Material to Amtrak at the applicable Amtrak Terminal Depot store.

(1) Except as set forth in Section G.12, if Contractor fails to deliver Material to Amtrak Terminal Depot store by the two (2) hour delivery deadline, Contractor shall be subject to the Performance Guarantees set forth in Section G.11.

ii). Within twenty-four (24) hours of the time Amtrak notifies Contractor of the need for Material at an Amtrak Enroute Depot, (either by an Amtrak enterprise asset management system generated request or some other agreed method, i.e.: e-mail), Contractor shall deliver the Material to Amtrak at the applicable Amtrak Enroute Depot or make it available for pick-up at the applicable Amtrak Enroute Depot.

(1) Except as set forth in Section G.12, if Contractor fails to deliver Material to the Amtrak Enroute Depot store by the twenty-four (24) hour delivery deadline, Contractor shall be subject to the Performance Guarantees set forth in Section G.11.

(2) Costs associated with movement of Material between Amtrak Terminal and Enroute Depots under performance of the TSSSA Contract shall be the responsibility of Contractor.

j). Material Handling by Amtrak

i). While Material is on Amtrak property, if requested by Contractor, Amtrak shall perform Material handling. Such Amtrak labor shall be provided at no charge to Contractor.

k). Contractor's Material Storage

i). Contractor's Material will be stored at either the Amtrak Terminal Depots or at any other Contractor's managed locations, as per Contractor's material strategy in line with expected consumption demand.

(1) In addition, Contractor's Material will be stored at the commissioning location of the Cars.

(2) Once commissioning is completed, Contractor shall relocate all Contractor's Material to the Amtrak sites unless otherwise agreed to by Amtrak.

ii). The Amtrak Enroute Depot shall all be considered unstaffed for the purpose of Material handling and are not considered warehouses in Amtrak's Materials management system.

(1) The only personnel located at these sites shall be maintenance of equipment personnel. Contractor shall propose methods for managing, tracking, receiving, and storing the Material required at an Amtrak Enroute Depot, subject to Amtrak approval.

l). Material Maintenance

i). Contractor shall be responsible for any required or OEM recommended maintenance during the storage period.

(1) This shall include, but not be limited to, turning rotating equipment, greasing, corrosion protection, etc.

m). Contractor's Material Storage Locations

i). Amtrak shall provide Contractor Space to use at the Amtrak facilities as available.

Figure G-2: Amtrak Terminal Depots, Contractor Available Space

Terminal Depots	Contractor Available Space (Sq. Ft.)
Washington, DC	1000
New Orleans, LA	1000
Chicago, IL	1000
Hialeah, FL	1000
New York, NY	1000
Boston, MA	1000
Seattle, WA	1000
Oakland, CA	1000
Los Angeles, CA	1000
Sanford, FL (Option)	1000
Lorton, VA (Option)	0

ii). As Amtrak may be able to provide more space, the Contractor shall approach Amtrak before obtaining additional space externally. It remains the Contractor's responsibility to plan and arrange for additional warehouse space as needed in proximity to the depots to be able to fulfill its obligations under this contract.

iii). In addition, Contractor shall specify the additional onsite storage space requirements necessary for equipment associated with the OESS, including any details on restrictions for storage of any equipment and any storage needs beyond the available space listed in Figure G-2.

n). Contractor Access

i). Amtrak will provide access and use of the sites and facilities to Contractor as listed above in Figure G-2.

(1) Contractor may use Amtrak's facilities and sites at no cost. Contractor shall be permitted to use agreed upon areas or sites for Material storage.

(2) If additional space is required by Contractor, such space shall be secured by Contractor at Contractor's expense and at no cost to Amtrak.

(3) General infrastructure or equipment such as cranes, as well as special tools or fixtures designed for the Cars, will be available for use by Contractor in support of the TSSSA Contract unless otherwise mutually agreed.

(4) Upon Contractor's reasonable request, such Amtrak-owned assets and infrastructure will be operated by Amtrak employees. Contractor-owned assets and infrastructure will be operated by Contractor's employees.

(5) Amtrak may allow Contractor to use Amtrak owned special tools and jigs for use by Contractor's employees.

ii). Amtrak may consider allowing qualified and trained Contractor representatives to operate Amtrak-owned assets in the event no Amtrak resource is readily available. Under such terms, Contractor shall be responsible for any damages or liability.

o). System Interfaces

i). Contractor will be expected to integrate with Amtrak's material management and warehouse software such that Amtrak's enterprise asset management system would have visibility to inventory levels being maintained by Contractor.

p). Amtrak Depot Stocking Inventory

i). Material inventory levels will be based on the type and frequency of maintenance occurring at each Amtrak Depot.

(1) The inventory levels will be closely monitored as the Fleet is deployed to ensure Material delivery requirements are maintained and adapted to the Maintenance Plan and that items identified as aesthetic Materials are stocked in accordance with usage and lead time.

(2) Contractor is solely responsible for establishing inventory levels to meet the demand of the Maintenance Plan in order to meet the Performance Guarantees.

ii). Amtrak Terminal Depots, and non-Amtrak sites where required, shall be the primary stocking locations for most of the Material required for Equipment maintenance.

iii). Amtrak Enroute Depots are intended to be stocked with basic Material for Turnaround Service, such as brake shoes, filters, lights, and other regularly required supplies but not limited to the above Material if Contractor specifies other Material needed.

(1) In addition, a small quantity of the Material commonly subject to debris damage as well as the items identified in aesthetic Materials shall be made available for servicing at Amtrak Enroute Depots.

iv). Contractor shall provide the initial depot stocking strategy to Amtrak no later than one hundred eighty (180) days before delivery of the first Car and it shall be reviewed bi-annually with Amtrak over the life of the TSSSA Contract.

q). Physical Inventory

i). Amtrak may conduct a cycle count program of all Material maintained on Amtrak property to ensure that the inventory count is accurate, identify any lost or missing Material, and ensure that there are no Material discrepancies.

(1) This physical inventory frequency may be subject to change based on shrinkage and the quality of record keeping. In the event changes in inventory process are mutually agreed upon, both parties agree to update the relevant documents to reflect the processes in effect.

ii). Amtrak may direct Contractor to perform an annual review of slow-moving Material maintained on Amtrak property to adjust allocation of space.

(1) Slow moving Material shall be located to alternate warehousing locations or back to supplier.

r). Notice of Receipts, Issues and Returns

i). Notice of receipts, issues and returns will occur real time via material management system interface or e-mail to Contractor.

s). Amtrak Depots and Site Coverage

i). Contractor shall provide on-site support staff at the Amtrak Depots identified in Section G.10 Figure G-1; and at Amtrak's CNOC facility in Wilmington, DE.

ii). Contractor shall provide 24/7 manned support at Amtrak's CNOC facility and for all Amtrak Terminal Depots and 24/7 remote support for all Amtrak Enroute Depots via telephone or e-mail subject to Amtrak approval.

t). Return and Disposal of Material

i). Non-Rotable Material

(1) Once Non-Rotable Material is removed from the Equipment, Amtrak may dispose of it as it sees fit.

(a) Notwithstanding the foregoing, if Contractor requests the return of Non-Rotable Material removed from the Equipment, Amtrak shall endeavor to return the Material as reasonably requested.

(b) The Contractor shall be responsible for any transportation costs and for the proper disposal of the returned Non-Rotable Material.

(2) If Amtrak or Contractor determines that Material, other than Rotable Material, removed from the Equipment is faulty or suspect, Contractor shall have the cause of the issue diagnosed including associated Failure timelines and report to Amtrak on the findings and/or resolution of faulty or suspect Material removed.

ii). Rotable Material

(1) Within fourteen (14) days of the date of issuance of an item of Rotable Material, Amtrak shall plan to return the core of the Rotable Material, which is being removed from the Equipment and being replaced by the newly issued Material, to Contractor at one of Amtrak's Terminal Depots identified. If the core is not returned within fourteen (14) days of issuance of Rotable material, Contractor shall inform Amtrak in writing. If Amtrak has not returned the core within fourteen (14) days after such written notice, such core shall be categorized as overdue and Amtrak shall pay Contractor the amount associated with such core. Contractor shall pick up the core of the Rotable Material within Seven (7) days after Amtrak makes such core available for pickup at one of the Terminal Depots.

(2) Amtrak can facilitate shipping the Rotable Material for Contractor at Contractor's expense, but Contractor shall be responsible for preparation of all shipping documentation including obtaining any necessary Return Material Authorization (RMA) numbers.

(a) On the last day of each month, Contractor shall issue to Amtrak an invoice for all unreturned cores of Rotable Material that became overdue during the month.

(b) If and when the core is returned by Amtrak to Contractor, any amounts paid for the core will be credited back to Amtrak by Contractor.

(3) Biannually, at a minimum, the list of Rotable Material shall be reviewed by the parties and modified or adjusted, as mutually agreed.

(a) This may include additions or subtractions from the list of Rotable Material or changes to the scope of work for repair of any Material.

(b) If the parties do not agree on a modification to the list of Rotable Material, such modification shall not be made.

(4) The Contractor shall be responsible for tracking all Rotable Material's serial numbers from Amtrak to return to Amtrak's inventory.

G.11 Performance Guarantees and Performance Incentives

a). Availability

i). Car Held for Material (CHFM) shall be defined as:

(1) A Car Held for Material (CHFM) shall be defined as a Car or Spare Vehicle in BAM status that Amtrak has delivered to the designated Amtrak Depot or for which:

(a) Amtrak has notified Contractor of the need for Material (either by an Amtrak enterprise asset management system generated request or another agreed-upon method, i.e., e-mail) and

(b) after notification as described above, maintenance activities pertaining to said Material cannot be performed on the Car because Contractor has failed to deliver the Material to Amtrak at the Depot where the Car or Spare Vehicle is located, within the following period following such notification:

(i) two (2) hours to Amtrak Terminal Depots

(ii) twenty-four (24) hours to Amtrak Enroute Depots.

(2) Alternatively, a Car or Spare Vehicle in BAM status is set out enroute and:

(a) Amtrak has notified Contractor of the need for Material (either by an Amtrak enterprise asset management system generated request or another agreed-upon method, i.e., e- mail) and

(b) After notification as described above, maintenance activities pertaining to said Material cannot be performed on the Car or Spare Vehicle because Contractor has failed to deliver the Material to Amtrak designated Depot, within the following period following such notification"

(i) two (2) hours to Amtrak Terminal Depot

(ii) twenty-four (24) hours to Amtrak Enroute Depot.

(3) As a CHFM occurrence usually causes a negative impact to Amtrak's operations, Amtrak and Contractor have agreed to the Performance Guarantees set forth in Section G.11 and the General Provisions in Exhibit A-1.

(a) In the event of a CHFM as described above occur, Contractor shall pay Performance Guarantees to Amtrak.

(b) Performance Incentives are not applicable when CHFM occurs. Therefore, Contractor may not earn, and Amtrak shall not pay, Performance Incentives associated with CHFM.

(c) CHFM Performance Guarantees shall be in effect upon the first car Conditional Acceptance.

(4) Amtrak may request Material to rescue Cars or Spare Vehicles set out from service along its routes.

(a) Consumption will be reflected in an Amtrak-designated Amtrak Terminal Depot for the purpose of Material planning and guarantees.

(b) Material shall be moved by Amtrak to the location of the Car or Spare Vehicle.

(5) Amtrak shall use all reasonable efforts to move any Car or Spare Vehicle which requires work to an appropriate Amtrak Terminal Depot or Enroute Depot within one (1) day.

(a) Any additional time required to move such Car or Spare Vehicle to a maintenance facility shall not be deemed as "Out-of-Service" time.

(6) It is agreed that any time required to make such warranty repair or field modification work on any Car or Spare Vehicle shall be deemed "Out-of- Service" time.

(7) Spare Vehicles which are held for Material are not available for revenue service and shall be subject to CHFM Performance Guarantees amount in accordance with Section G.11.

b). Car Held For Material (CHFM) Performance Guarantees

(1) If the total of actual CHFM hours exceeds the requirements of delivering Material within two (2) hours at an Amtrak Terminal Depots or within twenty-four (24) hours at the affected Amtrak Enroute Depots, the difference will be multiplied by $100 per each hour.

(a) After the CHFM exceeds forty- eight (48)-hours beyond the Material delivery requirement, the guaranteed amount shall be assessed at $1,500 for each additional day until the Material is delivered and the CHFM has been resolved. Once the Material is available at the applicable Amtrak Depot, the Car or Spare Vehicle shall be released from CHFM status.

(b) If a CHFM is deemed operational by Amtrak, the Car will return to service. However, a performance guarantee of $150 per 24-hour period will be applied until the necessary Material is delivered to Amtrak.

(c) A Car shall remain in CHFM status for the purpose of Performance Guarantee calculations as long as the Materials have not been delivered, even if Amtrak has rectified the Failure using alternative sources to maintain continuous revenue operations.

(2) Cumulative CHFM Performance Guarantees incurred during each Measurement Period shall be invoiced as per Section G.11.

(3) The CHFM Performance Guarantee amounts set forth in this section shall be assessed independently of the Failure related Performance Guarantee amounts set forth elsewhere in this section and are effective upon the first car Conditional Acceptance.

(4) The amounts set forth in the above paragraph are subject to escalation as per pricing schedule in Exhibit J-2.

(5) In any calendar year, Contractor shall not be obligated to pay Amtrak Performance Guarantees that exceed twenty percent (20%) of the Annual Service Payment as that term is defined in the TSSSA General Provisions.

c). Reliability

i). Contractor understands that Amtrak shall suffer damages in the event of the Failure of Material. Contractor shall ensure that it provides reliable Material during the TSSSA Contract term. The parties agree to the following Performance Guarantee of reliability:

ii). Reliability Target

(1) The Contractor shall meet the Mean Distance Between Service Failure (MDBSF) and Mean Distance Between Component Failure (MDBCF) as defined in the equipment Technical Specification #1139. In the event that the MDBSF and MDBCF requirements of the Technical

Specification are not met, corrective actions shall be taken during the reliability demonstration testing. The parties agree that any Failure may only be allocated to one of the four (4) types of Failures as follows:

(a) Failure Type I.

(b) Failure Type II.

(c) Failure Type III.

(d) Failure Type IV.

(2) Amtrak has established the Failure rates per Measurement Period set forth in Figure G-3.

(3) The respective quantity of Failures per Measurement Period stated in Figure G-3 shall mean that the quantity of those Failures shall be neutral (no Performance Guarantees or Performance Incentives either party).

Figure G-3: Reliability Target – Allowable Failures within a Measurement Period

	Failure Type I	Failure Type II	Failure Type III	Failure Type IV
Failures per Car	0	1	1	0

(4) The performance guarantee will be applied once for each Failure occurrence; however, if another separate Failure occurs on the same Car, it would be treated independently of the first Failure.

(5) If a Failure meets the criteria for multiple Failure types, the more severe Failure (resulting in highest performance guarantee) type shall be applied. Any Failure of Equipment, system, Material, or other supplies, instructions, Technical Support, software, or services shall be considered independent of any other distinct Failure, unless proven to be related.

(6) Contractor is responsible for any secondary or subsequent Failure if a failed Car or Spare Vehicle is required to be moved to an Amtrak Depot for repairs.

(7) Amtrak and the Contractor will jointly work together, but the Contractor shall be responsible for disproving any Failure type identified on a Car.

iii). Conditions

(1) Typically, a Failure caused during a Scheduled Trip shall be corrected prior to the next Scheduled Trip by Amtrak or onboard train rider.

(2) Notwithstanding the foregoing, Amtrak shall have the right to use the Car or Spare Vehicle for a Scheduled Trip.

(a) In the event that Amtrak decides to run a Car or Spare Vehicle with a Failure:

(i) Contractor shall not be assessed additional Performance Guarantees tied to repeat of the same Failure beyond the original Failure until the original Failure has been repaired, so long as the Material is readily available, and

(ii) further or additional Failure(s) caused by running the Car or Spare Vehicle without correcting or repairing the original Failure shall not result in the recording of additional Failures under Section G.11

(b) The reliability Performance Guarantees and Incentives shall become effective at the expiration of the Three-Year Warranty period of each Car or Spare Vehicle.

(i) Reference General Provision Section 12 of the Equipment Contract General Provisions in Exhibit A-1 for applicable Liquidated Damages in effect during the Three-Year Warranty Period.

(c) If a Car was not in Revenue Service for a continuous period exceeding seven (7) days during the Measurement Period due to Material unavailability by the Contractor, the reliability targets (Allowable Failures within a Measurement Period) shall be prorated by days in service.

d). Reliability Performance Guarantees and Performance Incentives

i). Calculation of Performance Guarantees and Performance Incentives

(1) Once the parties have agreed on the Data, the parties shall calculate the reliability metrics on each car for the given Measurement Period. The parties shall compare the target value as defined in Figure G-3 – Reliability Target Value Table to the actual Failure Rate for each Car

(a) The target value less the actual Failure multiplied by the USD $ amounts listed below for each type of Failure is the guarantee. If there are no Failures in excess of the target values defined in Figure G-3, Amtrak shall pay an incentive of $2,000.

(2) The sum of the amounts for each of the Failure Types above the target values shall be the calculated Performance Guarantees, and if there are no failures above any of the target values then Performance Incentives shall be calculated for each car.

(a) Failure – Type I the amount of $ 29,960.

(b) Failure – Type II the amount of $5,992.

(c) Failure – Type III the amount of $322.

(d) Failure – Type IV the amount of $60,000

(e) No Failures above the target values in Figure G-3 – the incentive amount of $2,000. Incentives will only be paid if there are no total failures above the target values in Figure G-3 for the performance period.

(3) The Performance Guarantee and Incentives amounts set forth in this section shall be assessed independently of the CHFM Performance Guarantee amounts set forth in elsewhere in this section.

(a) Any proration shall affect reliability targets in that Measurement Period only and shall be handled on a Car-by-Car basis.

(4) The amounts set forth in this section are subject to escalation as per pricing schedule in Exhibit J-2.

(5) In any calendar year, Contractor shall not be obligated to pay Amtrak Performance Guarantees that exceed twenty percent (20%) of the Annual Service Payment as that term is defined in the TSSSA General Provisions.

(6) In any calendar year, Amtrak shall not be obligated to pay the Contractor Performance Incentives that exceed five percent (5%) of the Annual Service Payment as that term is defined in the TSSSA General Provisions.

e). Performance Guarantees and Performance Incentives – Payment and Credits

(1) Amtrak and Contractor shall use the following process to calculate Performance Guarantees and Performance Incentives associated with the availability and the reliability targets as set out in this Chapter and settle the payments and credits resulting from this process.

(2) Within ten (10) days after each Measurement Period, Contractor shall compile the Equipment recorded Data and provide it to Amtrak. The parties shall review the data together not later than ten (10) days after provision of this Data and will reconcile any differences that may exist between Contractor's Data and any corresponding Data that Amtrak may possess. After such reconciliation, such Data will be deemed accepted by the parties. Any difference between Contractor's Data and Amtrak's Data that cannot be reconciled in accordance with this Section, shall be resolved in accordance with the Claims and Disputes section of the General Provisions Exhibit A-1.

(3) The agreed-upon Data of each Measurement Period shall be listed in a reconciliation table. This reconciliation table shall include all measures that result in Performance Guarantees and/or Performance Incentives as well as the sums for the balancing of availability and reliability. This may subsequently lead to setoffs on a one-for-one basis.

(4) The net Performance Guarantee or Performance Incentives from the Measurement Period documented on the reconciliation table shall be dispensed as follows:

(5) If a balance is owed to Amtrak, Contractor shall credit the following month's invoice. The credit shall be presented on the invoice as a separate line item.

(6) If a balance is owed to Contractor, Contractor shall invoice Amtrak with the amount due. Amtrak shall pay such invoice in accordance with the General Provisions in Exhibit A-1.

(7) Any other set-off against Performance Guarantees or Performance Incentives owed to a party shall be allowed only if the parties have agreed to such set-off.

(8) At the end of the TSSSA Contract term or upon TSSSA Contract termination after the last set-off has been made by the parties, if the remaining balance is negative, that amount shall be paid to Amtrak by Contractor or Amtrak, in its sole discretion, may elect to deduct such amount from any payment due to Contractor under the TSSSA Contract. If the amount is positive, that amount shall be paid to Contractor by Amtrak.

ii). Annual Reconciliation

(1) Amtrak and the Contractor shall hold a reconciliation meeting annually at the end of the second Measurement Period of that year to review the accumulated Failures, total Performance Guarantees or Incentives, and to establish the Annual Service Payment for the following year.

(2) If necessary, the Annual Service Payment shall be adjusted to reflect any changes between the forecasted amount and any net changes resulting from approved change orders, Fragmented Continuous Maintenance and scheduled heavy repair events, or other impacts.

(3) In the event the accumulated Performance Guarantees or Incentives exceed their respective limits, any Performance Guarantees or Incentives for that year shall be reconciled with the Annual Service Payment.

(4) Annual Material Inventory Listing and Review

(a) Additionally, the Contractor shall provide an annual inventory listing with all Materials at each of the supported Amtrak Terminal Depots and Enroute Depots.

(b) The Material inventory listing shall indicate all Materials intended to be stocked at each location and their annual usage rate.

(c) Amtrak and Contractor shall perform a review of the planned stocking levels along with the annual usage rate or Failure history for specific Materials to determine if any adjustments are warranted.

G.12 Exclusions

a). Exclusion from the Assessment of Performance Guarantees and Performance Incentives Associated with the Availability of Material

i). The exclusions for the assessment of Performances Guarantees for availability are expressly set forth below. For the avoidance of doubt, Performance Guarantees for reliability are not subject to these exclusions.

ii). Force Majeure Events

(1) Subject to Contractor meeting the requirements of Article 28 of the General Provisions in Exhibit A-1, during the period of a Force Majeure Event affecting Contractor, Contractor shall not be assessed Performance Guarantees for availability due to its inability to provide certain Material.

iii). Major Wreck Repair Events

(1) In the case where Contractor has been requested to supply Material for a major wreck repair, which could place Contractor at risk of not supplying Material to meet contractually obligated Material needs, Contractor shall inform Amtrak of this potential so that Amtrak can decide how to proceed with the supply of such Material.

(a) If Contractor is instructed to proceed with the supply of such Material, both parties agree that in the event of a subsequent demand causing available stock to become depleted within normal lead times, the event will not be included in the calculation of the Performance Guarantees.

(b) If, however, the Material is not replaced within the published lead times and Contractor has a need for the Material to fulfill its obligations under the TSSSA Contract, Performance Guarantees will be assessed.

iv). Material Consumption for Cars Not Covered under the TSSSA Contract

(1) If applicable, Material supplied by Contractor for the repair of other Cars in Amtrak use shall not be subject to Performance Guarantees for availability.

b). Specific Exclusions from the Service Price

i). Repair of Wrecks, Accidents or Damage

(1) In the event of damage other that Minor Debris Damage resulting from a wreck or accident, within twenty (20) days of Amtrak's request or a later date as agreed to by Amtrak, Contractor shall render its support by analyzing the damage and inform Amtrak of the extent of the damage and the estimated costs of repair.

(a) The quotation for repairing this damage shall include relevant documentation on the analysis of the damage (for example, brief report with image), the time required for the repair, and the estimated prices of Material along with any Contractor markups for Material.

(b) The quotation shall be sent to Amtrak in writing. Contractor shall work with Amtrak to provide a mutually acceptable offer.

(c) In the event where significant engineering time and costs are incurred in the establishment of the estimate for repair, or if support for the repair process shall require technical support from Contractor, this will also be quantified, and agreement obtained from Amtrak before proceeding with final quotation.

ii). Upon receipt of a purchase order from Amtrak, Contractor will initiate support and begin making repairs. Support shall include all functions of the TSSSA Contract along with:

(1) Detailed bills of material for damage repair;

(2) Specification of repair tooling;

(3) Material ordering and planning;

(4) Creation or supply of repair procedures and standards;

(5) On-site technical support during repair; and

(6) Quality assurance support.

iii). At no point shall Contractor invoice Amtrak for services provided by personnel assigned to and funded by this TSSSA Contract.

iv). Third Party Repairs

(1) In all cases, if Amtrak chooses a third party instead of Contractor to perform or support any repairs, or if Amtrak chooses not to implement suggested repairs, Contractor reserves the right to either inspect such repairs at completion or assess the complete impact on the operation and determine if they meet Contractor's standards. Contractor shall have no liability with respect to the repairs performed by Third Parties.

(a) If Amtrak retains a third party to repair damage to a component, spare, or item on the Equipment, that if supplied by Contractor, would be considered Material under the TSSSA Contract, such component, spare, or item shall be deemed Material once removed from the Equipment and Contractor's obligations with respect to Material shall apply.

(b) Both parties shall mutually agree on how to reinstate the Equipment under the TSSSA Contract so that the operating condition of the Equipment meets the standard of original manufacture (wear and tear excepted).

v). Aesthetic Upgrades

(1) Throughout the life of the TSSSA Contract, to remain consistent with market trends and the desires of its internal stakeholders and partners, Amtrak may elect, in its sole discretion, to make aesthetic upgrades in addition to ongoing aesthetic material replacements, including, but not limited to, color schemes, interior Materials, or interior layouts within the Cars and Spare Vehicles.

(a) In the event Amtrak decides to pursue upgrades to any of the Cars and/or Spare Vehicles, Contractor shall lend its support by partnering with the Amtrak designers to develop Material replacement programs to facilitate the upgrades. Contractor shall develop an initial quote to support the upgrades and shall send all supporting documentation, including the quote, to Amtrak in writing. Contractor shall work with Amtrak to provide a mutually acceptable offer.

(2) Contractor shall initiate support for the upgrade under the terms of this TSSSA Contract upon receiving a purchase order from Amtrak. Support shall include all functions of the TSSSA Contract along with:

(a) Detailed bills of material;

(b) Specification of tooling;

(c) Material ordering and planning;

(d) Creation or supply of procedures and standards;

(e) On-site technical support; and

(f) Quality assurance support.

(3) At no point shall Contractor invoice Amtrak for services provided by personnel assigned to and funded by this TSSSA Contract.

vi). Excluded Consumable Material

(1) The following Materials are defined in this TSSSA Contract as excluded from Consumable Material:

(a) Tissues, soaps, water and cleaning liquids for the water and waste system;

(b) Crew kits;

(c) Water bottles;

G.13 Training and Documentation

a). Documentation Maintenance

i). Contractor shall be responsible for maintaining the documentation required by the Equipment Contract under Chapter 23 of the Equipment Specification throughout the life of the TSSSA Contract.

ii). Contractor shall issue updates to the printed manuals every three (3) months. Distribution of updates will be the responsibility of Amtrak.

iii). Every six (6) month period, unless otherwise approved by Amtrak, a complete reissue of the electronic documents with all current updates will be provided by Contractor.

iv). Electronic technical manuals as specified in Chapter 23 of the Equipment Specification shall be updated by Contractor in real time.

b). Contractor's Training

i). During the manufacturing of the Equipment, the personnel responsible for managing each of the Terminal Depots shall be required to participate in the production build and testing process for each Car type. This will ensure that the Contractor will provide experienced personnel to the Terminal Depots prior to the Equipment arriving.

ii). Contractor shall develop a new employee training program for Amtrak review. Records shall be maintained at each Terminal Depot for Amtrak review to ensure all personnel have been properly trained.

c). Amtrak Training

i). Annually, Contractor shall be responsible for providing training classes or holding training classes at each Terminal Depot during all shifts at no additional cost to Amtrak, beyond the "Train the Trainer" sessions approved during the development of the initial training plan. Contractor shall support the training of Amtrak employees by:

(1) Working together with on-the-job training for Amtrak personnel in a continuous manner.

(2) Participating in conjunction with Amtrak in an annual review of the training materials for the Equipment.

(3) Training during the TSSSA contract shall include “best in class” continuous improvement training presented by the Contractor once per year at each Terminal Depot during all shifts.

(a) Continuous improvement training, developed and presented by the Contractor, shall incorporate all maintenance activities that will improve the reliability of the Equipment.

d). Contractor’s Material Documentation Role

i). In addition to other Documentation obligations that may occur elsewhere in the Statement of Work, Contractor shall perform the following:

(1) Providing training materials necessary for “Train the Trainer” sessions and for Amtrak to establish and hold ongoing maintenance training.

(2) Material part number establishment.

(a) Material identification to be updated as revisions take place or Material replacement occurs due to obsolescence or alternative sourcing of Materials that have been accepted by Amtrak as meeting the approved level of performance and function as the original Material being replaced.

(i) This includes issuing of newly defined LRU in case of lower level of Material replacement being agreed upon or in the event of new Material numbers.

(b) In performing the work, Contractor shall only provide Material of the same or similar standards, functionality, features and quality as the original equipment manufactured Material provided under the TSSSA Contract, except where Contractor seeks and is granted Amtrak approval, which shall not be unreasonably withheld.

(c) If Contractor wishes to change the supplier of any Material (a “Proposed Supplier Change”), Contractor shall notify Amtrak in writing of the Proposed Supplier Change including the new supplier’s name and Contractor’s, suppliers’ part numbers, and any of the information reasonably requested by Amtrak.

(3) Notification to Amtrak if the bill of material for any Material, assembly, or LRU requires updating due to proposed changes by a manufacturer to any components or subcomponents within an assembly.

(a) Changes shall include, but not be limited to, changes to Material manufacturer, technical specifications, Materials, geometry, functionality, country of origin, or method of manufacture.

(4) Contractor is also responsible for updating affected documentation such as serialized Material lists, bills of Materials, drawings, schematics, training documentation, and manuals.

(5) Contractor shall notify Amtrak of LRU revision changes for updates to Amtrak parts catalog.

(6) Notification to Amtrak when Contractor observes that the documentation used by Amtrak technicians does not reflect a current and correct status.

ii). Contractor to provide Documentation Oversight Plan to ensure current and correct documentation.

e). Communications Plan – Communications and Meetings

i). Communication Plan

(1) Daily meetings will be held between Amtrak and Contractor at each site location to cover local logistics, shop moves, Equipment repair status, and other activities.

(a) Contractor shall participate in operations meetings and conference calls as required, but no less than outlined in Figure G-4 below, at dates and times agreed to by the parties.

(b) The designated Contractor's representatives and Amtrak's representatives shall communicate regularly outside of these designated meeting to ensure the success of the operation and relationship.

Figure G-4: Meetings

Frequency	Discussion
Daily Meeting	1. Review Availability/Out-of-Service Units 2. Review Failures and Cause(s) of Failures 3. Collect Issues/Concerns
Weekly Meeting / Conference Call	1. Collect Metrics 2. Joint Review of Metrics 3. Facilitate TSSSA Contract 4. Document Disputes 5. Collect Issues/Concerns 6. Resolve Disputes Issues/Concerns 7. Review Work Order Accuracy
Monthly Meeting	1. Resolve Disputes 2. Resolve Issues/ Concerns 3. Finalize Monthly Metrics for Settlement 4. Discuss Equipment performance 5. Review FMPs 6. Review Purchase order requests 7. Review of Metrics 8. Contractual Review 9. Diagnostics/Predictive Analysis Review 10. Staffing Review 11. Continuous Improvement Review 12. Contractor Recommendations Training 13. Partnership Topics 14. Obsolescence Management 15. Untimely Delivery of Material
Biannual and Annual Meetings	1. Resolve Contractual Issues 2. Review Action Items 3. Forecast Annual Service Payment for Following Year 4. Reconcile Annual Annual Service Payment 5. Review Material Usage, Stocking Levels, and Inventory Value Review Performance Metrics 6. Review Reliability Targets and Trends
Continuous Improvement Meeting	1. Review Job Analysis 2. Review Performance Against Baseline 3. Review Contractor Proposals Evaluate Business Case Proposals

(a) Once both parties have mutually resolved open issues that may include, but not be limited to, performance metrics, requisition status, core status or Performance Guarantees or Performance Incentives, it is understood that the issue is closed.

(b) However, should Contractor wish to dispute any of the issues, or if Contractor believes that specific claims are excluded, then Contractor shall have the burden of proof to justify the exclusion.

(c) The descriptions of the following meetings are intended to identify and discuss issues at various levels within the organizations, with the intent to resolve open issues at the lowest possible level.

(2) Contractor's costs for attending meetings described in this section and Figure G-4 are already included in the basic monthly compensation.

ii). Weekly Meetings

(1) Among other things, the intent for the weekly meetings is for the local Amtrak and Contractor representatives to coordinate activities and attempt to resolve any issues that have been raised over the previous week.

(2) Issues that are unresolved and that have been escalated from the daily meetings shall be discussed during the weekly meeting with the intent for both parties to mutually agree to a resolution.

(3) Discussion topics would include TSSSA Contract performance metrics, Amtrak enterprise asset management system Work Order accuracy, and any issues that the parties have not agreed to.

(4) Should any specific issue or issues not be resolved during the weekly meeting, they will be documented for discussion and resolution during the monthly meeting.

(5) Open items from previous weekly meetings will be tracked for resolution.

iii). Monthly Meetings

(1) Among other things, the intent for the monthly meeting is for both parties to resolve contractual issues and review action items in a face-to-face setting.

(2) The expectation is that an agenda will be mutually developed and that both parties will complete regular action items as may be required.

(3) The monthly meeting will also be an opportunity to discuss any related engineering issues, modifications, FMPs, or topics as either party may require, as well as review of Data and calculation of the performance metrics.

(4) The parties agree to mutually resolve any open issues that have been documented as part of the weekly meetings.

iv). Biannual and Annual Meetings

(1) The intent for the biannual and annual meetings called out in this TSSSA Contract is for both parties to resolve contractual issues and review action items in a face-to-face setting.

(a) The expectation is that an agenda will be mutually developed and that both parties will complete regular action items as may be required.

(b) The biannual and annual meetings will also be an opportunity to discuss any related engineering issues, Material issues, maintenance issues, modifications, FMPs, or topics as either party may require, as well as review of Data and calculation of the performance metrics.

(c) The parties agree to mutually resolve any open issues that have been documented as part of the monthly meetings.

v). Other Meetings

(1) Daily meetings will be held between Amtrak and Contractor at each site location to cover local logistics, shop moves, Car repair status, and other activities.

(2) The parties shall recognize that the need for other meetings requiring participation by Contractor's personnel will arise from time to time.

(3) The parties agree to cooperate in making available the appropriate personnel to attend those meetings, upon being given reasonable notice by Amtrak.

f). Operating Reports

i). As reasonably required by Amtrak, Contractor shall supply reports in support of the ongoing TSSSA Contract deliverables.

ii). Contractor to provide four (4) times a year an estimate of the value of Material that fulfills the requirements of Section 1.3.

G.14 Continuous Improvement

a). Purpose of Continuous Improvement

i). The overall objective of having an ongoing focus on continuous improvement and reducing the amount of time required to maintain the Equipment will be one of the primary goals pursued by the maintenance planners.

ii). This will be a repetitive cycle of comparing maintenance plans against actual time taken, suggesting improvements or changes to maintenance processes or methods.

iii). In the event where processes or tasks change, Contractor will work closely with Amtrak labor management, quality assurance and the training department to implement recommended changes.

iv). Amtrak seeks opportunities to improve maintenance, both in the ability to predict and plan for maintenance and the actual maintenance performed on the Equipment.

(1) Through the use of diagnostic monitoring and analytical tools, efficiencies may be gained through software applications and diagnostic data to predict Failures before they occur or provide early indication when maintenance should be scheduled in order to avoid reacting to Unscheduled Maintenance.

(2) Early indication and identification by the Contractor are essential to helping drive the continuous improvement philosophy.

(3) To the extent that the Contractor is able to effectively predict maintenance needs and prevent an Unscheduled Maintenance event, Amtrak will consider corrective actions recommended as a result of Contractors' predictive analysis to be a Scheduled Maintenance event for those actions identified by the Contractor provided the Contractor provides Amtrak with notice of the preventive maintenance action at least 48 hours prior to the need for maintenance.

(4) Maintenance activity efficiencies can be gained through improvements to the rate for successful first-time repairs, repair time spent waiting for Material, troubleshooting or fault-finding time, repair or replacement process, alternative repair location(s), or training in maintenance and operations, among others.

v). In collaboration, Amtrak and Contractor share the objective of minimizing the out-of-service time, improving performance, maximizing efficiencies of the maintenance and operations of the Equipment, improving predictive analytics, and extending the periodicities between maintenance activities.

(1) This will entail thorough research, diagnostic monitoring and predictive analysis, discussions, agreements and appropriate field test analysis to ensure changes to maintenance practices are appropriate taking the associated risks into account.

(2) Amtrak is open to the concept of sharing of documented cost savings or adjustments to TSSSA Contract Performance Guarantees and Incentives that can be realized over the course of the TSSSA.

b). Continuous Improvement Team

i). The parties agree to jointly participate in the team make-up as described in Table 4.

c). Setting Standards and Processes Around Continuous Improvement

i). The Continuous Improvement Team shall meet and jointly determine:

(1) As an initial task:

(a) Contractor shall develop the Job Analysis which will include the resources, number of hours, Material, procedures, tooling and related documents required for Scheduled and Unscheduled Maintenance activities requiring Amtrak labor of more than one-quarter (0.25) labor hour.

(b) This Job Analysis will become baseline and will need to be shop floor validated prior to approval.

(2) Specific Contractor deliverables.

(a) Contractor to submit first draft of the Job Analysis at the end of the first Car's Three-Year Warranty Period.

(b) Contractor to have all applicable Job Analyses approved and in place within twenty-four (24) months after the end of the first Car's Three-Year Warranty Period.

ii). On an on-going basis:

(1) In preparation for the continuous improvement meeting, on an annual basis, a benchmark analysis utilizing Contractor's global experience of maintenance for comparison with the Amtrak actuals shall be provided by Contractor as a deliverable.

(2) For any proposed continuous improvement, Contractor will create a business case that justifies the improvement and submit to Amtrak for review and approval.

(3) If Amtrak approves the business case the parties will mutually agree to cost and benefit sharing.

G.15 Fleet Modification Program

a). Failure Rate

i). If the Failure of a particular item of Material exceeds ten percent (10%) of the installed quantity in the Fleet in any given twelve (12) month period, with the unit of Material being at the LRU level at which the part is replaced or transacted, if requested by Amtrak, Contractor will institute a Fleet Modification Program (FMP) to address the identified Fleet defect.

ii). Excluded from the calculation of the ten percent (10%) are Failures of LRUs that would not have failed if an agreed-upon Fleet Modification Program had been implemented. The burden of proof rests upon Contractor.

b). Fleet Modification Program Plan

i). Within thirty (30) days of Amtrak's request for a Fleet Modification Program (FMP), Contractor shall provide a written, detailed Fleet Modification Program Plan for the Fleet Modification Program addressing the Fleet defect for Amtrak's approval.

(1) The Fleet Modification Program Plan shall include Contractor's schedule for delivering the FMP required Materials, suggested standard hours for installation, which shall be agreed to by the parties, and installation schedule.

(2) Amtrak shall provide its then current labor costs, management fee and overhead rate, adjusted annually, for the given Fleet Modification Program period.

(3) Such Fleet Modification Program Plan shall have as its goal to bring the Fleet to optimal operating condition in as short a timeframe as possible with the least amount of financial and other impact to Amtrak.

(4) Within sixty (60) days of receipt of the Fleet Modification Program Plan, Amtrak shall notify Contractor in writing whether it approves of such plan.

(5) If after fifteen (15) days Amtrak has not responded, Contractor shall provide written notice to Amtrak that the Fleet Modification Program will be accepted as submitted unless otherwise notified within five (5) business days from such written notice.

(6) If Amtrak notifies the Contractor in writing that it does not approve of the Fleet Modification Program Plan, Contractor shall revise the proposed Fleet Modification Program Plan until approved by Amtrak, whose approval shall not be unreasonably withheld.

(7) Upon approval, the Fleet Modification Program shall be implemented promptly in accordance with a mutually agreed upon schedule.

ii). Contractor shall provide all required Material, instructions and technical support along with reimbursement for Amtrak labor required to carry out the Fleet Modification Program.

(1) The reimbursement of Amtrak labor shall be monthly unless otherwise agreed to by the parties.

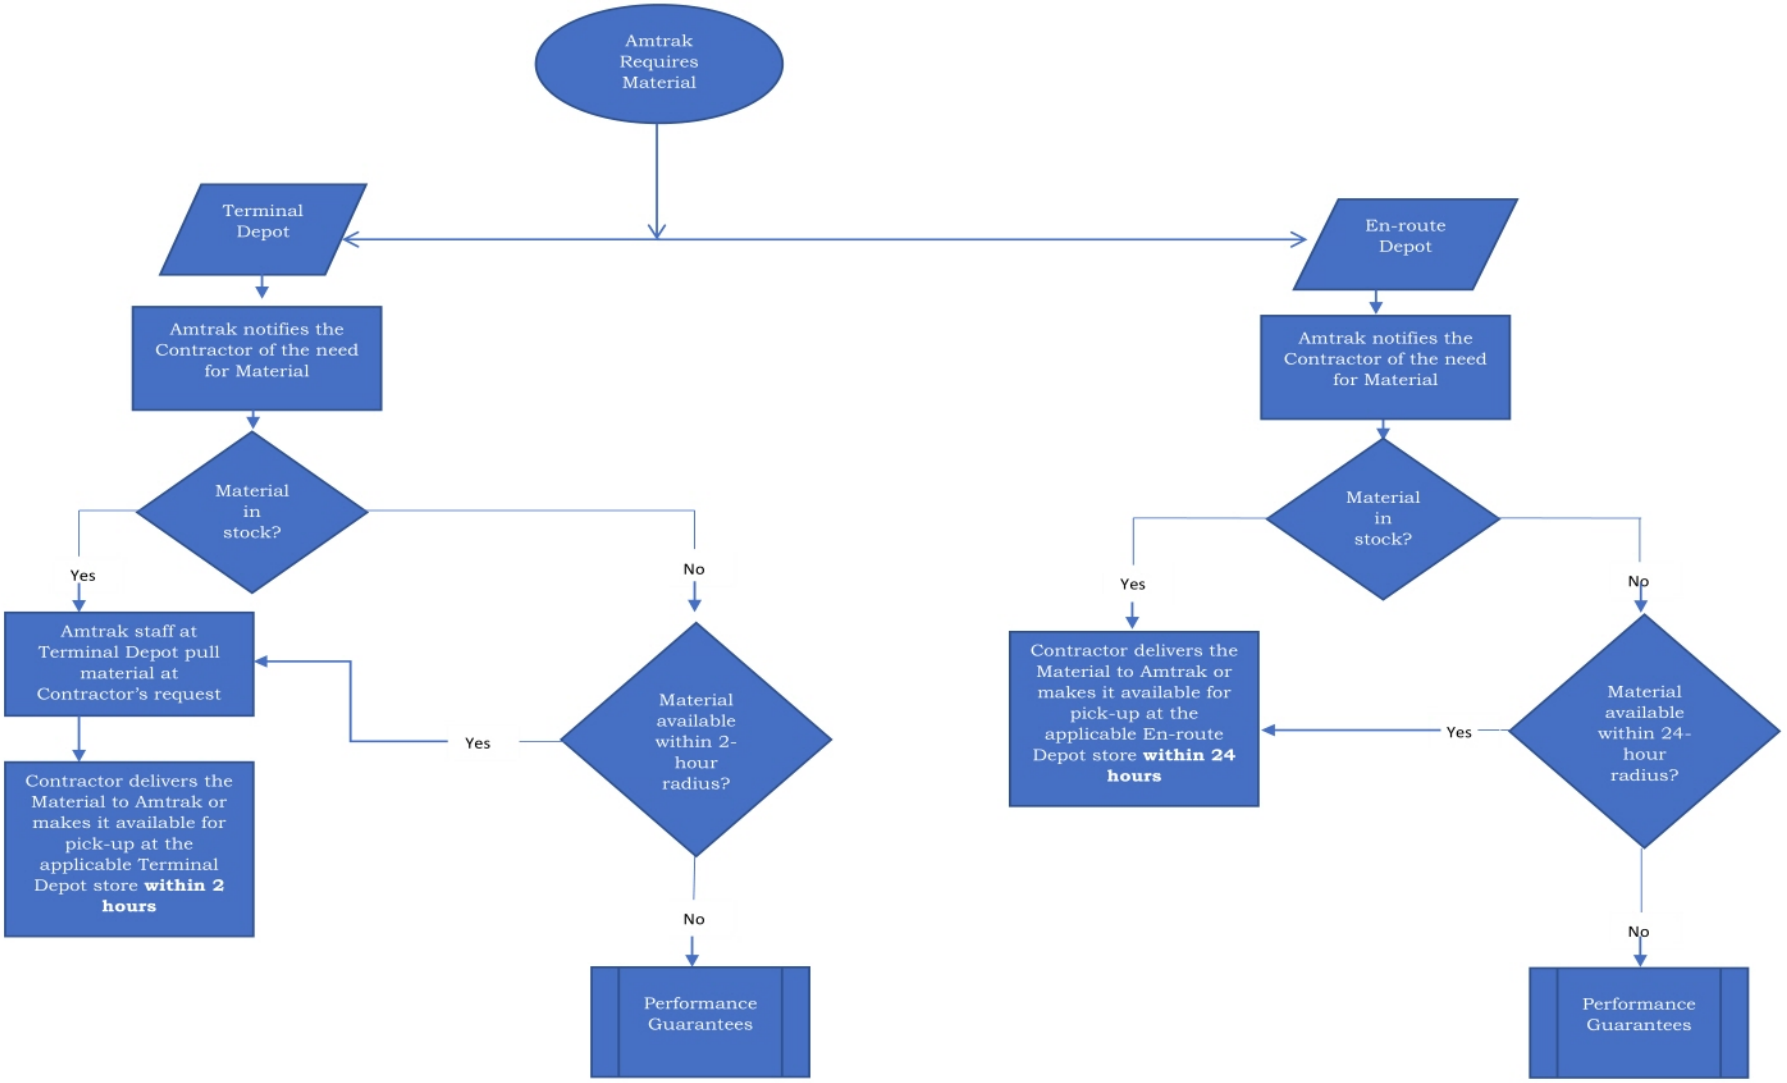
iii). If Material for the Equipment's scheduled Fleet Modification Program is not available on the agreed-upon date per the Fleet Modification Program Plan, the Equipment shall then be considered in CHFM status.

G.16 CDRLs

CDRL	Description	Due
CDRL G-01	Preliminary Mobilization Plan	3 years prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-02	Interim Mobilization Plan	2 years prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-03	An agenda and a recommended list of participants for both parties.	30 days prior to kick-off meeting.
CDRL G-04	The Contractor shall develop and submit to Amtrak for review and approval a comprehensive Maintenance Plan	1 year prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-05	Contractor shall stock all Amtrak Terminal Depot warehouse sites and Enroute Depot locations with sufficient Material needed to support the agreed upon Maintenance Plan.	30 days prior to Delivery of first Car.
CDRL G-06	Final Mobilization Plan including the details of Material quantities, the comprehensive Maintenance Plan, the Life Cycle Maintenance Schedule, detailed training scheduled and all other maintenance information necessary to initiate service	1 year prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-07	A list of defined roles, responsibilities, and reporting structures for the Team Leads and key team personnel	3 years prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-08	Monthly mobilization progress report	Monthly after kickoff
CDRL G-09	TSSSA Program Management and Staffing Plan	3 years prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-10	Contractor shall develop and submit to Amtrak for review and approval a Life-cycle Maintenance Schedule listing of all Fragmented Continuous Maintenance activities	1 year prior to the scheduled Conditional Acceptance of the first Car.
CDRL G-11	Annual Maintenance Schedule	1 year prior to the scheduled Conditional

		Acceptance of the first Car.
CDRL G-12	Work Order Templates	1 year prior to the scheduled Conditional Acceptance of the first Car
CDRL G-13	Operator's Manual	Bi-Annually
CDRL G-14	Book of Wear and Appearance Standards	2 years prior to the scheduled Conditional Acceptance of the first Car

Appendix A:



Responsibility Matrix

Ref.	Activity	TSSSA Responsibility
	Management	
1	Amtrak maintenance staff	Amtrak
2	Implementation of the Maintenance Plan	Amtrak
3	Management of Contractor's Technical Support staff	Contractor
4	Management of warranty claims and associated activity	Contractor
	Direct Labor	
5	Scheduled Maintenance labor	Amtrak
6	Unscheduled Maintenance	Amtrak
7	Labor for component replacement	Amtrak
8	Labor for any repair or overhaul activities to be carried out outside of the Depot	Contractor
9	Labor for inspection, repair, cleaning, and train preparation	Amtrak
	Materials	
10	Provide Scheduled Maintenance Material	Contractor
11	Provide Unscheduled Maintenance Material	Contractor
12	Provide All Consumable Spares & Lubricants (oils, grease, etc.) required for the maintenance and operation of the long-distance fleet covered by this contract.	Contractor
13	Provide Spares for Special Tools delivered by the Contractor	Contractor
14	Provide Rotable Materials	Contractor
15	Provide all Materials for Aesthetic Material replacement (reference G.10.h)	Contractor
16	Material Control at Terminal Depots (Shipping/Receiving/Warehouse/Material Distribution to Mechanical)	Amtrak
17	Material Management (Procurement/Planning)	Contractor
18	Transportation of all Material	Contractor
19	Supply Chain Management	Contractor
20	Cost of Material for Excluded Matter Damage	Amtrak
	Technical Support Services	
21	Management of incident investigation and recovery	Amtrak & Contractor
22	Provide technical support to incident investigation and recovery	Contractor
23	Technical support to investigate and resolve systemic fleet problems	Contractor
24	Technical support to Help Desk (CNOC)	Contractor
25	Supply and updating of maintenance documentation/instructions	Contractor
26	Performance engineering, including performance analysis and trending	Amtrak & Contractor
27	Updating of drawings, documentation, Technical Library	Contractor
28	Configuration control of all Cars	Contractor
297	RAMS and improvement processes and events	Contractor
	Training	
30	Initial training of train the trainer staff	Contractor
31	On-going training of training staff	Contractor
32	On-going training of maintenance staff	Contractor
	General	

Ref.	Activity	TSSSA Responsibility
33	Repainting – minor and Major damage e.g. ballast	Amtrak & Contractor
34	Maintenance services for the Wi-Fi System	Amtrak & Contractor
35	Crash/accident/misuse repairs while under control of Contractor	Contractor
36	Failed Car recovery	Amtrak
37	Vehicle movement planning	Amtrak
	Amtrak Maintenance Facility Equipment	
38	Provide access to facilities and equipment on site	Amtrak
39	Provide Special Tools and test equipment for Cars	Contractor
40	Calibration of Special Tools & test equipment	Contractor
	Digital Technology	
41	Maintenance and support of DT systems – general	Contractor
42	Provide an integrated maintenance information management system	Contractor
	Miscellaneous	
43	Provide office space on site for Contractor's staff	Amtrak
44	Vehicle (Car History Book) records updating	Contractor
45	Equipment movements at Amtrak Depots	Amtrak
46	Equipment storage at Amtrak Depots	Amtrak

Sample Work Instruction

	AMTRAK TRADE SECRET - CONFIDENTIAL AND PROPRIETARY INFORMATION	
Work Instruction #	**Title**	LDSL 975 to 957 Filter Upgrade
MOD00379		
Revision	**Date**	**# of Pages**
2.2		11
Equipment	**Type**	
LDSL	ALL	
# Personnel	**Estimated Task Duration**	**Total Man Hours**
3	8	24

1. PURPOSE

The purpose of this work instruction is to outline the step-by-step procedure to upgrade the Graham-White 975 Filter with Manual Drain Valve to the Graham-White 957 Coalescing Filter with Auto-Stop Drain Valve and Heater on LDSL cars.

2. SCOPE

This work instruction outlines the step-by-step procedure to upgrade the Graham-White 975 Filter with Manual Drain Valve to the Graham-White 957 Coalescing Filter with Auto-Stop Drain Valve and Heater on LDSL cars.

3. HISTORY

None.

4. SAFETY PRECAUTIONS

WARNING

WEAR PERSONAL PROTECTIVE EQUIPMENT AT ALL TIMES WHILE CONDUCTING THIS PROCEDURE.

WARNING

PRIOR TO COMMENCING THIS PROCEDURE, COMPLY WITH ALL CODE OF FEDERAL REGULATIONS, TITLE 49, CHAPTER II, PART 218, REQUIREMENTS AND APPLY AMTRAK'S BLUE SIGNAL PROTECTION.

WARNING

TO PREVENT PERSONAL INJURY WHEN USING COMPRESSED AIR, OBSERVE ALL AMTRAK AND GOVERNMENT REGULATIONS. COMPRESSED AIR USED FOR CLEANING SHALL NOT EXCEED A PRESSURE OF 30 PSI. DO NOT USE COMPRESSED AIR TO BLOW DIRT FROM YOUR BODY OR CLOTHING.

5. REQUIRED PARTS, TOOLS AND REFERENCES

5.1.4. Amtrak Drawing 0051760

5.1.5. Amtrak Drawing 0051500

6. PROCEDURE

6.1. PIPING

6.1.1. Remove all air supply from the car.

6.1.2. Remove all necessary shrouds to access the Graham-White 975 Filter Assembly and respective piping.

6.1.3. Drain all air from the Main Reservoir and other supply tanks.

6.1.4. Loosen the three sleeve nuts of the input and output piping. Then loosen and remove the four bolts for the two 1" flanges on each side of the filter. Set both flanges and hardware aside for reuse.

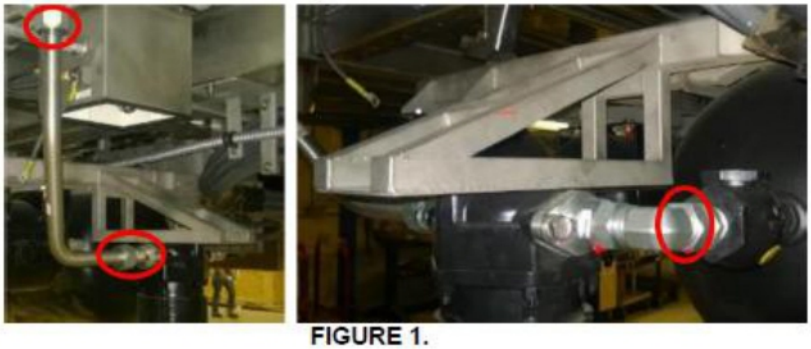

FIGURE 1.

AMTRAK TRADE SECRET - CONFIDENTIAL AND PROPRIETARY INFORMATION

6.1.5. Loosen and remove the two bolts at the top of the filter and remove the filter assembly. Set aside.

6.1.6. Plug the input and output piping using plastic pipe plugs to prevent any debris from getting into the air brake system.

6.1.7. Using a cutting wheel, remove the triangular shaped support bracket from the large support frame. Grind the surface smooth to prepare for welding.

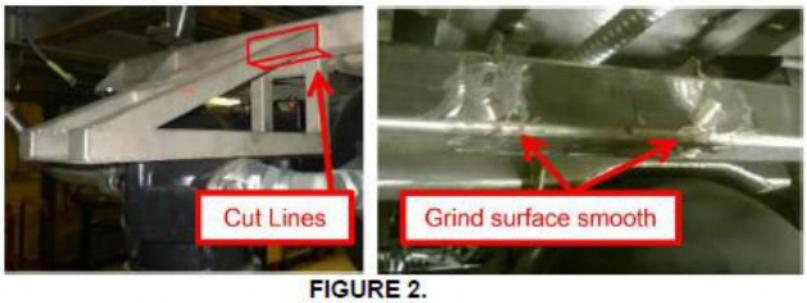

FIGURE 2.

6.1.8. Install 1" Swivel 90° Elbow (42 427 02708) to the 1" output flange removed earlier.

6.1.9. Attach the flange and elbow to the existing 1" Elbow before the 1" Check Valve and attach the 975 filter assembly removed earlier to the 1" Flange. NOTE: This is for fit up only. The 1" gasket is not required and the bolts only need to be hand tight.

FIGURE 3.

6.1.10. Attach the new main reservoir pipe assembly (50 000 10343) to the 1" input flange removed earlier. Bolt the flange to the input side of the 975 Filter and hand tighten.

6.1.11. Tighten the upper sleeve nut of the new main reservoir pipe assembly. Then begin tightening all hardware, sleeve nuts and fittings to get a dry fit of the piping.

6.1.12. Attach the new support bracket assembly (50 000 07018) to the 975 Filter using the same two bolts removed earlier in step 7.5. Slide the support bracket so that it is tight up against the main support frame.

6.1.13. Tack weld the new support bracket to the frame and then remove all of the piping, filter, flanges and elbows.

6.1.14. Finish welding the new support bracket per Amtrak's welding procedures.

6.1.15. Install the new 957 Filter with ASDV from the Graham White installation kit (50 000 04663) to the support bracket using the two ½" bolts in the top of the filter.

6.1.16. Attach the new main reservoir pipe assembly (50 000 10343) and hand tighten the bolts of the flange to the input side of the filter. Also hand tighten the sleeve nut at the opposite end of the pipe. **NOTE: Use the original 1" Flange gaskets.**

6.1.17. Attach the output side of the filter to the flange and hand tighten the bolts.

6.1.18. Tighten both flanges and all fittings first. Then tighten the two ½" bolts on top of the filter. Torque all ½" bolts to 78 ft-lbs.

6.1.19. Weld Pilot Controller Support Bracket to the main air brake support frame located 8 inches from the edge shown below.

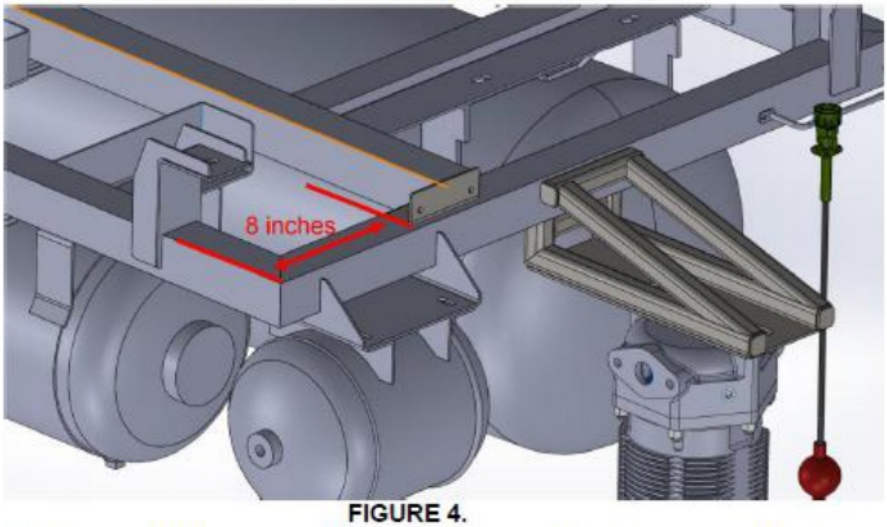

FIGURE 4.

6.1.20. Install the Pilot Controller in the Graham White installation kit to the side of the support bracket using the supplied hardware in the kit.

6.1.21. Install the stainless steel braided hoses and fittings (items 7, 8, 9, 10, 11, 12 and 13 in the diagram below) supplied in the Graham-White installation kit to the respective connection points of the pilot controller and filter assembly.

AMTRAK TRADE SECRET - CONFIDENTIAL AND PROPRIETARY INFORMATION

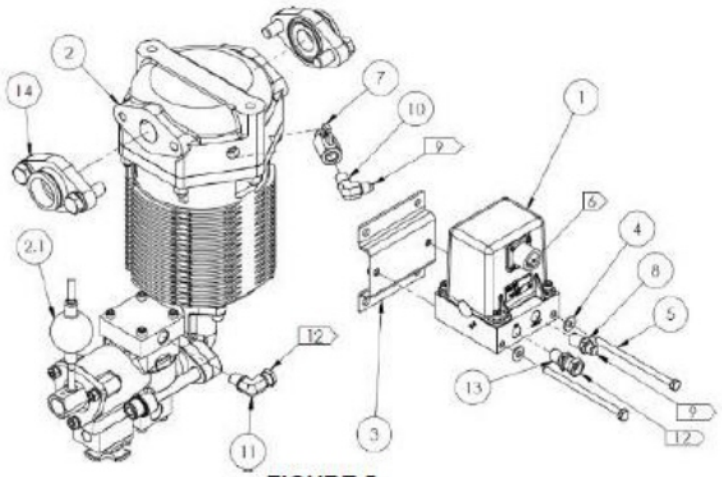

FIGURE 5.

6.1.22. Install a 3/8" NPT brass 90° elbow (42 805 20868) to the exhaust port of the ASDV and tighten so the elbow exhaust is facing towards the rail.

6.1.23. Install a ¼" brass street elbow (42 801 00132) to the other exhaust port of the ASDV and tighten so the elbow exhaust is facing towards the rail.

6.2. ELECTRICAL

6.2.1. Remove the cover from Pullbox #2 located above the filter assembly.

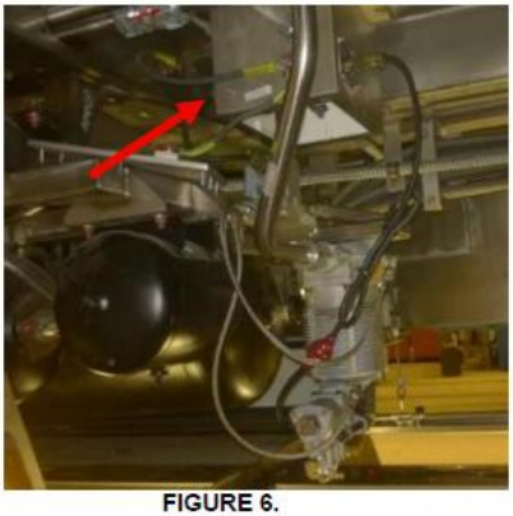

FIGURE 6.

6.2.2. Unwrap the bundle of wires in the pullbox and locate wires labeled U-SR649/PB2_SPARE and U-SR650/PB2_SPARE.

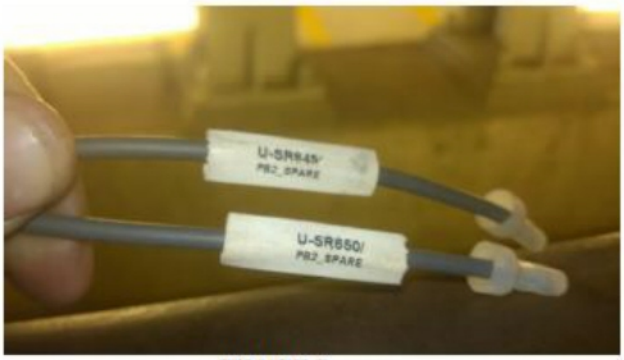

FIGURE 7.

6.2.3. Neatly wrap the wires not being used and secure them in the top of the pullbox using zip ties.

6.2.4. Install 4 point terminal block (24 030 0817X) to the inside wall of pullbox #2 using four (4) #10-32 x 1" machine screws and locknuts.

FIGURE 8.

6.2.5. Drill a ½" hole in the side of Pullbox #2 and install ½" strain relief connector (25 871 01378) and sealing ring (26 568 06173) to the pullbox.

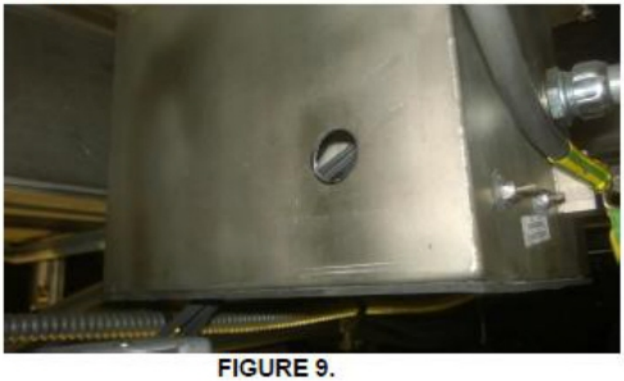

FIGURE 9.

6.2.6. Drill a 2" hole in the opposite side of Pullbox #2 and install the Amphenol mounting plate (50 000 07117) to the pullbox using ¼"-20 x 1" bolts and locknuts. Use sealant to prevent moisture intrusion.

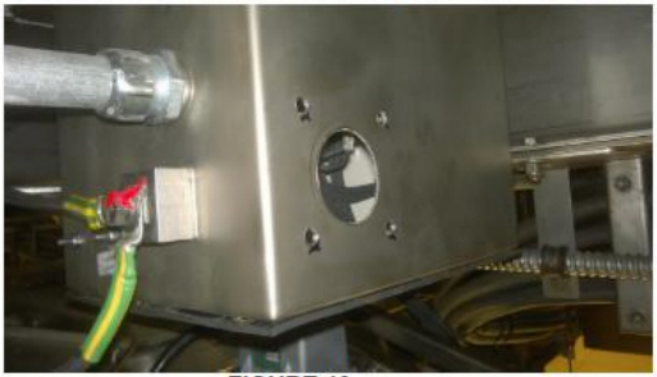

FIGURE 10.

6.2.7. Install the 2-pole Amphenol plug supplied in the Graham-White installation kit to the mounting plate using the supplied hardware.

FIGURE 11.

6.2.8. Remove cover of the Pilot Controller by removing the 4 cap screws. (This will require cutting the Tamper Evident Labels)

6.2.9. 7.32 Locate the Time Delay switch on the circuit board and use a small Phillips head screwdriver to adjust the Time Delay switch to Setting 4 (60-Minute Interval).

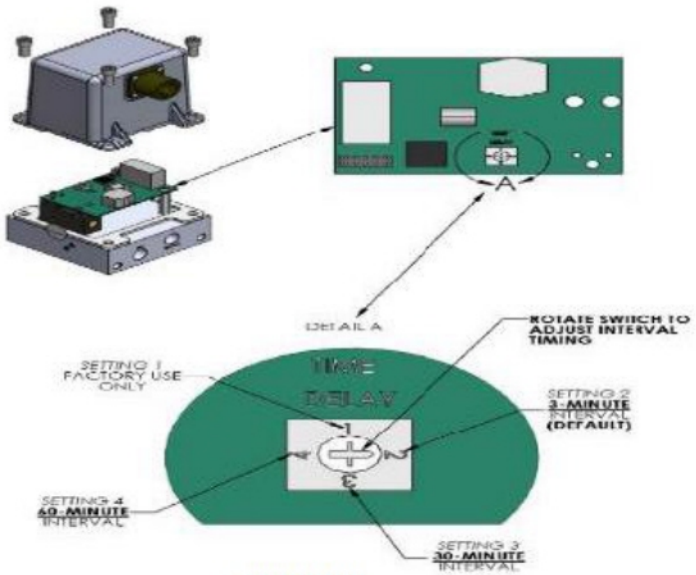

FIGURE 12.

6.2.10. Replace the Pilot Controller Cover using the same 4 cap screws.

6.2.11. Connect all wiring to the new terminal block per schematic below using ten ring terminals (25 999 30122).

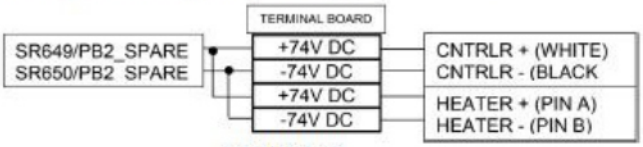

FIGURE 13.

6.2.12. Connect the pilot controller and heater cables to their respective Amphenol plugs.

6.2.13. Remove the front and back cover of the circuit breaker panel located in the electric locker.

6.2.14. Locate wires labeled U-SR649/PB2_SPARE and U-SR650/PB2_SPARE in the bundle of spare wires on the back of the circuit breaker panel.

FIGURE 14.

AMTRAK TRADE SECRET - CONFIDENTIAL AND PROPRIETARY INFORMATION

6.2.15. Wrap the wires not being used and secure them back to their original location.

6.2.16. Terminate U-SR649/PB2_SPARE on terminal ELCT6.12_9 using ring terminal (25 999 30122) and terminate U-SR650/PB2_SPARE on terminal ELCT6.12_10 using ring terminal (25 999 30122).

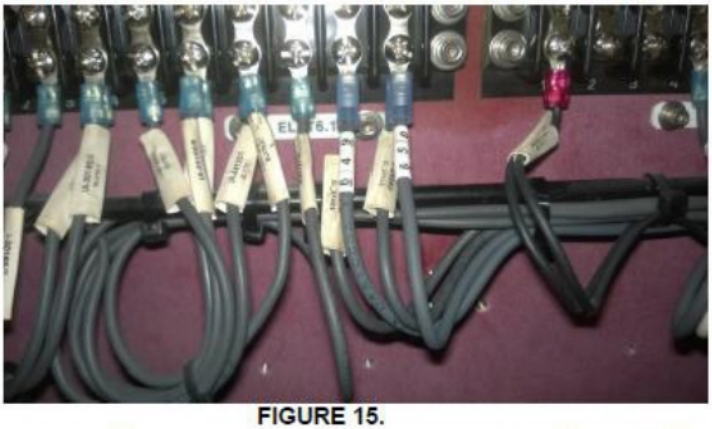

FIGURE 15.

6.2.17. Locate the spare 74VDC 10A 2P circuit breaker at the top of the circuit breaker panel. Connect the breaker to ELCT6.12_9 and ELCT6.12_10 using 16 AWG wire (25 613 02008) and four ring terminals (25 999 30122). Connect wire 649 to the positive side of the circuit breaker and 650 to the negative. Label new wires 649/+ and 650/-.

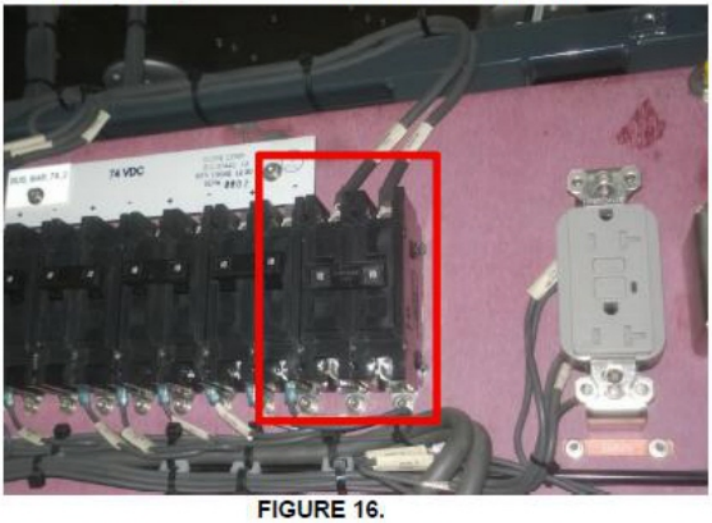

FIGURE 16.

6.2.18. Secure all new wiring using zip ties.

6.3. TESTING

6.3.1. Connect the car to Main Reservoir supply air and allow the brake system to charge for 10 minutes.

6.3.2. Check all pipe fittings for Main Reservoir leakage. Ensure the mini ball valve at the top of the new filter is open.

6.3.3. Turn the circuit breaker on and ensure the drain valve exhausts.

6.3.4. Apply torque stripe (47 651 00000) to all hardware and fittings.

FIGURE 17.

6.3.5. Reinstall all covers and access covers, install new circuit breaker label (50 000 10344) to the panel.

7. RECORD KEEPING

Document repairs to the equipment in WMS (Work Management System) and all appropriate MAP forms.

NOTE

Return the removed Air Filter Assembly (23 582 21413) to Material control as a core.

PROPOSAL FORM

NATIONAL RAILROAD PASSENGER CORPORATION
PROCUREMENT AND LOGISTICS DEPARTMENT
2955 MARKET STREET
PHILADELPHIA, PA 19104
PROJECT: UNIVERSAL SINGLE LEVEL FLEET REPLACEMENT PROGRAM
ATTENTION: GINA PITCHERELLA, PROCUREMENT SENIOR MANAGER

DATE OF RFP: 3/31/2026 Rev 0
RFP NO.: DOC5509033158
ELECTRONIC CLOSE DATE: 9/30/2026

Having thoroughly examined the Solicitation Documents as set forth in last section of the Instructions to Offerors and familiarized itself with the requirements contained therein, Offeror does hereby: (1) accept all of the terms and conditions of the Solicitation Documents (as may be modified by Amtrak by issuance of an amendment prior to the Close Date); and (2) tender a Financial Proposal for the following: Single Level Fleet Replacement – Equipment in accordance with Contract documents. Offeror's Total Firm Fixed Price for said Supplies/Services is in the amount of _____dollars ($_____).

Please refer to Exhibit I-2-Pricing Schedule which includes Options.

Offeror shall provide all supervision, labor, materials, tools, supplies, insurance, bonds or guarantees, permits, equipment transportation, overhead, profit, and any applicable duties or tariffs and any other items necessary to accomplish the Work, as set forth in the Solicitation Documents.

If awarded a contract, the Offeror agrees to complete the work within the agreed upon Delivery Schedule.

Offeror hereby acknowledges receipt of the following Amendments and certifies that its Price Proposal includes any and all price changes resulting from such Amendments:

Amendment Number	Date

This Proposal is firm for 365 calendar days after the Electronic Close Date.

IMPORTANT NOTICE: This Proposal Form, along with the Pricing Schedule and all other Solicitation Documents identified with an asterisk under the last section of the Instructions to Offerors, must be received by Amtrak prior to 2:00 P.M. (Eastern Time) on the Electronic Close Date specified above.

PROPOSAL FORM – TSSSA

NATIONAL RAILRAD PASSENGER CORPORATION
PROCUREMENT AND LOGISTICS DEPARTMENT
2955 MARKET STREET
PHILADELPHIA, PA 19104
PROJECT: UNIVERSAL SINGLE LEVEL FLEET REPLACEMENT PROGRAM
ATTENTION: GINA PITCHERELLA, PROCUREMENT SENIOR MANAGER

DATE OF RFP: 3/31/2026 Rev 0
RFP NO.: DOC5509033158
ELECTRONIC CLOSE DATE: 9/30/2026

Having thoroughly examined the Solicitation Documents as set forth in the last section of the Instructions to Offerors and familiarized itself with the requirements contained therein, Offeror does hereby: (1) accept all of the terms and conditions of the Solicitation Documents (as may be modified by Amtrak by issuance of an amendment prior to the Close Date); and (2) tender a Financial Proposal for the following Supplies and services: Single Level Fleet Replacement – Technical Support and Spares Supply Agreement in accordance with Contract documents. Offeror's Total Not to Exceed Price for said Services is in the amount of _____dollars ($_____).

Please refer to Exhibit J-2 Pricing Schedule – Single Level Fleet – TSSSA which includes Options.

Offeror shall provide all supervision, labor, materials, tools, supplies, insurance, bonds or guarantees, permits, equipment transportation, overhead, profit, and any applicable duties or tariffs and any other items necessary to accomplish the Work, as set forth in the Solicitation Documents.

If awarded a contract, the Offeror agrees to complete the work within the agreed upon Period of Performance.

Offeror hereby acknowledges receipt of the following Amendments and certifies that its Price Proposal includes any and all price changes resulting from such Amendments:

Amendment Number	Date

This Proposal is firm for 365 calendar days after the Electronic Close Date.

IMPORTANT NOTICE: This Proposal Form, along with the Pricing Schedule and all other Solicitation Documents identified with an asterisk under the last section of the Instructions to Offerors, must be received by Amtrak prior to 2:00 P.M. (Eastern Time) on the Electronic Close Date specified above.

THE UNDERSIGNED CERTIFIES THAT, TO THE BEST OF HIS/HER KNOWLEDGE,

Exhibit J-2 TSSSA Pricing Schedule

NOTES

All TSSSA pricing (USD) shall be based on the year 2029, subject to escalation from January 1, 2030 as per Table 6A
TSSSA pricing shall include all work as described in Exhibit G-TSSSA SOW.
All Contractors should price each table accordingly and supply a TSSSA cost for all years 1 -20, including any assumptions. These costs are to be all inclusive with OH and Profit.
Payment within 90 days from invoice date
Definition: Monthly Material Service Fee: Fixed monthly material fee per Active Equipment, subject to escalation, covering all materials as per Scope of Work, excluding the materials required for overhaul
Definition: Monthly Support Service Fee: Fixed monthly technical support fee for the fleet, subject to escalation, as per Scope of Work
Excluded Matter Damage (EMD) Materials. The Contractor shall be responsible for procuring and maintaining adequate stock of materials required for Excluded Matter Damage ("EMD Materials"). Amtrak shall be responsible for the cost of EMD Materials upon delivery to Amtrak, when such materials are requested by Amtrak. EMD Materials shall be invoiced to Amtrak on an open-book, cost-plus basis, consisting of the actual price paid by the Contractor to the subsupplier, plus a surcharge of twenty percent (20%). The surcharge shall cover freight, storage, handling, overhead, and profit
These cells contain formulas and shall not be modified
These cells are to be filled out by the Contractor

Exhibit J-2 TSSSA Pricing Schedule

Table 6A - ESCALATION FOR TECHNICAL SUPPORT, SPARES AND SUPPLIES AGREEMENT ("TSSSA")

Pricing firm until December 2029. For years 2030 onward, an escalation factor shall be applied as per below formulars.
TSSSA Costing shall be based on below mechanism proposed by Amtrak, not on optional alternatives proposed by Contractor (if any)

Cost Element	Name of Index	Source	Data Series Name	URL	How will this index be used in escalation calculation?
Monthly Material Service Fee and Overhaul materials	Producer Price Index by Commodity: Transportation Equipment: Railroad Equipment	US Bureau of Labor Statistics	(WPU144) "wpu"	https://data.bls.gov/pdq/SurveyOutputServlet	Xn(material) = Xo (material) * (wpu Q4 n-1 / wpu Q4 n-2) Xo (material) = Initial material service fee offered by Contractor, 2029 baseline Xn(material) = Escalated new material service fee for year n Thereafter each subsequent year, Xn-amount will become the new Xo-amount. wpu Q4 is the arithmetic average of WPU144 index for the months of October, November, December
Support Service Fee	Total compensation for Private industry workers in Nonunion, service-providing industries	US Bureau of Labor Statistics	CIU201S0000000520I "ciu"	https://data.bls.gov/dataViewer/view/timeseries/CIU201S0000000520I	Yn(labor) = Yo (labor) * (ciu Q4 n-1 / ciu Q4 n-2) Yo (labor) = Initial support service fee offered by Contractor, 2029 baseline. Yn(labor) = Escalated new support service fee for year n Thereafter each subsequent year, Yn-amount will become the new Yo-amount ciu Q4 is the arithmetic average of WPU144 index for the months of October/November/December
Performance Guarantees and Incentives as per G11 of SoW	Total compensation for Private industry workers in Nonunion, service-providing industries	US Bureau of Labor Statistics	CIU201S0000000520I "ciu"	https://data.bls.gov/dataViewer/view/timeseries/CIU201S0000000520I	Zn(perf) = Zo (perf) * (ciu Q4 n-1 / ciu Q4 n-2) Zo (perf) = guarantee/incentive amount as per SoW, 2029 baseline. Zn(perf) = Escalated new guarantee/incentive amount for year n Thereafter each subsequent year, Zn-amount will become the new Zo-amount ciu Q4 is the arithmetic average of WPU144 index for the months of October/November/December

Option: Alternative proposal by Contractor (if any)

Cost Element	Name of Index	Source	Data Series Name	URL	How will this index be used in escalation calculation?
Monthly Material Service Fee and Overhaul materials					
Support Service Fee					
Performance Guarantees and Incentives as per G11 of SoW					

Cost impact on Monthly Material Service Fee and Overhaul materials if alternative proposed by Contractor is applied:

Cost impact on Monthly Support Service Fee if alternative proposed by Contractor is applied:

Notes

• In the first month of each calender year, starting January 2030, parties shall determine the new prices as per above formulars by applying the published quarter 4 arithemetic average of wpu/ciu index of previous year (Qn-1) and the published quarter 4 arithemetic average of wpu/ciu index of the year before previous year (Qn-2)) to the formulars. Contractor to invoice new prices beginning of each February for the services rendered in January onwards. For the sake of clarity, prices might increase in case of inflation or decrease in case of deflation.

• The yearly price increase / decrease shall be capped at +/- 10% maximum

26-FOI-00415 0000006242 Massachusetts Avenue, N.W. Washington, DC 20001 UNCLASSIFIED 4/30/2026

Table 6A - ESCALATION FOR TECHNICAL SUPPORT, SPARES AND SUPPLIES AGREEMENT ("TSSSA")

• Any annual price escalation specified in the Price Sheet shall not apply to any period of delay in project milestones or delivery in the execution of either the new-built contract or the TSSSA contract. If the aggregated delay exceeds twelve (12) months, the escalation shall be paused for one (1) year. For every additional twelve (12) months of aggregated delay (e.g., twenty-four (24) months, thirty-six (36) months), an additional one (1) year of escalation shall be paused.

• If the "wpu" or "ciu" index published by the U.S. Bureau of Labor Statistics is discontinued, substantially altered, or no longer available, the parties shall promptly meet and agree on a substitute index that most closely reflects the same economic conditions and cost trends as WPU144.

26-FOI-00415 00000006243 "UNCLASSIFIED" 4/30/2026

SUBJECT	CLASSIFICATION	DATE APPROVED	P/I NUMBER
Background Check	Human Resources	November 4, 2020	7.39.3

1.0 POLICY

Safety is Amtrak's highest priority. To protect its employees, customers, finances, data, property and other assets, Amtrak requires a Background Check of every Prospective Employee and certain Contractors, prior to commencing work for Amtrak.

2.0 RESPONSIBILITY

The Executive Vice President, Chief Human Resources Officer is responsible for the administration and interpretation of this policy. Exceptions to this policy are discouraged; however, if a manager believes an exception is warranted, a request should be forwarded to HRCompliance@amtrak.com for possible consideration by the Executive Vice President, Chief Human Resources Officer, in consultation with the department's Executive Vice President, Amtrak Police Department (APD), Law, Finance or other departments as appropriate.

3.0 PURPOSE

This policy establishes standards for conducting Background Checks.

4.0 SCOPE

This policy applies to all departments which engage or seek to engage outside firms or individuals to perform work for or on behalf of Amtrak, except the APD which is subject to applicable APD policies.

5.0 DEFINITIONS

For purposes of this policy, the following definitions apply:

5.1 Background Check. An investigation, review and evaluation of the background of a Prospective Employee, Contractor or current employee. A Background Check shall include the following:

- A review of relevant criminal history databases;
- Social Security number verification;
- A review of relevant databases to determine the individual's eligibility to work in the United States;
- Prior employment verification and references;
- Education, licensure or certification verification; and
- Credit checks when job-related and consistent with business necessity.

5.2 Contractor. An Independent Contractor or Temporary Contractor as defined in the Independent and Temporary Contractor Services policy, P/I 7.13, or a Professional Services contractor as defined in the Consultant Services policy, P/I 1.6.

5.3 Prospective Employee. A candidate for employment who accepts a conditional offer of employment.

26-FOI-00415 00000006243 "UNCLASSIFIED" 4/30/2026

6.0 BACKGROUND CHECK REQUIREMENTS (PROSPECTIVE EMPLOYEE)

A Background Check will be required of each Prospective Employee within six (6) months prior to commencing work for, or on behalf of, Amtrak.

7.0 BACKGROUND CHECK REQUIREMENTS (CONTRACTOR)

A Background Check will be required of each Contractor within six (6) months prior to commencing work for, or on behalf of, Amtrak when the work performed or expected to be performed entails or is expected to entail either:

7.1 Access to Facilities / Infrastructure. Unsupervised physical access to facilities owned or operated by Amtrak (e.g., individuals who receive an Amtrak identification badge and / or security key card) or access to Amtrak infrastructure, including but not limited to administrative rights access to Amtrak IT infrastructure and systems; or

7.2 Access to Other Information. Access to any of the following types of Amtrak information:

- Protected Critical Infrastructure Information (PCII) and Sensitive Security Information (SSI);
- Vulnerability assessments;
- Security risk assessments;
- Threat assessments;
- Corporate Security Plan information;
- Tactical and operational plans prepared by or for the Mobile Team and its partners, including but not limited to deployment schedules and baggage screening schedules;
- Security Procedures and Alert Plans prepared by or for Amtrak;
- Deployment Schedules and Resource Loading regarding Mobile Team operations;
- Security Capital Plan documents;
- Information regarding security remediation plans, solutions and priorities;
- Control Systems and related technical information, including but not limited to Positive Train Control, SCADA infrastructure and Dispatch Systems and related controls;
- Emergency and / or disaster recovery plans;
- Business continuity and recovery plans;
- Emergency response procedures; or
- Credit card information, including but not limited to PCI data.

7.3 Access Exemptions. Individuals having access to the information listed in Sections 7.1 and 7.2 above solely in connection with anticipated or actual litigation or in response to a subpoena or other legal process, and individuals whose work is not expected to involve access as described in Sections 7.1 and 7.2 above, are exempted from this policy.

8.0 CURRENT EMPLOYEE

Upon request by the department's Executive Vice President and in consultation with the Law Department and APD, the Executive Vice President, Chief Human Resources Officer (or that

26-FOI-00415 00000006243 "UNCLASSIFIED" 4/30/2026

individual's designee) shall have the authority to require background checks on current employees where there is a safety or security necessity, or where there are heightened security risks. Amtrak reserves the right to take disciplinary action, up to and including termination, based on the results of a Background Check of a current employee.

9.0 CRIMINAL CONVICTION NOTIFICATION

In accordance with the Disclosure of Criminal Convictions policy, P/I 7.57, employees and Contractors are required to report any conviction received while working for Amtrak within seventy-two (72) hours of the conviction.

10.0 CREDIT CHECK

For a limited number of positions that may require significant financial responsibility, a Background Check may include a credit check. Human Resources, in consultation with the affected Amtrak department, shall determine whether, due to the work to be performed, a Background Check should include a credit history check.

11.0 DRUG AND ALCOHOL RECORDS

Pursuant to the Drug and Alcohol-Free Workplace Program Guidelines and Procedures, for all Prospective Employees and current employees who seek to begin Department of Transportation-regulated service, a Background Check will include a review of information from prior employers detailing the employee's or Prospective Employee's drug and alcohol testing records.

12.0 REPEAT BACKGROUND CHECK

The Executive Vice President, Chief Human Resources Officer and a department's Executive Vice President (or their designees) shall have authority to require periodic re-investigations in the form of repeat Background Checks in circumstances where there is a law enforcement, safety or security necessity.

13.0 ADMINISTRATION

13.1 The Human Resources department is responsible for the following:

13.1.1 Ensuring Background Checks are conducted on every Prospective Employee and Independent Contractor in accordance with this policy and Amtrak's Background Check Guidelines.

13.1.2 Maintaining Background Check investigation reports in accordance with Amtrak's record retention policies.

13.2 For contracts negotiated by the Procurement department (except for contracts to procure Temporary Contractors, as they are defined in the Independent and Temporary Contractor Services policy, P/I 7.13), the Procurement department is responsible for the following:

13.2.1 Ensuring that firms or entities complete a Contractor Staffing Resource Background Check Certification form, NRPC 3524, affirming compliance with

26-FOI-00415 00000006243 "UNCLASSIFIED" 4/30/2026

this policy and Background Check Guidelines including the requirement to conduct a Background Check on every Professional Services contractor within six (6) months prior to the individual commencing work for or on behalf of Amtrak.

13.2.2 Providing the firm or entity a copy of this policy and the Background Check Guidelines.

13.2.3 Ensuring the appropriate contractual provisions reflecting the requirements of this policy are incorporated into agreements between Amtrak and the firm or entity.

13.3 For contracts negotiated by individual departments outside the Procurement process and when acquiring Temporary Contractors, the department is responsible for the following:

13.3.1 Ensuring that firms or entities (including a Staffing Agency) complete a Contractor Staffing Resource Background Check Certification form, NRPC 3524, affirming compliance with this policy and Background Check Guidelines including the requirement to conduct a Background Check on every Professional Services contractor or Temporary Contractor within six (6) months prior to the Professional Services contractor or Temporary Contractor commencing work for or on behalf of Amtrak.

13.3.2 Providing the firm or entity (including a Staffing Agency) a copy of this policy and the Background Check Guidelines.

13.3.3 Ensuring the appropriate contractual provisions reflecting the requirements of this policy are incorporated into agreements between Amtrak and the firm or entity.

14.0 FURTHER CHECKS

Nothing in this policy shall be interpreted to restrict or broaden Amtrak's ability to conduct or require more in-depth background investigations of employees, Prospective Employees, Independent Contractors, Professional Services contractors or Temporary Contractors who perform security-sensitive duties and to make disqualification decisions based on the results of such additional background investigations.

15.0 POST-DISQUALIFICATION

If an individual has been disqualified for an employment or Contractor position based upon the Background Check and pursuant to this policy and / or the Background Check Guidelines, such position may not be filled, except on a temporary basis, until either: (a) the time for submitting an appeal or waiver request has expired; or (b) the appeal or request for a waiver has been resolved. This provision does not apply to individuals who are rejected or terminated for failing to provide complete and accurate information during the application process.

26-FOI-00415 00000006243 "UNCLASSIFIED" 4/30/2026

16.0 CONFIDENTIALITY

Background Check reports are confidential and to be disseminated only to the extent permitted by law and reasonably necessary for Amtrak to meet its legitimate business needs.

17.0 AUDIT

Human Resources shall conduct periodic audits to ensure compliance with this policy.

18.0 NON-COMPLIANCE

Failure to comply with this policy and the Background Check Guidelines poses an unacceptable risk to Amtrak and may result in disciplinary action.

EXHIBIT M-1
BUY AMERICA REQUIREMENTS

UNIVERSAL SINGLE LEVEL FLEET REPLACEMENT EQUIPMENT
DOMESTIC PREFERENCE REQUIREMENTS/AMTRAK BUY AMERICAN ACT

As noted in the instructions to offerors, this request for proposal (RFP) and the resulting Supplies contracts will be subject to Amtrak's domestic preference requirements found at 49 U.S.C. § 24305(f) (the "Amtrak Buy American Act"), the domestic preference requirements of the Build America, Buy America Act (BABA) § 70914, Pub. L. No. 117-58, div. G, tit. IX, subtit. A, 135 Stat. 429, 1298 (2021), as implemented by OMB, USDOT, and FRA and 2 C.F.R. §200.32. The technical support supplies agreement (TSSSA) will be subject to these Amtrak Buy American Act, as well. The applicable Buy American provision is also set forth in the Supplementary General Provisions for Nonconstruction Contracts.

I. Amtrak Buy American Act Requirements

A. The Amtrak Buy American requirements of this RFP are comprised of two parts:

Part I – Domestic Preference/Buy American Certification and Waiver Processes: Offeror must complete the Domestic Preference/Buy American Act Certification forms to indicate that the proposed Equipment will undergo final assembly in the U.S. and that more than fifty-five percent (55%) of the cost of all components will be manufactured in the U.S. or indicate that a waiver(s) will be required and sufficient documentation to process the waiver(s) is submitted with that Certificate indicating non- compliance. (See Domestic Preference/Buy American Act Certifications).

Part II – Buy American Pre-Award, Ongoing, and Post-Delivery Audits: The Buy American process for this procurement and the resulting contracts will include both pre-award and post-delivery audits. Amtrak, the FRA, and/or its representative(s) will also provide ongoing oversight of the awardee's Buy American compliance during the Equipment's design and manufacture.

B. Certification Requirements

Each Offeror shall submit the Buy America Certifications with its Supplies Technical Proposal. Supplies Technical Proposals not accompanied by properly completed Buy America Certifications may be rejected as nonresponsive.

The Offeror is bound by the certifications submitted with its Proposal and is not permitted to change its certifications after submission of the Proposal. In no event may Offeror change its certification, after contract award.

Where the Offeror certifies in its Proposal that it will comply with the Buy American requirements and later determines that it cannot, the Offeror shall not be eligible for a waiver of those requirements, unless FRA determines that circumstances completely beyond the Offeror's control exist making compliance impossible (e.g., where the intended supplier for a particular component goes out of business and no other supplier exists). No price adjustments will be allowed under these circumstances.

Offeror certifications and requests to correct certifications are subject to FRA/Amtrak audit, and the Offeror/Contractor and its suppliers agree that by submitting a proposal to supply a component or by

submitting a Proposal to supply the Equipment to provide all required information to support any such audit(s)the following Buy America documentation must be included as part of the Supplies Technical Proposal submission:

1. Completed and signed Buy American Certificates;
2. Completed and signed Buy American Component Supplier Certification Forms (Exhibit M-3), one for each domestic component supplier whose component will be calculated to demonstrate that more than fifty-five (55) percent of the cost of all components is domestic; and
3. Any Buy American Waiver Requests and justifications (see below for detailed requirements regarding application for waivers).

II. Amtrak Buy American Act -- Overview

The Amtrak Buy American Act requires Amtrak to purchase only those items that are "manufactured in the United States substantially from domestic components.
The statute does not define what it means to be "substantially" domestic, however, Amtrak and the FRA have interpreted this to mean that more than fifty-five (55) percent of the cost of all components must be domestic and the end product must be manufactured in the United States.

Amtrak has additional Buy America requirements for the steel and iron used to manufacture the following types of primarily steel and iron manufactured goods or end products:

- Railcar systems and components, including items such as steel car shells, wheels, couplers, trucks, axles, piping, battery boxes, enclosures, mounting racks, and grab irons.
- Structural construction materials, including items such as steel or iron beams and columns, and bridge trusses.
- Steel track work used in track projects, including items such as running rail, contact rail, switch rails, and turnouts.

The additional requirements for steel and iron are that all steel and iron manufacturing processes must have taken place in the United States, except any metallurgical processes involving refinement of steel additives. In other words, Amtrak requires all manufacturing process from the ***initial melting stage*** through the application of coatings take place in the United States. The initial melting stage in the production of steel occurs when iron feedstock (e.g., iron ore, pig iron, reduced iron) or scrap steel is melted to produce steel. Depending on the production process used, the initial melting stage commonly may occur in a blast furnace, a basic oxygen furnace, or an electric arc furnace. The iron feedstock, scrap steel, or other inputs at this stage may be non-domestic. Products from steel that was melted and cast outside the U.S., and only reheated to below its melting point or cold worked in the United States, do not meet this standard.

(Note: if an Offeror has achieved the 55% requirement of the Amtrak Buy American Act, it is acceptable for Offeror to utilize steel from nondomestic sources on components that are confirmed as foreign and not included in the calculation of the 55%.)

Amtrak encourages maximizing domestic materials wherever possible.

A. (1) Definitions. As used herein--

Component means any article, material, or supply, whether manufactured or unmanufactured, that is directly incorporated into the end product at the final assembly location. Amtrak has

included at Representative List of Trainset Components at Exhibit M-4 to the RFP. The items on the list are presumed to be components, but in determining whether an item is a component, the definition here shall prevail.

Cost of components means--

(a) For components purchased by Contractor, the acquisition cost, including transportation costs to the place of incorporation into the end product (whether or not such costs are paid to a domestic firm), and any applicable duty (whether or not a duty-free entry certificate is issued); or

(b) For components manufactured by Contractor, all costs associated with the manufacture of the component, including transportation costs as described in paragraph (1) of this definition, plus allocable overhead costs, but excluding profit. Cost of components does not include any costs associated with the manufacture of the end product.

Domestic end product means--

(a) An unmanufactured end product mined or produced in the United States; or

(b) An end product manufactured in the United States, if the cost of its components mined, produced, or manufactured in the United States exceeds 55 percent of the cost of all its components.

End product means any vehicle, structure, product, article, material, supply, or system, which directly incorporates constituent components at the final assembly location, that is acquired for public use under a federally-funded third-party contract, and which is ready to provide its intended end function or use without any further manufacturing or assembly change(s).

Foreign end product means an end product other than a domestic end product.

Subcomponent means any article, material, or supply, whether manufactured or unmanufactured, that is one step removed from a component in the manufacturing process and that is incorporated directly into a component.

United States means the fifty (50) States, the District of Columbia, and outlying areas.

B. The Amtrak Buy American requirement has two elements as follows:

(1) Final assembly of the Equipment must occur in the United States (no waivers will be granted to this requirement), and
(2) More than fifty-five (55) percent of the cost of the components of each rail car or vehicle must be domestic (manufactured in the U.S.). (see Exhibit M-4, Representative List of Trainset Components for Purposes of Amtrak 49 USC 24305(f) .

In the case of the manufacture of a new rail car, final assembly would typically include, ***as a minimum***, the following operations: installation and interconnection of propulsion control equipment, propulsion cooling equipment, brake equipment, energy sources for auxiliaries and controls, heating and air conditioning, communications equipment, motors, wheels and axles, suspensions and frames; the inspection and verification of all installation and interconnection work; and the in-plant testing of the stationary product to verify all functions.

A **Proposal** will be deemed compliant with the Amtrak Buy American Act requirements in this RFP under the following circumstances:

The Proposal indicates final assembly of the Equipment will occur in the U.S. and **EITHER**:

(1) More than fifty-five (55) percent of the cost of the Components will be domestic (manufactured in the U.S.) and the Offeror submits a Certificate indicating compliance (Exhibit M-2) and a form documenting the U.S. location of each components' manufacture; **OR**

(2) More than fifty-five (55) percent of the cost of the Trainset Components cannot be manufactured in the U.S. and the Offeror submits a Buy American Act Certificate indicating non-compliance (Exhibit M-2) and a form, documenting the components that will be manufactured in the U.S. and for components that cannot be manufactured in the U.S. submits documentation sufficient to process and support a waiver from the Amtrak Buy American Act requirements (see 49 U.S.C. § 24305 (f).

All certifications are subject to audits.

C. Non-Compliance Certification and Waiver Process

As set forth above, final assembly of the Equipment must occur in the U.S. No waiver of this requirement will be granted and a Proposal containing such a request for waiver will be rejected as nonresponsive.

A waiver from the Amtrak Buy American Act regarding the requirement that more than fifty-five (55) percent of the cost of the Trainset components must be of U.S. origin may be granted if the FRA determines one of the following to be true:

(1) Applying the requirement would be inconsistent with the public interest;
(2) The required component(s) are not produced in the U.S. in a sufficient and reasonably available amount or are not of a satisfactory quality;
(3) Including the required component(s) would cause the rolling stock or power train equipment to not be bought and delivered in the U.S. within a reasonable time; and/or
(4) imposing the requirements will unreasonably increase the cost of the Trainset or other end products.

(See 49 U.S.C. § 24305(f)(4)).

D. Waiver Process

Offeror shall submit, as part of its Supplies Technical Proposal, any waiver request(s) together with its Buy America(n) Act Certificate indicating non-compliance.

At minimum and where applicable, the Offeror's waiver request shall include the following information for each component:

(1) Identification and description of the Equipment proposed under this project;
(2) Identification of the Component(s), including the cost, country of origin, and the name of the supplier or sub-supplier, not meeting the applicable Amtrak Buy American Act requirement;
(3) Description of the process used to find U.S. suppliers of component(s) for which a waiver is being requested;
(4) Description of a process demonstrating a commitment to finding and/or developing U.S. suppliers in future procurements;
(5) Cost differential(s) to secure domestic component(s) as compared with nondomestic component(s);
(6) Issues with quality or quantity of compliant component(s);
(7) Issues with timely delivery of compliant component(s);
(8) Citation to the specific 49 U.S.C. § 24305(f)(4) waiver category(ies) under which the waiver is sought;
(9) Justification supporting the application of the waiver category(ies) cited to the extent not already answered by the above; and
(10) Any other information that offeror can provide that might influence the waiver decision such as:

a. Whether offeror can source the initial quantity of the component non-domestically and then the remainder in the U.S.;
b. Whether manufacturing in the U.S. can occur over time. Please provide details on when and where;
c. The number of jobs offeror would add in the U.S.; and
d. Whether this would create a second domestic supplier moving forward.

The Offeror must provide clear justification for each separate component for which a waiver is being requested. Offeror should also provide a statement detailing the percentage of domestic content by cost and quantity of components.

The FRA will review the waiver documentation provided by Amtrak. The FRA in consultation with Amtrak will identify any deficiencies with the waiver request(s). Waiver documentation review by the FRA does not guarantee the waiver request will be granted; instead its purpose is only to determine that sufficient information has or has not been submitted and to make a determination. If request deficiencies are identified, the deficiencies may be discussed with the Offerors during one on one interviews, which shall be held only in the event they are determined by Amtrak to be needed.

Contract award can be made only to Offerors that have certified Buy American compliance (either by certification that the Offeror can meet assembly and the applicable component percentage (more than 55 percent of the cost of all components) requirements or by certification that the Offeror can meet assembly requirements but not the applicable component percentage requirements and the Offeror has submitted a complete waiver request(s)). Contract award will not occur before the FRA has reached a final decision on any waivers. Offeror certifications, waiver request(s) and justifications are subject to FRA/Amtrak audit, and the Offeror/Contractor and its suppliers agree that by submitting a proposal to supply a component or by submitting the Proposal to supply the Equipment to provide all required information to support any such audit(s).

III. Buy America(n) Pre-Award, Ongoing, and Post-Delivery Audits

26-FOI-00415 000000006244 "UNCLASSIFIED" 4/30/2026

The Buy America(n) process for this procurement will include pre-award and post-delivery audits. In addition, throughout design and manufacture of the Equipment, Amtrak or their representative(s) will provide ongoing oversight of selected Offeror's Buy American compliance.

The presumptive awardee/Contractor must agree (and get agreement from its suppliers and/or proposed suppliers) to provide to Amtrak or its representatives all relevant documents, including Buy American certifications, waiver requests and justifications, bills of lading or other shipping documents, and any other documents verifying the final assembly location and origin of manufacture for included components. The presumptive awardee/Contractor must also agree (and get agreement from its suppliers and/or proposed suppliers) to give access to manufacturing plants and assembly locations to allow Amtrak or their representatives to complete audits. Information obtained during all audits will be kept confidential to the extent allowed by Federal and State laws.

Pre-award Audit: The pre-award audit will be conducted before Amtrak enters into a formal contract with the presumptive awardee. The pre-award audit may include, at Amtrak's discretion, an inspection of the facility where final assembly is to occur, an inspection of documentation provided by the presumptive awardee detailing the assembly activities that will occur at this facility, procurement documentation, and an inspection of all Buy America(n) Certification Forms and Supplemental Documents provided by suppliers for all included components and site visits to selected component manufacturing plants to verify the assertions made in those certifications. All Buy American Certification Forms submitted by component suppliers shall be signed and dated by the responsible official having knowledge of the origin of manufacture for the particular component(s). Unsigned forms will be rejected. The pre-award audit will take place during the evaluation process or some other time frame as indicated by Amtrak, but prior to Contract Award.

Post-delivery Audit: The post-delivery audit of the first serial production of the Equipment will be completed by Amtrak and/or their representatives before the final acceptance by Amtrak. Amtrak will not accept Equipment if the post-delivery audit cannot be completed to verify the Contractor's compliance with the Buy American requirements.

EXHIBIT M-2

DOMESTIC PREFERENCE/BUY AMERICA(N) ACT CERTIFICATIONS

Bidder/Offeror must complete one of the certifications below indicating whether it can meet the requirements of 49 U.S.C. § 24305(f) and the domestic preference requirements of the Build America, Buy America Act (BABA) § 70914, Pub. L. No. 117-58, div. G, tit. IX, subtitle. A, 135 Stat. 429, 1298 (2021), as implemented by OMB, USDOT, and FRA.

Certificate of Compliance with Domestic Preference/Buy America(n) Requirements
The bidder or offeror hereby certifies that it will comply with the requirements of 49 U.S.C. § 24305(f), and the domestic preference requirements of the BABA, as implemented by OMB, USDOT, and FRA.

Exhibit M-4 Representative List of Car Components

No.	Component
	STRUCTURE AND EXTERIOR/INTERIOR
1	Vehicle Body
1.1	Shell structure/frame - end, floor, roof, side
1.2	Integrated cab/CEM structure
2	Vehicle Fitting Out
2.1a	Windows - door
2.1b	Windows - side
2.1c	Windows - end (windscreens)
2.2	Floor substructures
2.3	Floor coverings and carpeting
2.4	Thresholds
2.5	Interior paneling
2.6	Glass partitions
2.7	Obstacle deflectors
2.8	Exterior appurtenances - skirts, handrails
2.9	Vehicle paintwork
2.10	Sound and thermal insulations
	INTERIOR APPOINTMENTS
3	Interior Appointments
3.1	Interior appointments (e.g. interior fittings, fabric furnishings, etc.)
3.2	Interior appurtenances - handles, stanchions
3.3a	Seats - passengers (regular and fold-down)
3.3b	Seats - driver
3.4	Tables
3.5	Restroom fresh water tanks
3.6	Toilets
3.7	Restroom retention tanks
3.8	Luggage racks and partitions
3.9	Suitcase racks
3.10	Bicycle/surf board racks
3.11	Food storage equipment
3.12	Galleys
	BOGIES AND SUSPENSIONS
4	Running Gear
4.1	Bogie frames (where applicable) , mounts for propulsion system, suspension system supports, safety add-ons
4.2	Wheelset (incl. bearings, axles, wheels)
4.3	Suspension systems (primary, secondary, and emergency support)
4.3	Dampers
4.5	Tilting systems/technologies
4.6	Wheelset guides
4.7	Stabilizers
	TRACTION/ELECTRICAL EQUIPMENT
5	Power System/Drive Unit
5.1	Traction Converter (incl. converter, inverter, rectifier, chopper)
5.2	Transformers
5.3	Traction motors
5.4	Pantographs
5.5	Lightning arrestor
5.6a	Gearbox
5.6b	Gears

26-FCI-00418 0000008248 UNCLASSIFIED 4/30/2026

5.7	Traction-brake resistors
5.8	Switchgears and associated components
5.9	Batteries and other storage devices
	TRAIN OPERATION CONTROLS
6	Control Apparatus for Train Operation
6.1	Power supply controls/on-board computers
6.2	Traction Control Unit
6.3	Brake Control Unit
6.4	Train control devices
6.5	Wheel slip and slide protection - speed sensors
6.6	System data acquisition/fault storage devices - measurement and logging devices
	AUXILIARY EQUIPMENT
7	Auxiliary Operating Equipment
7.1	Auxiliary converter/transformer
7.2	Battery charger
7.3	Onboard supply system - outlets
7.4	Traction converter cooling unit
7.5	Traction motor blower
	TRAIN CONTROL AND MONITORING SYSTEM AND SAFETY DEVICES
8	Monitoring and Safety Devices
8.1	Diagnostics equipment (incl. brake and speed indicators)
8.2	Event recorders
8.3	Smoke detectors
8.4	Fire extinguishers, fire detection and suppression system
8.5	Automatic Train Control system (incl. ATO)
8.6	Positive Train Control system
8.7	Driver's vigilance and deadman systems
8.8	Horns and warning bells
8.9	Data transmission devices
8.10	Communication equipment - train radio
8.11	Exterior and interior cameras
8.12	Windscreen cleaning facilities
	LIGHTING SYSTEM
9	Lighting
9.1	Exterior lighting equipment - flashing lights, auxiliary lights, headlights, marker lights, etc.
9.2	Interior lighting equipment - console lighting, driver's cab lighting, emergency lighting, instrument lighting, equipment room lighting, passenger cabin lighting, reading lights, etc.
	HVAC SYSTEM
10	Air Conditioning
10.1	Air conditioning unit (incl. ventilation, condensers, filtering system, heat exchangers, controllers, regulators, pressure protection elements)
10.2	Air intakes and outlets
10.3	Compressors
10.4	Heaters
10.5	Air distribution elements - ducts, pumps, pipes
	ANCILLARY EQUIPMENT
11	Ancillary Operating Equipment
11.1	Sanding equipment
11.2	Lubricating equipment
	DOOR SYSTEM
12	Doors, Entrances
12.1	Passenger door panels
12.2	Cab door panels

12.3	Exterior door actuators
12.4	Exterior door controls
12.5	Interior door panels
12.6	Interior door actuators
12.7	Interior door controls
12.8	Ladders

EXHIBIT N

PARENT GUARANTY

THIS PARENT GUARANTY ("Guaranty"), dated as of _____ __, 2026, is made by _____, a corporation organized under the laws of the State of _____, ("Guarantor"), in favor National Railroad Passenger Corporation, a corporation organized under the laws of the District of Columbia, United States ("Amtrak").

WHEREAS, _____*[enter name of Guarantor's subsidiary – Primary Obligor]*_____, a _*[enter State of incorporation]*_____ corporation ("Primary Obligor"), is a subsidiary of Guarantor; and

WHEREAS, the Primary Obligor executed and delivered Contract *[enter contract number*_____dated _____, titled _____ which contain or evidence obligations in favor of Amtrak (together with all amendments, extensions, renewals, replacements, consolidations and replacements, and all related documents, agreements, and instruments now or in the future related to or in respect of the foregoing, are hereafter referred to as the "Contract" and all obligations, liabilities and indebtedness of Primary Obligor to Amtrak now or hereafter arising out of or under the Contract, are hereafter referred to as the "Contract Obligations"); and

WHEREAS, Guarantor may derive substantial direct and indirect benefit from the transactions and/or consideration resulting from the Contract Obligations and Amtrak requires this Guaranty be executed and delivered by Primary Obligor as set forth in the Contract.

NOW, THEREFORE, in consideration of the mutual promises and agreements contained herein, the parties agree as follows:

1. Guaranty. Guarantor hereby unconditionally and irrevocably guarantees, in accordance with the terms of this Guaranty, to Amtrak, and its successors and assigns, the full and prompt payment and performance when due of the Contract Obligations and all the indebtedness, liabilities and other obligations of the Primary Obligor to Amtrak pursuant to the Contract. The foregoing indebtedness, liabilities and other obligations of the Primary Obligor, and all other indebtedness, liabilities and obligations to be paid or performed by Guarantor in connection with this Guaranty (including any and all amounts due under Section 11 hereof), shall hereinafter be collectively referred to as the "Obligations." In the event of default, non-payment or other non-compliance by the Primary Obligor in performance of any of the Contract Obligations and the expiration without cure of any applicable cure period in accordance with the Contract, Guarantor shall, within five (5) business days of receipt of written demand from Amtrak, pay or perform such Contract Obligations.

2. Payment. All payments by Guarantor to Amtrak shall be made in United States Dollars. This Guaranty and Guarantor's liability with respect to the Obligations shall remain in full force and effect without regard to and shall not be impaired or affected by (a) any insolvency, bankruptcy, reorganization, assignment for the benefit of creditors or other insolvency proceeding of the Primary Obligor, (b) any merger or change of structure of the Primary Obligor or Guarantor, and (c) any amendment, extension or modification of the Contract or Contract Obligations.

26-FOI-00415 00000006249 "UNCLASSIFIED" 4/30/2026

3. Consents. Guarantor hereby consents and agrees that, without notice to or further assent from Guarantor: (i) the time, manner, place or terms of any payment or performance of the Contract Obligations may be extended or changed, including by an increase or decrease in the interest rate on any Obligation or any fee or other amount payable under the Contract Obligations, by a modification or renewal of the Contract Obligations agreed to by Primary Obligor and Amtrak; (ii) the time for Primary Obligor's performance of or compliance with any term, covenant or agreement on its part to be performed or observed under the Contract Obligations may be extended, or such performance or compliance waived, or failure in or departure from such performance or compliance consented to, all in such manner and upon such terms as Amtrak may deem proper; (iii) Amtrak may discharge or release, in whole or in part, any other guarantor or any other person or entity ("Person") liable for the payment and performance of all or any part of the Obligations, and may permit or consent to any such action or any result of such action, nor shall Amtrak be liable to Guarantor for any failure to collect or enforce payment of the Obligations; (iv) Amtrak may request and accept other guaranties of the Obligations and may, from time to time, in whole or in part, surrender, release, subordinate, modify, waive, rescind, compromise or extend any such guaranty and may permit or consent to any such action or the result of any such action; (v) Amtrak may exercise, or waive or otherwise refrain from exercising, any other right, remedy, power or privilege granted by the Contract Obligations, or otherwise available to Amtrak, with respect to the Obligations and any collateral therefor, even if the exercise of such right, remedy, power or privilege affects or eliminates any right of subrogation or any other right of Guarantor against Primary Obligor, and (vi) Amtrak may pursue relief under other security provided by Primary Obligor or any other Person, at any time to secure the Obligations, and may, from time to time, in whole or in part, exchange, surrender, release, waive, rescind, modify, extend, or compromise such security all as Amtrak may deem advisable, and all without impairing, abridging, releasing or affecting this Guaranty; provided, however, that in no event shall Amtrak receive duplicate recovery under this Guaranty for the same Contract Obligations for which any recovery or payment has already been received or made from any collateral, bond, letter of credit or other security, with respect to the Contract Obligations.

4. Waivers. (a) Guarantor waives and agrees not to assert: (i) any right to require Amtrak to proceed against Primary Obligor any other guarantor or any other Person, to proceed against or exhaust any letter of credit, bonds, collateral or other security held for the Obligations (except to the extent required by applicable law), to give notice of or institute any public or private sale, foreclosure, or other disposition of any collateral or security for the Obligations, including, without limitation, to comply with provisions of the Uniform Commercial Code ("UCC") applicable to the Obligations, the Contract Obligations, or transactions contemplated by them, or any equivalent provision of any other applicable law in connection with the sale, foreclosure, or other disposition of any collateral or to pursue any other right, remedy, power or privilege of Amtrak whatsoever; (ii) any defense arising by reason of any lack of corporate or other authority or any other defense of Primary Obligor, Guarantor or any other Person; (iii) any defense to the enforcement of this Guaranty or any rights of Amtrak created or granted hereby or to the recovery by Amtrak against Primary Obligor or any other Person liable therefor of any deficiency after a judicial or nonjudicial foreclosure or sale, even though such a foreclosure or sale may destroy or impair the subrogation rights of Guarantor or the right of Guarantor to proceed against Primary Obligor or any other obligor of the Obligations for reimbursement; (b) Guarantor waives any and all notice of the acceptance of this Guaranty, and any and all notice of the creation, modification, or accrual of the Obligations, or the reliance by Amtrak upon this Guaranty, or the exercise of any right, power or privilege hereunder. The Obligations shall conclusively be deemed to have been created, contracted, incurred and permitted to exist in reliance upon this Guaranty. Guarantor waives promptness, diligence, presentment, protest, demand for payment, notice of default, dishonor or nonpayment and all other notices to or upon Primary Obligor, Guarantor or any other Person with

26-FOI-00415 00000006249 "UNCLASSIFIED" 4/30/2026

respect to the Obligations. (c) Upon the occurrence and during the continuance of any Default (as hereinafter defined), a separate action or actions may be brought against Guarantor, whether or not Primary Obligor or any such other guarantor is joined therein or a separate action or actions are brought against Primary Obligor or any such other guarantor. (d) Guarantor shall not have any right to require Amtrak to obtain or disclose any information with respect to (i) the financial condition or character of Primary Obligor or the ability of Primary Obligor to pay and perform the Obligations; or (ii) the existence or nonexistence of any other guaranties of all or any part of the Obligations. For the avoidance of doubt, Guarantor shall be entitled to all defenses, limitations and exclusions available to the Primary Obligor under the Contract.

5. Corporate Interest. The Guarantor hereby unconditionally and irrevocably declares and warrants to Amtrak, and its successors, transferees, and assigns that its obligations pursuant to this Guaranty do not include any obligation which if incurred would constitute a violation to its corporate interest.

6. Continuing Guaranty. Guarantor agrees that this Guaranty is a continuing guaranty relating to any Obligations, including Obligations which may exist continuously or which may arise from time to time, and Guarantor expressly acknowledges that this Guaranty shall remain in full force and effect notwithstanding that there may be periods in which no Obligations exist. This Guaranty shall continue to be effective or shall be reinstated and revived, as the case may be, if, for any reason, any payment of the Obligations by or on behalf of Primary Obligor shall be rescinded or must otherwise be restored by Amtrak, whether as a result of proceedings in bankruptcy or reorganization or otherwise. To the extent any payment is rescinded or restored, the Obligations shall be revived in full force and effect without reduction or discharge for such payment.

7. Payments. Guarantor hereby agrees, in furtherance of the foregoing provisions of this Guaranty that any payments made with respect to a Default hereunder (defined below) shall include interest which, but for the filing of a petition in bankruptcy with respect to Primary Obligor, would have accrued on such Obligations, whether or not a claim is allowed against Primary Obligor for such interest in any such bankruptcy proceeding. All payments made by Guarantor hereunder may be applied in such order as Amtrak shall elect. As used herein, "Default" means any of the following: (a) Primary Obligor shall fail to pay when due or perform any of the Contract Obligations, in accordance with the terms of the Contract; (b) Guarantor shall fail in any material respect to perform or observe any term, covenant or agreement contained in this Guaranty on its part to be performed or observed; or (c) (i) Primary Obligor or Guarantor shall admit in writing its inability to, or shall fail generally or be generally unable to, pay its debts as they become due, or shall make a general assignment for the benefit of creditors, or shall file a voluntary petition in bankruptcy or a petition or answer seeking reorganization, to effect a plan or other arrangement with creditors or any other relief under the Bankruptcy Code or under any other state or federal law relating to bankruptcy or reorganization granting relief to debtors, whether now or hereafter in effect (collectively, "Bankruptcy Laws"), (ii) Primary Obligor or Guarantor shall be adjudicated a bankrupt, or shall make an assignment for the benefit of creditors, or shall apply for or consent to the appointment of any custodian, receiver or trustee for all or any substantial part of Primary Obligor's or Guarantor's property, or shall take any action to authorize any of the actions set forth above in this clause, or (iii) an involuntary petition seeking any of the relief specified in this clause shall be filed against Primary Obligor or Guarantor, or any order for relief shall be entered against Primary Obligor or Guarantor in any involuntary proceeding under any Bankruptcy Laws.

26-FOI-00415 00000006249 "UNCLASSIFIED" 4/30/2026

8. Notices. All notices and other communications provided for hereunder shall, unless otherwise stated herein, be in writing (including by facsimile) and shall be mailed, sent via facsimile or delivered by hand (i) if to Amtrak, to the following address:

National Railroad Passenger Corporation (Amtrak)
Law Department
1 Massachusetts Ave., NW
Washington, D.C. 20001

and (ii) if to Guarantor, at or to its address or facsimile number set forth below its name on the signature page hereof, or at or to such other address or facsimile number as such party shall have designated in a written notice to the other party. All such notices and communications shall be effective upon receipt.

9. No Waiver. No failure on the part of Amtrak to exercise, and no delay in exercising, any right, remedy, power or privilege hereunder shall operate as a waiver thereof, nor shall any single or partial exercise of any such right, remedy, power or privilege preclude any additional exercise thereof or the exercise of any other right, remedy, power or privilege, provided that recovery from such exercise of rights is without duplication of any other recovery obtained from rights exercised under the Contract, or any collateral, bond, letter of credit or other guaranty, with respect to the Contract Obligations.

10. Costs and Expenses. Guarantor agrees to pay all costs and expenses of Amtrak and fees and disbursements of counsel reasonably expended and justified in connection with the good faith enforcement or attempted enforcement, or preservation of any rights under this Guaranty, necessitated by Guarantor's failure to comply with its Obligations hereunder.

11. Guarantor Defenses. Except as provided in the prior paragraph, (a) unless the Primary Obligor has been discharged or otherwise excused from payment or performance of its obligations secured by this Guaranty pursuant to a bankruptcy, insolvency, reorganization, receivership or similar proceedings, the Guarantor shall not, under this Guaranty or any of its provisions, have any greater obligations or liability than the Primary Obligor under the Contract, and (b) the limitations and exclusions of obligations and liability of the Primary Obligor included in the Contract shall equally limit and exclude liability and obligations of the Guarantor under this Guaranty, (c) the Guarantor's cumulative liability hereunder shall be limited to the Contract Amount, which upon the effective date hereof is $[ ], and (d) in the event of any claim under this Guaranty, the Guarantor shall be entitled to assert any defense, set-off or counterclaim that the Primary Obligor could assert had such claim been made directly against the Primary Obligor under the Contract arising out of Amtrak's failure to perform or breach of the Contract. For avoidance of doubt, these defenses, setoffs and counterclaims do not include (i) defenses arising from the insolvency, reorganization, or bankruptcy of the Primary Obligor and (ii) defenses previously asserted by the Primary Obligor against such claims to the extent such defenses have been finally resolved in Amtrak's favor either by the parties or by a court of last resort or by arbitration conducted pursuant to the Contract.

12. Binding Effect; Entire Agreement; Amendments. This Guaranty shall be binding upon Guarantor and its successors and assigns, and inure to the benefit of and be enforceable by Amtrak and its successors, transferees and assigns, as permitted under the terms of the Contract; provided that Guarantor shall not have the right to assign or transfer its rights and obligations hereunder without the prior written consent of Amtrak. This Guaranty constitutes the entire

agreement of Guarantor with respect to the matters set forth herein and supersedes any prior agreements, commitments, discussions and understandings, oral or written, with respect thereto. There are no conditions to the full effectiveness of this Guaranty. This Guaranty may not be amended except by a writing signed by Guarantor and Amtrak. No waiver of any rights of Amtrak under any provision of this Guaranty or consent to any departure by Guarantor therefrom shall be effective unless in writing and signed by Amtrak. Any such amendment, waiver or consent shall be effective only in the specific instance and for the specific purpose for which given.

13. Severability. Whenever possible, each provision of the Guaranty shall be interpreted in such manner as to be effective and valid under all applicable laws and regulations. If, however, any provision of this Guaranty shall be prohibited by or invalid under any such law or regulation, it shall be deemed modified to conform to the minimum requirements of such law or regulation, or, if for any reason it is not deemed so modified, it shall be ineffective and invalid only to the extent of such prohibition or invalidity without affecting the remaining provisions of this Guaranty.

14. Governing Law. This Guaranty shall be governed by, and construed in accordance with, the law of the District of Columbia, United States.

15. Arbitration. Any dispute, controversy or claim between Guarantor and Amtrak arising out of or relating to this Guaranty, including the formation, interpretation, breach or termination thereof, and including whether the claims asserted are arbitrable, will be referred to and finally determined by arbitration in accordance with the JAMS International Arbitration Rules. The Tribunal will consist of three arbitrators, each (and not just the chair) chosen in accordance with JAMS International Arbitration Rule 7.5 (or any successor rule to that rule). The Chair of the arbitration panel should be an attorney with at least 20 years of active litigation experience or be a retired judge. The place of arbitration will be Washington, D.C. The language to be used in the arbitral proceedings will be English. Judgment upon the award rendered by the arbitrator(s) may be entered in any court having jurisdiction thereof. The arbitral award will be deemed final and definitive, binding the parties, which expressly waive any appealing procedure. Notwithstanding, each party reserves the right to access the competent courts with the purpose of (i) assuring the arbitration, (ii) obtaining provisional remedy for the protection of rights before the arbitration is initiated, and (iii) enforcing any decision of the arbitration panel, including, without limitation, the arbitral award. The arbitration award may be enforced in any country having jurisdiction over a party or the parties.

16. Consent to Jurisdiction. If for any reason notwithstanding the arbitration provisions of this Guaranty, resort to courts for judicial relief is necessary or appropriate, (a) Guarantor consents to the jurisdiction and venue of the United States District Court for the District of Columbia in any suit, action or proceeding brought by Amtrak against Guarantor in connection with or arising from this Guaranty, and (b) Guarantor further agrees that any suit, action or proceeding brought by Guarantor against Amtrak in connection with this Guaranty shall be brought solely in the United States District Court for the District of Columbia. Once a final judgment, order or award is issued in arbitration (or if for any reason arbitration is not utilized, by any court) in favor of Amtrak, the judgment, order or award may be enforced by Amtrak in any court of competent jurisdiction, including those of England.

17. Waiver of Jury Trial. ***The parties knowingly, voluntarily and with advice of counsel, waive trial by jury in an action or proceeding arising out of this Guaranty or the underlying transactions or Obligations contemplated or covered by it.***

EXHIBIT P

FINANCIAL CAPABILITY SUBMITTAL REQUIREMENTS

The financial capability of the Offeror will be evaluated as part of the financial proposal. This exhibit provides the submittal requirements from the Offeror for financial capability.

Financial information described below should be packaged separately for each entity with a cover sheet identifying the name of the organization and its role in the Offeror organization (i.e., Offeror, Equity Member, or Guarantor). Offerors shall identify any information, which it believes is entitled confidential by placing the word "confidential" on each page as described.

1. Financial Statements and Credit Ratings

Financial statements for the Offeror, each Equity Member of Offeror, and each Guarantor for the three most recent completed fiscal years must be provided to demonstrate financial capability of the Offeror. If the entity has been in existence for less than 3 fiscal years, Offeror should expressly state that such entity has been in existence for less than 3 fiscal years and shall provide financial statements for the number of fiscal years it has been in existence.

Financial statement information must include:

1.1. Opinion Letter (Auditor's Report), required for those financial statements that are audited

1.2. Balance Sheet

1.3. Income Statement

1.4. Statement of Changes in Cash Flow

1.5. Footnotes, required for those financial statements that are audited.

In addition, financial statements must meet the following requirements:

1.6. GAAP - Financial statements must be prepared in accordance with U.S. Generally Accepted Accounting Principles ("U.S. GAAP") or International Financial Reporting Standards ("IFRS"). If financial statements are prepared in accordance with principles other than U.S. GAAP or IFRS, a letter must be provided from a certified public accountant discussing the areas of the financial statements that would be affected by a conversion to U.S. GAAP or IFRS. A restatement of the financial information in accordance with U.S. GAAP or IFRS is not required.

1.7. U.S. Dollars - Financial statements must be provided in U.S. dollars, if available. If financial statements are not available in U.S. dollars, the Offeror must include summaries of the Income Statements and Balance Sheets for the applicable time- periods converted to U.S. dollars by a certified public accountant.

1.8. Audited – Fiscal year-end financial statements must be audited by an independent party qualified to render audit opinions (e.g. a certified public accountant). If audited financials are not available for an entity, the Proposal shall include unaudited financial statements for such entity, certified as true, correct, and accurate by the chief executive officer, chief financial officer, treasurer, or similar position of the entity.

1.9. English - Financial statement information must be prepared in English. If audited financial statements are prepared in a language other than English, translations of all financial statement information must be provided with the original financial statement information.

1.10. Newly Formed Entity - If the Offeror is a newly formed entity and does not have independent financial statements, financial statements for the Equity Members shall be provided (and the Offeror shall expressly state that the Offeror is a newly formed entity and does not have independent financial statements).

1.11. Guarantee - Financial statements of each Guarantor must be provided to demonstrate financial capability of the Offeror. The Offeror shall note that Amtrak may, in its discretion and based upon the review of the information provided, specify that another acceptable Guarantor is required.

1.12. SEC Filings - If the Offeror or any other entity for whom financial information is submitted hereby files reports with the Securities and Exchange Commission, then such financial statements shall be provided through a copy of their annual report on Form 10K or Form 20F. For all subsequent quarters, provide a copy of any report filed on Form 10Q, Form 8-K, or Form K-6, which has been filed since the latest filed 10K or 20F.

1.13. Notes and Disclosures – Notes and disclosures to the financial statements shall address any material changes in financial condition as described herein and report any off- balance sheet liabilities.

1.14. Credit Ratings - If available, credit ratings and credit rating reports must be supplied for each Offeror, Equity Member, and Guarantor that submits financial statements with its Proposal. If credit ratings do not exist for any Offeror, Equity Member, or Guarantor that has submitted financial statements with its Proposal, then the Proposal must include a statement specifying that no credit ratings exist for that entity.

2. Material Changes in Financial Condition

Information regarding any Material Changes in Financial Condition for Offeror, each Equity Member, and Guarantor for the past 3 years and anticipated for the next reporting period must be provided with the Proposal. Financial statements dated more than 12 months prior to the Close Date shall include a letter from the affected entity's chief financial officer or treasurer or an independent auditor's statement disclosing any Material Change that has occurred or is pending since the date of the financial statements.

If no Material Change has occurred and none is pending, the Offeror, Equity Member, or Guarantor, as applicable, shall provide a letter from its chief executive, chief financial officer, treasurer, or similar position so certifying. At the discretion of Amtrak, any

failure to disclose a prior or pending Material Change may result in disqualification from further

26-FOI-00415 00000006250 "UNCLASSIFIED" 4/30/2026

participation in the selection process.

In instances where a Material Change has occurred or is anticipated, the affected entity shall provide a statement describing the following:

2.1. Each Material Change in detail;

2.2. The likelihood that the developments will continue during the period of performance for the Contract; and

2.3. The projected full extent of the changes likely to be experienced in the periods ahead.

Estimates of the impact on revenues, expenses, and the change in equity shall be provided separately for each Material Change as certified by the chief executive, chief financial officer or treasurer or similar position. References to the notes in the financial statements are not sufficient to address the requirement to discuss the impact of Material Changes.

Where a Material Change will have a negative financial impact, the affected entity shall also provide a discussion of measures that would be undertaken to insulate the Project from any recent material changes and those currently in progress or reasonably anticipated in the future. If the financial statements indicate that expenses and losses exceed income in each of the 3 completed fiscal years (even if there has not been a material change), the affected entity shall provide a discussion of measures that will be undertaken to make the entity profitable in the future and an estimate of when the entity will be profitable.

The Offeror must disclose to Amtrak any Material Change that occurs after it has submitted its Proposal. Failure to disclose any Material Change that occurred after submission of its Proposal may result in disqualification, at the sole discretion of Amtrak.

3. Guarantor Letter of Support

The Proposal must include a letter from the chief executive, chief financial officer, treasurer, or similar position of each Guarantor explicitly stating that it will guarantee both the performance and financial obligations of the entity on behalf of which it is providing a guarantee.

The Guarantor's financial information shall be used for purposes of evaluating the affected member's financial capability. Following review of the financial information provided and the letter of support, Amtrak may, in its sole discretion, specify that an additional guarantee will be required in order to demonstrate financial capability.

4. Security

The Offeror shall provide a statement certified by the chief financial officer or treasurer of the Proposer that it will be able to obtain all required performance security as required under Section 6 of Exhibit A-1. The Offeror shall also identify the Qualified Issuer(s) that will provide any performance security under the contract and its rating information.

26-FOI-00415 00000006250 "UNCLASSIFIED" 4/30/2026

5. Off-Balance Sheet Liabilities

A letter from the Chief Financial Officer or treasurer of the entity or the certified public accountant for each entity for which financial information shall be submitted, identifying all off- balance sheet liabilities. References to notes in the financial statements are not sufficient for identifying all off-balance sheet liabilities. If no off-balance sheet liabilities exist, then a letter certified by the Chief Financial Officer or treasurer of the entity shall be provided stating that no off-balance sheet liabilities exist.

6. Financing Sources

While the Offeror is not required to arrange or bring financing to deliver the project, should the Offeror intend to use financing to deliver the project, then the Offeror shall describe their plan for financing the project including:

6.1. Identity of the lenders or investors anticipated to be used;

6.2. Amounts, types and purpose of each financing facility to be used;

6.3. Letters of commitment from the anticipated lenders and/or investors;

6.4. Term sheets for each facility stating the costs, terms, and other assumptions used to calculate financing costs and amounts, and.

6.5. The proposed steps for arranging and closing financing.

7. Major Agreements

The Offeror shall provide the major agreements between the Offeror and its major participants. The major agreements include, but are not limited to, subcontracts, financing agreements, equity agreements, commitment letters, and parent guarantees.

The Offeror shall submit updated agreements to provide sufficient evidence to support the Offeror's ability to deliver the Project according to its Financial Proposal.

26-FOI-00415 00000006251 "UNCLASSIFIED" 4/30/2026

Exhibit Q-1 - Milestone Payment Schedule

Milestone #	Description	Payment % of Total Contract Amount at the time Milestone is met (5% of each payment will be added to reflect Retainage).
	Mobilization	
1	Performance Securities and Insurance submitted by Contractor, Issuance of NTP, completion of Kick-off Meetings and completion of detailed Specification review	1.0%
	Pre-Design Review	
2	Amtrak approval of Project Schedule and Project Management Plan including engineering and production schedules, System Integration Plan and Quality Assurance Program Plan (CDRL 3-01; CDRL 3-02; CDRL 3-05; CDRL 5-01)	1.5%
3	Amtrak approval of Reliability Program Plan and Reliability Prediction Summary Report (CDRL 4-01; CDRL 4-03)	0.5%
4	Amtrak approval of System Safety Program Plan (CDRL 25-01)	0.5%
5	Amtrak approval of Test and Inspection Plan (CDRL 5-15, CDRL 20-02)	0.5%
6	Amtrak approval of Training Plan (CDRL 23-01)	0.5%
7	Amtrak approval of Master Manual Plan (CDRL 23-08)	0.5%
	Design Reviews	
8	Amtrak approval of Preliminary Design Review (CDRL 3-09)	1.0%
9	Amtrak approval of Intermediate Design Review (CDRL 3-18)	1.0%
10	Amtrak approval of Preventative Maintenance Schedule and Mean Time to Repair (CDRL 4-07)	0.5%
11	Amtrak approval of Mock-Ups (CDRL 3-55; CDRL 3-56; CDRL 3-57; CDRL 3-58; CDRL 3-59)	2.0%
12	Amtrak approval of Carbody Structural Report (CDRL 6-17)	0.5%
13	Amtrak approval of Dynamic Simulation Report (CDRL 7-03)	0.5%
14	Amtrak approval of Final Design Review (CDRL 3-34)	3.0%
15	Amtrak approval of LRU List (CDRL 3-54)	0.5%
16	Amtrak approval of all Test Procedures (CDRL 20-03)	1.0%
17	Amtrak approval of Book of Quality (Chapter 5)	0.5%
	FAIs, Production and Testing	
18	Amtrak approval of completion and closeout of Major Sub System FAIs (Refer to Chapter 5.8.b.ii)	4.0%
19	Amtrak approval of FAI of each Car type and Amtrak approval of the closure of all open items (Chapter 5) (prorated by Car type)	4.0%
20	Amtrak approval of draft Manuals (CDRL 23-09)	3.0%
21	Successful completion of user training program (CDRL 23-15)	3.0%
22	Acceptance of Special Tools and BTEs (CDRL 21-01; CDRL 21-02)	1.0%
23	Issuance of Production/Test completion form with closure of all open items with a fully executed pre-shipping inspection report by Amtrak for a Consist to be shipped (prorated by number of cars)	10.0%
24	FDA approval of all Car types and all Cars (CDRL 16-01)	2.0%
	Commissioning and CA	
25	Amtrak approval of all As-Built Drawings and Schematics (CDRL 03-44, CDRL 23-03) (prorated for each car type)	7.5%
26	Successful delivery of all Pilot Cars, and completion of all associated activities and testing including but not limited to, climate test, Pilot Car Reliability Testing, and receipt of FRA and Amtrak approvals for each car type (prorated by car type)	10.0%
27	Conditional Acceptance of Production Cars including closure of all open items (Chapter 22) (prorated by number of cars)	20.0%
	Final Acceptance	
28	Final Acceptance of Production Cars (prorated by number of cars)	8.0%
29	Amtrak approval and delivery of final Manuals	4.0%
30	Amtrak approval of successful completion and acceptance of Fleet Service Reliability Demonstration Test (CDRL 4-04; CDRL 4-05)	3.0%
	Retainage	
31	Final Payment (refer to GPs Article 10)	5.0%

September 15, 2023

Amit Bose
Administrator
Federal Railroad Administration
U.S. Department of Transportation
1200 New Jersey Avenue, SE
Washington, DC 20590

Dear Administrator Bose:

Pursuant to 49 C.F.R. § 37.7(b), National Railroad Passenger Corporation (Amtrak) hereby submits to the Federal Railroad Administration the request for a determination of equivalent facilitation in connection with its Long Distance core accessible trainset concept, which would substitute trainset-based Alternative Design Standards for certain regulatory standards that are specific to individual rail cars.

Attached to this letter are the request for equivalent facilitation and appendices, which include materials used in furtherance of our request for equivalent facilitation.

Please do not hesitate to contact me if you have any questions.

Sincerely,

Roger Harris
President

Enclosures

Request For Equivalent Facilitation

I. Introduction

As Amtrak develops plans for procuring and deploying new rail equipment for overnight train service on our Long Distance network, we are committed to enhancing and improving the customer experience for customers with disabilities, including customers who use wheeled mobility devices. Many of today's regulatory standards that define accessible rail cars do not provide a truly accessible journey. To ensure that all customers have equal access to the unique experiences offered by our Long Distance services, we are re-imagining what is possible. Community engagement has played and will continue to play a critical role in this process.

In addition, new train designs and technologies offer opportunities to deliver a better and more accessible experience to customers with mobility disabilities. Strict compliance with existing regulations hinder some of these new alternatives.

After providing opportunities for the public to provide feedback, Amtrak is submitting this equivalent facilitation request to the Federal Railroad Administration for approval to use alternative design standards that provide equal or better accessibility. This reflects Amtrak's dedication to fostering an environment where everyone feels welcome, comfortable, and valued throughout their journey.

II. Entity Information

Name: National Railroad Passenger Corporation (Amtrak)
Address: 1 Massachusetts Ave., NW
Washington, DC 20001
Contact: Keren Rabin
Telephone: 202-906-2171

III. Specific Provision of Part 38 Concerning which Amtrak is Seeking Determination of Equivalent Facilitation

As stated above, Amtrak is seeking a determination of "equivalent facilitation" on several regulatory provisions that define standards of accessibility that are specific to individual rail cars (as opposed to entire trainsets). In lieu of strict compliance with the following provisions in 49 CFR Part 38, Amtrak proposes to use the Alternative Design Standards described below in Section IV, which would meet or exceed the level of accessibility or usability of the train, as further described below in Section V.

38.111(a)(1) requires individual single-level rail passenger coaches to have a specific number of accessible spaces, regardless of the number or location of accessible spaces elsewhere on the train. It states:

> (1) Single-level rail passenger coaches and food service cars (other than single-level dining cars) shall comply with §§ 38.113 through 38.123 of this part. Compliance with § 38.125 of this part shall be required only to the extent necessary to meet the requirements of paragraph (d) of this section.

38.111(a)(4) requires individual bi-level lounge cars to be accessible on the lower level and to have accessible restrooms in the car, regardless of the accessibility of the upper level and regardless of the availability of accessible restrooms in other nearby accessible cars. It states:

Bi-level lounge cars shall have doors on the lower level, on each side of the car from which passengers board, complying with § 38.113, a restroom complying with § 38.123, and at least one space complying with § 38.125(d) (2) and (3) to provide table service to a person who wishes to remain in his or her wheelchair and space to fold and store a wheelchair for a person who wishes to transfer to an existing seat.

38.111(a)(5) requires accessible restrooms in each individual single-level coach and food service car, as well as in each individual dining or lounge car if there is a restroom for other passengers, regardless of the availability of accessible restrooms in other nearby accessible cars and regardless of whether the "restroom for other passengers" is on the same floor as the accessible seating locations. It states:

Restrooms, complying with § 38.123 shall be provided in single-level rail passenger coaches and food services cars adjacent to the accessible seating locations required by paragraph (d) of this section. Accessible restrooms are required in dining and lounge cars only if restrooms are provided for other passengers.

38.111(a)(6) requires each individual sleeper car to have accessible accommodations, regardless of the number or location of accessible bedrooms elsewhere on the train. It states:

Sleeper cars shall comply with §§ 38.113 (b) through (d), 38.115 through 38.121, and 38.125 of this part, and have at least one compartment which can be entered and used by a person using a wheelchair or mobility aid and complying with § 38.127 of this part.

38.111(d) requires individual coaches to have a specific number of accessible spaces, regardless of the number or location of accessible spaces elsewhere on the train. It states:

Passenger coaches or food service cars shall have the number of spaces complying with § 38.125(d)(2) of this part and the number of spaces complying with § 38.125(d)(3) of this part, as required by § 37.91 of this title.

38.125(a) requires each individual rail car to have an accessible path from the platform to the accessible seating location, even for cars that are part of fixed trainsets with accessible spaces and accommodations on the upper level, with multiple elevators connected by an accessible path, as proposed in the Alternative Design Standards described herein. It states:

(1) General. All intercity rail cars, other than level entry cars, required to be accessible by §§ 38.111 (a) and (e) of this subpart shall provide a level-change mechanism or boarding device (e.g., lift, ramp or bridge plate) complying with either paragraph (b) or (c) of this section and sufficient clearances to permit a wheelchair or other mobility aid user to reach a seating location complying with paragraph (d) of this section.

(2) Exception. If level-entry boarding, portable or platform lifts, ramps or bridge plates meeting the applicable requirements of this section are provided on station platforms or other stops required to be accessible, or mini-high platforms complying with § 38.113(d) are provided, the car is not required to be equipped with a car-borne device. The access systems or devices used at a station to which section 37.42 applies must permit compliance with that section.

38.125(d)(1) requires individual rail cars to have a specific number of accessible spaces, regardless of the number or location of accessible spaces elsewhere on the train. It states:

Requirements. All intercity rail cars required to be accessible by §§ 38.111 (a) and (e) of this subpart shall provide at least one, but not more than two, mobility aid seating location(s) complying with paragraph (d)(2) of this section; and at least one, but not more than two, seating location(s) complying with paragraph (d)(3) of this section which adjoin or overlap an accessible route with a minimum clear width of 32 inches.

IV. Alternative Means of Compliance

Amtrak proposes to comply with the following Alternative Design Standards as an alternative method of compliance, providing equal or better accessibility and usability of its trainsets, as further described below in Section V.

1. Trainset / Semi-Permanent Coupling

These Alternative Design Standards are based on the concept of an accessible core trainset offering enhanced mobility between cars and access to train amenities and utilizing semi-permanent coupling.

2. Number of Accommodations

a. The number of accessible coach spaces in a trainset will be equal to or greater than the number of coach cars in the trainset.

b. The number of accessible bedrooms in a trainset will be equal to or greater than the number of sleeper cars in the trainset (not including sleeper cars used primarily for crews or other non-revenue purposes).

3. Access to Amenities

All accessible coach spaces and all accessible bedrooms will be located along or within an accessible core area of the trainset, with access to dining, café and lounge cars and similar amenities, via an accessible 32” wide path. If or when accessible coach spaces or accessible bedrooms are located on the lower level of a bi-level car, access to amenities and redundant restrooms on the upper level will be via an accessible elevator, but such access may be more limited than for spaces and bedrooms on the upper level. [1]

4. Priority Positions

a. Accessible sleeper cars will have priority over any non-accessible sleeper cars in terms of proximity to dining, café and lounge cars.

b. Accessible coaches will have priority over any non-accessible coaches in terms of proximity to dining, café and lounge cars.

5. Access to Redundant Restrooms

All accessible spaces will have access to at least two accessible restrooms, via an accessible 32” wide path.

6. Access to Redundant Vertical Access Points

All accessible coach spaces and accessible bedrooms on the upper level of a bi-level train will have access, via an accessible 32” wide path, to at least two accessible elevators to provide access to the platform for boarding and deboarding.

[1] Based on feedback received, this was added to the original Alternative Design Standards that were posted for public comment.

7. Access to Lower Level Options

Bi-level trains will include at least one accessible coach seat and accessible wheelchair space on the lower level and at least one accessible bedroom on the lower level.[2]

V. Demonstration of How Proposed Design Standards Meet or Exceed the Level of Accessibility or Usability of the Train

The ADA regulations listed above require certain accessible accommodations in each individual rail car. For trains that are made up of rail cars that are regularly connected to others and disconnected, having each car be accessible is a practical rule that ensures sufficient access to accessible seating locations and other accommodations. However, while this rule ensures that each railcar is technically accessible, each individual accessible location is "isolated," not connected to other accessible locations, without access to a redundant restroom, and without direct (or often any) access to other parts of the train, such as dining, lounge, café or observation cars.

The Alternative Design Standards proposed herein are for "trainsets," or trains that utilize "semi-permanent coupling." The cars that make up these trainsets are not easily or regularly disconnected from each other, but rather, they are connected in fixed arrangements via connections that are not designed to be easily separated. This type of connection (similar type of connection used by Amtrak on its Acela trainsets) has many benefits, including smoother transitions for passengers traversing from one car to another.

Because of the unique nature of trainsets, Amtrak proposes that they should rightly be considered as a whole and not as the sum of their individual rail car parts. In other words, the accessibility of a trainset should be viewed and considered when it is fully "assembled."

If the Alternative Design Standards listed here are approved, Amtrak can provide a much more accessible and enjoyable train experience for customers with mobility disabilities than what the current regulations provide. The Alternative Design Standards require at least the same number of accessible seats, spaces and rooms as the regulations, so in that regard, they provide the same level of accessibility as the current regulations. In other respects, the Alternative Design Standards provide better accessibility and usability compared to current regulations. Instead of isolated accessible positions, Amtrak will provide a fully accessible core area of the train. The core will have accessible accommodations – for bi-level trains, these will be available on the upper level – connected via an accessible path to multiple seating spaces (allowing a person using a wheelchair to move to other locations within the train) and redundant restrooms (maintaining access to an accessible restroom even if one restroom is in use or out of service), and access to the amenities that are central to Amtrak's Long Distance journeys, such as dining cars, lounge cars, café cars, and the opportunity to take advantage of the expansive windows often provided on the upper level of bi-level train cars to enjoy the scenery. Amtrak can also locate accessible positions in priority locations, closer to the dining and lounge cars, making it easier for customers with mobility disabilities to get to those amenities.

[2] Based on feedback received, this was added to the original Alternative Design Standards that were posted for public comment.

VI. Documentation of Public Participation

a. Consultation with Individuals with Disabilities and Groups Representing Them

Amtrak holds quarterly and ad hoc meetings with representatives of the disability community to continually keep them informed of Amtrak's efforts to provide safe, efficient and comfortable service to all customers, including customers with disabilities, and get their input on accessibility issues. One such meeting was held in June 2023, where Amtrak and disability groups discussed ideas and principles for incorporating greater accessibility into plans for new long distance trains.

On Aug. 2, Amtrak met again with representatives from regional and national disability associations to present and get feedback on its plan to seek a determination of equivalent facilitation and to use the Alternative Design Standards defined herein. At this meeting, Amtrak presented preliminary concept designs based on the Alternative Design Standards. Those present at this meeting expressed overwhelmingly positive reactions to Amtrak's proposal. Organizations with representatives in attendance at this meeting included:

- Access Living
- Federal Railroad Administration
- Disability Rights Education & Defense Fund
- Open Doors Organization
- National Council on Independent Living
- National Disability Rights Network
- National Federation of the Blind
- Paralyzed Veterans of America
- STV Incorporated
- United Spinal Association
- U.S. Access Board
- U.S. Department of Justice
- Wounded Warrior Project

b. National Outreach Efforts to Provide Notice of Equivalent Facilitation, Hearing and Public Comment Opportunity

A comprehensive communications plan was executed to bring awareness to Amtrak's request for public comment on the accessibility of future long distance trains, and in particular, Amtrak's proposed request for equivalent facilitation. This included the development of a dedicated microsite to provide attendees with detailed information about the equivalent facilitation process, as well as the particulars of the equivalent facilitation request. On the site, the public could also submit their feedback and/or register to participate in a public meeting either in person or virtually.

The site's visibility and awareness for the public meeting was enhanced through targeted digital advertising campaigns. A display ad campaign through USAToday.com received 7,277,801 impressions, and a second campaign through TravelDesk received 7,307,485 impressions.

To ensure media awareness and coverage, a media advisory was distributed both via PR Newswire and directly to a targeted list of relevant journalists across the United States and Canada. PR Newswire distribution included delivery of the media advisory to U.S.-based foreign language news outlets. The wire distribution reached a potential audience of 283,230,699. Feature stories about the public meeting and directing people to the microsite were published in Forbes (Unique Views per Month (UVM):

72,897,424), Trains (UVM: 645,330), Progressive Railroading (UVM: 37,216), TravelPulse (UVM: 423,198) and Mobility Management (UVM: 5,156). New Mobility (UVM: 58,113), a membership publication of the United Spinal Association, also shared details of the public meeting on its news site and Facebook, Instagram and Twitter accounts (Reach: 14,309).

Amtrak also reached out directly via email on two different occasions to nineteen organizations representing the disability community, sharing information on the equivalent facilitation process and associated public hearing. Disability organizations that received the hearing information included:

- Access Living
- American Association of People with Disabilities
- American Council of the Blind
- Autistic Self Advocacy Network
- National Association of the Deaf
- Christopher & Diana Reeve Foundation
- Cure Spinal Muscular Atrophy
- Disability Rights Education & Defense Fund
- Disability Rights of PA
- Epilepsy Foundation of America
- National Council on Disability
- National Council on Independent Living
- National Disability Rights Network
- National Federation of the Blind
- National Multiple Sclerosis Society
- Open Doors Organization
- Paralyzed Veterans of America
- The Jewish Federation of North America
- United Spinal Association

The public meeting information was also shared with Amtrak's more than 20,000 employees via the company's weekly online newsletter and through its Employee Resource Group for employees with disabilities.

c. Public Comment

Amtrak received over 200 public comments. Overall, feedback regarding the trainset design proposals is positive. Most commenters look forward to increased accessibility, especially the opportunity for people of all abilities to access all amenities on trains, move about independently while using wheelchairs, and travel with family members. Many travelers with mobility concerns emphasize their preference to travel with Amtrak, as opposed to airlines, and state that this preference would be even greater with the proposed accessibility enhancements.

Many commenters offered suggestions about Amtrak's plans and feedback from their own travel experiences, several of which were repeated throughout submissions. Notably, many recommended improvements to the boarding and deboarding process, with suggestions to offer improved ramp access for those using wheelchairs and for the elderly. Some included questions on Amtrak's plans for evacuating wheelchair users in the event of an emergency. Amtrak agrees that a safe and smooth boarding and deboarding process is critical for all of our customers and has made and will continue to make efforts to improve this experience for customers with mobility disabilities, including the use of car-borne boarding

technologies where feasible. Amtrak also agrees that emergency planning must include sufficient evacuation plans for customers with mobility disabilities, including those who use wheelchairs.

Several comments offered specific accessibility suggestions for Amtrak separate from the design standards proposed as a part of the equivalent facilitation process, including availability of refrigeration for medicines, improved signage for deaf passengers, Braille touchpoints for passengers who are blind and low sinks for wheelchair users. Amtrak appreciates these and all of the thoughtful comments received and will incorporate all such feedback into the design process to the extent feasible.

A small number of comments were negative. These comments mentioned concerns of whether seats would become smaller to accommodate wider aisles, whether these structural changes would be costly to customers and if using semi-permanent trainsets would cause issues of sidelining in the event of accidents or mechanical issues. Amtrak recognizes the importance of comfortable seats for customers, especially those traveling overnight or for long distances, and does not anticipate making seats smaller to accommodate greater accessibility for wheelchair users. With respect to cost and operational issues, Amtrak is and will continue to be focused on these, but based on current information, anticipates that the current approach will not create undue financial or operational concerns.

d. Aug. 30th Public Hearing

Amtrak held a public hearing on August 30, 2023 at the Hyatt Regency Capitol Hill in Washington D.C. and online via Zoom as a forum for members of the public to provide commentary on accessible train travel and the proposed Alternative Design Standards.

Thirty (30) individuals registered to attend the in-person meeting, and nine attended. For the virtual meeting held via Zoom, 136 people registered to attend and 82 logged on to the meeting.

The meeting began with a welcome and safety briefing from Dr. David Handera, Amtrak Vice President, Stations, Facilities, Properties and Accessibility at Amtrak followed by opening remarks regarding Amtrak's continued commitment to accessibility from Amtrak President Roger Harris.

Amtrak Vice President of Product Development and Customer Analytics Fred Gazzolo provided an overview of Amtrak's request for equivalent facilitation, including a review of the Alternative Design Standards and a comparison of a train layout that complies with current regulations against two trainset design concepts that comply with the Alternative Design Standards, providing better accessibility and usability of the train.

Following the presentation, members of the public who were in attendance gave statements. One person provided comment in-person. Five individuals provided comments virtually (four on camera and one via proxy reading of a written comment).

Several commenters (and some who submitted written comments online echoed these points) stated that all cars and all levels in the trainset should be fully accessible, rather than only certain cars or levels. That said, to the extent these commenters addressed the comparison between Amtrak's proposal and the current regulations, they acknowledged that the accessibility provided by the Alternative Design Standards was a marked improvement in providing access to the upper level and all amenities. Moreover, full end-to-end accessibility poses a variety of challenges that make it infeasible, and Amtrak does not believe that it would meaningfully enhance the customer experience beyond what is provided by Amtrak's proposal. Amtrak developed the Alternative Design Standards (as originally shared with the public) without accessible spaces on the lower level of bi-level trains, primarily due to concerns that creating accessible spaces in those areas would provide reduced accessibility and usability compared to the planned spaces.

Nonetheless, based on this feedback, Amtrak revised the Alternative Design Standards it is submitting here to include lower level positions, in both coach and sleeper accommodations, which will provide additional accessible options for customers. However, customers located in lower level positions may not have the same access to amenities and redundant restrooms as those on the upper level. Amtrak will ensure that customers making selections for particular locations are provided clear information about the extent to which these amenities are available to them.

Other commenters shared their views on other accessibility issues, not directly related to the Alternative Design Standards or the equivalent facilitation request. All input and comments were received and noted and will be considered by Amtrak as it continues its planning.

Following the public statements, meeting attendees were reminded that the public comment period would remain open until September 5 in case they had any additional feedback they wanted to provide after the day's presentation. Following the hearing, on August 31, Amtrak shared the slides that had been presented at the hearing with all attendees and notified them that the comment period would be extended to September 8.

VII. Conclusion

The core accessible trainset approach outlined in the Alternative Design Standards would allow Amtrak to design, procure and deliver long distance trainsets that are substantially more accessible and usable for persons with disabilities than what is currently set out in the ADA regulations. An overwhelming majority of those who commented on Amtrak's proposal are in support of it. Some have argued that nothing short of fully end-to-end accessible trains are acceptable, with wheelchair access throughout each level of each car. Amtrak has made some important modifications to its submission in response to these comments. Others, like the Rail Passengers Association, have commended the fact that Amtrak's proposal would yield substantial improvements in accessibility, while also being mindful of the comfort of all passengers and the need to increase capacity. Even those who have argued for full end to end accessibility have not denied (nor can they) that this proposal provides far better accessibility to persons with disabilities than what is provided by the current regulations. Given that this is the applicable standard for equivalent facilitation, Amtrak respectfully asks the FRA to approve this request and make a determination of equivalent facilitation.

U.S. Department
of Transportation

**Federal Railroad
Administration**

1200 New Jersey Avenue, SE
Washington, DC 20590

November 15, 2023

Mr. Roger Harris
President
National Passenger Railroad Corporation
1 Massachusetts Avenue, NW
Washington, DC 20001

Dear Mr. Harris:

On September 15, 2023, the National Railroad Passenger Corporation (Amtrak) requested from the Federal Railroad Administration (FRA) an equivalent facilitation determination for the new single and bi-level long-distance trainsets Amtrak is preparing to procure. In a new design, Amtrak proposes to use a "core accessible" trainset concept in which all accessible spaces and amenities are concentrated within several cars in the center of a trainset rather than locating discrete accessible spaces throughout the train in individual rail passenger cars. The U.S. Department of Transportation (DOT) Americans with Disabilities Act (ADA) regulations at 49 C.F.R. § 38.2 states, "[d]epartures from particular technical and scoping requirements of these guidelines by use of other designs and technologies are permitted where the alternative designs and technologies used will provide substantially equivalent or greater access to and usability of the vehicle." FRA considers requests for equivalent facilitation on a case-by-case basis and determinations are limited to the specific request under consideration. For the reasons set out below, I am granting Amtrak's request.

Current Railcar Requirements

The ADA requires all "new rail passenger cars for use in intercity rail transportation rail cars" to be "readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs."[1] The term "rail passenger car" means, with respect to intercity rail transportation, "single-level and bi-level coach cars, single-level and bi-level dining cars, single-level and bi-level sleeping cars, single-level and bi-level lounge cars, and food service cars."[2]

According to DOT ADA regulations, rail passenger cars "shall be considered to be readily accessible to and usable by individuals with disabilities" if they meet the minimum requirements in 49 C.F.R. parts 37 and 38.[3] Rail passenger cars, including business or first-class passenger

[1] 42 U.S.C. § 12162(a)(2)(A).
[2] 42 U.S.C. § 12161(4).
[3] 49 C.F.R. § 37.7(a).

cars, are required to have "at least one, but not more than two, mobility aid seating location(s)" for passengers who wish to travel seated in their mobility devices and "at least one, but not more than two, seating location(s)" for passengers who opt to transfer to a regular seat and store their devices.[4] Sleeper cars are required to contain at least one accessible sleeper compartment.[5] Neither the ADA nor DOT's regulation on sleeper accommodations limit the number of accessible sleeper compartments that can be in any one car.

There is no ADA or regulatory requirement that the upper level of bi-level cars be accessible to those who cannot navigate stairs. There is also no ADA or regulatory requirement for through car access (except where feasible for single level dining cars) or redundant accessible restrooms. Instead, the current minimum requirement is for a 32" path from the passenger rail car door to the accessible seating or sleeper location(s) and one accessible restroom.[6]

Amtrak's Request

Instead of strict compliance with the above requirements for individual rail cars, Amtrak proposes an alternative design with "trainsets" that would use "semi-permanent coupling" and offer an accessible trainset core in the center of the full trainset. Specifically, Amtrak proposes the following for its new trainset design:

(1) The same or greater number of accessible seats and sleeper compartments as the regulation requires will be available for passengers, except that these spaces would be concentrated in the center or core of each trainset.
(2) Accessible accommodations will be available on the upper level of bi-level trainsets via onboard elevators. At least two elevators will be accessible on every trainset.
(3) An accessible 32" wide path will be provided to multiple seating and sleeper spaces, redundant restrooms, and amenities that are central to Amtrak's long-distance passenger experiences, such as dining cars, lounge cars, café cars, and the expansive windows on the scenic upper level of bi-level train cars.
(4) Accessible seating and sleeper positions will be in priority locations, closer to the dining and lounge cars, making it possible for customers with mobility disabilities to get to those amenities.
(5) Bi-level trainsets will still have at least one lower-level coach seat and sleeper compartment and one available accessible restroom to provide accessibility options for passengers who cannot or prefer not to ride on the upper level. Passengers opting for the lower-level seat or sleeper location would only have access to the upper-level amenities and a redundant restroom when the train is not moving since safe operation of the elevator during train operation has not been established.
(6) Some cars beyond the trainset's core will have no accessible spaces, sleeper compartments, or accessible restrooms.

As required by 49 C.F.R. § 37.7(b)(3), Amtrak conducted significant public outreach on this request, including announcing its plan at its June 2023 standing quarterly meetings with the

[4] 49 C.F.R. § 38.125(d).
[5] 49 C.F.R. § 38.111(a)(6).
[6] 49 C.F.R. §§ 38.113(a)-(b), 38.123(b), and 38.125(d)(1).

disability community; holding a special virtual community meeting on August 2, 2023; conducting national online targeted outreach; and holding a hybrid public meeting on August 30, 2023.

FRA's Determination

Through its public outreach, Amtrak received over 200 public comments. Community feedback for Amtrak's proposal was generally[7] positive, though a few commenters requested full access by a 32" aisle width throughout the trainset. However, full trainset access is not required by the regulations. Amtrak's plan offers more than what is required by the regulations by providing access to the upper level in bi-level trains; access to all amenities such as dining, lounge, and scenic view cars; access to lower-level accessible seating and sleeper space; and redundant restrooms.

Over the years, FRA has received numerous complaints about the old design, which even though technically compliant, isolates passengers who are unable to climb stairs or travel through aisles or cab end doors—for hours or even days on long-distance routes. Thankfully, engineering and operational innovation developed in the years since the ADA regulations were drafted provides an opportunity for more equitable integration. As depicted in the material submitted with Amtrak's request and as described above, FRA finds Amtrak's proposed design provides "substantially equivalent or greater access to and usability of the vehicle."[8] The trainset design provides an integrated transportation experience with greater access for persons with mobility and other[9] disabilities to the amenities of travel, such as the dining and lounge cars, when, under the current regulations, isolated service in individual rail cars is permitted. For these reasons, FRA is granting Amtrak's request for equivalent facilitation.

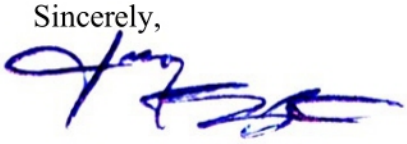
This approval is limited to the specific trainset procurement described in Amtrak's submission. The equipment must be maintained in the configuration depicted. Under 49 C.F.R. § 37.7(b)(5)-(6), determinations of equivalent facilitation are made on a case-by-case basis "and pertain only to the specific situation" for which the equivalent facilitation is sought. Other passenger rail project sponsors contemplating a similar design would be required to submit a separate request for a determination of equivalent facilitation. Amtrak should seek FRA's advice on whether a new determination would be required for additional future procurements using a similar design.

In addition, 49 C.F.R. § 37.7(b)(6) expressly prohibits entities from making claims that a determination of equivalent facilitation indicates approval or endorsement of any product or method by the Federal Government, the DOT, or its FRA. Any use of this letter as a product endorsement or certification of compliance, or reliance on this letter in marketing materials, is

---

[7] Several commenters noted operational concerns, such as issues related to emergency egress from the upper level, Amtrak's choice for trainsets and how equipment breakdowns would be handled, and safety considerations with elevators onboard trains. While these are all important topics, they are not germane to this request since this equivalent facilitation decision only concerns whether the design meets or exceeds the ADA standards. Amtrak remains responsible for demonstrating to FRA that these new trainsets meet operational and safety standards.

[8] 49 C.F.R. § 38.2.



[9] For example, people who are blind or have low vision may benefit from limiting the length of travel in a moving train to access amenities.

therefore unauthorized. No entity other than Amtrak may infer applicability of this determination to its own projects, products, methods, or equipment.

Finally, this determination of equivalent facilitation applies to the design of trainsets and depends upon the specific configuration of those trainsets. Therefore, to remain compliant with this determination, Amtrak must address the operational challenges in using trainsets in long distance service on the National Network so that the trainset configuration approved here can be maintained. Further, this letter does not contemplate the safety of the proposed requirements for the new trainset design. For example, the accessible pathways through the trainsets' articulations must be capable of remaining 32" whether the trainset is being operated on straight or curved track. FRA will perform a comprehensive safety evaluation upon final design. Please continue to work with the FRA Office of Railroad Development on requesting funding for and developing the facilities necessary to maintain and operate this equipment.

Thank you for your continued efforts to improve accessible transportation for all. Please continue to engage with the FRA and the disability community as these trainset designs progress. If you have any questions about this determination, please contact Mr. Calvin Gibson, Director of Civil Rights, at (202) 493-6010, or calvin.gibson@dot.gov.

Sincerely,

Amit Bose
Administrator

EXHIBIT S
Billing Guidelines for Task Services Performed by Amtrak

Amtrak Billing Guidelines

26-FOI-00415 00000006254 "UNCLASSIFIED" 4/30/2026

- Amtrak will issue monthly invoices to Contractor for all hours worked regardless of whether the Task was completed. Such invoice shall list the hours worked, the equipment unit number and the tasks performed. Under no circumstances will Amtrak wait until all units have been completed within an FMI or warranty work before billing the Contractor.

- For Warranty obligations, Contractor shall provide to Amtrak all spare parts and components needed to effectuate the Tasks prior to the start of the Tasks. Contractor understands that Amtrak is not a routine provider of the Tasks contemplated by this agreement and that Amtrak's performance of the same shall not extinguish or diminish Contractor's warranty obligations under the Contract.

- Amtrak shall perform the Tasks within a reasonable timeframe taking into account its business operations, labor agreements, available staffing and other factors. Amtrak's performance shall not affect liquidated damages or performance guarantees payable to Amtrak under the Contract.

- Nothing shall be interpreted to require Amtrak to perform the Tasks without compensation.

- Contractor shall reimburse Amtrak for all costs incurred by Amtrak in connection with the Tasks. Such costs may include, but are not limited to, the following:

➢ **Direct labor and management costs** for all assigned Amtrak employees for actual hours worked while performing Tasks, including but not limited to: any adjustments, allowances and arbitrary hours in accordance with the then-current existing labor agreements; travel costs; overnight accommodations (including boarding and lodging); travel time and mandatory rest time as the result of performing work hereunder; and Amtrak's overhead rates, as set forth in Appendix A hereof ("Overhead/Rate Schedule").

Note: *Amtrak, in its sole discretion, may agree to an alternative billing arrangement where the Tasks are based upon mutually agreed upon estimated hours. If Amtrak agrees to an alternative billing arrangement, the terms and conditions of the arrangement will be agreed to prior to implementation of the arrangement.*

Amtrak Billing Guidelines(con'd)

26-FOI-00415 00000006254 "UNCLASSIFIED" 4/30/2026

- **Costs for any materials and supplies** required for performance of the Tasks that have not been provided by Contractor to Amtrak. Any materials and supplies issued from Amtrak's inventory shall be charged at Amtrak's inventory cost in effect at the time the material or supplies are issued, plus any actual shipping/transportation costs and shipping/ transportation cost additives. Any materials and supplies which are procured by Amtrak, but which are not issued from Amtrak's inventory, shall be charged at Amtrak's actual cost incurred. Material handling and General and Administrative (G&A) overhead rates as set forth in the Overhead/Rate Schedule shall be added to the cost of all materials and supplies.

- **Costs for all third-party contract services** and for any related additional insurance. Costs will be billed at actual cost incurred, plus the G&A overhead rates as set forth in the Overhead/Rate Schedule.

- **Costs for equipment, vehicles, work trains, wire trains, rolling stock** and any other such items which are leased by Amtrak and required for performance of the Tasks shall be charged at the actual cost of the lease, plus the G&A overhead rates as set forth in the Overhead/Rate Schedule.

- **Retroactive wage and benefit costs** (i.e., adjustments made subsequent to performance of the Tasks) which shall be reimbursed based on the actual cost, plus all associated current overhead rates as set forth in the Overhead/Rate Schedule.

- **Any other actual costs**, not listed, necessary to effectively perform the Tasks shall be charged at actual costs, plus Amtrak's overhead rates as set forth in the Overhead/Rate Schedule.

- The overhead rates are computed in accordance with Amtrak's accounting policies and procedures. These rates are updated periodically by Amtrak and will be made available to Contractor, upon request. The applicable billable overhead rates shall be the rates in effect (i) at the time of performance of the Tasks with respect to Tasks performed by Amtrak forces, and (ii) as of the date, Amtrak receives the invoice from its contractors with respect to Tasks performed by Amtrak contractors.

Amtrak Billing Guidelines(con'd)

26-FOI-00415 00000006254 "UNCLASSIFIED" 4/30/2026

- In addition to reimbursement of the costs described above, Contractor shall pay Amtrak a 10% management fee applied to all billable costs and overhead rates.

- Prior to Amtrak performing any FMIs, Contractor shall issue a Purchase Order reflecting the estimated hours needed to complete the FMI and, working with Amtrak's Finance Department, the amount needed for the PO based upon the number of units and the timing of the work.

- Contractor shall pay all undisputed amounts on Amtrak invoices within thirty (30) days of receipt via electronic payment. Failure to pay invoices when due may be considered a breach. If payments are not made by the due date, Amtrak may, at its sole discretion, offset such payments against a future invoice or reduce the amount of retainage returned to cover such payments. Contractor shall pay all amounts stated in invoices in full without set-off or counterclaim unless otherwise agreed to by Amtrak.

- If Contractor objects to any charges identified on a monthly invoice, it shall notify Amtrak of its objection in writing within thirty (30) days of receipt of said invoice. Within thirty (30) days thereafter, Amtrak will provide Contractor with additional documentation and/or explanation as required, to support the accuracy of the charges. If Amtrak finds an adjustment is due, Amtrak will issue a credit memo in the amount of the adjustment. If, after reviewing the additional information provided by Contractor, the billing dispute is still not resolved, the issue shall be resolved in accordance with the Claims and Disputes provision of the Contract.

AMTRAK SUPPLIER RESPONSIBILITY QUESTIONNAIRE

RESPONSES TO THE QUESTIONS CONTAINED IN THIS QUESTIONNAIRE MUST BE SUBMITTED ON THIS FORM.

The signatory of this Questionnaire guarantees the truth and accuracy of all statements and answers to the questions herein.

Failure to complete and return this questionnaire, the provision of any false statements, or the failure to answer (a) question(s) when required, may render the bid/proposal non-responsive.

Where an explanation is required or needed, please provide the explanation on the form directly or by adding additional pages, as necessary. Submit the completed form and explanations to the contracting official. The contracting official may request additional information based on your responses.

Contractors must submit updated information to the awarding authority if changes have occurred that would render any of the responses inaccurate in any way.

Updates must be submitted to the awarding authority within 30 days of the change(s).

The responses in this Questionnaire will not be made available to the public for review.

REQUEST FOR PROPOSAL ("RFP") – EXHIBIT T
UNIVERSAL SINGLE LEVEL FLEET REPLACEMENT PROGRAM
NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)
1 Massachusetts Ave NW, Washington DC 20001

BIDDER/CONTRACTOR INFORMATION

Business Name:
DUNS Number:
Address:
Phone Number
Point of Contact Person:

TYPE OF SUBMISSION:
The Questionnaire being submitted is:
□ An initial submission of a completed Questionnaire.
□ An update of a prior Questionnaire dated _____/_____/_____.

A. BUSINESS ORGANIZATION/STRUCTURE
Indicate the organizational structure of the company. "Company" includes a sole proprietorship, corporation, joint venture, consortium, association, or any combination thereof.

□ **Corporation:** Date incorporated: _____/_____/_____ State of incorporation: _____
List the corporation's current officers.
President:
Vice President:
Secretary:
Treasurer:
□ Check the box only if the company is a publicly traded corporation.
List those who own 5% or more of the corporation's stocks. Use Attachment A if more space is needed. Publicly traded corporations need not list the owners of 5% or more of the corporation's stocks.

□ **Limited Liability Company:** Date of formation: _____/_____/_____ State of formation: _____
List members who own 5% or more of the company.

□ **Partnership:** Date formed: _____/_____/_____ State of formation: _____
List all partners in the company.

□ **Sole Proprietorship:** Date started: _____/_____/_____
List any company(s) that you have been associated with as an owner, partner, or officer for the last five years. Do not include ownership of stock in a publicly traded company in your response to this question.

□ **Joint Venture:** Date formed: _____/_____/_____
List: (1) each company that is a member of the joint venture and (2) the percentage of ownership the company will have in the joint venture. **Each member of the Joint Venture must complete a separate Questionnaire for the Joint Venture's submission to be considered as responsive.**

B. OWNERSHIP AND NAME CHANGES

Is the company a subsidiary, parent, holding company, or affiliate of another company? □ **Yes** □ **No**

If **Yes**, explain the relationship between the company and the associated companys. Include information about an affiliated company only if one company owns 50% or more of another company, or if an owner, partner or officer of the company holds a similar position in another company.

Have any of the company's owners, partners, or officers operated a similar business in the past five years? □ **Yes** □ **No**

If **Yes**, list the names and addresses of all such businesses, and the person who operated the business. Include information about a similar business only if an owner, partner or officer of the company holds a similar position in another company.

Has the company changed names in the past five years? □ **Yes** □ **No**

If **Yes**, list all prior names, addresses, and the dates they were used. Explain the reason for each name change in the last five years.

Are any of the company's licenses held in the name of a corporation or partnership? □ **Yes** □ **No**

If Yes, the name of the corporation or partnership that actually holds the license.

C. FINANCIAL RESOURCES AND RESPONSIBILITY

Is the company now, or has it ever been at any time in the last five years, the debtor in a bankruptcy case? □ **Yes** □ **No**

Is your company in the process of, or in negotiations toward, being sold? □ **Yes** □ **No**

D. PERFORMANCE HISTORY

How many years has the company been in business? _____ Years.

Has the company ever held any contracts with Amtrak? □ **Yes** □ **No**

If, **Yes,** list all contracts the company has had with Amtrak for the last 10 years. For each contract listed in response to this question, include: (a) contract number; (b) total contract value; (c) starting date; and (d) ending date.

In the past five years, has a governmental or private entity or individual terminated the company's contract prior to completion of the contract? **Yes** □ **No**

In the past five years, has the company used any subcontractor to perform work on a government contract when you knew that the subcontractor had been debarred by a governmental entity?
□ **Yes** □ **No**

In the past five years, has the company been debarred or determined to be a non-responsible bidder or contractor? □ **Yes** □ **No**

E. DISPUTES

In the past five years, has the company been the defendant in court on a matter related to any of the following issues?

(a) Payment to subcontractors? □ **Yes** □ **No**

(b) Work performance on a contract? □ **Yes** □ **No**

(c) Employment-related litigation brought by an employee? □ **Yes** □ **No**

Does the company have any outstanding judgements pending against it? □ **Yes** □ **No**

In the past five years, has the company been assessed liquidated damages on a contract?
□ **Yes** □ **No**

REQUEST FOR PROPOSAL ("RFP") – EXHIBIT T
UNIVERSAL SINGLE LEVEL FLEET REPLACEMENT PROGRAM
NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)
1 Massachusetts Ave NW, Washington DC 20001

F. COMPLIANCE

In the past five years, has the company or any of its owners, partners or officers, ever been investigated, cited, assessed any penalties, or been found to have violated any laws, rules, or regulations enforced or administered, by any federal or state governmental entities? □ **Yes** □ **No**

If a license is required to perform any services provided by the company, in the past five years, has the company, or any person employed by the company, been investigated, cited, assessed any penalties, subject to any disciplinary action by a licensing agency, or found to have violated any licensing laws? □ **Yes** □ **No**

G. BUSINESS INTEGRITY

For questions (a), (b), and (c) below, check **Yes** if the situation applies to the company. For these questions, the term "company" includes any owners, partners, or officers in the company. The term "owner" does not include owners of stock in the company if the company is a publicly traded corporation.

(a) Is a governmental entity or public utility currently investigating the company for making (a) false claim(s) or material misrepresentation(s)? □ **Yes** □ **No**

(b) In the past five years, has a governmental entity or public utility alleged or determined that the company made (a) false claim(s) or material misrepresentation(s)? □ **Yes** □ **No**

(c) In the past five years, has the company been convicted or found liable in a civil suit for, making false claim(s) or material misrepresentation(s) to any governmental entity or public utility?
□ **Yes** □ **No**

In the past five years, has the company or any of its owners or officers been convicted of a crime involving the of a government contract, the awarding of a government contract, the performance of a government contract, or the crime of fraud, theft, embezzlement, perjury, bribery? For this question, the term "owner" does not include those who own stock in a publicly traded corporation. □ **Yes** □ **No**
